

96-kHz, 24-Bit Digital Audio Interface Receiver

FEATURES

- One-Chip Digital Audio Interface Receiver (DIR) Including Low-Jitter Clock-Recovery System
- Compliant With Digital Audio Interface Standards: IEC60958 (former IEC958), JEITA CPR-1205 (former EIAJ CP-1201, CP-340), AES3, EBU tech3250
- Clock Recovery and Data Decode From Biphasic Input Signal, Generally Called S/PDIF, EIAJ CP-1201, IEC60958, AES/EBU
- Biphasic Input Signal Sampling Frequency (f_s) Range: 28 kHz to 108 kHz
- Low-Jitter Recovered System Clock: 50 ps
- Jitter Tolerance Compliant With IEC60958-3
- Selectable Recovered System Clock: 128 f_s , 256 f_s , 384 f_s , 512 f_s
- Serial Audio Data Output Formats: 24-Bit I²S; MSB-First, 24-Bit Left-Justified; MSB-First 16-, 24-Bit Right-Justified
- User Data, Channel-Status Data Outputs Synchronized With Decoded Serial Audio Data
- No External Clock Required for Decode
- Includes Actual Sampling Frequency Calculator (Needs External 24.576-MHz Clock)
- Function Control: Parallel (Hardware)
- Functions Similar and Pin Assignments Equivalent to Those of DIR1703
- Single Power Supply: 3.3 V (2.7 V to 3.6 V)
- Wide Operating Temperature Range: –40°C to 85°C
- 5 V-Tolerant Digital Inputs
- Package: 28-pin TSSOP, Pin Pitch: 0,65 mm

APPLICATIONS

- Car Audio Head Units
- Car Audio External Amplifiers

DESCRIPTION

The DIR9001-Q1 is a digital audio interface receiver that can receive a 28-kHz to 108-kHz sampling-frequency, 24-bit-data-word, biphasic-encoded signal. The DIR9001-Q1 complies with IEC60958-3, JEITA CPR-1205 (Revised version of EIAJ CP-1201), AES3, EBUtech3250, and it can be used in various applications that require a digital audio interface.

The DIR9001-Q1 supports many output system clock and output data formats and can be used flexibly in many application systems. As the all functions which the DIR9001-Q1 provides can be controlled directly through control pins, it can be used easily in an application system that does not have a microcontroller. Also, as dedicated pins are provided for the channel-status bit and user-data bit, processing of their information can be easily accomplished by connecting with a microcontroller, DSP, etc.

The DIR9001-Q1 does not require an external clock source or resonator for decode operation if the internal actual-sampling-frequency calculator is not used. Therefore, it is possible to reduce the cost of a system.

The operating temperature range of the DIR9001-Q1 is specified as –40°C to 85°C, which makes it suitable for automotive applications.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SpAct is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

| | | VALUE | UNIT |
|------------------------------------------|----------------------------|--------------------------------|---------|
| V_{CC} | Supply voltage | –0.3 to 4 | V |
| V_{DD} | | | |
| V_{CC} to V_{DD} | Supply voltage differences | ±0.1 | V |
| AGND to DGND | Ground voltage differences | ±0.1 | V |
| Digital input voltage | Digital input | –0.3 to 6.5 | V |
| | Digital output | –0.3 to ($V_{DD} + 0.3$) < 4 | |
| Analog input voltage | XTI, XTO | –0.3 to ($V_{CC} + 0.3$) < 4 | V |
| | FILT | –0.3 to ($V_{CC} + 0.3$) < 4 | |
| Input current (any pins except supplies) | | ±10 | mA |
| Ambient temperature under bias | | –40 to 125 | °C |
| Storage temperature | | –55 to 150 | °C |
| Junction temperature | | 150 | °C |
| Lead temperature (soldering) | | 260 | °C, 5 s |
| Package temperature (reflow, peak) | | 260 | °C |

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|----------------------------------------------|----------------------------------|--------------|-----|-----|------|

DEVICE INFORMATION

ACCEPTABLE BIPHASE INPUT SIGNAL AND BIPHASE INPUT PIN (RXIN)

The DIR9001-Q1 can decode the biphase signal format which is specified in one of the following standards. Generally, these following standards may be called Sony/Philips digital interface format (S/PDIF) or AES/EBU.

- IEC60958 (revised edition of former IEC958)
- JEITA CPR-1205 (revised edition of former EIAJ CP-1201, CP-340)
- AES3
- EBU tech3250

The sampling frequency range and data word length which DIR9001-Q1 can decode is as follows:

- Sampling frequency range is 28 kHz to 108 kHz.
- Maximum audio sample word length is 24-bit.

Note of others about the biphase input signal.

- The capture ratio of the built-in PLL complies with level III of sampling frequency accuracy (12.5%), which is specified in IEC60958-3.
- The jitter tolerance of the DIR9001-Q1 complies with IEC60958-3.
- The PLL may also lock in outside of the specified sampling-frequency range, but extended range is not assured.

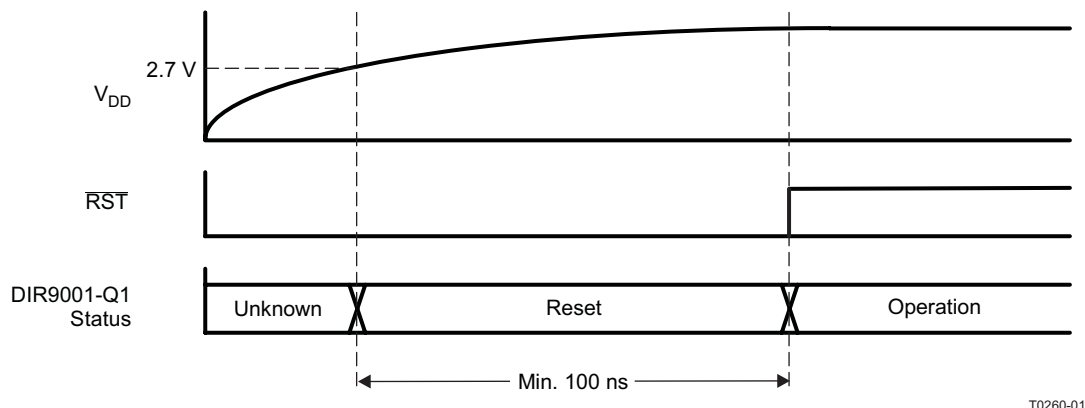

Notice about the signal level and transmission line of the biphase input signal.

- The signal level and the transmission line (optical, differential, single-ended) are different in each standard.
- The biphase input signal is connected to the RXIN pin of the DIR9001-Q1.
- The RXIN pin has a 5-V tolerant TTL-level input.
- An optical receiver module (optical to electric converter) such as TOSLINK, which is generally used in consumer applications, is connected directly to the RXIN pin without added external components.
- The output waveform of the optical receiver module varies depending on the characteristics of each product type, so a dumping resistor or buffer amplifier might be required between the optical receiver module output and the DIR9001-Q1 input. Careful handling is required if the optical receiver module and the DIR9001-Q1 are separated by a long distance.
- The DIR9001-Q1 needs an external amplifier if it is connected to a coaxial transmission line.
- The DIR9001-Q1 needs an external differential to single-ended converter, attenuator, etc., for general consumer applications if non-optical transmission line is used.

SYSTEM RESET

The DIR9001-Q1 reset function is controlled by an external reset pin, $\overline{\text{RST}}$.

The reset operation must be performed during the power-up sequence as shown in Figure 4. Specifically, the DIR9001-Q1 requires reset operation with a 100-ns period after the supply voltage rises above 2.7 V.

T0260-01

Figure 4. Required System Reset Timing

The state of each output pins during reset is shown in Table 1.

