## 5 Detailed Description

### 5.1 Block Diagram

Figure 5-1 shows the system block diagram of the CC1121 device.

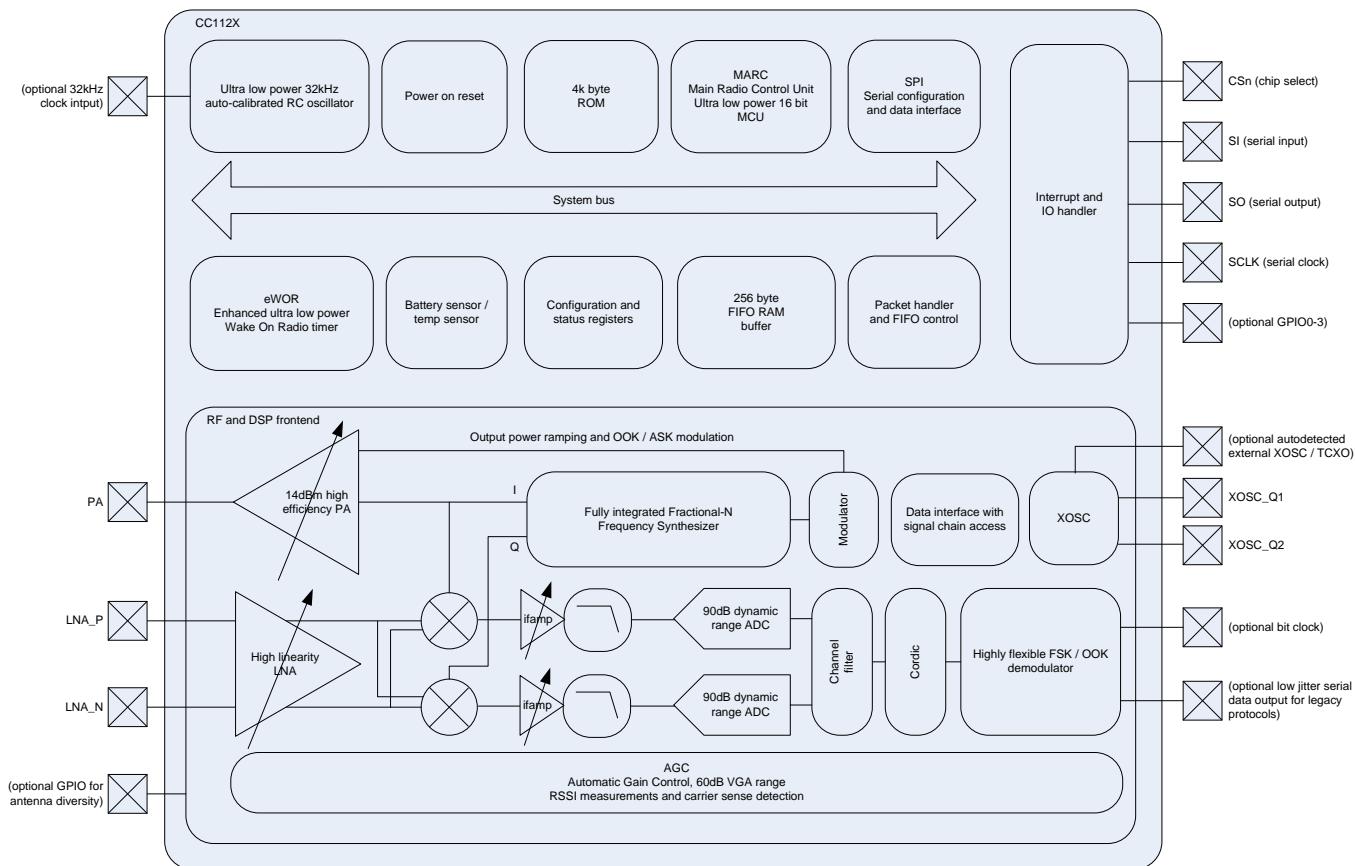

Figure 5-1. System Block Diagram

### 5.2 Frequency Synthesizer

At the center of the CC1121 device there is a fully integrated, fractional-N, ultra-high-performance frequency synthesizer. The frequency synthesizer is designed for excellent phase noise performance, providing very high selectivity and blocking performance. The system is designed to comply with the most stringent regulatory spectral masks at maximum transmit power.

