bq40z50 1 节、2 节、3 节和 4 节串联锂离子电池组管理器

1 特性

- 全集成 1 节、2 节、3 节和 4 节串联锂离子或锂聚合物电池组管理器及保护
- 下一代已获专利的 Impedance Track™ 技术可准确测量锂离子和锂聚合物电池中的可用电量
- 高侧 N 通道保护场效应晶体管 (FET) 驱动
- 充电或者静止状态时集成的电池均衡
- 可编程保护特性的完全阵列
  - 电压
  - 电流
  - 温度
  - 充电终止时间
  - CHG/DSG FET
  - 模拟前端 (AFE)
- 精密的充电算法
  - 日本电子与信息技术工业协会 (JEITA)
  - 增强型充电
  - 自适应充电
  - 电池均衡
- 支持 TURBO 升压模式
- 支持电池跳变点 (BTP)
- 诊断寿命数据监视器和黑匣子记录器
- 发光二极管 (LED) 显示
- 支持 2 线制系统管理总线 (SMBus) v1.1 接口
- 安全散列算法 (SHA-1) 认证
- 紧凑封装：32 导线四方扁平无引线 (QFN) (RSM)

2 应用

- 笔记本/上网本
- 医疗与测试设备
- 便携式仪表

3 说明

bq40z50 器件采用已获专利的 Impedance Track™ 技术，是一款基于电池组的单芯片全集成解决方案，针对 1 节、2 节、3 节和 4 节串联锂离子或锂聚合物电池组提供电量监测、保护及认证等一些列丰富的功能。

bq40z50 器件利用其集成的高性能模拟外设，测量锂离子或锂聚合物电池的可用容量、电压、电流、温度和其他关键参数，保留准确的数据记录，并通过 SMBus v1.1 兼容接口将这些信息报告给系统主机控制器。

4 修订历史记录

Changes from Original (December 2013) to Revision A **Page**

- 已添加 *ESD 额定值表、特性描述部分、器件功能模式部分、应用和实施部分、电源相关建议部分、布局部分、器件和文档支持部分及机械、封装和可订购信息部分* ... 1
- 新增特性：支持 TURBO 升压模式 ... 1
- 新增特性：支持电池跳变点 (BTP) ... 1
- 将一项特性要点从“诊断寿命数据监视器”更改为“诊断寿命数据监视器和黑匣子记录器” ... 1
- 更新了“说明”部分的第二段。 添加了文本“bq40z50 器件为主机系统提供最大的功率和电流，从而支持 Turbo 升压模式。 . . . ” ... 3

5 说明（续）

bq40z50 器件为主机系统提供最大的功率和电流，从而支持 Turbo 升压模式。 该器件还支持电池跳变点，从而在预设的充电阈值状态向主机系统发送 BTP 中断信号。

bq40z50 针对过压、欠压、过流、短路电流、过载和过热情况，以及其他电池组和电池相关故障提供基于软件的 1 级和 2 级安全保护。

具有针对认证码密钥的安全内存的 SHA-1 认证能够识别真正的电池组。

这个紧凑的 32 导线 QFN 封装在尽可能地提供电池电量测量应用的功能性和安全性的同时，最大限度地降低解决方案成本和智能电池的尺寸。

Pin Functions

PIN NAME	PIN NUMBER	TYPE(1)	DESCRIPTION
PBI	1	P	Power supply backup input pin
VC4	2	IA	Sense voltage input pin for most positive cell, and balance current input for most positive cell
VC3	3	IA	Sense voltage input pin for second most positive cell, balance current input for second most positive cell, and return balance current for most positive cell
VC2	4	IA	Sense voltage input pin for third most positive cell, balance current input for third most positive cell, and return balance current for second most positive cell
VC1	5	IA	Sense voltage input pin for least positive cell, balance current input for least positive cell, and return balance current for third most positive cell
SRN	6	I	Analog input pin connected to the internal coulomb counter peripheral for integrating a small voltage between SRP and SRN where SRP is the top of the sense resistor.
NC	7	—	Not internally connected. Connect to VSS.
SRP	8	I	Analog input pin connected to the internal coulomb counter peripheral for integrating a small voltage between SRP and SRN where SRP is the top of the sense resistor.
VSS	9	P	Device ground
TS1	10	IA	Temperature sensor 1 thermistor input pin
TS2	11	IA	Temperature sensor 2 thermistor input pin
TS3	12	IA	Temperature sensor 3 thermistor input pin
TS4	13	IA	Temperature sensor 4 thermistor input pin
NC	14	—	Not internally connected
BTP_INT	15	O	Battery Trip Point (BTP) interrupt output

7.1 Absolute Maximum Ratings

Over-operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Supply voltage range, V_{CC}	BAT, VCC, PBI	–0.3	30	V
Input voltage range, V_{IN}	PACK, SMBC, SMBD, $\overline{\text{PRES}}$ or $\overline{\text{SHUTDN}}$, BTP_INT, $\overline{\text{DISP}}$	–0.3	30	V
	TS1, TS2, TS3, TS4	–0.3	V_{REG} + 0.3	V
	PTC, PTCEN, LEDCNTLA, LEDCNTLB, LEDCNTLC	–0.3	V_{BAT} + 0.3	V
	SRP, SRN	–0.3	0.3	V
	VC4	VC3 – 0.3	VC3 + 8.5, or VSS + 30	V
	VC3	VC2 – 0.3	VC2 + 8.5, or VSS + 30	V
	VC2	VC1 – 0.3	VC1 + 8.5, or VSS + 30	V
	VC1	VSS – 0.3	VSS + 8.5, or VSS + 30	V
Output voltage range, V_O	CHG, DSG	–0.3	32	
	PCHG, FUSE	–0.3	30	V
Maximum VSS current, I_{SS}			50	mA
T_{STG}	Storage temperature	–65	150	°C
Lead temperature (soldering, 10 s), T_{SOLDER}			300	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Typical values stated where T_A = 25°C and VCC = 14.4 V, Min/Max values stated where T_A = –40°C to 85°C and VCC = 2.2 V to 26 V (unless otherwise noted)

			MIN	NOM	MAX	UNIT

C_{PBI}	External PBI capacitor		2.2			µF
T_{OPR}	Operating temperature		–40		85	°C

7.4 Thermal Information

THERMAL METRIC[1]		RSM (QFN)	UNIT
		32 PINS	
$R_{\theta JA, High K}$	Junction-to-ambient thermal resistance[2]	47.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case(top) thermal resistance[3]	40.3	
$R_{\theta JB}$	Junction-to-board thermal resistance[4]	14.7	
ψ_{JT}	Junction-to-top characterization parameter[5]	0.8	
ψ_{JB}	Junction-to-board characterization parameter[6]	14.4	
$R_{\theta JC(bottom)}$	Junction-to-case(bottom) thermal resistance[7]	3.8	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.
(2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
(3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
(4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
(5) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta JA}$, using a procedure described in JESD51-2a (sections 6 and 7).
(6) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining $R_{\theta JA}$, using a procedure described in JESD51-2a (sections 6 and 7).
(7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

7.5 Electrical Characteristics: Supply Current

Typical values stated where T_A = 25°C and VCC = 14.4 V, Min/Max values stated where T_A = –40°C to 85°C and VCC = 2.2 V to 20 V (unless otherwise noted)