Table 1. Output-Pin States During Reset Period

| CLASSIFICATION | PIN NAME | WHILE $\overline{\text{RST}} = \text{L}$ |
|-----------------------|---------------------------|------------------------------------------|
| Clock | BCKO | L |
| | LRCKO | L |
| | SCKO | L |
| Data | DOUT | L |
| Flag and status | $\overline{\text{AUDIO}}$ | L |
| | BFRAME | L |
| | CLKST | L |
| | COUT | L |

| | ERROR | H |
| | FSOUT0 | L |
| | FSOUT1 | L |
| Oscillation amplifier | UOUT | L |
| | XTO | Output |

OPERATION MODE AND CLOCK TRANSITION SIGNAL OUT

Operation Mode

The DIR9001-Q1 has the following three operation modes.

These modes are selected by the connection of the CKSEL pin.

- PLL MODE: For demodulating a biphasic input signal; always outputs PLL source clock
- XTI MODE: For clock generator; always outputs XTI source clock
- AUTO MODE: Automatic clock source selection; output source depends on ERROR pin.

Notes about operation mode selection:

- Normally, the PLL mode: CKSEL = L is selected to decode a biphasic input signal.
- The XTI mode is a mode that supplies the XTI source clock to peripheral devices (A/D converters, etc); therefore, recovered clock and decoded data is not output.
- When the XTI source is not used, an XTI source is not required. In this case, clocks are not output in the XTI mode.
- At the time of XTI mode selection, biphasic decode function continues to operate. Therefore, the biphasic input status (ERROR) and the result of the sampling frequency calculator (a required XTI source for operation), are always monitored. That is, the following output pins: ERROR, BFRAME, FSOUT[1:0], CLKST, AUDIO and EMPH are always enabled.

The details of these three modes are given in [Table 2](#).

Table 2. Operation Mode and Clock Source

| OPERATION MODE | CKSEL PIN SETTING | ERROR PIN STATUS | SCKO, BCKO, LRCKO CLOCK SOURCE | DOUT DATA | AUDIO EMPH | FSOUT [1:0] | BFRAME | COUT UOUT |
|----------------|------------------------|------------------|---------------------------------------------|--------------|------------|-------------|--------|-----------|
| PLL | L | H | PLL (VCO) free-running clock ⁽¹⁾ | MUTE (Low) | LOW | HL | LOW | LOW |
| | | L | PLL recovered clock | Decoded data | OUT | OUT | OUT | OUT |
| XTI | H | H | XTI clock | MUTE (Low) | LOW | HL | LOW | LOW |
| | | L | XTI clock | MUTE (Low) | OUT | OUT | OUT | LOW |
| AUTO | Connected to ERROR pin | H | XTI clock | MUTE (Low) | LOW | HL | LOW | LOW |
| | | L | PLL recovered clock | Decoded data | OUT | OUT | OUT | OUT |

(1) The VCO free-running frequency is not a constant frequency, because the VCO oscillation frequency is dependent on supply voltage, temperature, and process variations.

Clock Transition Signal Out

The CLKST pin outputs the PLL status change between LOCK and UNLOCK. The CLKST output pulse depends only on the status change of the PLL.

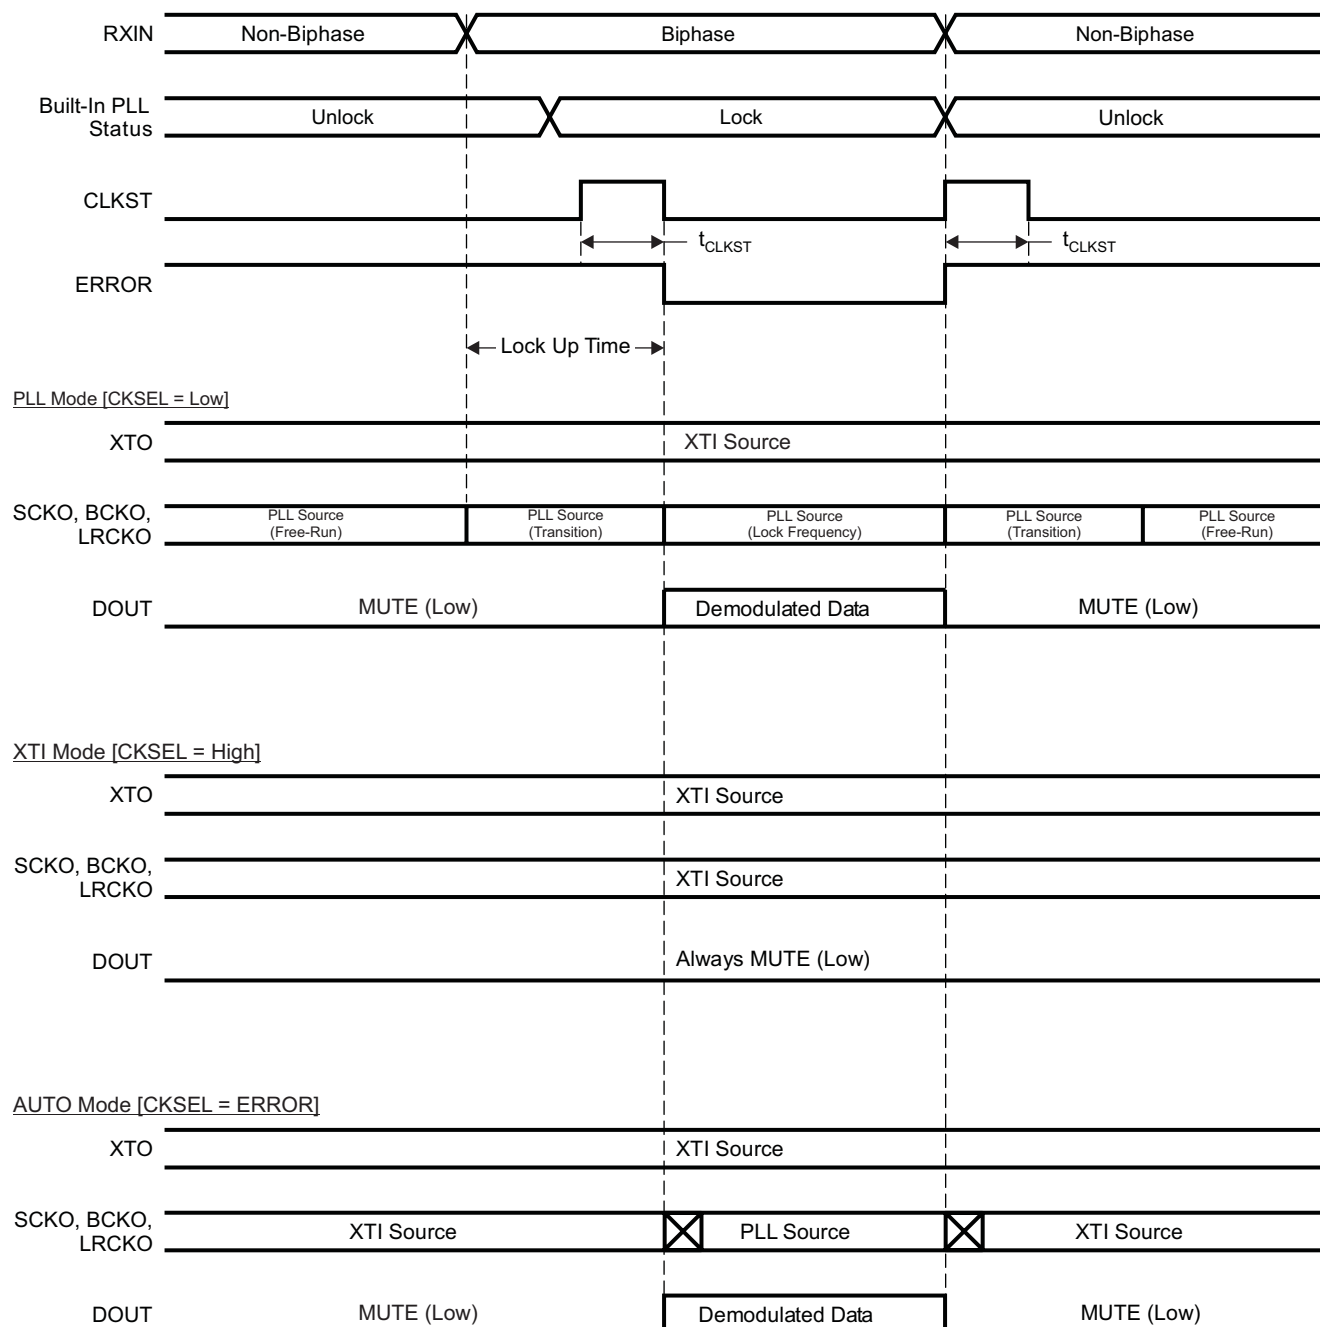

As this signal indicates a clock transition period due to a PLL status change, it can be used for muting or other appropriate functions in an application.

