

## DLP650TE 0.65 4-K UHD DMD

### 1 特性

- 0.65 英寸对角线微镜阵列
  - 4-K UHD (3840 × 2160) 显示分辨率
  - 7.6μm 微镜间距
  - ±12° 微镜倾斜度 (相对于平坦表面)
  - 角落照明
- 高速串行接口 (HSSI) 输入数据总线
- 支持 4K 超高清 (60Hz) 和全高清 (240Hz)
- 由 DLPC7540 显示控制器、DLPA100 电源管理和电机驱动器 IC 支持激光荧光、LED、RGB 激光和灯泡运行

### 2 应用

- 激光电视
- 智能投影仪
- 企业投影仪

### 3 说明

DLP650TE 数字微镜器件 (DMD) 是一款数控微机电系统 (MEMS) 空间照明调制器 (SLM)，可用于实现高亮度 4-K UHD 显示系统。DLP® 产品 0.65 英寸 4-K UHD 芯片组由 DMD、DLPC7540 显示控制器以及 DLPA100 电源和电机驱动器组成。芯片组外形紧凑，可为体型小巧的 4-K UHD 显示提供完整的系统解决方案。

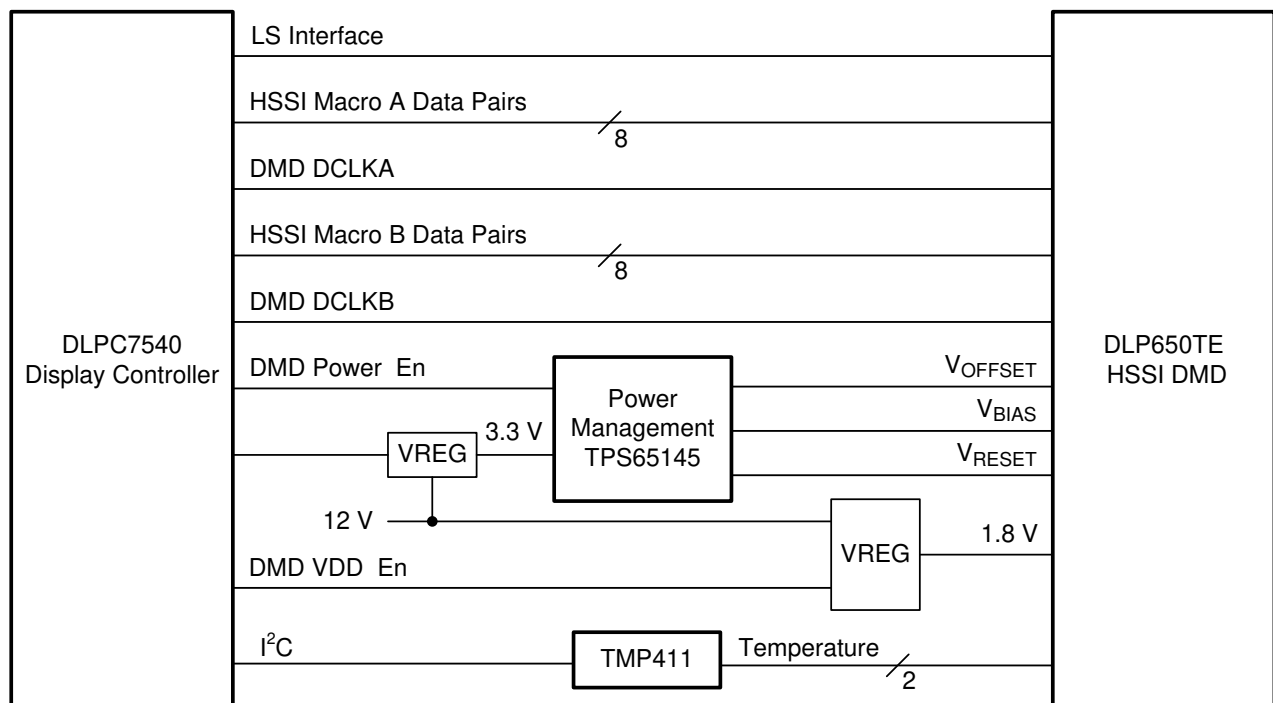

DMD 生态系统还提供现成的资源，帮助用户加快设计周期。这些资源包括 [量产就绪型光学模块](#)、[光学模块制造商](#)和[设计公司](#)。

访问 [TI DLP 显示技术入门](#)页，了解有关使用 DMD 开始设计的更多信息。

#### 器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸 (标称值)
DLP650TE	FYP(149)	32.2mm × 22.3mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device is not implied at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure above or below the Recommended Operating Conditions for extended periods may affect device reliability.

Parameter Name	Description	MIN	MAX	UNIT
<b>Supply Voltage</b>				
$V_{DD}$	Supply voltage for LVCMOS core logic and LVCMOS low speed interface (LSIF) <sup>(1)</sup>	- 0.5	2.3	V
$V_{DDA}$	Supply voltage for high speed serial interface (HSSI) receivers <sup>(1)</sup>	- 0.3	2.2	V
$V_{OFFSET}$	Supply voltage for HVCMOS and micromirror electrode <sup>(1) (2)</sup>	- 0.5	11	V
$V_{BIAS}$	Supply voltage for micromirror electrode <sup>(1)</sup>	- 0.5	17	V
$V_{RESET}$	Supply voltage for micromirror electrode <sup>(1)</sup>	- 13	0.5	V
$ V_{DDA} - V_{DD} $	Supply voltage delta (absolute value) <sup>(3)</sup>		0.3	V
$ V_{BIAS} - V_{OFFSET} $	Supply voltage delta (absolute value) <sup>(4)</sup>		11	V
$ V_{BIAS} - V_{RESET} $	Supply voltage delta (absolute value) <sup>(5)</sup>		30	V
<b>Input Voltage</b>				
	Input voltage for other inputs - LSIF and LVCMOS <sup>(1)</sup>	- 0.5	2.45	V
	Input voltage for other inputs - HSSI <sup>(1) (6)</sup>	- 0.2	$V_{DDA}$	V
<b>Low speed interface (LSIF)</b>				
$f_{CLOCK}$	LSIF clock frequency (LS_CLK)		130	MHz
$ V_{ID} $	LSIF differential input voltage magnitude <sup>(6)</sup>		810	mV
$I_{ID}$	LSIF differential input current <sup>(7)</sup>		10	mA
<b>High speed serial interface (HSSI)</b>				
$f_{CLOCK}$	HSSI clock frequency (DCLK)		1.65	GHz
$ V_{ID} $	HSSI differential input voltage magnitude Data Lane <sup>(6)</sup>		700	mV
$ V_{ID} $	HSSI differential input voltage magnitude Clock Lane <sup>(6)</sup>		700	mV
<b>Environmental</b>				
$T_{ARRAY}$	Temperature, operating <sup>(8)</sup>	0	90	°C
$T_{ARRAY}$	Temperature, non-operating <sup>(8)</sup>	- 40	90	°C
$T_{DP}$	Dew point temperature, operating and non-operating (non-condensing)		81	°C

- (1) All voltage values are with respect to the ground terminals ( $V_{SS}$ ). The following required power supplies must be connected for proper DMD operation:  $V_{DD}$ ,  $V_{DDA}$ ,  $V_{OFFSET}$ ,  $V_{BIAS}$ , and  $V_{RESET}$ . All  $V_{SS}$  connections are also required.
- (2)  $V_{OFFSET}$  supply transients must fall within specified voltages.
- (3) Exceeding the recommended allowable absolute voltage difference between  $V_{DDA}$  and  $V_{DD}$  may result in excessive current draw.
- (4) Exceeding the recommended allowable absolute voltage difference between  $V_{BIAS}$  and  $V_{OFFSET}$  may result in excessive current draw.
- (5) Exceeding the recommended allowable absolute voltage difference between  $V_{BIAS}$  and  $V_{RESET}$  may result in excessive current draw.
- (6) This maximum input voltage rating applies when each input of a differential pair is at the same voltage potential. LVDS and HSSI differential inputs must not exceed the specified limit or damage may result to the internal termination resistors.
- (7) Differential inputs must not exceed the specified limit or damage may result to the internal termination resistors. Specification applies to both the High speed serial interface (HSSI) and the low speed interface (LSI).
- (8) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point (TP1) shown in [Figure 7-1](#) and the package thermal resistances using the [Micromirror Array Temperature Calculation](#).

