

针对与 bq2419x 充电器控制器一起使用的电池管理单元 **Impedance Track™** 电量计

查询样品: **bq27531-G1**

特性

- 针对单节锂离子电池应用的电池电量计
- 驻留在系统主板上
- 基于已获专利的 **Impedance Track™** 技术的电池电量计
 - 可为准确续航时间预测建模电池放电曲线
 - 可针对电池老化、电池自放电以及温度/速率低效情况进行自动调节
 - 低值感应电阻器 (**5mΩ** 至 **20mΩ**)
- 具有可定制充电配置的电池充电器管理器
 - 可根据温度配置的充电电压和电流
 - 可选健康状态 (**SoH**) 和基于多级别的充电配置
- 无主机自主电池管理系统
 - 精简的软件开销可实现平台间的轻松可移植性以及更短代工生产 (**OEM**) 设计周期
 - 更高的可靠性和安全性

- 运行时间提升
 - 阻抗跟踪 (**Impedance Track**) 技术带来了更长的运行时间
 - 针对充电器终止的更加严密的精度控制
 - 经改进的再充电阈值
- 智能充电-定制的和自适应充电配置
 - 基于 **SoH** 的充电器控制
 - 温度水平充电 (**TLC**)
- 针对 **bq2419x** 单节开关模式电池充电器的电池充电器控制
 - 独立充电解决方案
 - 出厂模式性能
- **400kHz I²C™** 用于与系统微处理器端口相连接的接口
- 采用 **15** 引脚 **NanoFree™ (CSP)** 封装内

应用范围

- 智能手机、功能型手机和平板电脑
- 数码相机与数码摄像机
- 手持终端设备
- **MP3** 或多媒体播放器

说明

德州仪器 (TI) 的 bq27531-G1 系统侧锂离子电池管理单元是一款微控制器外设，此外设提供针对单节锂离子电池组的 **Impedance Track™** 电量检测和充电控制。此器件只需很少的系统微处理器固件开发。与 bq2419x 单节开关模式充电器一起使用，bq27531-G1 管理一个嵌入式电池（不可拆卸）或一个可拆卸电池组。

bq27531-G1 采用已获专利的 **Impedance Track™** 算法支持电量检测，可提供诸如剩余电池容量 (mAh)，充电状态 (%), 续航时间 (分钟)，电池电压 (mV)，温度 (°C) 以及健康状况 (%) 等信息。

通过 bq27531-G1 进行电池电量监测只需将 **PACK+** (P+), **PACK-** (P-) 以及热敏电阻 (T) 连接至可拆卸电池组或嵌入式电池电路。CSP 选项采用尺寸为 2.61mm × 1.96mm 的 15 焊球封装，引线间距为 0.5mm。它是空间受限应用的理想选择。

GENERAL DESCRIPTION

The bq27531-G1 accurately predicts the battery capacity and other operational characteristics of a single Li-based rechargeable cell. It can be interrogated by a system processor to provide cell information, such as time-to-empty (TTE), and state-of-charge (SOC) as well as SOC interrupt signal to the host.

The bq27531-G1 can control a bq2419x Charger IC without the intervention from an application system processor. Using the bq27531-G1 and bq2419x chipset, batteries can be charged with the typical constant-current, constant voltage (CCCV) profile or charged using a Multi-Level Charging (MLC) algorithm.

Information is accessed through a series of commands, called *Standard Commands*. Further capabilities are provided by the additional *Extended Commands* set. Both sets of commands, indicated by the general format *Command()*, are used to read and write information contained within the device control and status registers, as well as its data flash locations. Commands are sent from system to gauge using the bq27531-G1's I²C serial communications engine, and can be executed during application development, pack manufacture, or end-equipment operation.

Cell information is stored in the device in non-volatile flash memory. Many of these data flash locations are accessible during application development. They cannot, generally, be accessed directly during end-equipment operation. Access to these locations is achieved by either use of the bq27531-G1's companion evaluation software, through individual commands, or through a sequence of data-flash-access commands. To access a desired data flash location, the correct data flash subclass and offset must be known.

The key to the bq27531-G1 high-accuracy gas gauging prediction is Texas Instrument's proprietary Impedance Track™ algorithm. This algorithm uses cell measurements, characteristics, and properties to create state-of-charge predictions that can achieve less than 1% error across a wide variety of operating conditions and over the lifetime of the battery.

The device measures battery charge/discharge activity by monitoring the voltage across a small-value series sense resistor (5 mΩ to 20 mΩ typ.) located between the system's V_{SS} and the battery's PACK- terminal. When a cell is attached to the device, cell impedance is computed, based on cell current, cell open-circuit voltage (OCV), and cell voltage under loading conditions.

