

AMC1204 适用于分流测量的 20MHz 二阶隔离式 Δ - Σ 调制器

1 特性

- 针对分流电阻器进行优化的 $\pm 250\text{mV}$ 输入电压范围
- 安全相关认证：
 - 符合 DIN VDE V 0884-11: 2017-01 标准的 4250V_{PK} (AMC1204B) 基础型隔离
 - 3005V_{RMS} (AMC1204B) 隔离长达 1 分钟，符合 UL1577 标准
 - 符合 CAN/CSA No. 5A 组件验收服务通知和 DIN EN 61010-1 标准
 - 工作电压：1200V_{PEAK}
 - 瞬态抗扰度：15kV/ μs
- 高电磁场抗扰度
(请参阅 [SLLA181A 应用报告](#))
- 出色的交流性能：
 - SNR: 84dB (最小值)
 - THD: -80dB (最大值)
- 出色的直流精度：
 - INL: ± 8 LSB (最大值)
 - 增益误差: $\pm 2\%$ (最大值)
- 外部时钟输入，可轻松实现同步
- 完整的额定工作温度范围

2 应用

- 基于分流电阻器的电流感应，可用于：
 - 电机控制
 - 绿色能源
 - 逆变器应用
 - 不间断电源

3 说明

AMC1204 和 AMC1204B 是 1 位数字输出、隔离型 Δ - Σ ($\Delta\Sigma$) 调制器，时钟频率高达 20MHz。二氧化硅 (SiO_2) 隔离栅抗磁干扰能力强，为调制器输出提供数字隔离功能。经认证，该隔离栅可提供高达 4000V_{PEAK} (AMC1204) 和 4250V_{PEAK} (AMC1204B) 的基本电隔离，符合 UL1577、VDE V 0884-11 和 CSA 标准或规范。

AMC1204 和 AMC1204B 可为测量隔离栅中分流电阻的小信号提供单芯片解决方案。这些类型的电阻通常用于感测电机控制逆变器、低能耗生成系统以及其他工业应用的电流中的数字输入 D 类音频放大器。AMC1204 和 AMC1204B 差分输入可轻松连接分流电阻或其他低电平信号源。内部基准可免除对外部组件的需要。当与适当的外部数字滤波器配合使用时，可在 78kSPS 数据速率下获得 14 个有效位数 (ENOB)。

调制器采用 5V 模拟电源 (AVDD)，而隔离数字接口则可通过 3V，3.3V 或 5V 电源 (DVDD) 供电。

AMC1204 和 AMC1204B 采用 SOIC-16 (DW) 和 SOIC-8 (DWV) 封装，额定温度范围为 -40°C 至 105°C 。

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
AMC1204	SOIC (16)	10.30mm x 7.50mm
	SOIC (8)	5.85mm x 7.50mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision E (September 2015) to Revision F	Page
• 已更改 将经认证的数字隔离 项目符号更改为安全相关认证 并根据 ISO 标准更改了详细信息	1
• 已删除 删除了隔离栅使用寿命长 项目符号（位于特性 部分）	1
• 已更改 将 VDE V 0884-10 更改为 VDE V 0884-11（位于说明 部分）	1
• 已更改 将标题从简化原理图 更改为器件方框图	1
• Changed <i>Absolute Maximum Ratings</i> condition statement	5
• Added <i>Power Ratings</i> table	6
• Changed <i>Insulation Specifications</i> table per ISO standard	6
• Changed <i>Safety-Related Certification</i> table per ISO standard	8
• Changed <i>Safety Limiting Values</i> table per ISO standard	8
• Added <i>Insulation Characteristics Curves</i> as per ISO standard	11
• 已更改 更改了 相关文档 部分	30
• 已删除 删除了 相关链接 部分	30

Changes from Revision D (December 2013) to Revision E	Page
• 已添加 添加了 <i>ESD</i> 额定值 表、特性 说明 部分、器件功能模式、应用和实施 部分、电源相关建议 部分、布局 部分、器件和文档支持 部分和机械、封装和可订购信息 部分	1
• 已更改 更改了经认证的数字隔离 特性项目符号中的第一个子项目符号：将 IEC60747-5-5 更改为 VDE V 0884-10	1
• 已更改 将 IEC60747-5-5 更改为 VDE V 0884-10（位于说明 部分的第一段）	1