### 6.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system.

SYMBOL	PARAMETER	MIN	MAX	UNIT
$T_{DMD}$	DMD storage temperature	- 40	80	°C
$T_{DP-AVG}$	Average dew point temperature (non-condensing) <sup>(1)</sup>		28	°C

## 6.2 Storage Conditions (continued)

Applicable for the DMD as a component or non-operating in a system.

SYMBOL	PARAMETER	MIN	MAX	UNIT
T <sub>DP-ELR</sub>	Elevated dew point temperature range (non-condensing) <sup>(2)</sup>	28	36	°C
CT <sub>ELR</sub>	Cumulative time in the elevated dew point temperature range		24	Months

- (1) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.  
 (2) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT<sub>ELR</sub>.

## 6.3 ESD Ratings

SYMBOL	PARAMETER	DESCRIPTION	VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	V

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

## 6.4 Recommended Operating Conditions

Over operating free-air temperature range and supply voltages (unless otherwise noted) <sup>(1)</sup>

Parameter Name		MIN	NOM	MAX	UNIT
<b>Supply Voltages</b> <sup>(2) (3)</sup>					
V <sub>DD</sub>	Supply voltage for LVC MOS core logic and low speed interface (LSIF)	1.71	1.8	1.95	V
V <sub>DDA</sub>	Supply voltage for high speed serial interface (HSSI) receivers	1.71	1.8	1.95	V
V <sub>OFFSET</sub>	Supply voltage for HVCMOS and micromirror electrode <sup>(4)</sup>	9.5	10	10.5	V
V <sub>BIAS</sub>	Supply voltage for micromirror electrode	15.5	16	16.5	V
V <sub>RESET</sub>	Supply voltage for micromirror electrode	- 12.5	- 12	- 11.5	V
V <sub>DDA</sub> - V <sub>DD</sub>	Supply voltage delta, absolute value <sup>(5)</sup>			0.3	V
V <sub>BIAS</sub> - V <sub>OFFSET</sub>	Supply voltage delta, absolute value <sup>(6)</sup>			10.5	V
V <sub>BIAS</sub> - V <sub>RESET</sub>	Supply voltage delta, absolute value			29	V
<b>LVC MOS Input</b>					
V <sub>IH</sub>	High level input voltage <sup>(7)</sup>	0.7 x V <sub>DD</sub>			V
V <sub>IL</sub>	Low level input voltage <sup>(7)</sup>			0.3 x V <sub>DD</sub>	V
<b>Low Speed Interface (LSIF)</b>					
f <sub>CLOCK</sub>	LSIF clock frequency (LS_CLK) <sup>(8)</sup>	108	120	130	MHz
DCD <sub>IN</sub>	LSIF duty cycle distortion (LS_CLK)	44%		56%	
V <sub>ID</sub>	LSIF differential input voltage magnitude <sup>(8)</sup>	150	350	440	mV
V <sub>LVDS</sub>	LSIF voltage. <sup>(8)</sup>	575		1520	mV
V <sub>CM</sub>	Common mode voltage. <sup>(8)</sup>	700	900	1300	mV
Z <sub>LINE</sub>	Line differential impedance (PWB/trace)	90	100	110	Ω
Z <sub>IN</sub>	Internal differential termination resistance	80	100	120	Ω
<b>High Speed Serial Interface (HSSI)</b>					
f <sub>CLOCK</sub>	HSSI clock frequency (DCLK) <sup>(9)</sup>	1.2		1.6	GHz
DCD <sub>IN</sub>	HSSI duty cycle distortion (DCLK)	44%	50%	56%	
V <sub>ID</sub>   Data	HSSI differential input voltage magnitude Data Lane <sup>(9)</sup>	100		600	mV
V <sub>ID</sub>   CLK	HSSI differential input voltage magnitude Clock Lane <sup>(9)</sup>	295		600	mV
V <sub>CMDC</sub> Data	Input common mode voltage (DC) Data Lane <sup>(9)</sup>	200	600	800	mV

## 6.4 Recommended Operating Conditions (continued)

Over operating free-air temperature range and supply voltages (unless otherwise noted) <sup>(1)</sup>

Parameter Name		MIN	NOM	MAX	UNIT
VCM <sub>DC</sub> CLK	Input common mode voltage (DC) Clk Lane <sup>(9)</sup>	200	600	800	mV
VCM <sub>ACp-p</sub>	AC peak to peak (ripple) on common mode voltage of Data Lane and Clock Lane <sup>(9)</sup>			100	mV
Z <sub>LINE</sub>	Line differential impedance (PWB/trace)		100		Ω
Z <sub>IN</sub>	Internal differential termination resistance. ( R <sub>Xterm</sub> )	80	100	120	Ω
<b>Environmental</b>					
T <sub>ARRAY</sub>	Array temperature, long-term operational. <sup>(10) (11) (12) (13)</sup>	10		40 to 70	°C
	Array temperature, short-term operational, 500 hr max. <sup>(11) (14)</sup>	0		10	°C
T <sub>DP-AVG</sub>	Average dew point temperature (non-condensing) <sup>(15)</sup>			28	°C
T <sub>DP-ELR</sub>	Elevated dew point temperature range (non-condensing) <sup>(16)</sup>	28		36	°C
CT <sub>ELR</sub>	Cumulative time in elevated dew point temperature range			24	Months
Q <sub>AP-ILL</sub>	Window aperture illumination overfill <sup>(17) (18)</sup>			17	W/cm <sup>2</sup>
<b>LAMP ILLUMINATION</b>					
ILL <sub>UV</sub>	Illumination wavelength < 395 nm <sup>(10)</sup>		0.68	2	mW/cm <sup>2</sup>
ILL <sub>VIS</sub>	Illumination wavelengths between 395 nm and 800 nm			29.3	W/cm <sup>2</sup>
ILL <sub>IR</sub>	Illumination wavelength > 800 nm			10	mW/cm <sup>2</sup>
<b>SOLID STATE ILLUMINATION</b>					
ILL <sub>UV</sub>	Illumination wavelength < 410 nm <sup>(10)</sup>			3	mW/cm <sup>2</sup>
ILL <sub>VIS</sub>	Illumination wavelengths between 410 nm and 800 nm			34.7	W/cm <sup>2</sup>
ILL <sub>IR</sub>	Illumination wavelength > 800 nm			10	mW/cm <sup>2</sup>

- (1) [Recommended Operating Conditions](#) are applicable after the DMD is installed in the final product.
- (2) All power supply connections are required to operate the DMD: V<sub>DD</sub>, V<sub>DDA</sub>, V<sub>OFFSET</sub>, V<sub>BIAS</sub>, and V<sub>RESET</sub>. All V<sub>SS</sub> connections are required to operate the DMD.
- (3) All voltage values are with respect to the V<sub>SS</sub> ground pins.
- (4) V<sub>OFFSET</sub> supply transients must fall within specified max voltages.
- (5) To prevent excess current, the supply voltage delta | V<sub>DDA</sub> - V<sub>DD</sub> | must be less than specified limit.
- (6) To prevent excess current, the supply voltage delta | V<sub>BIAS</sub> - V<sub>OFFSET</sub> | must be less than specified limit.
- (7) LVCMOS input pin is DMD\_DEN\_ARSTZ.
- (8) See the low speed interface (LSIF) timing requirements in [Timing Requirements](#).
- (9) See the high speed serial interface (HSSI) timing requirements in [Timing Requirements](#).
- (10) Simultaneous exposure of the DMD to the maximum [Recommended Operating Conditions](#) for temperature and UV illumination will reduce device lifetime.
- (11) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point (TP1) shown in [Figure 7-1](#) and the package thermal resistances using the [Micromirror Array Temperature Calculation](#).
- (12) Per [Figure 6-1](#), the maximum operational array temperature should be de-rated based on the micromirror landed duty cycle that the DMD experiences in the end application. Refer to [Micromirror Landed Duty Cycle](#) for a definition of micromirror landed duty cycle.
- (13) Long-term is defined as the usable life of the device.
- (14) Short-term is the total cumulative time over the useful life of the device.
- (15) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.
- (16) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT<sub>ELR</sub>.
- (17) The active area of the DMD is surrounded by an aperture on the inside of the DMD window surface that masks structures of the DMD device assembly from normal view. The aperture is sized to anticipate several optical conditions. Overfill light illuminating the area outside the active array can scatter and create adverse effects to the performance of an end application using the DMD. The illumination optical system should be designed to minimize light flux incident outside the active array. Depending on the particular system's optical architecture and assembly tolerances, the amount of overfill light on the outside of the active array may cause system performance degradation.
- (18) Applies to the region in red in [Figure 6-2](#).