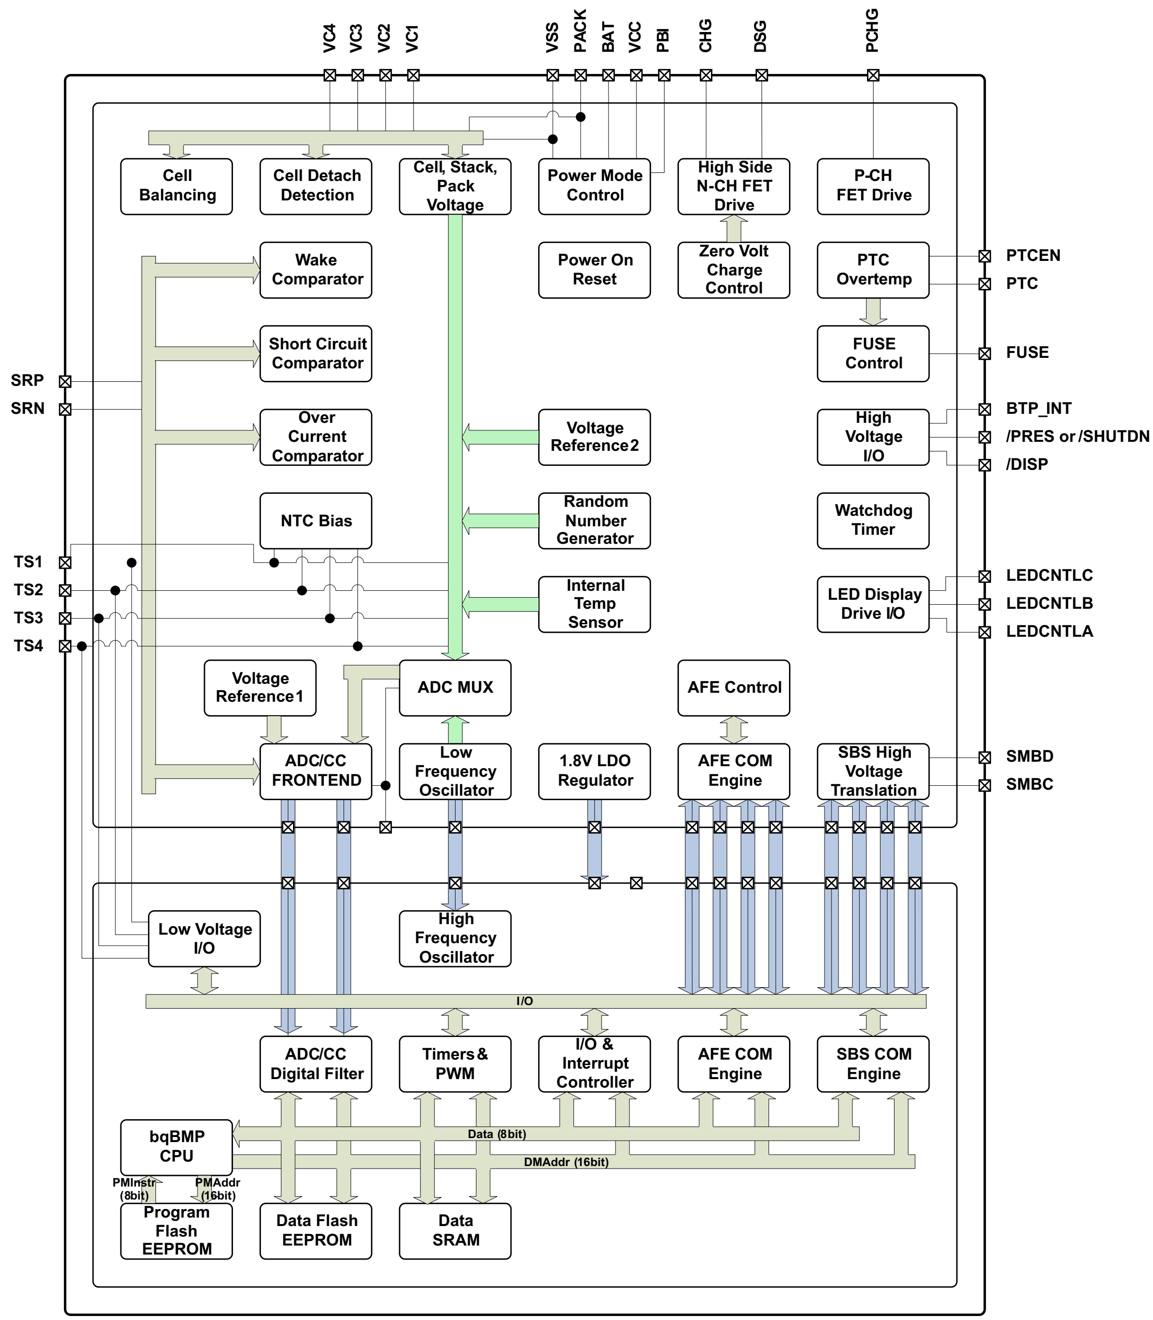
8 Detailed Description

8.1 Overview

The bq40z50 device, incorporating patented Impedance Track™ technology, provides cell balancing while charging or at rest. This fully integrated, single-chip, pack-based solution provides a rich array of features for gas gauging, protection, and authentication for 1-series, 2-series, 3-series, and 4-series cell Li-Ion and Li-Polymer battery packs, including a diagnostic lifetime data monitor and black box recorder.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Primary (1st Level) Safety Features

The bq40z50 supports a wide range of battery and system protection features that can easily be configured. See the *bq40z50 Technical Reference Manual* (SLUUA43) for detailed descriptions of each protection function.

The primary safety features include:

- Cell Overvoltage Protection
- Cell Undervoltage Protection
- Cell Undervoltage Protection Compensated
- Overcurrent in Charge Protection
- Overcurrent in Discharge Protection
- Overload in Discharge Protection
- Short Circuit in Charge Protection
- Short Circuit in Discharge Protection
- Overtemperature in Charge Protection
- Overtemperature in Discharge Protection
- Undertemperature in Charge Protection
- Undertemperature in Discharge Protection
- Overtemperature FET protection
- Precharge Timeout Protection
- Host Watchdog Timeout Protection
- Fast Charge Timeout Protection
- Overcharge Protection
- Overcharging Voltage Protection
- Overcharging Current Protection
- Over Precharge Current Protection

8.3.2 Secondary (2nd Level) Safety Features

The secondary safety features of the bq40z50 can be used to indicate more serious faults via the FUSE pin. This pin can be used to blow an in-line fuse to permanently disable the battery pack from charging or discharging. See the *bq40z50 Technical Reference Manual* (SLUUA43) for detailed descriptions of each protection function.

The secondary safety features provide protection against:

- Safety Overvoltage Permanent Failure
- Safety Undervoltage Permanent Failure
- Safety Overtemperature Permanent Failure
- Safety FET Overtemperature Permanent Failure
- Qmax Imbalance Permanent Failure
- Impedance Imbalance Permanent Failure
- Capacity Degradation Permanent Failure
- Cell Balancing Permanent Failure
- Fuse Failure Permanent Failure
- PTC Permanent Failure
- Voltage Imbalance at Rest Permanent Failure
- Voltage Imbalance Active Permanent Failure
- Charge FET Permanent Failure
- Discharge FET Permanent Failure
- AFE Register Permanent Failure
- AFE Communication Permanent Failure
- Second Level Protector Permanent Failure

Feature Description (接下页)

- Instruction Flash Checksum Permanent Failure
- Open Cell Connection Permanent Failure
- Data Flash Permanent Failure
- Open Thermistor Permanent Failure

8.3.3 Charge Control Features

The bq40z50 charge control features include:

- Supports JEITA temperature ranges. Reports charging voltage and charging current according to the active temperature range
- Handles more complex charging profiles. Allows for splitting the standard temperature range into two sub-ranges and allows for varying the charging current according to the cell voltage
- Reports the appropriate charging current needed for constant current charging and the appropriate charging voltage needed for constant voltage charging to a smart charger using SMBus broadcasts
- Reduces the charge difference of the battery cells in fully charged state of the battery pack gradually using a voltage-based cell balancing algorithm during charging. A voltage threshold can be set up for cell balancing to be active. This prevents fully charged cells from overcharging and causing excessive degradation and also increases the usable pack energy by preventing premature charge termination.
- Supports pre-charging/zero-volt charging
- Supports charge inhibit and charge suspend if battery pack temperature is out of temperature range
- Reports charging fault and also indicates charge status via charge and discharge alarms

8.3.4 Gas Gauging

The bq40z50 uses the Impedance Track algorithm to measure and calculate the available capacity in battery cells. The bq40z50 accumulates a measure of charge and discharge currents and compensates the charge current measurement for the temperature and state-of-charge of the battery. The bq40z50 estimates self-discharge of the battery and also adjusts the self-discharge estimation based on temperature. The device also has TURBO BOOST mode support, which enables the bq40z50 to provide the necessary data for the MCU to determine what level of peak power consumption can be applied without causing a system reset or transient battery voltage level spike to trigger termination flags. See the *bq40z50 Technical Reference Manual* (SLUUA43) for further details.