Changes from Revision C (August 2012) to Revision D	Page
• 已更改 更改了经认证的数字隔离 特性项目符号中的第一个子项目符号：将 IEC60747-5-2 更改为 IEC60747-5-5	1
• 已删除 删除了芯片照片	1
• 已添加 向文档添加了 DWV (SSO-8) 封装	1

• 已更改 将 IEC60747-5-2 更改为 IEC60747-5-5（位于说明 部分的第一段）	1
• 已更改 更改了说明 部分的最后一段	1
• Added DWV pin out drawing	4
• Added DWV information to Pin Descriptions table	4
• Added DWV package to Thermal Information table	5
• Changed first paragraph of <i>Digital Output</i> section: changed 78.1% to 89.06% and 21.9% to 10.94%	22

Changes from Revision B (August 2011) to Revision C
Page

• 已更改 更改了经认证的数字隔离、隔离电压特性项目符号	1
• 已添加 向文档添加了 AMC1204B	1
• 已更改 更改了“说明”部分，以添加 AMC1204B	1
• Changed package name from TSSOP to SO	4
• Changed footnote 1 in <i>Electrical Characteristics</i> table	9
• Changed Analog Inputs, V_{CM} parameter minimum specification and unit in <i>Electrical Characteristics</i> table	9
• Changed Digital Output, C_{OUT} and C_{LOAD} parameters unit specifications in <i>Electrical Characteristics</i> table	10
• Updated Figure 53	27
• Updated Figure 55	28
• Updated Figure 56	29

5 Pin Configuration and Functions

NC = no internal connection.

Pin Functions

PIN			I/O	DESCRIPTION
NAME	NO.			
	8 PINS	16 PINS		
AVDD	1	1	Power	High-side power supply
VINP	2	2	Analog input	Noninverting analog input
VINN	3	3	Analog input	Inverting analog input
AGND	4	4, 8 ⁽¹⁾	Power	High-side ground
DGND	5	9, 16	Power	Controller-side ground
DATA	6	11	Digital output	Modulator data output
CLKIN	7	13	Digital input	Modulator clock input
DVDD	8	14	Power	Controller-side power supply
NC	—	5-7, 10, 12, 15	—	No internal connection; can be tied to any potential or left unconnected

(1) Both pins are connected internally via a low-impedance path; thus, only one of the pins must be tied to the ground plane.

6 Specifications

6.1 Absolute Maximum Ratings

see ⁽¹⁾

	MIN	MAX	UNIT
Supply voltage, AVDD to AGND or DVDD to DGND	−0.3	6	V
Analog input voltage at VINP, VINN	AGND − 0.5	AVDD + 0.5	V
Digital input voltage at CLKIN	DGND − 0.3	DVDD + 0.3	V
Input current to any pin except supply pins	−10	10	mA
Maximum virtual junction temperature, T _J		150	°C
Operating ambient temperature, T _{OA}	−40	125	°C
Storage temperature, T _{stg}	−65	150	°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under the [Electrical Characteristics](#) is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per JEDEC standard 22, test method A114-C.01 ⁽¹⁾	±3000	V
		Charged-device model (CDM), per JEDEC standard 22, test method C101 ⁽²⁾	±1500	
		Machine model (MM), per JEDEC standard 22, test method A115A	±200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T _A	Operating ambient temperature	−40		105	°C
AVDD	High-side (analog) supply voltage	4.5	5	5.5	V
DVDD	Controller-side (digital) supply voltage	2.7	3.3	5.5	V

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		AMC1204, AMC1204B		UNIT
		DW (SOIC)	DWV (SOIC)	
		16 PINS	8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	78.5	106.5	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	41.3	53.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	50.2	60.3	°C/W
ψ _{JT}	Junction-to-top characterization parameter	11.5	18.5	°C/W
ψ _{JB}	Junction-to-board characterization parameter	41.2	58.9	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	n/a	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC package thermal metrics application report](#).