图 6-1. Maximum Recommended Array Temperature - Derating Curve

图 6-2. Illumination Overfill Diagram - Critical Area

## 6.5 Thermal Information

symbol	Thermal Metric	DLP650TE	Unit
		FYP Package	
		149 Pins	
R <sub>ARRAY_TO_CERAMIC</sub>	Thermal resistance, active area to test point 1 (TP1) <sup>(1)</sup>	0.6	°C/W

- (1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the DMD within the temperature range specified in the [Recommend Operating Conditions](#). The total heat load on the DMD is largely driven by the incident light absorbed by the active area; although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array. Optical systems should be designed to minimize the light energy falling outside the window clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

## 6.6 Electrical Characteristics

Over operating free-air temperature range and supply voltages (unless otherwise noted)

SYMBOL	PARAMETER <sup>(1) (2)</sup>	TEST CONDITIONS <sup>(1)</sup>	MIN	TYP	MAX	UNIT
<b>Current – Typical</b>						
I <sub>DD</sub>	Supply current V <sub>DD</sub> <sup>(3)</sup>			800	1250	mA
I <sub>DDA</sub>	Supply current V <sub>DDA</sub> <sup>(3)</sup>			900	1200	mA

## 6.9 System Mounting Interface Loads

PARAMETER	MIN	TYP	MAX	UNIT
<b>When loads are applied on both the electrical and thermal interface areas</b>				
Maximum load to be applied to the electrical interface area <sup>(1)</sup>			111	N
Maximum load to be applied to the thermal interface area <sup>(1)</sup>			111	N
<b>When load is applied on the electrical interface area only</b>				
Maximum load to be applied to the electrical interface area <sup>(1)</sup>			222	N
Maximum load to be applied to the thermal interface area <sup>(1)</sup>			0	N

(1) The load should be applied uniformly in the corresponding areas shown in Figure 6-14.

**图 6-14. System Mounting Interface Loads**

## 6.10 Micromirror Array Physical Characteristics

SYMBOL	PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
M	Number of active columns <sup>(1)</sup>			1920		micromirrors
N	Number of active rows <sup>(1)</sup>			1080		micromirrors
P	Micromirror (pixel) pitch <sup>(1)</sup>			7.6		um
	Micromirror active array width <sup>(1)</sup>	(micromirror pitch) x (number of active columns)		14.592		mm
	Micromirror active array height <sup>(1)</sup>	(micromirror pitch) x (number of active rows)		8.208		mm
	Micromirror active border <sup>(2)</sup>	Pond of micromirror (POM)		14		micromirrors/side

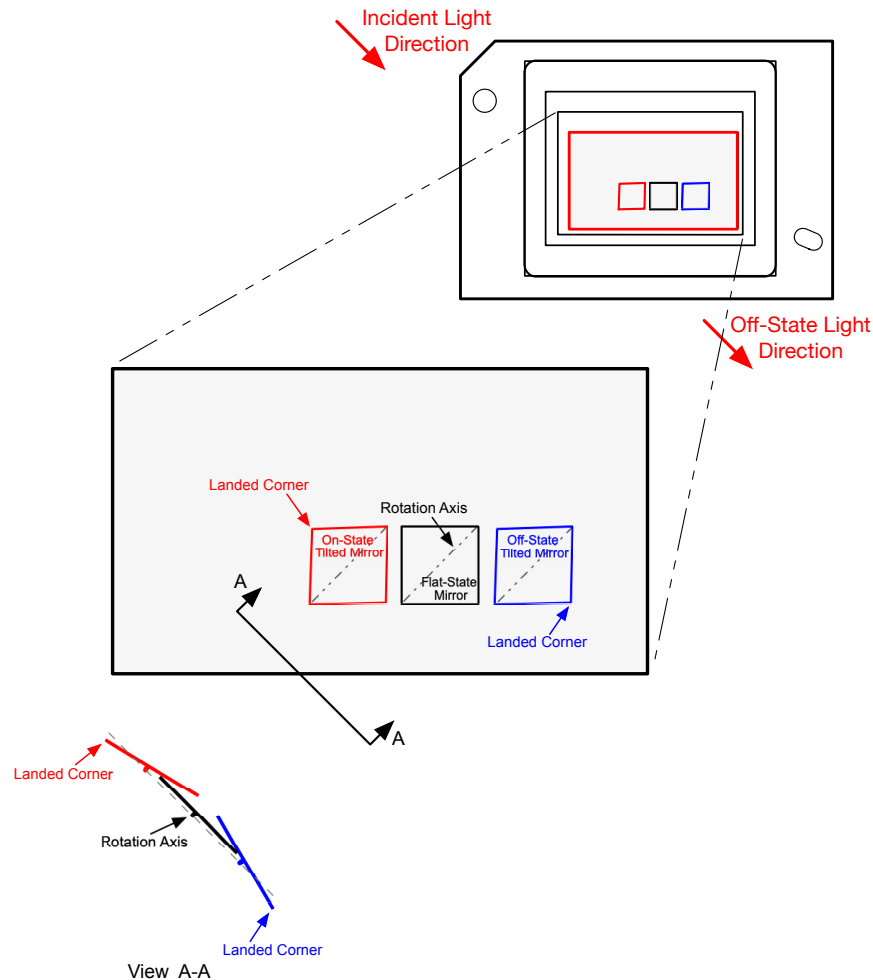

(1) See [Figure 6-15](#).

(2) The structure and qualities of the border around the active array includes a band of partially functional micromirrors called the POM. These micromirrors are structurally and/or electrically prevented from tilting toward the bright or ON state, but still require an electrical bias to tilt toward OFF.

- (5) When the micromirror array is landed (not parked), the tilt direction of each individual micromirror is dictated by the binary contents of the CMOS memory cell associated with each individual micromirror. A binary value of 1 results in a micromirror landing in the ON State direction. A binary value of 0 results in a micromirror landing in the OFF State direction, see [Figure 6-16](#).
- (6) The time required for a micromirror to nominally transition from one landed state to the opposite landed state.
- (7) The minimum time between successive transitions of a micromirror.
- (8) Conditions of Acceptance: All DMD image performance returns will be evaluated using the following projected image test conditions:
  - Test set degamma shall be linear
  - Test set brightness and contrast shall be set to nominal
  - The diagonal size of the projected image shall be a minimum of 60 inches
  - The projection screen shall be 1x gain
  - The projected image shall be inspected from an 8 foot minimum viewing distance
  - The image shall be in focus during all image performance tests
- (9) Bright pixel definition: A single pixel or mirror that is stuck in the ON position and is visibly brighter than the surrounding pixels
- (10) Gray 10 screen definition: All areas of the screen are colored with the following settings:
  - Red = 10/255
  - Green = 10/255
  - Blue = 10/255
- (11) POM definition: Rectangular border of off-state mirror surrounding the active area.
- (12) Dark pixel definition: A single pixel or mirror that is stuck in the OFF position and is visibly darker than the surrounding pixels.
- (13) Adjacent pixel definition: Two or more stuck pixels sharing a common border or common point, also referred to as a cluster.
- (14) Unstable pixel definition: A single pixel or mirror that does not operate in sequence with the parameters loaded into memory. The unstable pixel appears to be flickering asynchronously with the image.

**图 6-16. Micromirror Landed Orientation and Tilt**

## 6.12 Window Characteristics

PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
Window material designation		Corning EagleXG			
Window refractive index	at wavelength 546.1 nm	1.5119			
Window transmittance, average over the wavelength range 420-680 nm	Applies to all angles 0-30 AOI <sup>(1)</sup> <sup>(2)</sup>	97.8%			
Window transmittance, average over the wavelength range 420-680 nm	Applies to all angles 30-45 AOI <sup>(1)</sup> <sup>(2)</sup>	96.4%			

(1) Single-pass-through both surfaces and glass

(2) AOI - angle of incidence is the angle between an incident ray and the normal to a reflecting or refracting surface

## 6.13 Chipset Component Usage Specification

Reliable function and operation of the DLP650TE DMD requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology consists of the TI technology and devices used for operating or controlling a DLP DMD.