8.3.5 Configuration

8.3.5.1 Oscillator Function

The bq40z50 fully integrates the system oscillators and does not require any external components to support this feature.

8.3.5.2 System Present Operation

The bq40z50 checks the $\overline{\text{PRES}}$ pin periodically (1 s). If $\overline{\text{PRES}}$ input is pulled to ground by the external system, the bq40z50 detects this as system present.

8.3.5.3 Emergency Shutdown

For battery maintenance, the emergency shutdown feature enables a push button action connecting the $\overline{\text{SHUTDN}}$ pin to shutdown an embedded battery pack system before removing the battery. A high-to-low transition of the $\overline{\text{SHUTDN}}$ pin signals the bq40z50 to turn off both CHG and DSG FETs, disconnecting the power from the system to safely remove the battery pack. The CHG and DSG FETs can be turned on again by another high-to-low transition detected by the $\overline{\text{SHUTDN}}$ pin or when a data flash configurable timeout is reached.

8.3.5.4 1-Series, 2-Series, 3-Series, or 4-Series Cell Configuration

In a 1-series cell configuration, VC4 is shorted to VC, VC2 and VC1. In a 2-series cell configuration, VC4 is shorted to VC3 and VC2. In a 3-series cell configuration, VC4 is shorted to VC3.

Feature Description (接下页)

8.3.5.5 Cell Balancing

The device supports cell balancing by bypassing the current of each cell during charging or at rest. If the device's internal bypass is used, up to 10 mA can be bypassed and multiple cells can be bypassed at the same time. Higher cell balance current can be achieved by using an external cell balancing circuit. In external cell balancing mode, only one cell at a time can be balanced.

The cell balancing algorithm determines the amount of charge needed to be bypassed to balance the capacity of all cells.

8.3.6 Battery Parameter Measurements

8.3.6.1 Charge and Discharge Counting

The bq40z50 uses an integrating delta-sigma analog-to-digital converter (ADC) for current measurement, and a second delta-sigma ADC for individual cell and battery voltage and temperature measurement.

The integrating delta-sigma ADC measures the charge/discharge flow of the battery by measuring the voltage drop across a small-value sense resistor between the SRP and SRN terminals. The integrating ADC measures bipolar signals from –0.1 V to 0.1 V. The bq40z50 detects charge activity when $V_{SR} = V_{(SRP)} – V_{(SRN)}$ is positive, and discharge activity when $V_{SR} = V_{(SRP)} – V_{(SRN)}$ is negative. The bq40z50 continuously integrates the signal over time, using an internal counter. The fundamental rate of the counter is 0.26 nVh.

8.3.7 Battery Trip Point (BTP)

Required for WIN8 OS, the battery trip point (BTP) feature indicates when the RSOC of a battery pack has depleted to a certain value set in a DF register. This feature allows a host to program two capacity-based thresholds that govern the triggering of a BTP interrupt on the BTP_INT pin and the setting or clearing of the *OperationStatus[BTP_INT]* on the basis of *RemainingCapacity()*.

An internal weak pull-up is applied when the BTP feature is active. Depending on the system design, an external pull-up may be required to put on the BTP_INT pin. See *Electrical Characteristics: PRES, BTP_INT, DISP* for details.

8.3.8 Lifetime Data Logging Features

The bq40z50 offers lifetime data logging for several critical battery parameters. The following parameters are updated every 10 hours if a difference is detected between values in RAM and data flash:

- Maximum and Minimum Cell Voltages
- Maximum Delta Cell Voltage
- Maximum Charge Current
- Maximum Discharge Current
- Maximum Average Discharge Current
- Maximum Average Discharge Power
- Maximum and Minimum Cell Temperature
- Maximum Delta Cell Temperature
- Maximum and Minimum Internal Sensor Temperature
- Maximum FET Temperature
- Number of Safety Events Occurrences and the Last Cycle of the Occurrence
- Number of Valid Charge Termination and the Last Cycle of the Valid Charge Termination
- Number of Qmax and Ra Updates and the Last Cycle of the Qmax and Ra Updates
- Number of Shutdown Events
- Cell Balancing Time for Each Cell
  (This data is updated every 2 hours if a difference is detected.)
- Total FW Runtime and Time Spent in Each Temperature Range
  (This data is updated every 2 hours if a difference is detected.)

Feature Description (接下页)

8.3.9 Authentication

The bq40z50 supports authentication by the host using SHA-1.

8.3.10 LED Display

The bq40z50 can drive a 3-, 4-, or 5- segment LED display for remaining capacity indication and/or a permanent fail (PF) error code indication.

8.3.11 Voltage

The bq40z50 updates the individual series cell voltages at 0.25-second intervals. The internal ADC of the bq40z50 measures the voltage, and scales and calibrates it appropriately. This data is also used to calculate the impedance of the cell for the Impedance Track gas gauging.

8.3.12 Current

The bq40z50 uses the SRP and SRN inputs to measure and calculate the battery charge and discharge current using a 1-mΩ to 3-mΩ typ. sense resistor.

8.3.13 Temperature

The bq40z50 has an internal temperature sensor and inputs for four external temperature sensors. All five temperature sensor options can be individually enabled and configured for cell or FET temperature usage. Two configurable thermistor models are provided to allow the monitoring of cell temperature in addition to FET temperature, which use a different thermistor profile.

8.3.14 Communications

The bq40z50 uses SMBus v1.1 with MASTER mode and packet error checking (PEC) options per the SBS specification.

8.3.14.1 SMBus On and Off State

The bq40z50 detects an SMBus off state when SMBC and SMBD are low for two or more seconds. Clearing this state requires that either SMBC or SMBD transition high. The communication bus will resume activity within 1 ms.

8.3.14.2 SBS Commands

See the *bq40z50 Technical Reference Manual* (SLUUA43) for further details.

8.4 Device Functional Modes

The bq40z50 supports three power modes to reduce power consumption:

- In NORMAL mode, the bq40z50 performs measurements, calculations, protection decisions, and data updates in 250-ms intervals. Between these intervals, the bq40z50 is in a reduced power stage.
- In SLEEP mode, the bq40z50 performs measurements, calculations, protection decisions, and data updates in adjustable time intervals. Between these intervals, the bq40z50 is in a reduced power stage. The bq40z50 has a wake function that enables exit from SLEEP mode when current flow or failure is detected.
- In SHUTDOWN mode, the bq40z50 is completely disabled.

9 Applications and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The bq40z50 is a gas gauge with primary protection support, and that can be used with a 1-series to 4-series Li-Ion/Li Polymer battery pack. To implement and design a comprehensive set of parameters for a specific battery pack, users need the Battery Management Studio (bqSTUDIO) graphical user-interface tool installed on a PC during development. The firmware installed on the bqSTUDIO tool has default values for this product, which are summarized in the *bq40z50 Technical Reference Manual* (SLUUA43). Using the bqSTUDIO tool, these default values can be changed to cater to specific application requirements during development once the system parameters, such as fault trigger thresholds for protection, enable/disable of certain features for operation, configuration of cells, chemistry that best matches the cell used, and more are known. This data is referred to as the "golden image."