The device external temperature sensing is optimized with the use of a high accuracy negative temperature coefficient (NTC) thermistor with R₂₅ = 10.0kΩ ±1%, B_{25/85} = 3435K ± 1% (such as Semitec NTC 103AT). The bq27531-G1 can also be configured to use its internal temperature sensor. When an external thermistor is used, a 18.2k pull up resistor between BI/TOUT and TS pins is also required. The bq27531-G1 uses temperature to monitor the battery-pack environment, which is used for fuel gauging and cell protection functionality.

To minimize power consumption, the device has different power modes: NORMAL, SLEEP, SLEEP+, HIBERNATE, and BAT INSERT CHECK. The bq27531-G1 passes automatically between these modes, depending upon the occurrence of specific events, though a system processor can initiate some of these modes directly.

For complete operational details, refer to [bq27531-G1 Technical Reference Manual](#).

DATA COMMANDS

STANDARD DATA COMMANDS

The bq27531-G1 uses a series of 2-byte standard commands to enable system reading and writing of battery information. Each standard command has an associated command-code pair, as indicated in [Table 2](#). Because each command consists of two bytes of data, two consecutive I²C transmissions must be executed both to initiate the command function, and to read or write the corresponding two bytes of data. Additional details are found in the [bq27531-G1 Technical Reference Manual](#).

Control(): 0x00/0x01

Issuing a *Control()* command requires a subsequent 2-byte subcommand. These additional bytes specify the particular control function desired. The *Control()* command allows the system to control specific features of the bq27531-G1 during normal operation and additional features when the device is in different access modes, as described in [Table 3](#). Additional details are found in the [bq27531-G1 Technical Reference Manual](#).

CHARGER DATA COMMANDS

The charger registers are mapped to a series of single byte Charger Data Commands to enable system reading and writing of battery charger registers. During charger power up, the registers are initialized to Charger Reset State. The fuel gauge can change the values of these registers during the System Reset State.

Each of the bits in the Charger Data Commands can be read/write. It is important to note that System Access can be different from the read/write access as defined in bq2419x charger hardware. The fuel gauge may block write access to the charger hardware when the bit function is controlled by the fuel gauge exclusively. For example, the *[VREGx]* bits of *Chrgr_Voltage_Reg4* are controlled by the fuel gauge and cannot be modified by system.

The bq27531 reads the corresponding registers of *System_Stat_Reg8()* and *Fault_Reg9()* every second to mirror the charger status. Other registers in the bq2419x are read when registers are modified by the bq27531.

FUNCTIONAL DESCRIPTION

The bq27531-G1 measures the cell voltage, temperature, and current to determine battery SOC. The bq27531-G1 monitors charge and discharge activity by sensing the voltage across a small-value resistor (5 mΩ to 20 mΩ typ.) between the SRP and SRN pins and in series with the cell. By integrating charge passing through the battery, the battery's SOC is adjusted during battery charge or discharge.

The total battery capacity is found by comparing states of charge before and after applying the load with the amount of charge passed. When an application load is applied, the impedance of the cell is measured by comparing the OCV obtained from a predefined function for present SOC with the measured voltage under load. Measurements of OCV and charge integration determine chemical state of charge and chemical capacity (Qmax). The initial Qmax values are taken from a cell manufacturers' data sheet multiplied by the number of parallel cells. It is also used for the value in **Design Capacity**. The bq27531-G1 acquires and updates the battery-impedance profile during normal battery usage. It uses this profile, along with SOC and the Qmax value, to determine *FullChargeCapacity*() and *StateOfCharge*(), specifically for the present load and temperature. *FullChargeCapacity*() is reported as capacity available from a fully charged battery under the present load and temperature until *Voltage*() reaches the **Terminate Voltage**. *NominalAvailableCapacity*() and *FullAvailableCapacity*() are the uncompensated (no or light load) versions of *RemainingCapacity*() and *FullChargeCapacity*() respectively.

The bq27531-G1 has two flags accessed by the *Flags*() function that warns when the battery's SOC has fallen to critical levels. When *RemainingCapacity*() falls below the first capacity threshold, specified in **SOC1 Set Threshold**, the [SOC1] (*State of Charge Initial*) flag is set. The flag is cleared once *RemainingCapacity*() rises above **SOC1 Clear Threshold**.

When *Voltage*() falls below the system shut down threshold voltage, **SysDown Set Volt Threshold**, the [SYSDOWN] flag is set, serving as a final warning to shut down the system. The SOC_INT also signals. When *Voltage*() rises above **SysDown Clear Voltage** and the [SYSDOWN] flag has already been set, the [SYSDOWN] flag is cleared. The SOC_INT also signals such change. All units are in mV.