### 备注

TI assumes no responsibility for image quality artifacts or DMD failures caused by optical system operating conditions exceeding limits described previously.

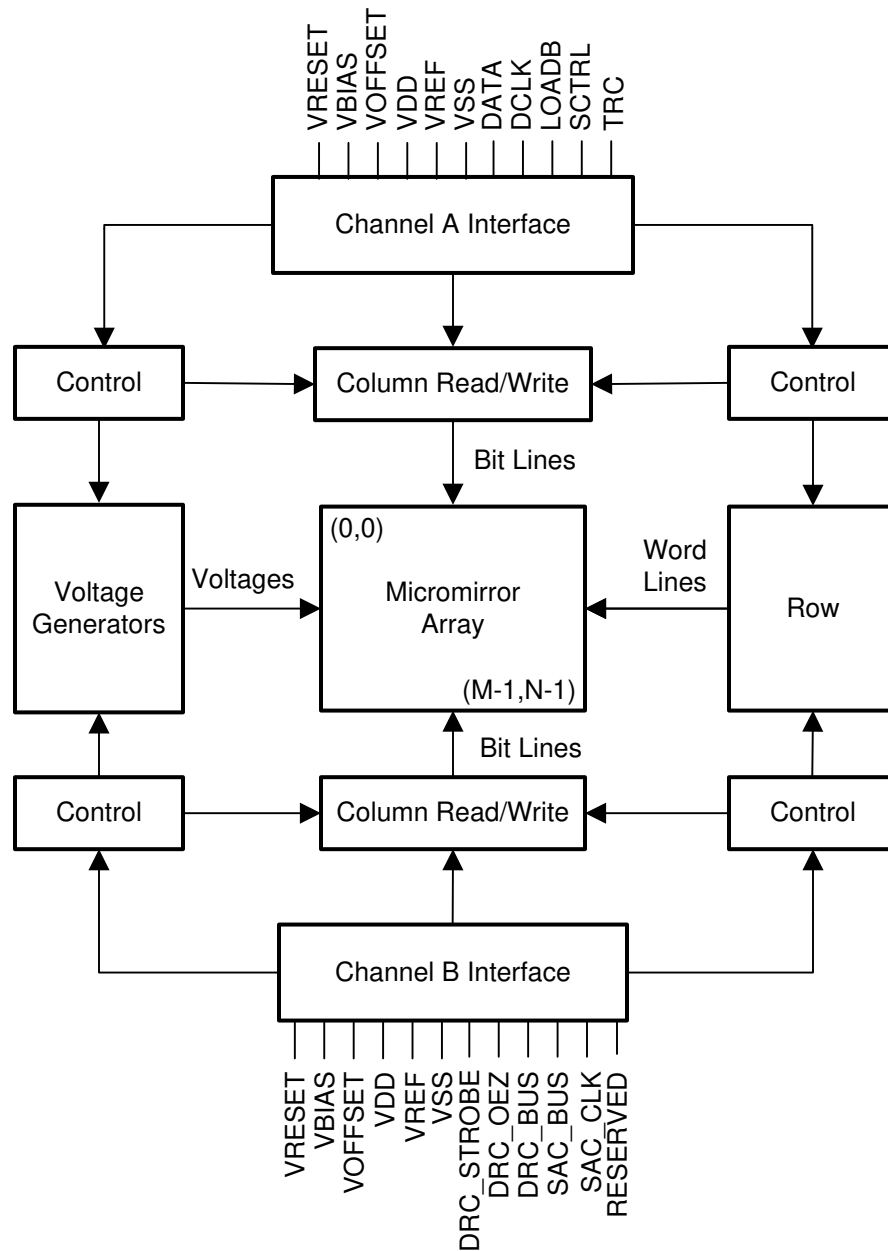

## 7 Detailed Description

### 7.1 Overview

The DMD is a 0.65-inch diagonal spatial light modulator that consists of an array of highly reflective aluminum micromirrors. The DMD is an electrical input, optical output micro-optical-electrical-mechanical system (MOEMS). The fast switching speed of the DMD micromirrors combined with advanced DLP image processing algorithms enables each micromirror to display four distinct pixels on the screen during every frame, resulting in a full 3840 × 2160 pixel image being displayed. The electrical interface is low voltage differential signaling (LVDS). The DMD consists of a two-dimensional array of 1-bit CMOS memory cells. The array is organized in a grid of M memory cell columns by N memory cell rows. Refer to 节 7.2. The positive or negative deflection angle of the micromirrors can be individually controlled by changing the address voltage of underlying CMOS addressing circuitry and micromirror reset signals (MBRST).

The DLP 0.65" 4-K UHD chipset is comprised of the DLP650TE DMD, [DLPC7540](#) display controller, the [DLPA100](#) power management and motor driver. To ensure reliable operation, the DLP650TE DMD must always be used with the DLP display controller and the power and motor specified in the chipset.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Power Interface

The DMD requires 4 DC voltages: 1.8 V source,  $V_{\text{OFFSET}}$ ,  $V_{\text{RESET}}$ , and  $V_{\text{BIAS}}$ . In a typical configuration, 3.3 V is created by the [DLPA100](#) power management and motor driver and is used on the DMD board to create the 1.8 V. The TI voltage regulator [TPS65145](#) takes in the 3.3 V and outputs  $V_{\text{OFFSET}}$ ,  $V_{\text{RESET}}$ ,  $V_{\text{BIAS}}$ .

### 7.3.2 Timing

The data sheet specifies timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be considered. Timing reference loads are not intended to be precise representations of any particular system environment or depiction of the actual load presented by a production test. TI recommends that system designers use IBIS or other simulation tools to correlate the timing reference load to a system environment. Use the specified load capacitance value for characterization and measurement of AC timing signals only. This load capacitance value does not indicate the maximum load the device is capable of driving.

## 7.4 Device Functional Modes

DMD functional modes are controlled by the DLPC7540 display controller. See the [DLPC7540 Display Controller Data Sheet](#) or contact a TI applications engineer.

## 7.5 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. Optimizing system optical performance and image quality strongly relate to optical system design parameter trades. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

### 7.5.1 Numerical Aperture and Stray Light Control

TI recommends that the light cone angle defined by the numerical aperture of the illumination optics is the same as the light cone angle defined by the numerical aperture of the projection optics. This angle must not exceed the nominal device micromirror tilt angle unless appropriate apertures are added in the illumination and projection pupils to block out flat-state and stray light from the projection lens. The micromirror tilt angle defines DMD capability to separate the "ON" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the micromirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle (and vice versa), contrast degradation and objectionable artifacts in the display border and active area could occur.

### 7.5.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display border and active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

### 7.5.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view, and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. Design the illumination optical system to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the average flux level in the active area. Depending on the particular system optical architecture, overfill light may have to be further reduced below the suggested 10% level in order to be acceptable.

## 7.6 Micromirror Array Temperature Calculation

图 7-1. DMD Thermal Test Point

Micromirror array temperature cannot be measured directly, therefore it must be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The relationship between array temperature and the reference ceramic temperature (thermal test TP1 in 图 7-1) is provided by the following equations:

$$T_{\text{ARRAY}} = T_{\text{CERAMIC}} + (Q_{\text{ARRAY}} \times R_{\text{ARRAY-TO-CERAMIC}}) \quad (5)$$

$$Q_{\text{ARRAY}} = Q_{\text{ELECTRICAL}} + Q_{\text{ILLUMINATION}} \quad (6)$$

where

- $T_{\text{ARRAY}}$  = Computed array temperature (°C)
- $T_{\text{CERAMIC}}$  = Measured ceramic temperature (°C) (TP1 location)
- $R_{\text{ARRAY-TO-CERAMIC}}$  = Thermal resistance of package specified in 节 6.5 from array to ceramic TP1 (°C/Watt)
- $Q_{\text{ARRAY}}$  = Total DMD power on the array (W) (electrical + absorbed)
- $Q_{\text{ELECTRICAL}}$  = Nominal electrical power (W)

- $Q_{\text{INCIDENT}}$  = Incident illumination optical power (W)
- $Q_{\text{ILLUMINATION}}$  = (DMD average thermal absorptivity  $\times$   $Q_{\text{INCIDENT}}$ ) (W)
- DMD average thermal absorptivity = 0.42

The electrical power dissipation of the DMD is variable and depends on the voltages, data rates, and operating frequencies. A nominal electrical power dissipation to use when calculating array temperature is 3.0 W. The absorbed power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. The equations shown above are valid for a single chip or multi-chip DMD system. It assumes an illumination distribution of 83.7% on the active array, and 16.3% on the array border.