CLKST does change due to PLL status change even if CKSEL = H in the XTI source mode.

When DIR9001-Q1 is reset in the state where it is locked to the biphasic input signal, the pulse signal of CLKST is not output. That is, the priority of reset is higher than CLKST.

The relation among the lock-in/unlock process, the CLKST and ERROR outputs, the output clocks (SCKO, BCKO, LRCKO), and data (DOUT) is shown in [Figure 6](#).

DIR9001-Q1 Status

Figure 6. Lock-In and Unlock Process

CLOCK DESCRIPTION

System Clock Source

DIR9001-Q1 has the following two clock sources for the system clock.

- PLL source (128 f_S , 256 f_S , 384 f_S , 512 f_S are available, recovered by built-in PLL)
- XTI source (One 24.576-MHz resonator or external clock source is required.)

Two clock sources are used for the following purpose.

- PLL source: Recovered system clock from the biphasic input signal
- XTI source: Clock source for peripheral devices (for example, A/D converter, microcontroller, etc.)
Measurement reference clock for the internal actual-sampling-frequency calculator

Description of PLL clock source

- The PLL clock source is the output clock of built-in PLL (including VCO).
- The PLL clock source frequency is selectable from 128 f_S , 256 f_S , 384 f_S , 512 f_S by PSCK[1:0].
- When the PLL is in the locked condition, the PLL clock source is the clock recovered from the biphasic input signal.
- When PLL is in the unlocked condition, the PLL clock source is the built-in free-running clock of the VCO.
- The frequency of the PLL clock source in the unlocked condition is not constant.
(The VCO free-running frequency is dependent on supply voltage, temperature, and variations in the die's wafer.)

Description of XTI clock source

- The XTI clock source is not used to recover the clock and decode data from the biphasic input signal.
- Therefore, if the DIR9001-Q1 is used only for recovering the clock and decoding data from the biphasic input signal, an XTI clock source is not required. In this case, the XTI pin must be connected to the DGND pin.
(The DIR9001-Q1 does not have a selection pin for using an XTI clock source or not using one.)

The selection method of clock source

- The output clock is selected from two clock sources by the level of the CKSEL pin.
- The selection of the system clock source depends only on the input level of CKSEL pin.
- CKSEL = L setting is required for recovering the clock and decoding data from biphasic input.
- CKSEL = H setting is required for XTI clock source output.
- The continuity of clock during the clock source transition between the XTI source and the PLL source is not assured.

Method of automatic clock source selection (CLOCK SOURCE MODE: AUTO)

- This method enables selection of the clock source automatically, using the DIR9001-Q1 ERROR status. The PLL source clock is output when ERROR = L; the XTI source is output when ERROR = H.
- To enable automatic clock source selection, the CKSEL pin must be connected to the ERROR pin.
- If XTI clock source is needed during the ERROR period, this method is recommended.
- Because the clock source during ERROR status is XTI, if an XTI clock source is not provided to the XTI pin, then SCKO, BCKO, and LRCKO are not output during the ERROR period.

The relationship between the clock/data source and the combination of CKSEL pin and PLL status inputs is shown in [Table 2](#).

The clock tree system is shown in [Figure 7](#).

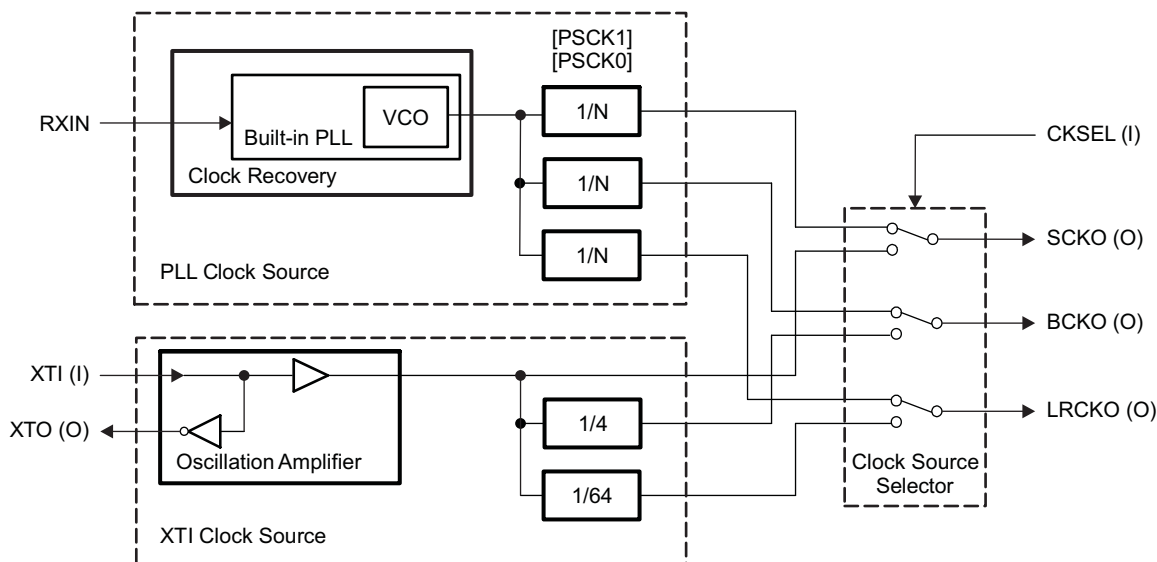

Figure 7. Clock Tree Diagram

PLL Clock Source (Built-In PLL and VCO) Description

The DIR9001-Q1 has on-chip PLL (including VCO) for recovering the clock from the biphasic input signal.

The clock that is output from the built-in VCO is defined as the PLL clock source.

In the locked state, the built-in PLL generates a system clock that synchronizes with the biphasic input signal.

In the unlocked state, the built-in PLL (VCO) generates a free-running clock. (The frequency is not constant.)

The PLL can support a system clock of $128 f_s$, $256 f_s$, $384 f_s$, or $512 f_s$, where f_s is the sampling frequency of the biphasic input signal.

The system clock frequency of the PLL is selected by PSCK[1:0].

The DIR9001-Q1 can decode a biphasic input signal through its 28 sampling-frequency range of kHz to 108 kHz, independent of the setting of PSCK[1:0].

Therefore, the DIR9001-Q1 can decode a biphasic input signal with a sampling frequency from 28 kHz to 108 kHz at all settings of PSCK[1:0].

The relationship between the PSCK[1:0] selection and the output clock (SCKO, BCKO, LRCKO) from the PLL source is shown in Table 3.

Table 3. SCKO, BCKO, and LRCKO Frequencies Set by PSCK[1:0]

| PSCK[1:0] SETTING | | OUTPUT CLOCK FROM PLL SOURCE | | |
|-------------------|-------|------------------------------|----------|-------|
| PSCK1 | PSCK0 | SCKO | BCKO | LRCKO |
| L | L | $128 f_s$ | $64 f_s$ | f_s |
| L | H | $256 f_s$ | $64 f_s$ | f_s |
| H | L | $384 f_s$ | $64 f_s$ | f_s |
| H | H | $512 f_s$ | $64 f_s$ | f_s |

In PLL mode (CKSEL = L), output clocks (SCKO, BCKO, LRCKO) are generated from the PLL source clock.