Typical Applications (接下页)

9.2.1 Design Requirements

表 1 shows the default settings for the main parameters. Use the bqSTUDIO tool to update the settings to meet the specific application or battery pack configuration requirements.

The device should be calibrated before any gauging test. Follow the bqSTUDIO **Calibration** page to calibrate the device, and use the bqSTUDIO **Chemistry** page to update the match chemistry profile to the device.

(1) When using the device the first time, if the a 1-s or 2-s battery pack is used, then a charger or power supply should be connected to the PACK+ terminal to prevent device shutdown. Then update the cell configuration (see the *bq40z50 Technical Reference Manual* (SLUUA43) for details) before removing the charger connection.

9.2.2 Detailed Design Procedure

9.2.2.1 High-Current Path

The high-current path begins at the PACK+ terminal of the battery pack. As charge current travels through the pack, it finds its way through protection FETs, a chemical fuse, the lithium-ion cells and cell connections, and the sense resistor, and then returns to the PACK– terminal (see 图 22). In addition, some components are placed across the PACK+ and PACK– terminals to reduce effects from electrostatic discharge.

9.2.2.1.1 Protection FETs

Select the N-channel charge and discharge FETs for a given application. Most portable battery applications are a good match for the CSD17308Q3. The TI CSD17308Q3 is a 47A, 30-V device with Rds(on) of 8.2 mΩ when the gate drive voltage is 8 V.

If a precharge FET is used, R1 is calculated to limit the precharge current to the desired rate. Be sure to account for the power dissipation of the series resistor. The precharge current is limited to $(V_{CHARGER} – V_{BAT})/R1$ and maximum power dissipation is $(V_{charger} – V_{bat})^2/R1$.

The gates of all protection FETs are pulled to the source with a high-value resistor between the gate and source to ensure they are turned off if the gate drive is open.

Capacitors C1 and C2 help protect the FETs during an ESD event. Using two devices ensures normal operation if one becomes shorted. To have good ESD protection, the copper trace inductance of the capacitor leads must be designed to be as short and wide as possible. Ensure that the voltage rating of both C1 and C2 are adequate to hold off the applied voltage if one of the capacitors becomes shorted.

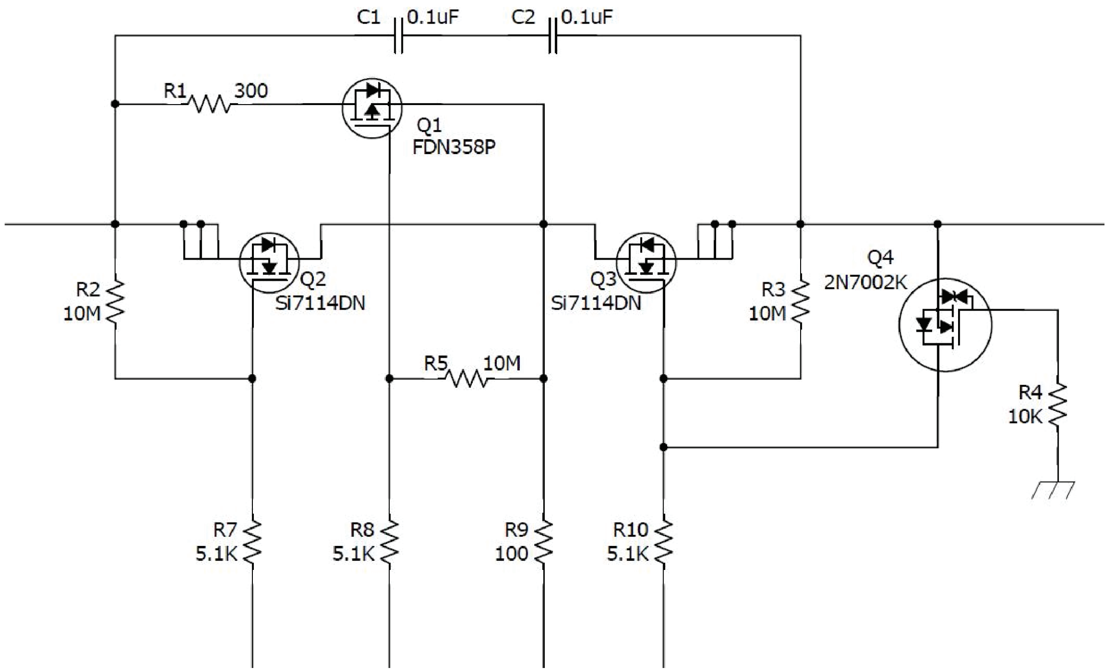

图 22. bq40z50 Protection FETs

9.2.2.1.2 Chemical Fuse

The chemical fuse (Dexerials, Uchihashi, and so forth) is ignited under command from either the bq294700 secondary voltage protection IC or from the FUSE pin of the gas gauge. Either of these events applies a positive voltage to the gate of Q5, shown in 图 23, which then sinks current from the third terminal of the fuse, causing it to ignite and open permanently.

It is important to carefully review the fuse specifications and match the required ignition current to that available from the N-channel FET. Ensure that the proper voltage, current, and Rds(on) ratings are used for this device. The fuse control circuit is discussed in detail in *FUSE Circuitry*.

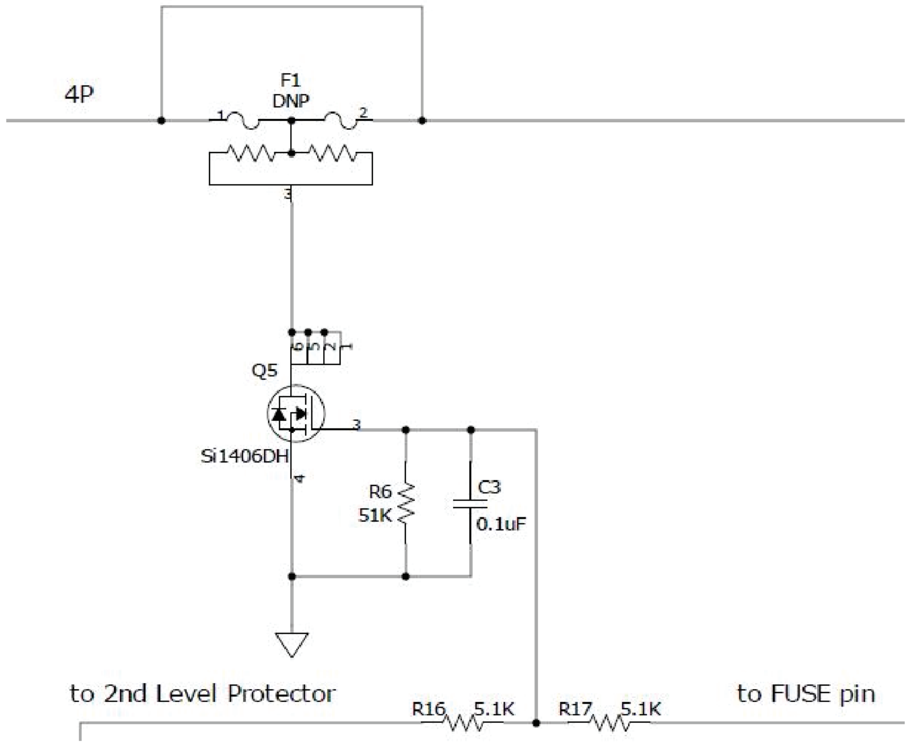

图 23. FUSE Circuit

9.2.2.1.3 Lithium-Ion Cell Connections

The important part to remember about the cell connections is that high current flows through the top and bottom connections; therefore, the voltage sense leads at these points must be made with a Kelvin connection to avoid any errors due to a drop in the high-current copper trace. The location marked 4P in 图 24 indicates the Kelvin connection of the most positive battery node. The connection marked 1N is equally important. The VC5 pin (a ground reference for cell voltage measurement), which is in the older generation devices, is not in the bq40z50 device. Therefore, the single-point connection at 1N to the low-current ground is needed to avoid an undesired voltage drop through long traces while the gas gauge is measuring the bottom cell voltage.