The sample calculation for a typical projection application is as follows:

$$Q_{\text{INCIDENT}} = 25 \text{ W (measured)} \quad (7)$$

$$T_{\text{CERAMIC}} = 55.0^{\circ}\text{C (measured)} \quad (8)$$

$$Q_{\text{ELECTRICAL}} = 3.0 \text{ W} \quad (9)$$

$$Q_{\text{ARRAY}} = 3.0\text{W} + (0.42 \times 25 \text{ W}) = 13.5 \text{ W} \quad (10)$$

$$T_{\text{ARRAY}} = 55.0^{\circ}\text{C} + (13.5\text{W} \times 0.6^{\circ}\text{C/W}) = 63.1^{\circ}\text{C} \quad (11)$$

## 7.7 Micromirror Landed-On/Landed-Off Duty Cycle

### 7.7.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the percentage of time that an individual micromirror is landed in the ON state versus the amount of time the same micromirror is landed in the OFF state.

For example, a landed duty cycle of 100/0 indicates that the referenced pixel is in the ON state 100% of the time (and in the OFF state 0% of the time); whereas 0/100 indicates that the pixel is in the OFF state 100% of the time. Likewise, 50/50 indicates that the pixel is ON for 50% of the time (and OFF for 50% of the time).

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) always add to 100.

### 7.7.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD micromirror array (also called the active array) to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD useful life.

Note that it is the symmetry/asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

### 7.7.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD temperature and landed duty cycle interact to affect DMD useful life, and this interaction can be exploited to reduce the impact that an asymmetrical landed duty cycle has on the DMD useful life. This is quantified in the de-rating curve shown in [Figure 6-1](#). The importance of this curve is that:

- All points along this curve represent the same useful life.
- All points above this curve represent lower useful life (and the further away from the curve, the lower the useful life).

- All points below this curve represent higher useful life (and the further away from the curve, the higher the useful life).

In practice, this curve specifies the maximum operating DMD temperature for a given long-term average landed duty cycle.

#### 7.7.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the landed duty cycle of a given pixel follows from the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel operates under a 100/0 landed duty cycle during that time period. Likewise, when displaying pure-black, the pixel operates under a 0/100 landed duty cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the landed duty cycle tracks one-to-one with the gray scale value, as shown in [表 7-1](#).

**表 7-1. Grayscale Value and Landed Duty Cycle**

GRAYSCALE VALUE	LANDED DUTY CYCLE
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20
90%	90/10
100%	100/0

Accounting for color rendition (but still ignoring image processing) requires knowing both the color intensity (from 0% to 100%) for each constituent primary color (red, green, and blue) for the given pixel as well as the color cycle time for each primary color, where “color cycle time” is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

Use this information to calculate the landed duty cycle of a given pixel during a given time period:

$$\text{Landed Duty Cycle} = (\text{Red\_Cycle\_}\% \times \text{Red\_Scale\_Value}) + (\text{Green\_Cycle\_}\% \times \text{Green\_Scale\_Value}) + (\text{Blue\_Cycle\_}\% \times \text{Blue\_Scale\_Value})$$

where

- Red\_Cycle\_%, represents the percentage of the frame time that red is displayed to achieve the desired white point
- Green\_Cycle\_% represents the percentage of the frame time that green is displayed to achieve the desired white point
- Blue\_Cycle\_%, represents the percentage of the frame time that blue is displayed to achieve the desired white point

For example, assume that the red, green, and blue color cycle times are 30%, 50%, and 20% respectively (in order to achieve the desired white point), then the landed duty cycle for various combinations of red, green, blue color intensities are shown in [表 7-2](#) and [表 7-3](#).

**表 7-2. Example Landed Duty Cycle for Full-Color,  
Color Percentage**

CYCLE PERCENTAGE		
RED	GREEN	BLUE
30%	50%	20%

**表 7-3. Example Landed Duty Cycle for Full-Color**

SCALE VALUE			LANDED DUTY CYCLE
RED	GREEN	BLUE	
0%	0%	0%	0/100
100%	0%	0%	30/70
0%	100%	0%	50/50
0%	0%	100%	20/80
0%	12%	0%	6/94
0%	0%	35%	7/93
60%	0%	0%	18/82
0%	100%	100%	70/30
100%	0%	100%	50/50
100%	100%	0%	80/20
0%	12%	35%	13/87
60%	0%	35%	25/75
60%	12%	0%	24/76
100%	100%	100%	100/0

The last factor to account for in estimating the landed duty cycle is any applied image processing. Within the DLPC7540 controller, the gamma function affects the landed duty cycle.

Gamma is a power function of the form  $\text{Output\_Level} = A \times \text{Input\_Level}^{\text{Gamma}}$ , where A is a scaling factor that is typically set to 1.

In the DLPC7540 controller, gamma is applied to the incoming image data on a pixel-by-pixel basis. A typical gamma factor is 2.2, which transforms the incoming data as shown in [图 7-2](#).

图 7-2. Example of Gamma = 2.2

From 图 7-2, if the gray scale value of a given input pixel is 40% (before gamma is applied), then gray scale value is 13% after gamma is applied. Therefore, it can be seen that since gamma has a direct impact displayed gray scale level of a pixel, it also has a direct impact on the landed duty cycle of a pixel.

Consideration must also be given to any image processing which occurs before the DLPC7540 controllers.

## 8 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 8.1 Application Information

DMDs are spatial light modulators, which reflect incoming light from an illumination source to one of two directions, with the primary direction being into a projection or collection optic. Each application is derived primarily from the optical architecture of the system and the format of the data coming into the DLPC7540 controller. Typical applications using the DLP650TE DMD include Laser TVs, smart projectors, and enterprise projectors.

DMD power-up and power-down sequencing is strictly controlled by the DLPC7540 through the TPS65145 PMIC. Refer to 节 9 for power-up and power-down specifications. To ensure reliable operation, the DLP650TE DMD must always be used with [DLPC7540](#) controller, a [DLPA100](#) PMIC/motor driver, and a [TPS65145](#) PMIC.

### 8.2 Typical Application

The DLP650TE DMD combined with DLPC7540 digital controller and a power management device provides full 4-K UHD resolution for bright, colorful display applications. A typical display system using laser phosphor illumination combines the DLP650TE DMD, [DLPC7540](#) display controller, [TPS65145](#) voltage regulator and [DLPA100](#) PMIC and motor driver. 图 8-1 shows a system block diagram for this configuration of the DLP 0.65" 4-K UHD chipset and additional system components needed. See 图 8-2 for a block diagram showing the system components needed along with the lamp configuration of the DLP 0.65" 4-K UHD chipset. The components include DLP650TE DMD, [DLPC7540](#) display controller and [DLPA100](#) PMIC and motor driver and a [TPS65145](#) PMIC.