The relationship between frequencies of LRCKO, BCKO, and SCKO at different sampling frequencies f_s of the biphas input signal are shown in Table 4.

Table 4. Output Clock Frequency in PLL Locked State (CKSEL = L)

| LRCKO | BCKO | SCKO (Depending on PSCK[1:0] Setting) | | | |
|----------|------------|---------------------------------------|-------------|-------------|-------------|
| f_s | $64 f_s$ | $128 f_s$ | $256 f_s$ | $384 f_s$ | $512 f_s$ |
| 32 kHz | 2.048 MHz | 4.096 MHz | 8.192 MHz | 12.288 MHz | 16.384 MHz |
| 44.1 kHz | 2.8224 MHz | 5.6448 MHz | 11.2896 MHz | 16.9344 MHz | 22.5792 MHz |

Required PLL Loop Filter Description

The DIR9001-Q1 incorporates a PLL for generating a clock synchronized with the biphas input signal.

The built-in PLL requires an external loop filter, which is specified as follows.

Operation and performance is assured for recommended filter components R1, C1, and C2.

Notes about Loop Filter Components and Layout

- The resistor and capacitors which comprise the filter should be located and routed as close as possible to the DIR9001-Q1.
- A carbon film resistor or metal film resistor, with tolerance less than 5%, is recommended.
- Film capacitors, with tolerance is less than 5%, is recommended.
- If ceramic capacitors are used for C1 and C2, parts with a low voltage coefficient and low temperature coefficient, such as CH or C0G, are recommended.
- The external loop filter must be placed on FILT pins.
- The GND node of the external loop filter must be directly connected with the AGND pin of the DIR9001-Q1; it must be not combined with other signals.

The configuration of external loop filter and the connection with the DIR9001-Q1 is shown in Figure 8.

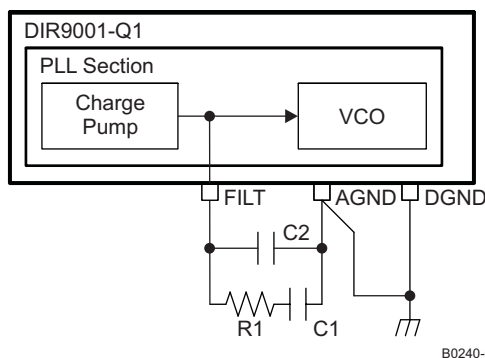

Figure 8. Loop Filter Connection

The recommended values of loop filter components is shown in Table 5.

Table 5. Recommended Value of Loop Filter Components

| REF. NO. | RECOMMENDED VALUE | PARTS TYPE | TOLERANCE |
|----------|----------------------|-----------------------------|------------|
| R1 | 680 Ω | Metal film or carbon | $\leq 5\%$ |
| C1 | 0.068 μF | Film or ceramic (CH or C0G) | $\leq 5\%$ |
| C2 | 0.0047 μF | Film or ceramic (CH or C0G) | $\leq 5\%$ |

XTI Clock Source and Oscillation Amplifier Description

This clock, driven by the built-in oscillation amplifier or input into the XTI pin from an external clock, is defined as the XTI source. A 24.576-MHz fundamental resonator or external 24.576-MHz clock is used as the XTI source.

The DIR9001-Q1 requires an XTI source for following purposes:

- The measurement reference clock of actual-sampling-frequency calculator
- The clock source for the XTI source mode (CKSEL = H setting)
(That is, the DIR9001-Q1 does not require an XTI source if it is only decoding the biphasic input signal.)

The XTI clock source is supplied in one of the following two ways; the details are described in [Figure 9](#).

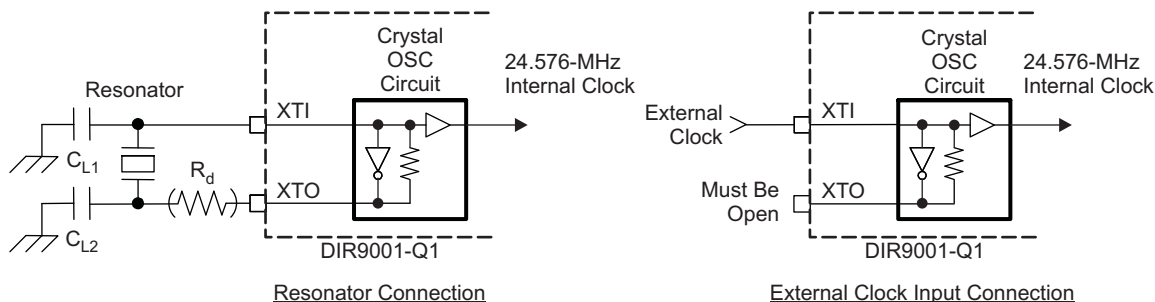

- Setting up an oscillation circuit by connecting a resonator with the built-in amplifier
- Applying a clock from an external oscillator circuit or oscillator module

To set up an oscillation circuit by connecting a resonator with the built-in amplifier:

- Connect a 24.576-MHz resonator between the XTI pin and XTO pin.
- The resonator should be a fundamental-mode type.
- A crystal resonator or ceramic resonator can be used.
- The load capacitor C_{L1} , C_{L2} , and the current-limiting resistor R_d depend on the characteristics of the resonator.
- No external feedback resistor between the XTI pin and XTO pin is required, as an appropriate resistor is incorporated in the device.
- No load other than the resonator is allowed on the XTO pin.

To connect an external oscillator circuit or oscillator module:

- Provide a 24.576-MHz clock on the XTI pin
- Note that the XTI pin is not 5-V tolerant; it is simple CMOS input.
- The XTO pin must be open.

B0241-01

Figure 9. XTI and XTO Connection Diagram

Description of oscillation amplifier operation:

- The built-in oscillation amplifier is always working.
- If the XTI source clock is not used, then the XTI pin must be connected to DGND.
- For reducing power dissipation, it is recommended to not use the XTI source clock.

In XTI mode (CKSEL = H), output clocks (SCKO, BCKO, LRCKO) are generated from XTI source clock.

The relation between output clock frequency (SCKO, BCKO, LRCKO) and the XSCK pin setting in XTI source mode is shown in [Table 6](#).

Table 6. SCKO, BCKO, LRCKO Output Frequency at XTI Mode

| XTI FREQUENCY | OUTPUT CLOCK FREQUENCY IN XTI SOURCE MODE (CKSEL = H) | | |
|---------------|-------------------------------------------------------|-----------|--------|
| | SCKO | BCKO | LRCKO |
| 24.576 MHz | 24.576 MHz | 6.144 MHz | 96 kHz |

DATA DESCRIPTION

Decoded Serial Audio Data Output and Interface Format

The DIR9001-Q1 supports following 4-data formats for the decoded data.

- 16-bit, MSB-first, right-justified
- 24-bit, MSB-first, right-justified
- 24-bit, MSB-first, left-justified
- 24-bit, MSB-first, I²S

Decoded data is MSB first and 2s-complement in all formats.