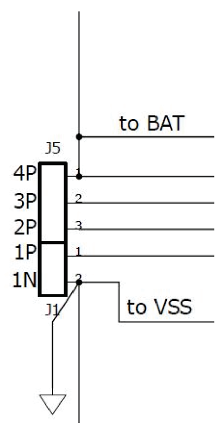

图 24. Lithium-Ion Cell Connections

9.2.2.1.4 Sense Resistor

As with the cell connections, the quality of the Kelvin connections at the sense resistor is critical. The sense resistor must have a temperature coefficient no greater than 50 ppm in order to minimize current measurement drift with temperature. Choose the value of the sense resistor to correspond to the available overcurrent and short-circuit ranges of the bq40z50. Select the smallest value possible to minimize the negative voltage generated on the bq40z50 V_{SS} node(s) during a short circuit. This pin has an absolute minimum of –0.3 V. Parallel resistors can be used as long as good Kelvin sensing is ensured. The device is designed to support a 1-mΩ to 3-mΩ sense resistor.

The ground scheme of bq40z50 is different from the older generation devices. In previous devices, the device ground (or low current ground) is connected to the SRN side of the Rsense resistor pad. The bq40z50, however, connects the low-current ground on the SRP side of the Rsense resistor pad, close to the battery 1N terminal (see *Lithium-Ion Cell Connections*). This is because the bq40z50 has one less VC pin (a ground reference pin VC5) compared to the previous devices. The pin was removed and was internally combined to SRP.

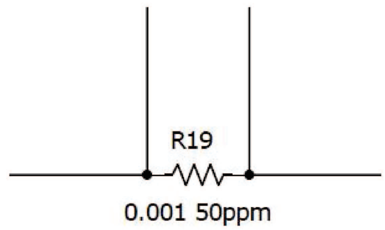

图 25. Sense Resistor

9.2.2.1.5 ESD Mitigation

A pair of series 0.1-μF ceramic capacitors is placed across the PACK+ and PACK– terminals to help in the mitigation of external electrostatic discharges. The two devices in series ensure continued operation of the pack if one of the capacitors becomes shorted.

Optionally, a tranzorb such as the SMBJ2A can be placed across the terminals to further improve ESD immunity.

9.2.2.2 Gas Gauge Circuit

The Gas Gauge Circuit includes the bq40z50 and its peripheral components. These components are divided into the following groups: Differential Low-Pass Filter, PBI, System Present, SMBus Communication, FUSE circuit, and LED.

9.2.2.2.1 Coulomb-Counting Interface

The bq40z50 uses an integrating delta-sigma ADC for current measurements. Add a 100-Ω resistor from the sense resistor to the SRP and SRN inputs of the device. Place a 0.1-μF (C18) filter capacitor across the SRP and SRN inputs. Optional 0.1-μF filter capacitors (C19 and C20) can be added for additional noise filtering, if required for your circuit.

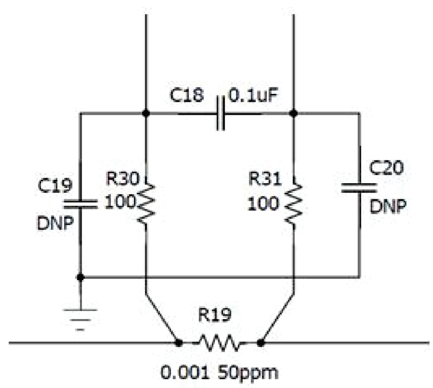

图 26. Differential Filter

9.2.2.2.2 Power Supply Decoupling and PBI

The bq40z50 has an internal LDO that is internally compensated and does not require an external decoupling capacitor.

The PBI pin is used as a power supply backup input pin providing power during brief transient power outages. A standard 2.2-µF ceramic capacitor is connected from the PBI pin to ground as shown in 图 27.

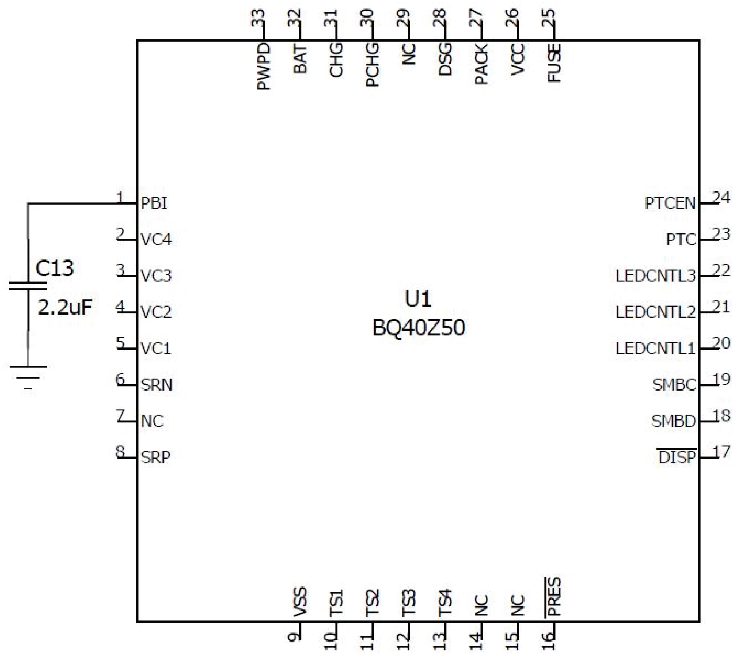

图 27. Power Supply Decoupling

9.2.2.2.3 System Present

The System Present signal is used to inform the gas gauge whether the pack is installed into or removed from the system. In the host system, this pin is grounded. The PRES pin of the bq40z50 is occasionally sampled to test for system present. To save power, an internal pullup is provided by the gas gauge during a brief 4-µs sampling pulse once per second. A resistor can be used to pull the signal low and the resistance must be 20 kΩ or lower to insure that the test pulse is lower than the VIL limit. The pull-up current source is typically 10 µA to 20 µA.

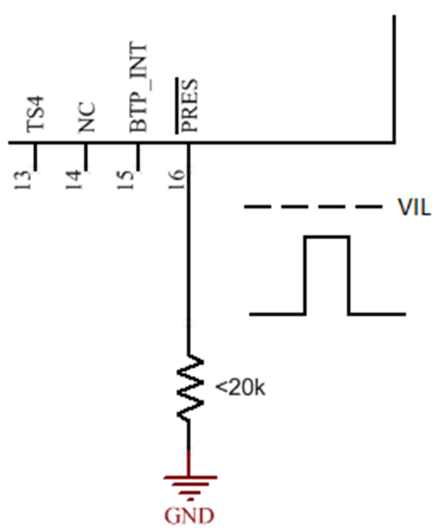

图 28. System Present Pull-Down Resistor

Because the System Present signal is part of the pack connector interface to the outside world, it must be protected from external electrostatic discharge events. An integrated ESD protection on the PRES device pin reduces the external protection requirement to just R29 for an 8-kV ESD contact rating. However, if it is possible that the System Present signal may short to PACK+, then R28 and D4 must be included for high-voltage protection.