6.5 Power Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_D	Maximum power dissipation (both sides)	AVDD = DVDD = 5.5 V			115.5	mW
		AVDD = 5.5 V, DVDD = 3.6 V			102.4	
P_{D1}	Maximum power dissipation (high-side supply)	AVDD = 5.5 V			88.0	mW
P_{D2}	Maximum power dissipation (low-side supply)	DVDD = 5.5 V			27.5	mW
		DVDD = 3.6 V			14.4	

6.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air, DW package	≥ 8	mm
		Shortest pin-to-pin distance through air, DWV package	≥ 8.5	
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface, DW package	≥ 8	mm
		Shortest pin-to-pin distance across the package surface, DWV package	≥ 8.5	
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the insulation	≥ 0.014	mm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112, DW package	≥ 400	V
		DIN EN 60112 (VDE 0303-11); IEC 60112, DWV package	≥ 175	
	Material group	According to IEC 60664-1, DW package	II	
		According to IEC 60664-1, DWV package	III	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300 V _{RMS}	I-IV	
		Rated mains voltage ≤ 600 V _{RMS}	I-III	
DIN VDE V 0884-11: 2017-01 ⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	At ac voltage (bipolar)	1200	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At ac voltage (sine wave)	849	V _{RMS}
		At dc voltage	1200	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 s (qualification test), AMC1204B	4250	V _{PK}
		V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test), AMC1204B	5100	
		V _{TEST} = V _{IOTM} , t = 60 s (qualification test), AMC1204	4000	
		V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test), AMC1204	4800	
V _{IOSM}	Maximum surge isolation voltage ⁽³⁾	Test method per IEC 60065, 1.2/50-μs waveform, V _{TEST} = 1.3 × V _{IOSM} = 6000 V _{PK} (qualification)	4615	V _{PK}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves and ribs on the PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.

Insulation Specifications (continued)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
q_{pd}	Apparent charge ⁽⁴⁾	Method a, after input/output safety test subgroup 2 / 3, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s, $V_{pd(m)} = 1.2 \times V_{IORM} = 1440 V_{PK}$, $t_m = 10$ s	≤ 5	pC
		Method a, after environmental tests subgroup 1, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s, $V_{pd(m)} = 1.3 \times V_{IORM} = 1560 V_{PK}$, $t_m = 10$ s	≤ 5	
		Method b1, at routine test (100% production) and preconditioning (type test), $V_{ini} = V_{IOTM}$, $t_{ini} = 1$ s, $V_{pd(m)} = 1.5 \times V_{IORM} = 1800 V_{PK}$, $t_m = 1$ s	≤ 5	
C_{IO}	Barrier capacitance, input to output ⁽⁵⁾	$V_{IO} = 0.5 V_{PP}$ at 1 MHz	1.2	pF
R_{IO}	Insulation resistance, input to output ⁽⁵⁾	$V_{IO} = 500$ V at $T_A < 85^\circ\text{C}$	$> 10^{12}$	Ω
		$V_{IO} = 500$ V at $85^\circ\text{C} < T_A < 105^\circ\text{C}$	$> 10^{11}$	
		$V_{IO} = 500$ V at $T_S = 150^\circ\text{C}$	$> 10^9$	
	Pollution degree		2	
	Climatic category		40/125/21	
UL1577				
V_{ISO}	Withstand isolation voltage	$V_{TEST} = V_{ISO} = 3005 V_{RMS}$ or $4250 V_{DC}$, $t = 60$ s (qualification), $V_{TEST} = 1.2 \times V_{ISO} = 3606 V_{RMS}$, $t = 1$ s (100% production test), AMC1204B	3005	V_{RMS}
		$V_{TEST} = V_{ISO} = 2500 V_{RMS}$ or $4000 V_{DC}$, $t = 60$ s (qualification), $V_{TEST} = 1.2 \times V_{ISO} = 2800 V_{RMS}$, $t = 1$ s (100% production test), AMC1204	2500	

(4) Apparent charge is electrical discharge caused by a partial discharge (pd).

(5) All pins on each side of the barrier are tied together, creating a two-pin device.