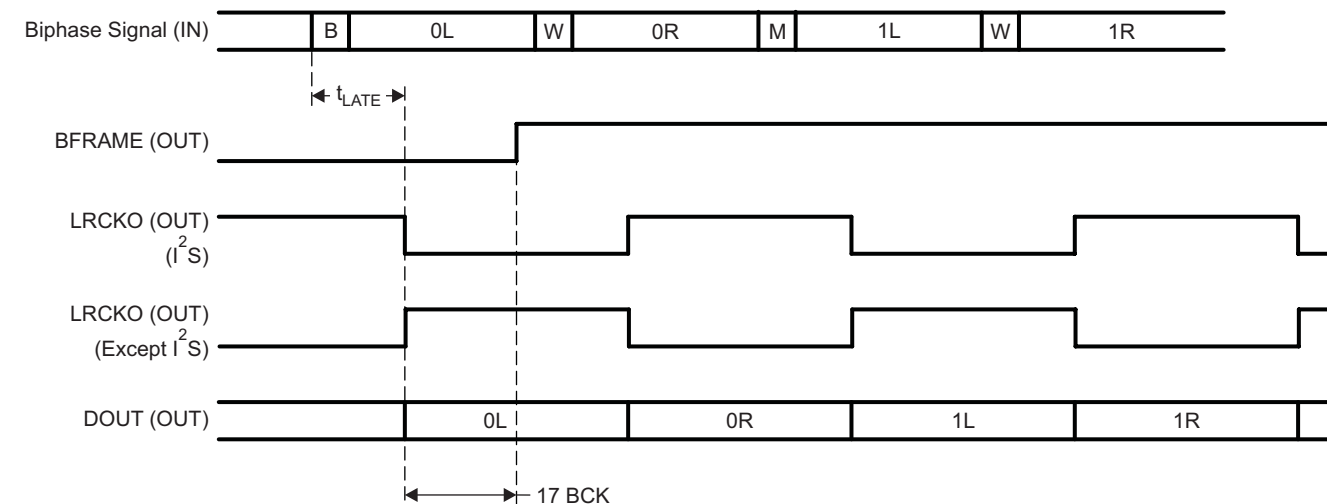

The decoded data is provided through the DOUT pin.

The format of the decoded data is selected by the FMT[1:0] pins.

The data formats for each FMT[1:0] pin setting are shown in [Table 7](#).

Table 7. Serial Audio Data Output Format Set by FMT[1:0]

| FMT[1:0] SETTINGS | | DOUT SERIAL AUDIO DATA OUTPUT FORMAT |
|-------------------|------|--------------------------------------|
| FMT1 | FMT0 | |
| L | L | 16-bit, MSB-first, right-justified |
| L | H | 24-bit, MSB-first, right-justified |
| H | L | 24-bit MSB-first, left-justified |
| H | H | 24-bit, MSB-first, I ² S |

| PARAMETERS | | MIN | TYP | MAX | UNIT |
|------------|--------------------|-----|---------|-----|------|
| t_{LATE} | LRCKO/DOUT latency | | $3/f_S$ | | s |

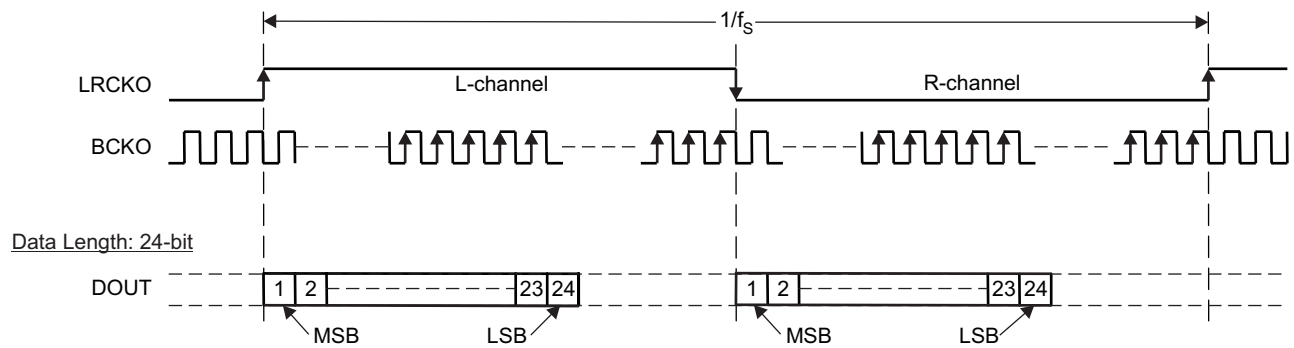

Figure 10. Latency Time Between Biphase Input and LRCKO/DOUT

The relationships among BCKO, LRCKO, and DOUT for each format are shown in [Figure 11](#).

Right Justified (MSB First, 24-bit, 16-bit)

Left Justified (MSB First)

I²S Format (MSB First)

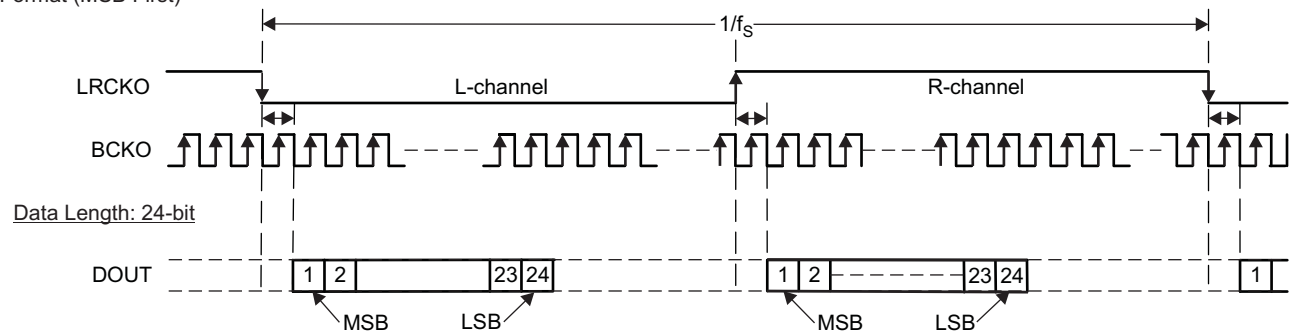

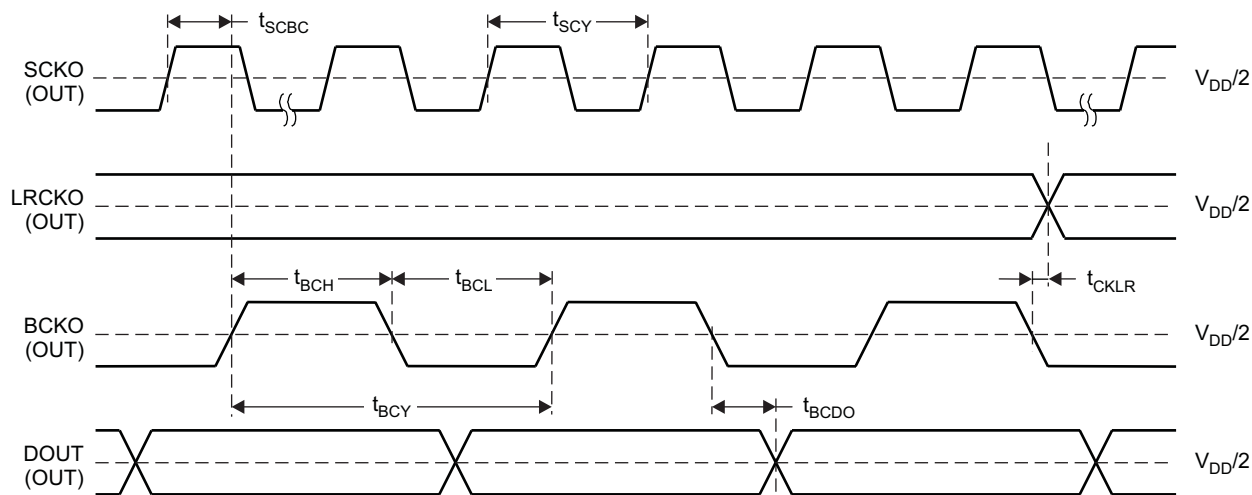

Figure 11. Decoded Serial Audio Data Output Formats

| PARAMETERS | | MIN | TYP | MAX | UNIT |
|------------|--------------------------------------------------|-----|-----------|-----|------|
| t_{SCY} | System clock pulse cycle time | 18 | | | ns |
| t_{SCBC} | Delay time of SCK rising edge to BCK rising edge | 4 | 8 | 15 | ns |
| t_{CKLR} | Delay time of BCKO falling edge to LRCKO valid | –5 | 0.5 | 0.5 | ns |
| t_{BCY} | BCKO pulse cycle time | | $1/64f_s$ | | s |
| t_{BCH} | BCKO pulse duration, HIGH | 60 | | | ns |
| t_{BCL} | BCKO pulse duration, LOW | 60 | | | ns |
| t_{BCDO} | Delay time of BCKO falling edge to DOUT valid | –5 | 1 | 5 | ns |
| t_r | Rising time of all signals | | | 10 | ns |
| t_f | Falling time of all signals | | | 10 | ns |

NOTE: Load capacitance of the LRCKO, BCKO, and DOUT pins is 20 pF. DOUT, LRCKO, and BCKO are synchronized with SCKO.