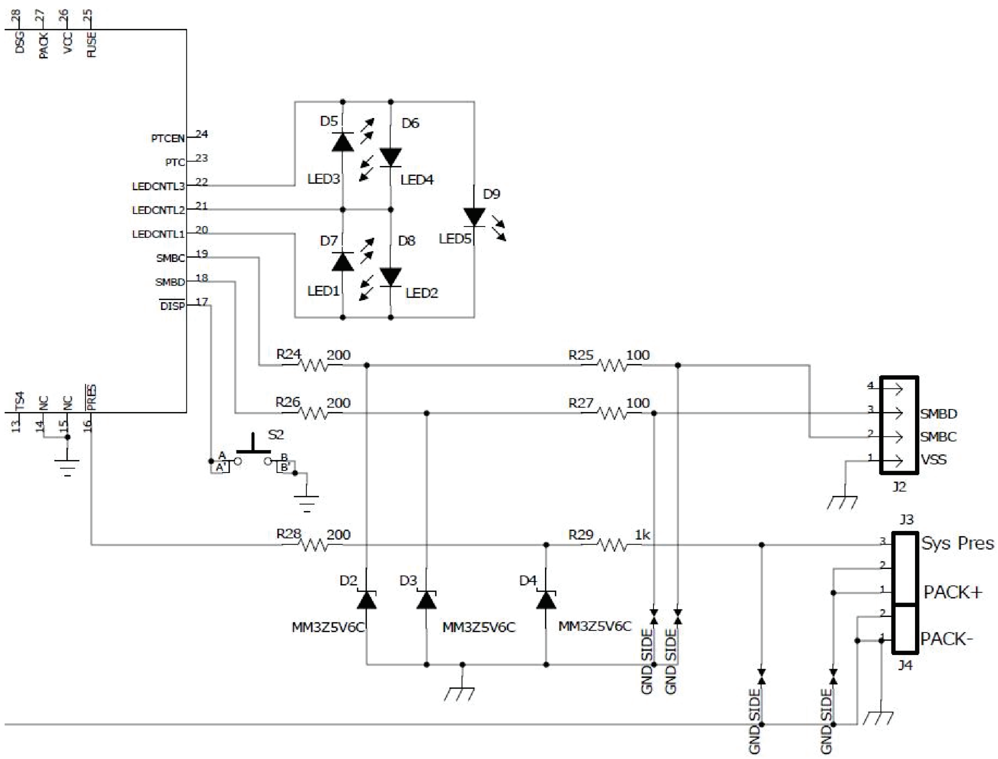

图 29. System Present ESD and Short Protection

9.2.2.2.4 SMBus Communication

The SMBus clock and data pins have integrated high-voltage ESD protection circuits, however, adding a Zener diode (D2 and D3) and series resistor (R24 and R26) provides more robust ESD performance.

The SMBus clock and data lines have internal pulldown. When the gas gauge senses that both lines are low (such as during removal of the pack), the device performs auto-offset calibration and then goes into SLEEP mode to conserve power.

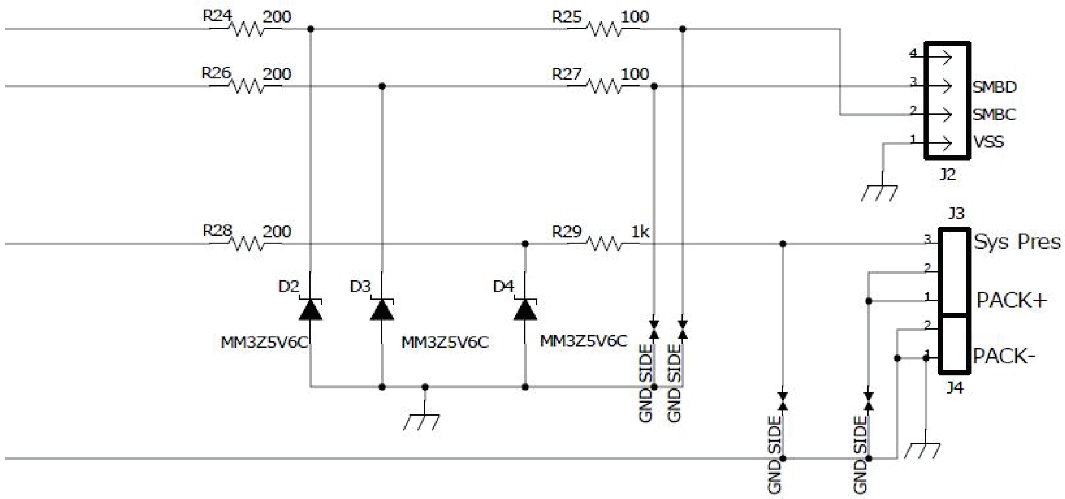

图 30. ESD Protection for SMB Communication

9.2.2.2.5 FUSE Circuitry

The FUSE pin of the bq40z50 is designed to ignite the chemical fuse if one of the various safety criteria is violated. The FUSE pin also monitors the state of the secondary-voltage protection IC. Q5 ignites the chemical fuse when its gate is high. The 7-V output of the bq294700 is divided by R16 and R6, which provides adequate gate drive for Q5 while guarding against excessive back current into the bq294700 if the FUSE signal is high.

Using C3 is generally a good practice, especially for RFI immunity. C3 may be removed, if desired, because the chemical fuse is a comparatively slow device and is not affected by any sub-microsecond glitches that come from the FUSE output during the cell connection process.

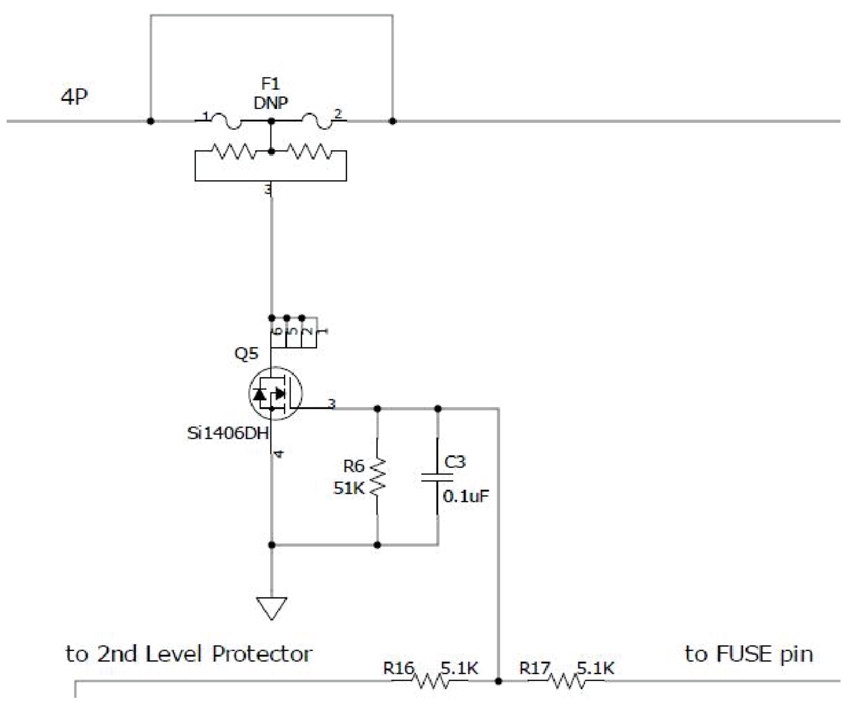

图 31. FUSE Circuit

When the bq40z50 is commanded to ignite the chemical fuse, the FUSE pin activates to give a typical 8-V output. The new design makes it possible to use a higher Vgs FET for Q5. This improves the robustness of the system, as well as widens the choices for Q5.