6.7 Safety-Related Certifications

VDE	UL	CSA
Certified according to DIN VDE V 0884-11: 2017-01 and DIN EN 61010-1 (VDE 0411-1): 2011-07	Recognized under 1577 component recognition program	Recognized under CSA component acceptance NO 5 program, IEC 60950-1, and IEC 61010-1
Basic insulation	Single protection	Basic insulation
Certificate number: 40047657	File number: E181974	Certificate number: 2350550

6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	DW-package, $R_{\theta JA} = 78.5^{\circ}\text{C/W}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$, $AVDD = DVDD = 5.5\text{ V}$, see Figure 2			289	mA
		DWV-package, $R_{\theta JA} = 106.5^{\circ}\text{C/W}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$, $AVDD = DVDD = 5.5\text{ V}$, see Figure 2			213	
P_S	Safety input, output, or total power ⁽¹⁾	DW-package, $R_{\theta JA} = 78.5^{\circ}\text{C/W}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$, see Figure 3			1592	mW
		DWV-package, $R_{\theta JA} = 106.5^{\circ}\text{C/W}$, $T_J = 150^{\circ}\text{C}$, $T_A = 25^{\circ}\text{C}$, see Figure 3			1173	mW
T_S	Maximum safety temperature				150	$^{\circ}\text{C}$

- (1) The maximum safety temperature, T_S , has the same value as the maximum junction temperature, T_J , specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S . These limits vary with the ambient temperature, T_A .
- The junction-to-air thermal resistance, $R_{\theta JA}$, in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:
- $T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.
- $T_{J(\text{max})} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(\text{max})}$ is the maximum junction temperature.
- $P_S = I_S \times AVDD_{\text{max}} + I_S \times DVDD_{\text{max}}$, where $AVDD_{\text{max}}$ is the maximum high-side supply voltage and $DVDD_{\text{max}}$ is the maximum controller-side supply voltage.

6.9 Electrical Characteristics

All minimum/maximum specifications at $T_A = -40^{\circ}\text{C}$ to 105°C , $AVDD = 4.5\text{ V}$ to 5.5 V , $DVDD = 2.7\text{ V}$ to 5.5 V , $V_{INP} = -250\text{ mV}$ to 250 mV , $V_{INN} = 0\text{ V}$, and sinc³ filter with OSR = 256, unless otherwise noted.

Typical values are at $T_A = 25^{\circ}\text{C}$, $AVDD = 5\text{ V}$, and $DVDD = 3.3\text{ V}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
RESOLUTION						
	Resolution		16			Bits
DC ACCURACY						
INL	Integral linearity error ⁽¹⁾	T _A = −40°C to 85°C	−8	±2	8	LSB
		T _A = −40°C to 105°C	−16	±5	16	LSB
DNL	Differential nonlinearity		−1		1	LSB
V _{OS}	Offset error ⁽²⁾		−1	±0.1	1	mV
TCV _{OS}	Offset error thermal drift		−3.5	±1	3.5	μV/°C
G _{ERR}	Gain error ⁽²⁾		−2%	±0.5%	2%	
TCG _{ERR}	Gain error thermal drift			±30		ppm/°C
PSRR	Power-supply rejection ratio			79		dB
ANALOG INPUTS						
FSR	Full-scale differential voltage input range	V _{INP} − V _{INN}	±320			mV
	Specified FSR		−250		250	mV
V _{CM}	Operating common-mode signal ⁽³⁾		−160		AVDD	mV