Either a crystal can be connected to XOSC\_Q1 and XOSC\_Q2, or a TCXO can be connected to the EXT\_XOSC input. The oscillator generates the reference frequency for the synthesizer, as well as clocks for the analog-to-digital converter (ADC) and the digital part. To reduce system cost, CC1121 device has high-accuracy frequency estimation and compensation registers to measure and compensate for crystal inaccuracies. This compensation enables the use of lower cost crystals. If a TCXO is used, the CC1121 device automatically turns on and off the TCXO when needed to support low-power modes and Wake-On-Radio operation.

### 5.3 Receiver

The CC1121 device features a highly flexible receiver. The received RF signal is amplified by the low-noise amplifier (LNA) and is down-converted in quadrature (I/Q) to the intermediate frequency (IF). At IF, the I/Q signals are digitized by the high dynamic-range ADCs.

An advanced automatic gain control (AGC) unit adjusts the front-end gain, and enables the CC1121 device to receive strong and weak signals, even in the presence of strong interferers. High-attenuation channels and data filtering enable reception with strong neighbor channel interferers. The I/Q signal is converted to a phase and magnitude signal to support both FSK and OOK modulation schemes.

#### NOTE

A unique I/Q compensation algorithm removes any problem of I/Q mismatch, thus avoiding time consuming and costly I/Q image calibration steps.

### 5.4 Transmitter

The CC1121 transmitter is based on direct synthesis of the RF frequency (in-loop modulation). To use the spectrum effectively, the CC1121 device has extensive data filtering and shaping in TX mode to support high throughput data communication in narrowband channels. The modulator also controls power ramping to remove issues such as spectral splattering when driving external high-power RF amplifiers.

### 5.5 Radio Control and User Interface

The CC1121 digital control system is built around the main radio control (MARC), which is implemented using an internal high-performance, 16-bit ultra-low-power processor. MARC handles power modes, radio sequencing and protocol timing.

A 4-wire SPI serial interface is used for configuration and data buffer access. The digital baseband includes support for channel configuration, packet handling, and data buffering. The host MCU can stay in power-down mode until a valid RF packet is received. This greatly reduces power consumption. When the host MCU receives a valid RF packet, it burst-reads the data. This reduces the required computing power.

The CC1121 radio control and user interface are based on the widely used the CC1101 transceiver. This relationship enables an easy transition between the two platforms. The command strobes and the main radio states are the same for the two platforms.

For legacy formats, the CC1121 device also supports two serial modes:

- Synchronous serial mode: The CC1121 device performs bit synchronization and provides the MCU with a bit clock with associated data.
- Transparent mode: The CC1121 outputs the digital baseband signal using a digital interpolation filter to eliminate jitter introduced by digital filtering and demodulation.

### 5.6 Enhanced Wake-On-Radio (eWOR)

eWOR, using a flexible integrated sleep timer, enables automatic receiver polling with no intervention from the MCU. The CC1121 device enters RX mode, it listens and then returns to sleep if a valid RF packet is not received. The sleep interval and duty cycle can be configured to make a trade-off between network latency and power consumption. Incoming messages are time-stamped to simplify timer resynchronization.

The eWOR timer runs off an ultra-low-power 32-kHz RC oscillator. To improve timing accuracy, the RC oscillator can be automatically calibrated to the RF crystal in configurable intervals.

## 5.7 Sniff Mode

The CC1121 device supports very quick start up times, and requires very few preamble bits. Sniff mode uses these conditions to dramatically reduce the current consumption while the receiver is waiting for data.