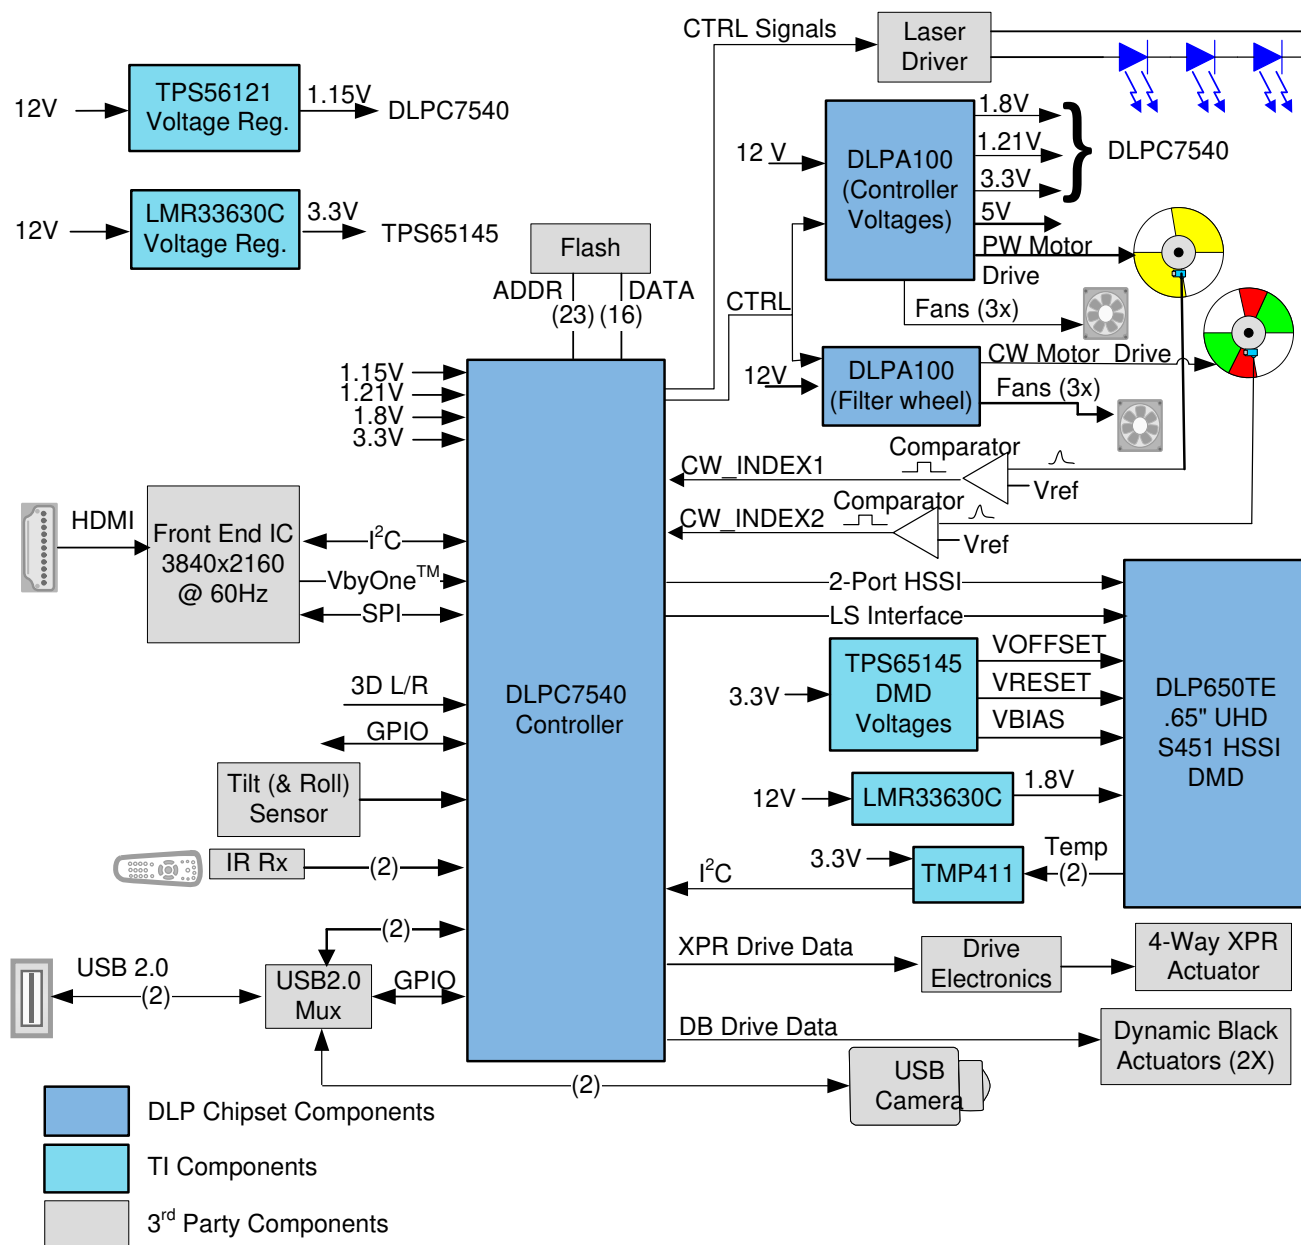

图 8-1. Typical 4K UHD Laser Phosphor Application Diagram

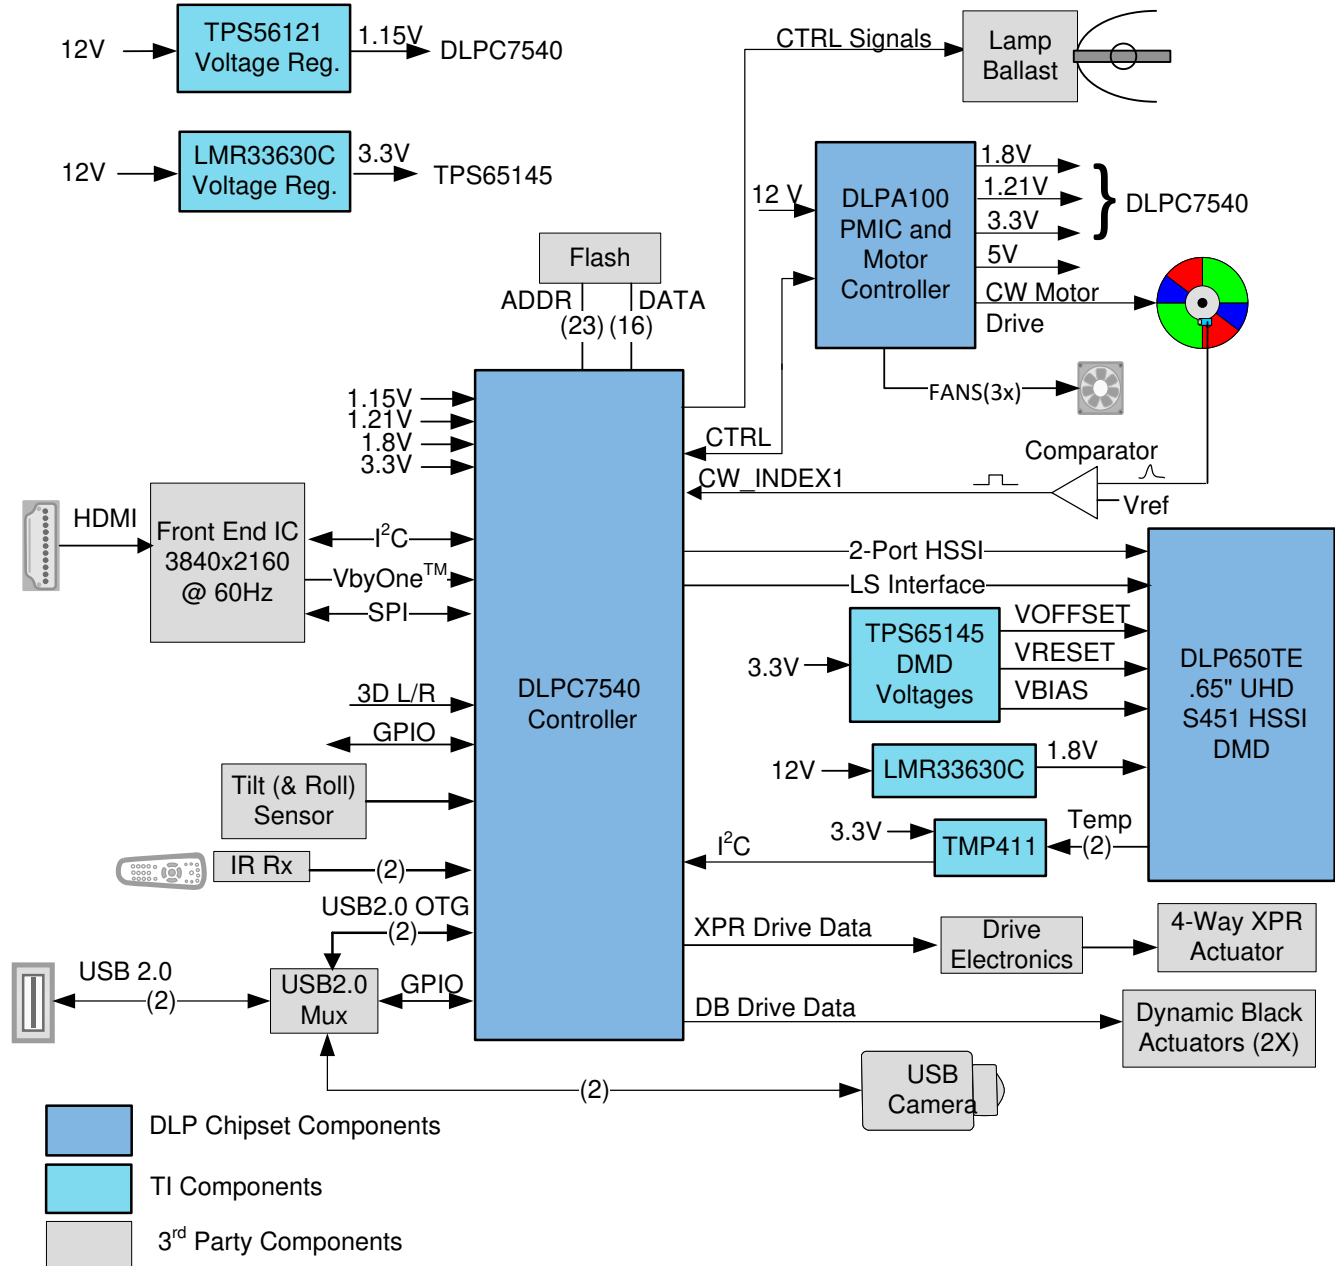

图 8-2. Typical 4K UHD Lamp Phosphor Application Diagram

### 8.2.1 Design Requirements

Other core components of the display system include an illumination source, an optical engine for the illumination and projection optics, other electrical and mechanical components, and software. The type of illumination used and desired brightness has a major effect on the overall system design and size.

The display system uses the DLP650TE DMD as the core imaging device and contains a 0.65-inch array of micromirrors. The DLPC7540 controller is the digital interface between the DMD and the rest of the system, taking digital input from front end receiver and driving the DMD over a high-speed interface. The DLPA100 PMIC serves as a voltage regulator for the controller, and color filter wheel and phosphor wheel motor control. The TPS65145 provide the DMD reset, offset and bias voltages. The LMR33630C provides 1.8-V power to the DLP650TE DMD.

### 8.2.2 Detailed Design Procedure

For a complete DLP system, an optical module or light engine is required that contains the DLP650TE DMD, associated illumination sources, optical elements, and necessary mechanical components.

To ensure reliable operation, the DMD must always be used with [DLPC7540](#) display controller and the [TPS65145](#) PMIC and [DLPA100](#). Refer to the DMD board reference design and DLPC7540 reference design for layout and design recommendations.

### 8.2.3 Application Curve

In a typical projector application, the luminous flux on the screen from the DMD depends on the optical design of the projector. The efficiency and total power of the illumination optical system and the projection optical system determines the overall light output of the projector. The DMD is inherently a linear spatial light modulator, so its efficiency just scales the light output. 图 8-3 describes the relationship of laser input optical power to light output for a laser-phosphor illumination system, where the phosphor is not at its thermal quenching limit. .

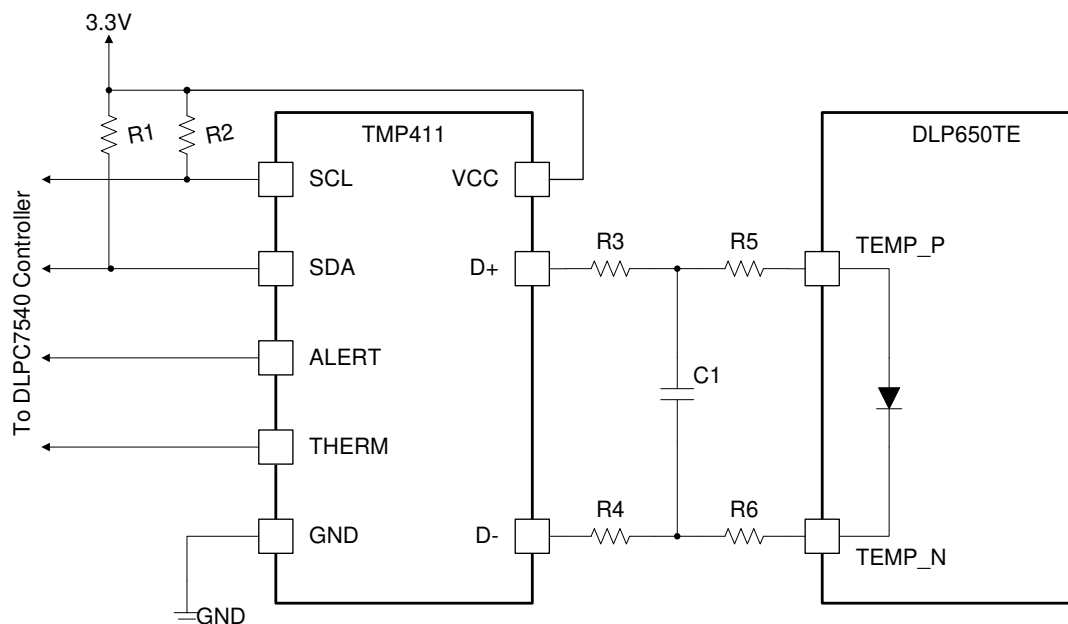

图 8-3. Normalized Light Output vs Normalized Laser Power for Laser Phosphor Illumination

### 8.3 Temperature Sensor Diode

The DMD features a built-in thermal diode that measures the temperature at one corner of the die outside the micromirror array. The thermal diode can be interfaced with the TMP411 temperature sensor as shown in 图 8-4. The software application contains functions to configure the [TMP411](#) to read the DLP650TE DMD temperature sensor diode. This data can be leveraged by the customer to incorporate additional functionality in the overall system design such as adjusting illumination, fan speeds, and so on. All communication between the [TMP411](#) and the [DLPC7540](#) controller happens over the I<sup>2</sup>C interface. The [TMP411](#) connects to the DMD via pins outlined in 表 5-1.