9.2.2.3 Secondary-Current Protection

The bq40z50 provides secondary overcurrent and short-circuit protection, cell balancing, cell voltage multiplexing, and voltage translation. The following discussion examines Cell and Battery Inputs, Pack and FET Control, Temperature Output, and Cell Balancing.

9.2.2.3.1 Cell and Battery Inputs

Each cell input is conditioned with a simple RC filter, which provides ESD protection during cell connect and acts to filter unwanted voltage transients. The resistor value allows some trade-off for cell balancing versus safety protection.

The integrated cell balancing FETs allow the AFE to bypass cell current around a given cell or numerous cells, effectively balancing the entire battery stack. External series resistors placed between the cell connections and the VCx I/O pins set the balancing current magnitude. The internal FETs provide a 200-Ω resistance (2 V < VDS < 4 V). Series input resistors between 100 Ω and 1 kΩ are recommended for effective cell balancing.

The BAT input uses a diode (D1) to isolate and decouple it from the cells in the event of a transient dip in voltage caused by a short-circuit event.

Also, as described in *High-Current Path*, the top and bottom nodes of the cells must be sensed at the battery connections with a Kelvin connection to prevent voltage sensing errors caused by a drop in the high-current PCB copper.

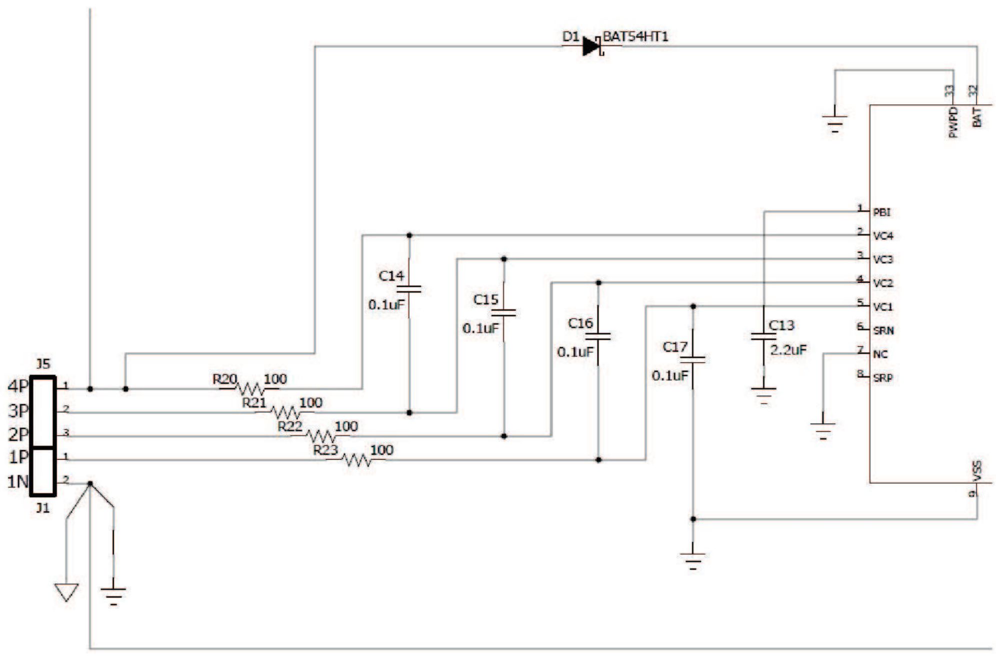

图 32. Cell and BAT Inputs

9.2.2.3.2 External Cell Balancing

Internal cell balancing can only support up to 10 mA. External cell balancing provide as another option for faster cell balancing. For details, refer to the application note, *Fast Cell Balancing Using External MOSFET* (SLUA420).

9.2.2.3.3 PACK and FET Control

The PACK and V_{CC} inputs provide power to the bq40z50 from the charger. The PACK input also provides a method to measure and detect the presence of a charger. The PACK input uses a 100-Ω resistor; whereas, the V_{CC} input uses a diode to guard against input transients and prevents mis-operation of the date driver during short-circuit events.

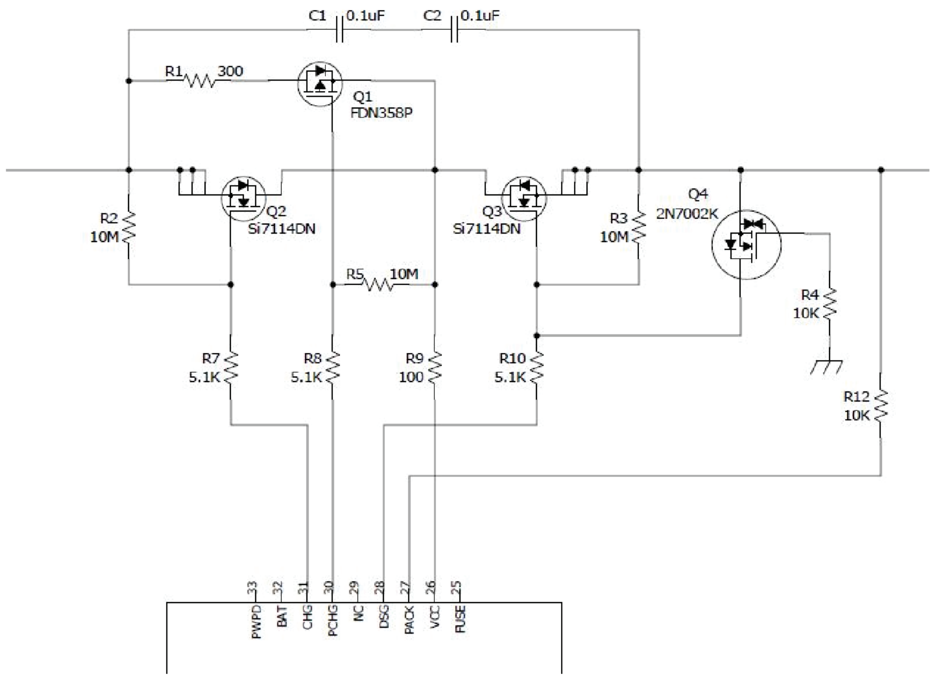

图 33. bq40z50 PACK and FET Control

The N-channel charge and discharge FETs are controlled with 5.1-kΩ series gate resistors, which provide a switching time constant of a few microseconds. The 10-MΩ resistors ensure that the FETs are off in the event of an open connection to the FET drivers. Q4 is provided to protect the discharge FET (Q3) in the event of a reverse-connected charger. Without Q4, Q3 can be driven into its linear region and suffer severe damage if the PACK+ input becomes slightly negative.

Q4 turns on in that case to protect Q3 by shorting its gate to source. To use the simple ground gate circuit, the FET must have a low gate turn-on threshold. If it is desired to use a more standard device, such as the 2N7002 as the reference schematic, the gate should be biased up to 3.3 V with a high-value resistor. The bq40z50 device has the capability to provide a current-limited charging path typically used for low battery voltage or low temperature charging. The bq40z50 device uses an external P-channel, pre-charge FET controlled by PCHG.

9.2.2.3.4 Temperature Output

For the bq40z50 device, TS1, TS2, TS3, and TS4 provide thermistor drive-under program control. Each pin can be enabled with an integrated 18-kΩ (typical) linearization pullup resistor to support the use of a 10-kΩ at 25°C (103) NTC external thermistor such as a Mitsubishi BN35-3H103. The reference design includes four 10-kΩ thermistors: RT1, RT2, RT3, and RT4. The bq40z50 device supports up to four external thermistors. Connect unused thermistor pins to V_{SS}.