Figure 12. Decoded Audio Data Output Timing

Channel-Status Data and User Data Serial Outputs

The DIR9001-Q1 can output channel-status data and user data synchronized with audio data from the biphasic input signal.

Each output data has its own dedicated output pin.

- Channel-status data (C, hereinafter) is output through COUT pin.
- User data (U, hereinafter) is output through UOUT pin.

The C and U outputs are synchronized with LRCKO recovered from the biphasic input signal.

The polarity of LRCKO recovered from the biphasic input signal depends on FMT[1:0] setting.

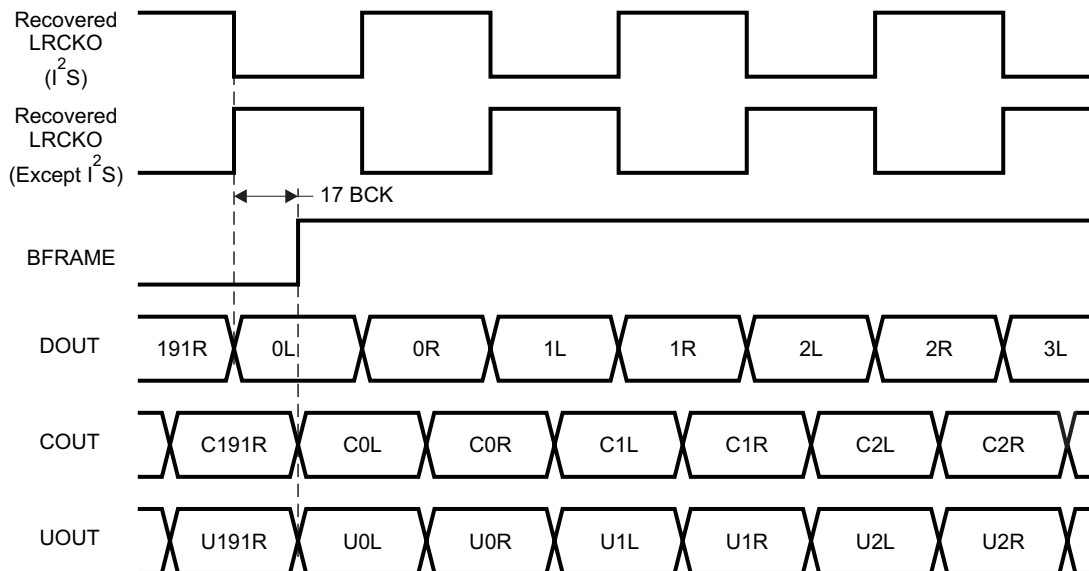

For detecting the top of the block of channel-status data or user data, the BFRAME pin is provided.

The BFRAME pin outputs a high level for an 8-LRCK period if the preamble *B* is detected in the received biphasic signal.

In processing these data by a microcontroller or register circuit, LRCKO is used as the data input clock, and the output pulse on the BFRAME pin is used as the top-of-block signal.

The relationship among LRCKO, BFRAME, DOUT, COUT, and UOUT is shown in [Figure 13](#).

When in the XTI mode and the PLL-locked state, COUT and UOUT output L.

NOTE: The numbers 0 through 191 of DOUT, COUT, and UOUT indicate frame numbers of the biphasic input.

Figure 13. LRCKO, DOUT, BFRAME, COUT, UOUT Output Timing

Channel-Status Data Information Output Terminal

The DIR9001-Q1 can output part of the channel-status information (bit 1, bit 3) through two dedicated pins, AUDIO and EMPH.

The channel-status information which can be output from dedicated pins is limited to information from the L-channel.

If channel-status information other than AUDIO or EMPH is required, or information from the R-channel, then the channel-status data on the COUT pin, which is synchronized with biphasic input signal, can be used.

These outputs are synchronized with the top of block.

The information that can be output through the dedicated pins is shown as follows.

AUDIO Pin

This is the output pin for the audio sample word information of the channel-status data bit 1.

Table 8. Audio Sample Word Information

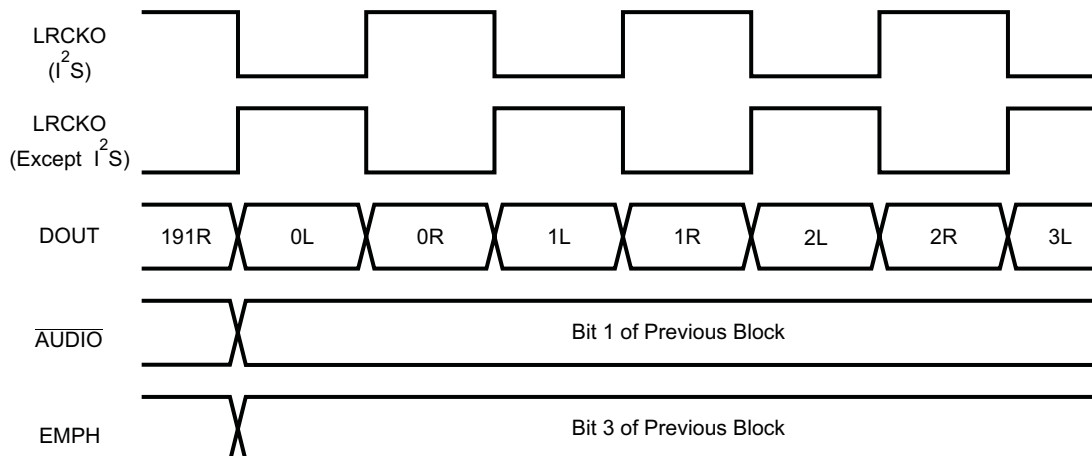

| AUDIO | DESCRIPTION |
|-------|--------------------------------------------------|
| L | Audio sample word represents linear PCM samples. |
| H | Audio sample word is used for other purposes. |

EMPH Pin

This is the output pin for the emphasis information of the channel-status data bit 3.

Table 9. Pre-Emphasis Information

| EMPH | DESCRIPTION |
|------|--------------------------------------------------------------|
| L | Two audio channels without pre-emphasis |
| H | Two audio channels with 50 μ s / 15 μ s pre-emphasis |

NOTE: The numbers 0 through 191 of DOUT indicate frame numbers of the biphase input.

Figure 14. AUDIO and EMPH Output Timing

ERRORS AND ERROR PROCESSING

Error Output Description

Error detection and data error processing for PLL errors

- PLL responds with unlock for data in which the rule of biphase encoding is lost (biphase error and frame-length error).
- PLL responds with unlock for data in which the preamble B, M, W can not be detected.

Error processing function and error output pins

- The DIR9001-Q1 has a data error detect function and an error output pin, ERROR.
- The ERROR pin is defined as the logical OR of data error and parity error detection.
- The ERROR rising edge is synchronized with CLKST.
- The ERROR falling edge is synchronized with LRCK.