Because the CC1121 can wake up and settle much faster than the duration of most preambles, it is not required to be in RX mode continuously while waiting for a packet to arrive. Instead, the enhanced Wake-On-Radio feature can be used to put the device into sleep periodically. By setting an appropriate sleep time, the CC1121 device can wake up and receive the packet when it arrives with no performance loss. This sequence removes the need for accurate timing synchronization between transmitter and receiver, and lets the user to trade off current consumption between the transmitter and receiver.

For more information, see the sniff mode design note ([SWRA428](#)).

## 5.8 Antenna Diversity

Antenna diversity can increase performance in a multipath environment. An external antenna switch is required. The CC1121 device uses one of the GPIO pins to automatically control the switch. The device also supports differential output control signals typically used in RF switches.

If antenna diversity is enabled, the GPIO alternates between high and low states until a valid RF input signal is detected. An optional acknowledge packet can be transmitted without changing the state of the GPIO.

An incoming RF signal can be validated by received signal strength or by using the automatic preamble detector. Using the automatic preamble detector ensures a more robust system and avoids the need to set a defined signal strength threshold (such a threshold sets the sensitivity limit of the system).

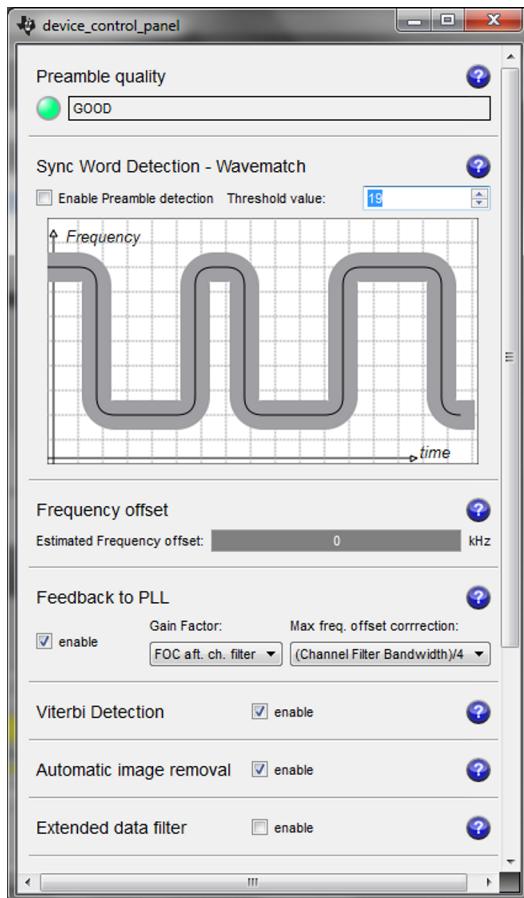

## 5.9 Low-Power and High-Performance Mode

The CC1121 device is highly configurable, enabling trade-offs between power and performance based on the needs of the application. This data sheet describes two modes: low-power mode and high-performance mode. These modes represent configurations where the device is optimized for either power or performance.

## 5.10 WaveMatch

Advanced capture logic locks onto the synchronization word and does not require preamble settling bytes. Therefore, receiver settling time is reduced to the settling time of the AGC, typically 4 bits.

The WaveMatch feature also greatly reduces false sync triggering on noise, further reducing the power consumption and improving sensitivity and reliability. The same logic can also be used as a high-performance preamble detector to reliably detect a valid preamble in the channel.

### 7.1 器件支持

#### 7.1.1 开发支持

##### 7.1.1.1 配置软件

CC1121 器件可使用 SmartRF Studio 软件 ([SWRC046](#)) 进行配置。强烈建议使用 SmartRF Studio 软件来获取最优寄存器设置并评估相关性能和功能。

#### 7.1.2 器件和支持开发工具命名规则

为了指出产品开发周期所处的阶段，TI 为所有微处理器 (MPU) 和支持工具的产品型号分配了前缀。每个器件都具有以下三个前缀中的一个：X、P 或无（无前缀）（例如，CC1121）。德州仪器 (TI) 建议为其支持的工具使用三个可用前缀指示符中的两个：TMDX 和 TMDS。这些前缀代表了产品开发的发展阶段，即从工程原型 (TMDX) 直到完全合格的生产器件和工具 (TMDS)。