C _{ID}	Differential input capacitance		3.5			pF
R _{ID}	Differential input resistance		12.5			kΩ
I _{IL}	Input leakage current	V _{INP} − V _{INN} = ±250 mV	−10		10	μA
		V _{INP} − V _{INN} = ±320 mV	−50		50	μA
CMTI	Common-mode transient immunity		15			kV/μs
CMRR	Common-mode rejection ratio	V _{IN} from 0 V to 5 V at 0 Hz	108			dB
		V _{IN} from 0 V to 5 V at 100 kHz	114			dB
EXTERNAL CLOCK						
t _{CLKIN}	Clock period		45.5	50	200	ns
f _{CLKIN}	Input clock frequency		5	20	22	MHz
Duty _{CLKIN}	Duty cycle	5 MHz ≤ f _{CLKIN} < 20 MHz	40%	50%	60%	
		20 MHz ≤ f _{CLKIN} ≤ 22 MHz	45%	50%	55%	
AC ACCURACY						
SINAD	Signal-to-noise + distortion	f _{IN} = 1kHz, T _A = −40°C to 85°C	78	87		dB
		f _{IN} = 1kHz, T _A = −40°C to 105°C	70	87		dB
SNR	Signal-to-noise ratio	f _{IN} = 1kHz, T _A = −40°C to 85°C	84	88		dB
		f _{IN} = 1kHz, T _A = −40°C to 105°C	83	88		dB
THD	Total harmonic distortion	f _{IN} = 1kHz, T _A = −40°C to 85°C		−96	−80	dB
		f _{IN} = 1kHz, T _A = −40°C to 105°C		−96	−70	dB
SFDR	Spurious-free dynamic range	f _{IN} = 1kHz, T _A = −40°C to 85°C	82	96		dB
		f _{IN} = 1kHz, T _A = −40°C to 105°C	72	96		dB
DIGITAL INPUTS ⁽³⁾						
I _{IN}	Input current	V _{IN} = DVDD to DGND	−10		10	μA
C _{IN}	Input capacitance		5			pF
CMOS Logic Family (CMOS With Schmitt-Trigger)						
V _{IH}	High-level input voltage	DVDD = 4.5V to 5.5V	0.7DVDD		DVDD + 0.3	V
V _{IL}	Low-level input voltage	DVDD = 4.5V to 5.5V	−0.3		0.3DVDD	V
LVCMOS Logic Family						
V _{IH}	High-level input voltage	DVDD = 2.7 V to 3.6 V	2		DVDD + 0.3	V

(1) Integral nonlinearity is defined as the maximum deviation from a straight line passing through the end-points of the ideal ADC transfer function expressed as number of LSBs or as a percent of the specified 500-mV input range.

(2) Maximum values, including temperature drift, are ensured over the full specified temperature range.

(3) Ensured by design.

Electrical Characteristics (continued)

All minimum/maximum specifications at $T_A = -40^{\circ}\text{C}$ to 105°C , $\text{AVDD} = 4.5\text{ V}$ to 5.5 V , $\text{DVDD} = 2.7\text{ V}$ to 5.5 V , $\text{VINP} = -250\text{ mV}$ to 250 mV , $\text{VINN} = 0\text{ V}$, and sinc³ filter with $\text{OSR} = 256$, unless otherwise noted.

Typical values are at $T_A = 25^{\circ}\text{C}$, $\text{AVDD} = 5\text{ V}$, and $\text{DVDD} = 3.3\text{ V}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{IL}	Low-level input voltage	DVDD = 2.7 V to 3.6 V	-0.3		0.8	V
DIGITAL OUTPUTS ⁽³⁾						
C _{OUT}	Output capacitance			5		pF
C _{LOAD}	Load capacitance				30	pF
CMOS Logic Family						
V _{OH}	High-level output voltage	DVDD = 4.5 V, I _{OH} = -100 μA	4.4			V
V _{OL}	Low-level output voltage	DVDD = 4.5 V, I _{OL} = 100 μA			0.5	V
LVCMOS Logic Family						
V _{OH}	High-level output voltage	I _{OH} = 20 μA	DVDD - 0.1			V
		I _{OH} = -4 mA, 2.7 V ≤ DVDD ≤ 3.6 V	DVDD - 0.4			V
		I _{OH} = -4 mA, 4.5 V ≤ DVDD ≤ 5.5 V	DVDD - 0.8			V
V _{OL}	Low-level output voltage	I _{OL} = 20 μA			0.1	V
		I _{OL} = 4 mA			0.4	V
POWER SUPPLY						
AVDD	High-side supply voltage		4.5	5	5.5	V
DVDD	Controller-side supply voltage		2.7	3.3	5.5	V
I _{AVDD}	High-side supply current	4.5 V ≤ AVDD ≤ 5.5 V		11	16	mA
I _{DVDD}	Controller-side supply current	2.7 V ≤ DVDD ≤ 3.6 V		2	4	mA
		4.5V ≤ DVDD ≤ 5.5 V		2.8	5	mA
P _D	Power dissipation	AVDD = 5.5 V, DVDD = 3.6 V		61.6	102.4	mW

6.10 Timing Requirements

Over recommended ranges of supply voltage and operating free-air temperature, unless otherwise noted. (See [Figure 1](#))

		MIN	NOM	MAX	UNIT

7 Detailed Description

7.1 Overview

The AMC1204 and AMC1204B are single-channel, second-order, delta-sigma ($\Delta\Sigma$) modulators designed for medium- to high-resolution analog-to-digital conversions. The isolated output of the converter (DATA) provides a stream of digital ones and zeros accurately representing the analog input voltage over time. The time average of this serial output is proportional to the analog input voltage.