The relationship between data error and detected parity error is shown in [Figure 15](#).

B0242-01

Figure 15. ERROR Output

The state of the ERROR pin and the details of error are shown in [Table 10](#).

Table 10. State of ERROR Output Pin

| ERROR | DESCRIPTION |
|-------|----------------------------------------------------|
| L | Lock state of PLL and nondetection of parity error |
| H | Unlock state of PLL or detection of parity error |

Parity Error Processing

Error detection and error processing for parity errors

- For PCM data, interpolation processing by previous data is performed.
- For non-PCM data, interpolation is not performed and data is directly output with no processing. (Non-PCM data is data with channel-status data bit 1 = 1.)

The processing for parity error occurrence is shown in [Figure 16](#).

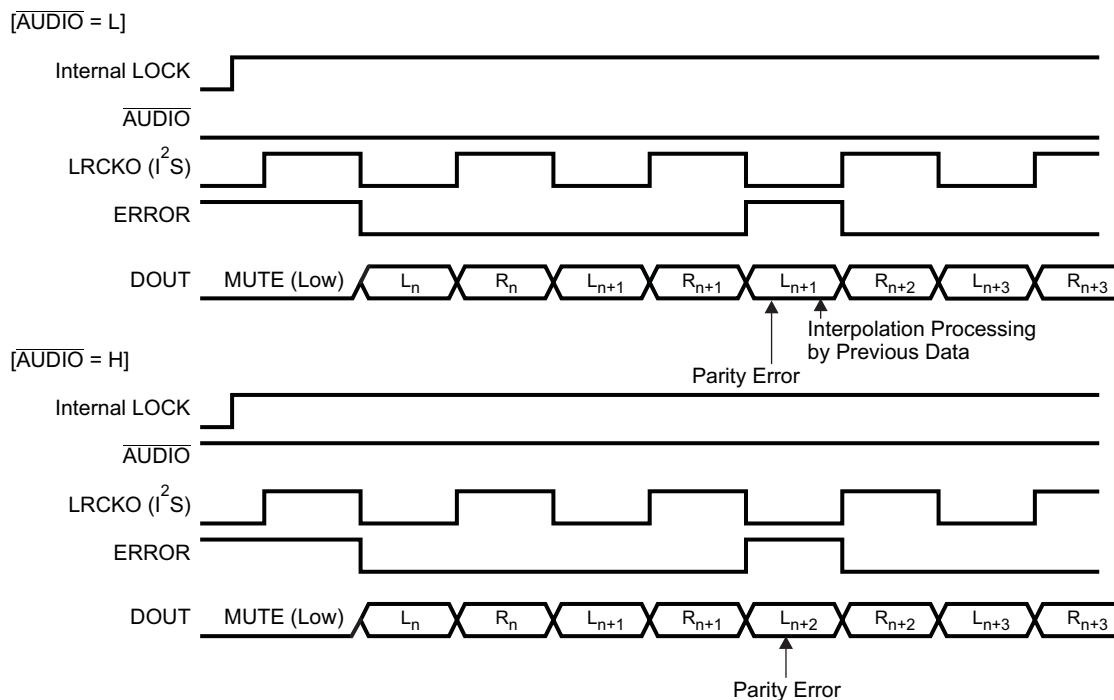

Figure 16. Processing for Parity Error Occurrence

Other Error

Error for sampling frequency change: A rapid continuous change or a discontinuous change of the input sampling frequency causes the PLL to lose lock.

CALCULATION OF ACTUAL SAMPLING FREQUENCY

The DIR9001-Q1 calculates the actual sampling frequency of the biphase input signal and outputs its result through dedicated pins.

To use this function, a 24.576-MHz clock source must be supplied to the XTI pin. The 24.576-MHz clock is used as a measurement reference clock to calculate the actual sampling frequency.

If the XTI pin is connected to DGND, calculation of the actual sampling frequency is not performed.

If there is an error in the XTI clock frequency, the calculation result and range are shifted correspondingly.

This output is the result of calculating the sampling frequency, it is not the sampling frequency information of the channel-status data (bit 24–bit 27).

The sampling frequency information of the channel-status data (bit 24–bit 27) is not output through these pins.

The calculation result is decoded into 2-bit data, which is output on the FSOUT[1:0] pins.

If the PLL is locked but the sampling frequency is out-of-range, or if the PLL is unlocked, FSOUT[1:0] = HL is output to indicate an abnormality.

When the XTI source clock is not supplied before power on, FSOUT [1:0] always outputs LL.

When the XTI source clock is stopped, the f_s calculator holds the last value of the f_s calculator result.

If XTI source clock is supplied, the f_s calculator resumes operation.

The calculated value is held until reset.

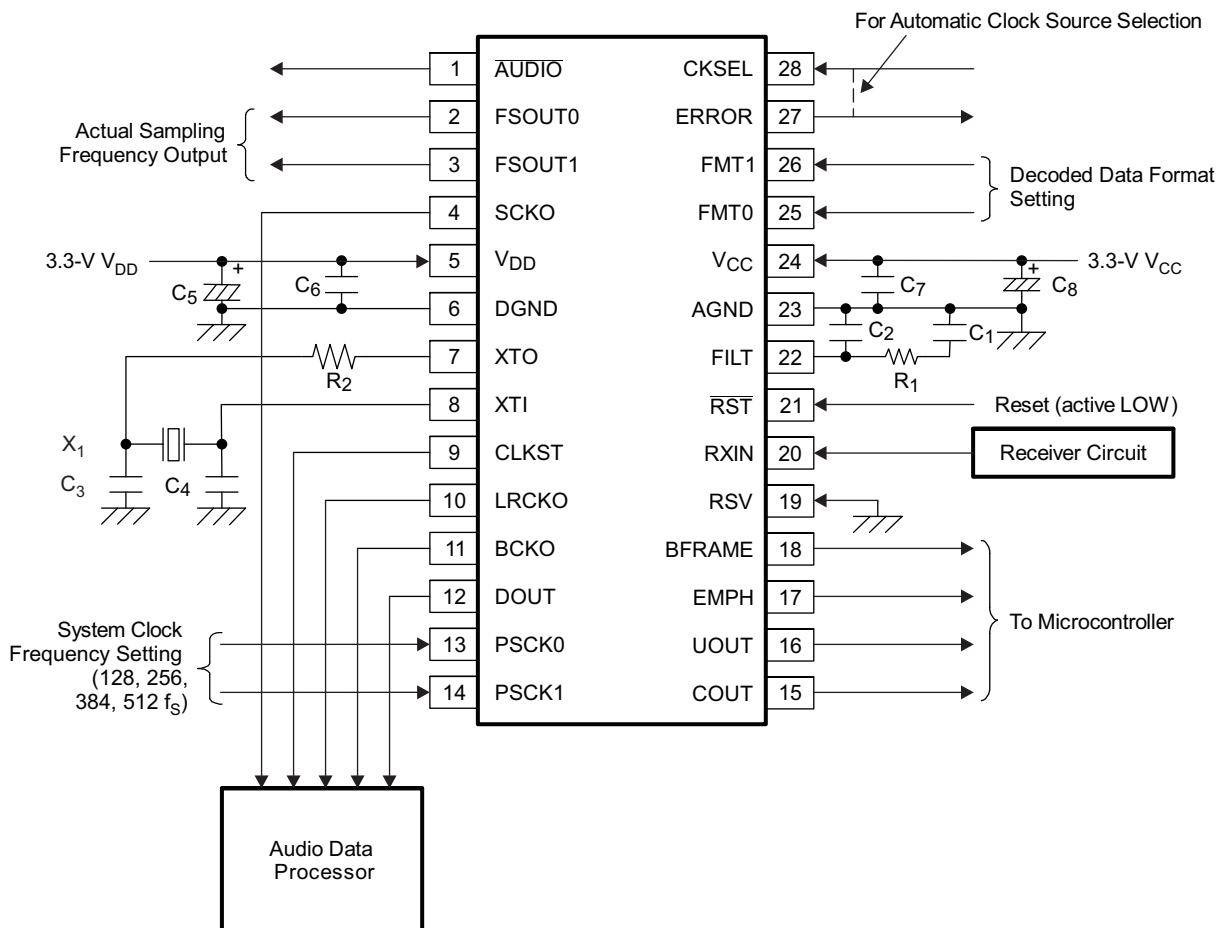

The relationship between the FSOUT[1:0] outputs and the range of sampling frequencies is shown in [Table 11](#).