器件开发进化流程：

**X** 试验器件不一定代表最终器件的电气规范标准并且不可使用生产组装流程。

**P** 原型器件不一定是最终芯片模型并且不一定符合最终电气标准规范。

无 完全合格的芯片模型的生产版本。

支持工具开发发展流程：

**TMDX** 还未经德州仪器 (TI) 完整内部质量测试的开发支持产品。

**TMDS** 完全合格的开发支持产品。

X 和 P 器件和 TMDX 开发支持工具在供货时附带如下免责条款：

“开发的产品用于内部评估用途。”

生产器件和 TMDS 开发支持工具已进行完全特性描述，并且器件的质量和可靠性已经完全论证。TI 的标准保修证书适用。

预测显示原型器件 (X 或者 P) 的故障率大于标准生产器件。由于它们的预计的最终使用故障率仍未定义，德州仪器 (TI) 建议不要将这些器件用于任何生产系统。只有合格的产品器件将被使用。

TI 器件的命名规则也包括一个带有器件系列名称的后缀。这个后缀表示封装类型（例如，RHB），且温度范围（例如，“空白”是默认的商业级温度范围）提供了读取任一 CC1121 器件完整器件名称的图例。

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

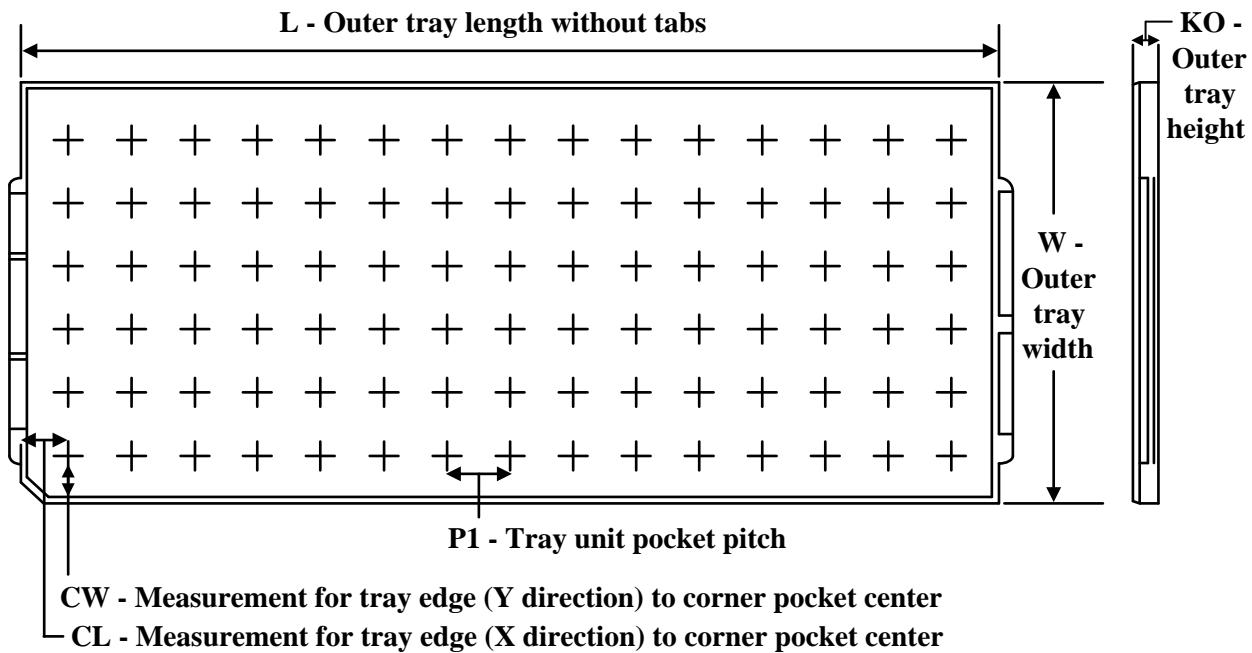

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