The [Functional Block Diagram](#) shows a detailed block diagram of the AMC1204 and AMC1204B. The analog input range is tailored to directly accommodate the voltage drop across a shunt resistor used for current sensing. The SiO₂-based capacitive isolation barrier supports a high level of magnetic field immunity as described in the [ISO72x Digital Isolator Magnetic-Field Immunity application report](#). The external clock input simplifies the synchronization of multiple current sense channels on system level. The extended frequency range of up to 20 MHz supports higher performance levels compared to the other solutions available on the market.

7.2 Functional Block Diagram

Figure 43. Detailed Block Diagram

7.3 Feature Description

7.3.1 Analog Input

The differential analog input of the AMC1204 and AMC1204B is implemented with a switched-capacitor circuit.

The AMC1204 and AMC1204B measure the differential input signal $V_{IN} = (VINP - VINN)$ against the internal reference of 2.5 V using internal capacitors that are continuously charged and discharged. Figure 44 shows the simplified schematic of the AMC1204 and AMC1204B input circuitry; the right side of Figure 44 illustrates the input circuitry with the capacitors and switches replaced by an equivalent circuit.

In Figure 44, the S_1 switches close during the input sampling phase. With the S_1 switches closed, C_{DIFF} charges to the voltage difference across $VINP$ and $VINN$. For the discharge phase, both S_1 switches open first and then both S_2 switches close. C_{DIFF} discharges approximately to $AGND + 0.8\text{ V}$ during this phase. This two-phase sample/discharge cycle repeats with a period of $t_{CLKIN} = 1/f_{CLKIN}$. f_{CLKIN} is the operating frequency of the modulator. The capacitors C_{IP} and C_{IN} are of parasitic nature and caused by bonding wires and the internal ESD protection structure.

Figure 44. Equivalent Analog Input Circuit

There are two restrictions on the analog input signals $VINP$ and $VINN$. First, if the input voltage exceeds the range $AGND - 0.5\text{ V}$ to $AVDD + 0.3\text{ V}$, the input current must be limited to 10 mA because the input protection diodes on the front end of the converter begin to turn on. In addition, the linearity and the noise performance of the device are ensured only when the differential analog input voltage remains within $\pm 250\text{ mV}$.

7.3.2 Modulator

The modulator topology of the AMC1204 and AMC1204B is fundamentally a second-order, switched-capacitor, $\Delta\Sigma$ modulator, such as the one conceptualized in Figure 45. The analog input voltage ($X_{(t)}$) and the output of the 1-bit digital-to-analog converter (DAC) are differentiated, providing an analog voltage (X_2) at the input of the first integrator or modulator stage. The output of the first integrator is further differentiated with the DAC output; the resulting voltage (X_3) feeds the input of the second integrator stage. When the value of the integrated signal (X_4) at the output of the second stage equals the comparator reference voltage, the output of the comparator switches from high to low, or vice versa, depending on its previous state. In this case, the 1-bit DAC responds on the next clock pulse by changing its analog output voltage (X_6), causing the integrators to progress in the opposite direction, while forcing the value of the integrator output to track the average of the input.

Feature Description (continued)

Figure 45. Block Diagram Of A Second-Order Modulator

The modulator shifts the quantization noise to high frequencies, as shown in [Figure 46](#); therefore, a low-pass digital filter should be used at the output of the device to increase the overall performance. This filter is also used to convert from the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation). A digital signal processor (DSP), microcontroller (μ C), or field programmable gate array (FPGA) can be used to implement the filter.

TI's microcontroller family [TMS320F28x7x](#) offers a suitable programmable, hardwired filter structure termed a *sigma-delta filter module* (SDFM) optimized for usage with the AMC1204, AMC1304 and AMC1305 devices. Also, the SD24_B converters on the [MSP430F677x](#) microcontrollers offer a path to directly access the integrated sinc-filters, thus offering a system-level solution for multichannel isolated current sensing. Another option is to use a suitable application-specific device such as the [AMC1210](#), a four-channel digital sinc-filter.