Leave TEMP\_N and TEMP\_P pins unconnected (NC) if the temp sensor is not used.

- A. Details omitted for clarity.
- B. See the [TMP411](#) data sheet for system board layout recommendation.
- C. See the [TMP411](#) data sheet for suggested component values for R1, R2, R3, R4, and C1.
- D.  $R5 = 0\ \Omega$ .  $R6 = 0\ \Omega$ . Place  $0\text{-}\Omega$  resistors close to the DMD package pins.

**图 8-4. TMP411 Sample Schematic**

## 9 Power Supply Recommendations

The following power supplies are all required to operate the DMD:

- $V_{SS}$
- $V_{BIAS}$
- $V_{DD}$
- $V_{OFFSET}$
- $V_{RESET}$

DMD power-up and power-down sequencing is strictly controlled by the DLP display controller.

### CAUTION

For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to any of the prescribed power-up and power-down requirements may affect device reliability. See the DMD power supply sequencing requirements in [图 9-1](#).

$V_{BIAS}$ ,  $V_{DD}$ ,  $V_{OFFSET}$ , and  $V_{RESET}$  power supplies must be coordinated during power-up and power-down operations. Failure to meet any of the below requirements results in a significant reduction in the DMD reliability and lifetime. Common ground  $V_{SS}$  must also be connected.

### 9.1 Power Supply Sequence Requirements

SYMBOL	PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
$t_{DELAY1}$	Delay requirement	from $V_{OFFSET}$ power up to $V_{BIAS}$ power up	1	2		ms
$t_{DELAY2}$	Delay requirement	from $V_{BIAS}$ and $V_{RESET}$ powered on and stable to DMD_EN_ARSTZ going high	20			$\mu$ s
$t_{DELAY3}$	Delay requirement	from $V_{OFFSET}$ , $V_{BIAS}$ and $V_{RESET}$ powered down to when VDD and VDDA can power down	50			$\mu$ s

### 9.2 DMD Power Supply Power-Up Procedure

- During power-up,  $V_{DD}$  must always start and settle before  $V_{OFFSET}$  plus  $t_{DELAY1}$  specified in [节 9.1](#),  $V_{BIAS}$ , and  $V_{RESET}$  voltages are applied to the DMD.
- During power-up, it is a strict requirement that the voltage difference between  $V_{BIAS}$  and  $V_{OFFSET}$  must be within the specified limit shown in [节 6.4](#).
- During power-up, there is no requirement for the relative timing of  $V_{RESET}$  with respect to  $V_{BIAS}$ .
- Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements specified in [节 6.1](#), in [节 6.4](#), and in [图 9-1](#).
- During power-up, LVCMOS input pins must not be driven high until after  $V_{DD}$  has settled at operating voltage listed in [节 6.4](#).