When the voltage is discharged to **Terminate Voltage**, the SOC will be set as 0.

COMMUNICATIONS

I²C INTERFACE

The bq27531-G1 supports the standard I²C read, incremental read, quick read, one-byte write, and incremental write functions. The 7-bit device address (ADDR) is the most significant 7 bits of the hex address and is fixed as 1010101. The first 8 bits of the I²C protocol are, therefore, 0xAA or 0xAB for write or read, respectively.

☐ Host generated ☐ Gauge generated

(a) 1-byte write

(b) quick read

(c) 1-byte read

(d) incremental read

(e) incremental write

(S = Start, Sr = Repeated Start, A = Acknowledge, N = No Acknowledge, and P = Stop).

The quick read returns data at the address indicated by the address pointer. The address pointer, a register internal to the I²C communication engine, increments whenever data is acknowledged by the bq27531-G1 or the I²C master. "Quick writes" function in the same manner and are a convenient means of sending multiple bytes to consecutive command locations (such as two-byte commands that require two bytes of data).

The following command sequences are not supported:

Attempt to write a read-only address (NACK after data sent by master):

Attempt to read an address above 0x6B (NACK command):

I²C Time Out

The I²C engine releases both SDA and SCL if the I²C bus is held low for 2 seconds. If the bq27531-G1 is holding the lines, releasing them frees them for the master to drive the lines. If an external condition is holding either of the lines low, the I²C engine enters the low-power sleep mode.

I²C Command Waiting Time

To ensure proper operation at 400 kHz, a $t_{(BUF)} \geq 66 \mu s$ bus-free waiting time must be inserted between all packets addressed to the bq27531-G1. In addition, if the SCL clock frequency (f_{SCL}) is > 100 kHz, use individual 1-byte write commands for proper data flow control. The following diagram shows the standard waiting time required between issuing the control subcommand and the reading the status result. For read-write standard command, a minimum of 2 seconds is required to get the result updated. For read-only standard commands, there is no waiting time required, but the host must not issue any standard command more than two times per second. Otherwise, the gauge could result in a reset issue due to the expiration of the watchdog timer.

Waiting time inserted between two 1-byte write packets for a subcommand and reading results
(required for $100 \text{ kHz} < f_{SCL} \leq 400 \text{ kHz}$)

Waiting time inserted between incremental 2-byte write packet for a subcommand and reading results
(acceptable for $f_{SCL} \leq 100 \text{ kHz}$)