Figure 46. Quantization Noise Shaping

Feature Description (continued)

7.3.3 Digital Output

A differential input signal of 0 V ideally produces a stream of ones and zeros that are high 50% of the time and low 50% of the time. A differential input of 250 mV produces a stream of ones and zeros that are high 89.06% of the time. A differential input of –250 mV produces a stream of ones and zeros that are high 10.94% of the time. This is also the specified linear input range of the modulator with the performance as specified in this data sheet. The range between 250 mV and 320 mV (absolute values) is the non-linear range of the modulator. The output of the modulator clips with a stream of only zeros with an input less than or equal to –320 mV or with a stream of only ones with an input greater than or equal to 320 mV. The input voltage versus the output modulator signal is shown in [Figure 47](#).

The system clock of the AMC1204 and AMC1204B is typically 20 MHz and is provided externally at the CLKIN pin. The data are synchronously provided at 20 MHz at the DATA output pin. The data are changing at the falling edge of CLKIN; for more details see the [Timing Requirements](#) section.

Figure 47. Analog Input Versus Amc1204 Modulator Output

7.4 Device Functional Modes

The AMC1204 is operational when the power supplies AVDD and DVDD are applied as specified in the [Recommended Operating Conditions](#) section.

The AMC1204 has no additional functional modes.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Digital Filter Usage

The modulator generates a bit stream that is processed by a digital filter to obtain a digital word similar to a conversion result of a conventional analog-to-digital converter (ADC). A very simple filter, built with minimal effort and hardware, is a sinc³-type filter, as shown in Equation 1:

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^3 \quad (1)$$

This filter provides the best output performance at the lowest hardware size (count of digital gates). For an oversampling rate (OSR) in the range of 16 to 256, this filter is a good choice. All the characterization in this document is also done with a sinc³ filter with OSR = 256 and an output word width of 16 bits.

In a sinc³ filter response (shown in Figure 48 and Figure 49), the location of the first notch occurs at the frequency of output data rate $f_{DATA} = f_{CLK}/OSR$. The –3-dB point is located at half the Nyquist frequency or $f_{DATA}/4$. For some applications, it may be necessary to use another filter type with different frequency response. Performance can be improved, for example, by using a cascaded filter structure. The first decimation stage could be built of a sinc³ filter with a low OSR and the second stage using a high-order filter.

Figure 48. Frequency Response Of The Sinc³ Filter

Figure 49. Pole Response Of The Sinc³ Filter

The effective number of bits (ENOB) is often used to compare the performance of ADCs and $\Delta\Sigma$ modulators. Figure 51 illustrates the ENOB of the AMC1204 and AMC1204B with different oversampling ratios. In this data sheet, this number is calculated from SNR using Equation 2:

$$SNR = 1.76dB + 6.02dB \times ENOB \quad (2)$$

An example code for an implementation of a sinc³ filter in an FPGA follows. For more information, see the [Combining ADS1202 with FPGA Digital Filter for Current Measurement in Motor Control Applications](#) application note, available for download at www.ti.com.

```

8.2 Typical Application

8.2.1 Frequency Inverter Application

Because of their high AC and DC performance, isolated $\Delta\Sigma$ modulators are being widely used in new generation frequency inverter designs. Frequency inverters are critical parts of industrial motor drives, photovoltaic inverters (string and central inverters), uninterruptible power supplies (UPS), electrical and hybrid vehicles, and other industrial applications. The input structure of the AMC1204 is optimized for use with low-impedance shunt resistors and is therefore tailored for isolated current sensing using shunts.

Figure 50. AMC1204 in a Frequency Inverter Application

8.2.1.1 Design Requirements

Figure 50 shows a diagram of the AMC1204 in a typical frequency inverter. When the inverter stage is part of a motor drive system, measurement of the motor phase current is done via the shunt resistors (R_{SHUNT}). Depending on the system design, either all three or only two phase currents are sensed.

In this example, an additional AMC1204 is used for isolated sensing of the DC link voltage. This high DC link voltage is reduced using a high-impedance resistive divider before being sensed by the AMC1204 across a smaller resistor. It is important to consider that the value of the resistor in the voltage divider can potentially degrade the performance of the measurement. Such phenomenon is described in the [Isolated Voltage Sensing](#) section.

8.2.1.2 Detailed Design Procedure

For modulator output bit-stream filtering, TI recommends a device from TI's [TMS320F28x7x](#) family of MCUs. This family supports up to eight channels of dedicated hardwired filter structures that significantly simplify system level design by offering two filtering paths per channel: one providing high accuracy results for the control loop and one fast response path for overcurrent detection.

Typical Application (continued)

8.2.1.3 Application Curves

In motor control applications, a very fast response time for overcurrent detection is required. The time for fully settling the filter in case of a step-signal at the input of the modulator depends on its order; that is, a sinc³ filter requires three data updates for full settling (with $f_{\text{DATA}} = f_{\text{CLK}} / \text{OSR}$). Therefore, for overcurrent protection, filter types other than sinc³ might be better choices. An alternative is, for example, the sinc² filter. Figure 52 compares the settling times of different filter orders.

Sincfast is a modified sinc² filter whose transfer function follows Equation 3.

$$H(z) = \left(\frac{1 - z^{-\text{OSR}}}{1 - z^{-1}} \right)^2 (1 + z^{-2\text{OSR}}) \quad (3)$$

Figure 51. Measured Effective Number Of Bits Versus Oversampling Ratio

Figure 52. Measured Effective Number of Bits Versus Settling Time

In the case of a continuous signal fed into a sinc filter, the time delay for such signal corresponds to half of the settling time shown in Figure 52.

Typical Application (continued)

8.2.2 Example of a Resolver-Based Motor Control Analog Front End

Figure 53 shows an example of two AMC1204 and AMC1204B devices and one ADS1209 (a dual-channel, 10-MHz, non-isolated modulator) connected to an AMC1210, building the entire analog front end of a resolver-based motor control application.

For detailed information on the ADS1209 and AMC1210, visit the respective device product folders at www.ti.com.

Figure 53. Example of a Resolver-Based Motor Control Analog Front End Schematic

8.2.3 Isolated Voltage Sensing

The AMC1204 is optimized for current-sensing applications using low-impedance shunts. However, the device can also be used in isolated voltage-sensing applications if the impact of the (usually higher) impedance of the resistor used in this case is considered. Figure 54 shows a simplified circuit typically used in high-voltage sensing applications.

Figure 54. Voltage Measurement Application

10 Layout

10.1 Layout Guidelines

- Place the decoupling capacitors for AVDD and DVDD as close as possible to the AMC1204.
- Ensure that the traces that connect the shunt resistor to the RC filter on the VINP terminal are symmetrical to and have the same length as the traces connecting to the VINN terminal.
- The top and bottom PCB layers underneath the AMC1204 must be kept free of any conductive materials in order to comply with the creepage and clearance distances shown in the section.

10.2 Layout Example

Figure 56 shows the recommended layout and placement of the decoupling capacitors and other components required by the AMC1204 and AMC1204B.

Figure 56. Recommended Layout

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

SOIC - 2.8 mm max height

Top View:

- Overall width: 11.5 ± 0.25 TYP
- Overall height: 5.95 to 5.75 (NOTE 3)
- Pin 1 ID AREA (circled with 'Q')
- Pin pitch (center-to-center): 2.54 (NOTE 4)
- Pin width: 0.51 to 0.31 (8X)
- Pin length: 1.27 (6X)
- Pin thickness: 0.15 (2X)
- Pin 1 location: 7.6 to 7.4 (NOTE 4)
- Feature callouts: $\oplus 0.25$ (M), C, A (S), B (S)

Side View:

- Seating Plane
- Pin thickness: 0.1 C
- Overall height: 2.8 MAX

Detail View:

- Feature callouts: C, $\oplus 0.25$ (M), C, A (S), B (S)

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.

LAND PATTERN EXAMPLE
9.1 mm NOMINAL CLEARANCE/CREEPAGE
SCALE:6X

SOLDER MASK DETAILS

4218796/A 09/2013

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL
 SCALE:6X

4218796/A 09/2013

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.