Table 11. Calculated Sampling Frequency Output

| NOMINAL f_s | ACTUAL SAMPLING FREQUENCY RANGE | CALCULATED SAMPLING FREQUENCY OUTPUT | |
|---------------|---------------------------------|--------------------------------------|--------|
| | | FSOUT1 | FSOUT0 |
| Out of range | Out of range or PLL unlocked | H | L |
| 32 kHz | 31.2 kHz–32.8 kHz | H | H |
| 44.1 kHz | 43 kHz–45.2 kHz | L | L |
| 48 kHz | 46.8 kHz–49.2 kHz | L | H |

TYPICAL CIRCUIT CONNECTION

Figure 17 illustrates typical circuit connection.

NOTES: R₁: Loop filter resistor, 680 Ω

R₂: Current-limiting resistor; generally, a 100 Ω–500 Ω resistor is used, but it depends on the crystal resonator.

C₁: Loop filter capacitor, 0.068 μF.

C₂: Loop filter capacitor, 0.0047 μF.

C₃, C₄: OSC load capacitor; generally, a 10-pF–30-pF capacitor is used, but it depends on the crystal resonator and PCB layout.

C₅, C₈: 10-μF electrolytic capacitor typical, depending on power-supply quality and PCB layout.

C₆, C₇: 0.1-μF ceramic capacitor typical, depending on power-supply quality and PCB layout.

X₁: Crystal resonator, use a 24.576-MHz fundamental resonator when XTI clock source is needed.

Figure 17. Typical Circuit Connection Diagram

APPLICATION INFORMATION

Differences From DIR1703

The DIR9001-Q1 has many improved functions compared to the DIR1703.

The DIR9001-Q1 functions are similar to those of the DIR1703.

The DIR9001-Q1 pin assignment is equivalent to that of the DIR1703.

The DIR9001-Q1 biphas input signal decoding function is almost equivalent to that of the DIR1703.

The differences between the DIR9001-Q1 and DIR1703 are shown in [Table 12](#).

Table 12. Main Differences Between DIR1703 and DIR9001-Q1

| DIFFERENCE | DIR1703 | DIR9001-Q1 |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operational supply-voltage range | 3 V to 3.6 V | 2.7 V to 3.6 V |
| Operation temperature range | –25°C to 85°C | –40°C to 85°C |
| Package | SSOP-28P, pin pitch: 0.65 mm | TSSOP-28P, pin pitch: 0.65 mm |
| Clock recovery architecture | SpAct™ feature | Conventional PLL |
| IEC60958-3 jitter tolerance | Not compliant | Compliant |
| IEC60958 sampling frequency accuracy | Level II (± 1000 ppm) | Level III ($\pm 12.5\%$) |
| Acceptable sampling frequency | 32/44.1/48/88.2/96 kHz, 1500 ppm | 28 kHz to 108 kHz continuous |
| Biphase input signal level | CMOS level | 5-V tolerant TTL level |
| Connection of loop filter | Between FILT pin and VCC | Between FILT pin and AGND |
| XTI source clock frequency | One of the following clock sources or resonators must be connected to the XTI pin: 4.069/5.6448/6.144/ 8.192/11.2896/12.288/ 16.384/16.9344/18.432/ 22.5792/24.576-MHz | Optional 24.576-MHz (24.576-MHz clock is only required to use the internal actual-sampling-frequency calculator or use the DIR9001-Q1 as a 24.576-MHz clock generator.) |
| BFRAME H period | $32/f_s$ | $8/f_s$ |
| Channel status and user data | Synchronous with LRCK transition | 17-BCK delay from LRCK transition |
| Latest tracked frequency hold | Available | Not available |
| PLL mode clock at error | Latest tracked frequency | VCO free-running frequency |
| Clock transition signal out | CKTRNS pin, active H | CLKST pin, active-high |
| Oscillation amplifier | External feedback resistor (typ. 1 M Ω) | Internal feedback resistor |

The differences between the DIR1703 and DIR9001-Q1 I/O pins are shown in [Table 13](#).

Table 13. The Differences Between DIR1703 and DIR9001-Q1 in All I/O Pin

| PIN NO. | DIR1703 | DIR9001-Q1 | DIFFERENCES | DESCRIPTIONS OF DIR9001-Q1 |
|---------|-----------------|-----------------|----------------------|----------------------------------------------------------------------------|
| 1 | ADFLG | AUDIO | Pin name only | Channel-status data information of non-audio sample word, active-low |
| 2 | BRATE0 | FSOUT0 | Pin name only | Actual-sampling-frequency calculated result output 0 |
| 3 | BRATE1 | FSOUT1 | Pin name only | Actual-sampling-frequency calculated result output 1 |
| 4 | SCKO | SCKO | Same function | System clock output |
| 5 | V _{DD} | V _{DD} | Same function | Digital power supply, 3.3-V |
| 6 | DGND | DGND | Same function | Digital ground |
| 7 | XTO | XTO | Same function | Oscillation amplifier output |
| 8 | XTI | XTI | Same function | Oscillation amplifier input, or external XTI source clock input |
| 9 | CKTRNS | CLKST | CLKST is active-high | Clock change/transition signal output |
| 10 | LRCKO | LRCKO | Same function | Audio data latch enable output |
| 11 | BCKO | BCKO | Same function | Audio data bit clock output |
| 12 | DOUT | DOUT | Same function | 16 bit–24 bit decoded serial digital audio data output |
| 13 | SCF0 | PSCK0 | Pin name only | SCKO output frequency selection 0 |
| 14 | SCF1 | PSCK1 | Pin name only | SCKO output frequency selection 1 |
| 15 | CSBIT | COUT | Pin name only | Channel-status data serial output synchronized with LRCKO |
| 16 | URBIT | UOUT | Pin name only | User data serial output synchronized with LRCKO |
| 17 | EMFLG | EMPH | Pin name only | Channel-status data Information of pre-emphasis (50 μs/15 μs) |
| 18 | BFRAME | BFRAME | Same function | Indication of top block of biphase input signal |
| 19 | BRSEL | RSV | Reserved | Reserved, must be connected to DGND |
| 20 | DIN | RXIN | Pin name only | Biphase digital data input |
| 21 | RST | RST | Same function | Reset control input, active-low |
| 22 | FILT | FILT | Same function | External filter connection terminal. Recommended filter must be connected. |
| 23 | AGND | AGND | Same function | Analog ground |
| 24 | V _{CC} | V _{CC} | Same function | Analog power supply, 3.3-V |
| 25 | FMT0 | FMT0 | Same function | Decoded serial digital audio data output format selection 0 |
| 26 | FMT1 | FMT1 | Same function | Decoded serial digital audio data output format selection 1 |
| 27 | UNLOCK | ERROR | Pin name only | Indication of internal PLL or data parity error |
| 28 | CKSEL | CKSEL | Same function | Selection of system clock source, Low: PLL (VCO) clock, High: XTI clock |

| DIR9001IPWRQ1.B | Active | Production | TSSOP (PW) 28 | 2000 LARGE T&R | Yes | NIPDAU | Level-2-260C-1 YEAR | -40 to 85 | DIR9001IQ1 |

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