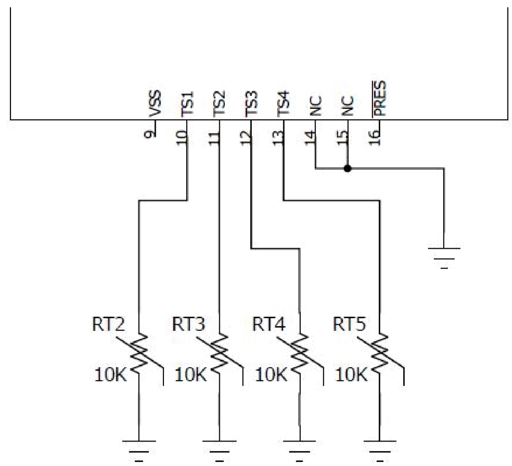

图 34. Thermistor Drive

9.2.2.3.5 LEDs

Three LED control outputs provide constant current sinks for the driving external LEDs. These outputs are configured to provide voltage and control for up to 5 LEDs. No external bias voltage is required. Unused LEDCNTL pins can remain open or they can be connected to V_{SS}. The DISP pin should be connected to V_{SS}, if the LED feature is not used.

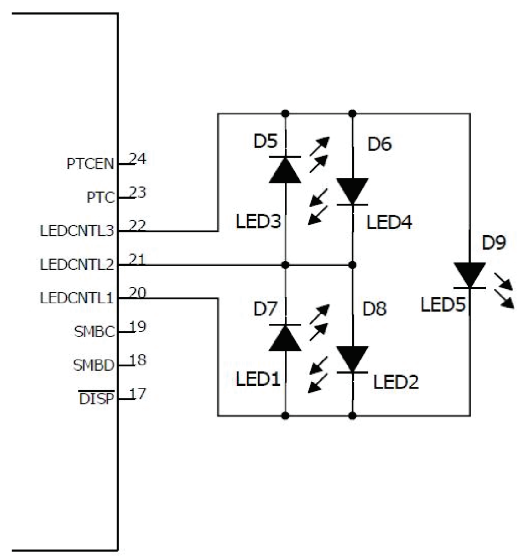

图 35. LEDs

9.2.2.3.6 Safety PTC Thermistor

The bq40z50 device provides support for a safety PTC thermistor. The PTC thermistor is connected between the PTC pin and V_{SS}. It can be placed close to the CHG/DSG FETs to monitor the temperature. The PTC pin outputs a very small current, typical ~370 nA, and the PTC fault will be triggered at ~0.7 V typical. A PTC fault is one of the permanent failure modes. It can only be cleared by a POR.

To disable this feature, connect a 10-kΩ resistor between PTC and V_{SS}.

10 Power Supply Recommendations

The device manages its supply voltage dynamically according to the operation conditions. Normally, the BAT input is the primary power source to the device. The BAT pin should be connected to the positive termination of the battery stack. The input voltage for the BAT pin ranges from 2.2 V to 26 V.

The VCC pin is the secondary power input, which activates when the BAT voltage falls below minimum Vcc. This allows the device to source power from a charger (if present) connected to the PACK pin. The VCC pin should be connected to the common drain of the CHG and DSG FETs. The charger input should be connected to the PACK pin.

11 Layout

11.1 Layout Guidelines

A battery fuel gauge circuit board is a challenging environment due to the fundamental incompatibility of high-current traces and ultra-low current semiconductor devices. The best way to protect against unwanted trace-to-trace coupling is with a component placement, such as that shown in 图 43, where the high-current section is on the opposite side of the board from the electronic devices. Clearly this is not possible in many situations due to mechanical constraints. Still, every attempt should be made to route high-current traces away from signal traces, which enter the bq40z50 directly. IC references and registers can be disturbed and in rare cases damaged due to magnetic and capacitive coupling from the high-current path. Note that during surge current and ESD events, the high-current traces appear inductive and can couple unwanted noise into sensitive nodes of the gas gauge electronics, as illustrated in 图 44.

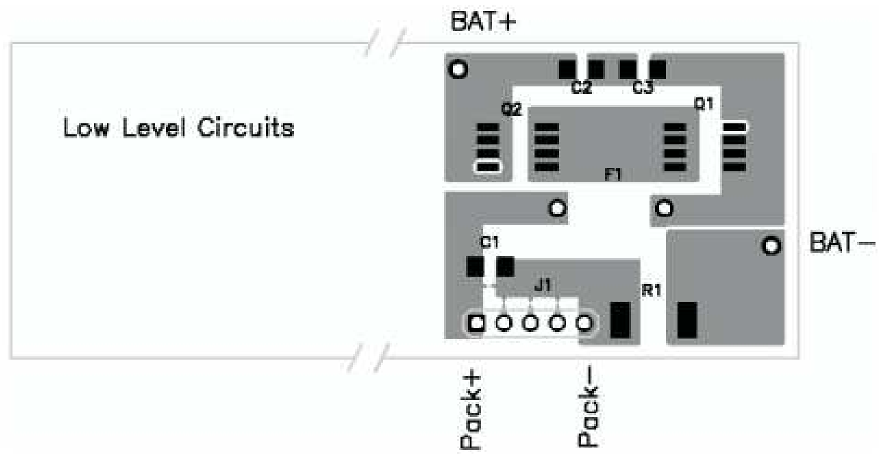

图 43. Separating High- and Low-Current Sections Provides an Advantage in Noise Immunity

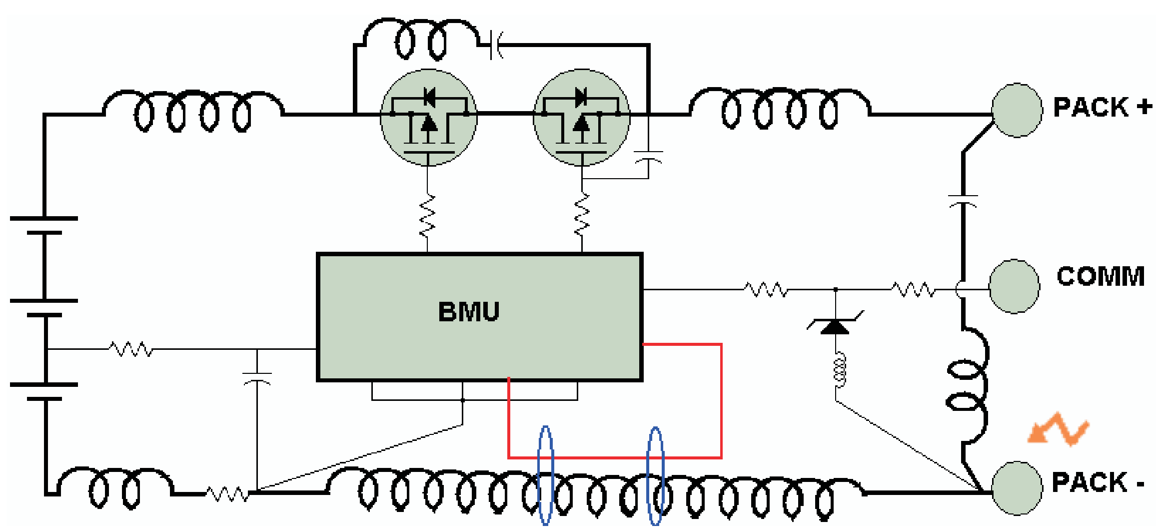

图 44. Avoid Close Spacing Between High-Current and Low-Level Signal Lines

Kelvin voltage sensing is extremely important in order to accurately measure current and top and bottom cell voltages. Place all filter components as close as possible to the device. Route the traces from the sense resistor in parallel to the filter circuit. Adding a ground plane around the filter network can add additional noise immunity. 图 45 and 图 46 demonstrates correct kelvin current sensing.

11.1.1 Protector FET Bypass and Pack Terminal Bypass Capacitors

The general principle is to use wide copper traces to lower the inductance of the bypass capacitor circuit. In 图 47, an example layout demonstrates this technique.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