Waiting time inserted after incremental read

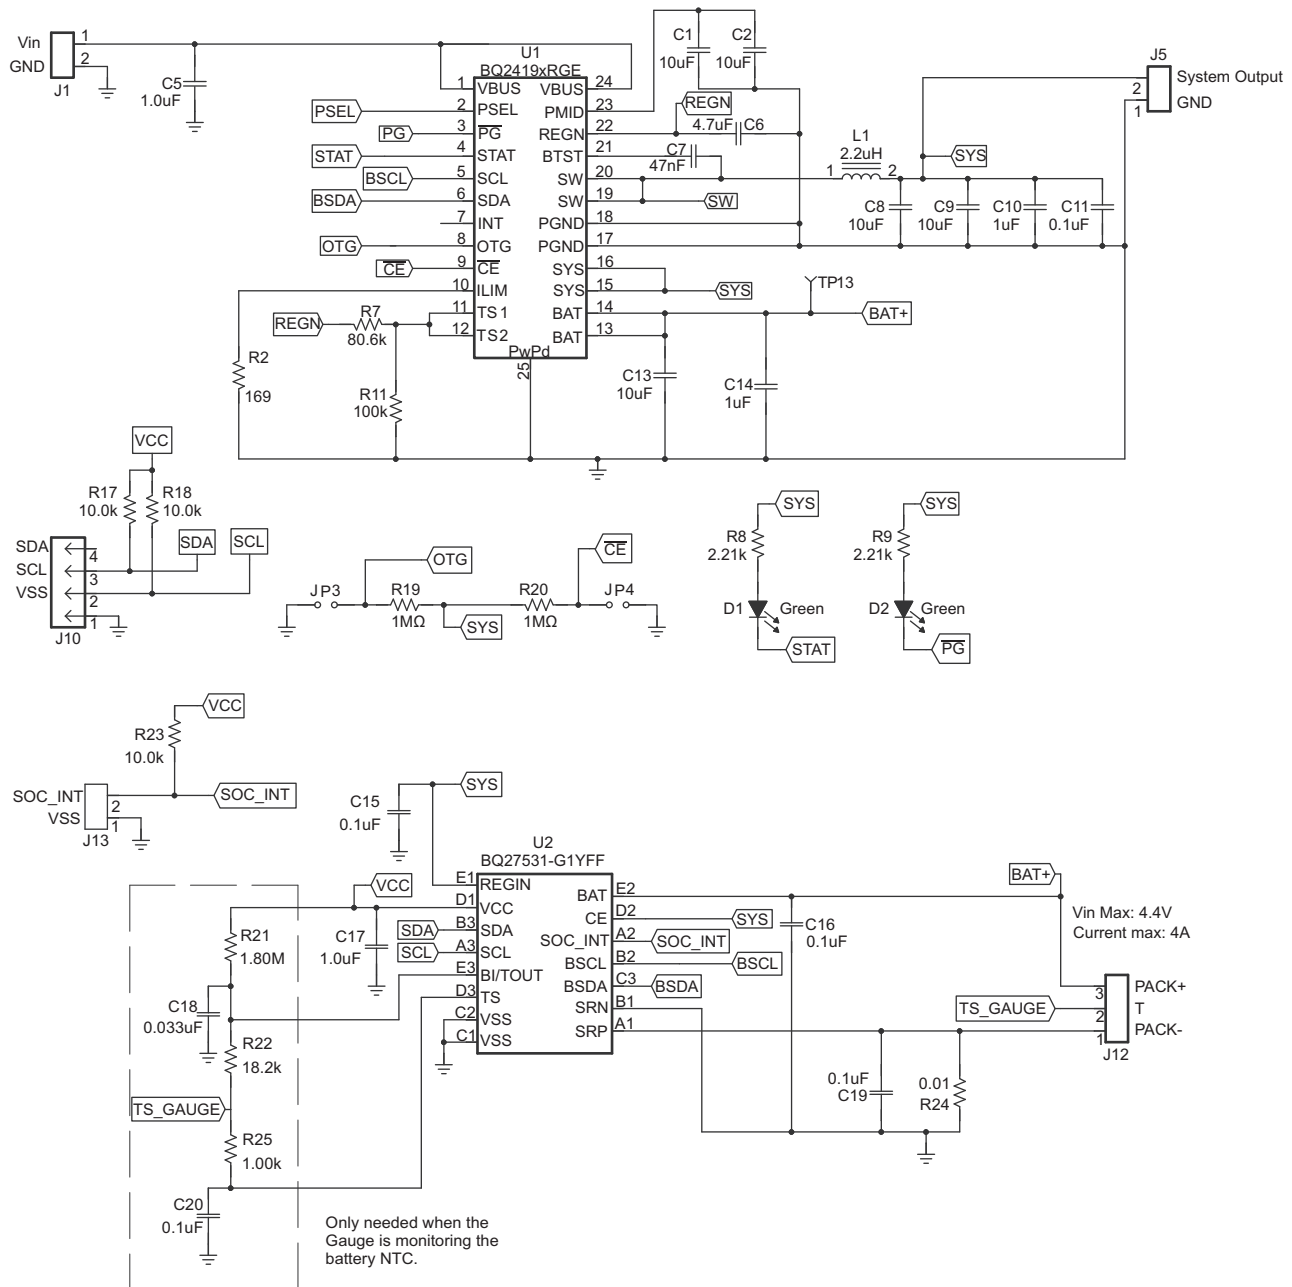

I²C Clock Stretching

A clock stretch can occur during all modes of fuel gauge operation. In SLEEP and HIBERNATE modes, a short clock stretch occurs on all I²C traffic as the device must wake-up to process the packet. In the other modes (BAT INSERT CHECK, NORMAL, SLEEP+) clock stretching only occurs for packets addressed for the fuel gauge. The majority of clock stretch periods are small as the I²C interface performs normal data flow control. However, less frequent yet more significant clock stretch periods may occur as blocks of Data Flash are updated. The following table summarizes the approximate clock stretch duration for various fuel gauge operating conditions.

Gauging Mode	Operating Condition / Comment	Approximate Duration
SLEEP HIBERNATE	Clock stretch occurs at the beginning of all traffic as the device wakes up.	$\leq 4 \text{ ms}$
BAT INSERT CHECK NORMAL SLEEP+	Clock stretch occurs within the packet for flow control (after a start bit, ACK or first data bit).	$\leq 4 \text{ ms}$
	Normal Ra table Data Flash updates.	24 ms
	Data Flash block writes.	72 ms
	Restored Data Flash block write after loss of power.	116 ms
	End of discharge Ra table Data Flash update.	144 ms

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