### 9.3 DMD Power Supply Power-Down Procedure

- During power-down,  $V_{DD}$  must be supplied until after  $V_{BIAS}$ ,  $V_{RESET}$ , and  $V_{OFFSET}$  are discharged to within the specified limit of ground. See [节 9.1](#).
- During power-down, it is a strict requirement that the voltage difference between  $V_{BIAS}$  and  $V_{OFFSET}$  must be within the specified limit shown in [节 6.4](#).
- During power-down, there is no requirement for the relative timing of  $V_{RESET}$  with respect to  $V_{BIAS}$ .
- Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements specified in [节 6.1](#), in [节 6.4](#), and in [图 9-1](#).
- During power-down, LVCMOS input pins must be less than specified in [节 6.4](#).

- A. See the [Pin Functions](#) table.
- B. To prevent excess current, the supply voltage difference  $|V_{BIAS} - V_{OFFSET}|$  must be less than the specified limit in [节 6.4](#).
- C. To prevent excess current, the supply difference  $|V_{BIAS} - V_{RESET}|$  must be less than the specified limit in [节 6.4](#).
- D.  $V_{BIAS}$  must power up after  $V_{OFFSET}$  has powered up, per  $t_{DELAY1}$  specification in [节 9.1](#).
- E.  $V_{RESET}$ ,  $V_{OFFSET}$  and  $V_{BIAS}$  ramps must start after  $V_{DD}$  and  $V_{DDA}$  are powered up and stable.
- F. After the DMD micromirror park sequence is complete, the DLP controller software initiates a hardware power-down that activates  $DMD\_EN\_ARSTZ$  and disables  $V_{BIAS}$ ,  $V_{RESET}$  and  $V_{OFFSET}$ .
- G. Under power-loss conditions where emergency DMD micromirror park procedures are being enacted by the DLP controller hardware  $DMD\_EN\_ARSTZ$  goes low.
- H.  $V_{DD}$  must remain powered on and stable until after  $V_{OFFSET}$ ,  $V_{BIAS}$ , and  $V_{RESET}$  are powered off, per  $t_{DELAY3}$  specification in [节 9.1](#).
- I. To prevent excess current, the supply voltage delta  $|V_{DDA} - V_{DD}|$  must be less than specified limit in [节 6.4](#).
- J. Not to scale. Details omitted for clarity.

**图 9-1. DMD Power Supply Requirements**

## 10 Layout

### 10.1 Layout Guidelines

The DLP650TE DMD is part of a chipset that is controlled by the [DLPC7540](#) display controller in conjunction with the [TPS65145](#) PMIC and the [DLPA100](#) power and motor controller. These guidelines are targeted at designing a PCB board with the DLP650TE DMD. The DMD board is a high-speed multi-layer PCB, with primarily high-speed digital logic including double data rate 3.2 Gbps and 250 Mbps differential data buses run to the DMD. TI recommends that full or mini power planes are used for  $V_{\text{OFFSET}}$ ,  $V_{\text{RESET}}$ , and  $V_{\text{BIAS}}$ . Solid planes are required for ground ( $V_{\text{SS}}$ ). The target impedance for the PCB is  $50\ \Omega \pm 10\%$  with exceptions listed in [表 10-1](#). TI recommends a 10 layer stack-up as described in [表 10-2](#). TI recommends manufacturing the PCB with a high quality FR-4 material.

### 10.2 Impedance Requirements

TI recommends a target impedance for the PCB of  $50\ \Omega \pm 10\%$  for all signals. The exceptions are listed in [表 10-1](#).

**表 10-1. Special Impedance Requirements**

SIGNAL TYPE	SIGNAL NAME	IMPEDANCE ( $\Omega$ )
DMD High Speed Data Signals	DMD_HSSI0_N_(0...7), DMD_HSSI0_P_(0...7), DMD_HSSI1_N_(0...7), DMD_HSSI1_P_(0...7), DMD_HSSI0_CLK_N, DMD_HSSI0_CLK_P, DMD_HSSI1_CLK_N, DMD_HSSI1_CLK_P	100- $\Omega$ differential (50- $\Omega$ single ended)
DMD Low Speed Interface Signals	DMD_LSO_WDATA_N, DMD_LSO_WDATA_P, DMD_LSO_CLK_N, DMD_LSO_CLK_P	100- $\Omega$ differential (50- $\Omega$ single ended)

### 10.3 Layers

[表 10-2](#) shows the layer stack-up and copper weight for each layer.

**表 10-2. Layer Stack-Up**

LAYER NO.	LAYER NAME	COPPER WT. (oz.)	COMMENTS
1	Side A—DMD, primary components, power mini-planes	0.5 oz. (before plating)	DMD and escapes. Two data input connectors. Top components including power generation and two data input connectors. Low frequency signals routing. Should have copper fill (GND) plated up to 1 oz.
2	Ground	0.5	Solid ground plane (net GND) reference for signal layers #1, 3
3	Signal (high frequency)	0.5	High speed signal layer. High speed differential data busses from input connector to DMD
4	Ground	0.5	Solid ground plane (net GND) reference for signal layers #3, #5
5	Power	0.5	Primary split power planes for 1.8 V, 3.3 V, 10 V, -14 V, 18 V
6	Power	0.5	Primary split power planes for 1.8 V, 3.3 V, 10 V, -14 V, 18 V
7	Ground	0.5	Solid ground plane (net GND) reference for signal layer #8
8	Signal (high frequency)	0.5	High speed signal layer. High speed differential data buses from input connector to DMD
9	Ground	0.5	Solid ground plane (net GND) Reference for signal layers #8, 10
10	Side B—Secondary components, power mini-planes	0.5 oz. (before plating)	Discrete components if necessary. Low frequency signals routing. Should be copper fill plated up to 1 oz.

## 10.4 Trace Width, Spacing

Unless otherwise specified, TI recommends that all signals follow the 0.005" / 0.015" (Trace-Width/Spacing) design rule. Use an analysis of impedance and stack-up requirements to determine and calculate actual trace widths.

Maximize the width of all voltage signals as space permits. Follow the width and spacing requirements listed in [表 10-3](#).

**表 10-3. Special Trace Widths, Spacing Requirements**

SIGNAL NAME	MINIMUM TRACE WIDTH (MIL)	MINIMUM TRACE SPACING (MIL)	LAYOUT REQUIREMENT
GND	MAXIMIZE	5	Maximize trace width to connecting pin as a minimum.
P3P3V	40	15	Create mini planes on layers 1 and 10 as needed. Connect to devices on layers 1 and 10 as necessary with multiple vias.
P1P8V	40	15	Create mini planes on layers 1 and 10 as needed. Connect to devices on layers 1 and 10 as necessary with multiple vias.
V <sub>OFFSET</sub>	40	15	Create mini planes on layers 1 and 10 as needed. Connect to devices on layers 1 and 10 as necessary.
V <sub>RESET</sub>	40	15	Create mini planes on layers 1 and 10 as needed. Connect to devices on layers 1 and 10 as necessary.
V <sub>BIAS</sub>	40	15	Create mini planes on layers 1 and 10 as needed. Connect to devices on layers 1 and 10 as necessary.

## 10.5 Power

TI strongly discourages signal routing on power planes or on planes adjacent to power planes. If signals must be routed on layers adjacent to power planes, they must not cross splits in power planes to prevent EMI and preserve signal integrity.

Connect all internal digital ground (GND) planes in as many places as possible. Connect all internal ground planes with a minimum distance between connections of 0.5". Extra vias may not be required if there are sufficient ground vias due to normal ground connections of devices.

Connect power and ground pins of each component to the power and ground planes with at least one via for each pin. Minimize trace lengths for component power and ground pins. (ideally, less than 0.100").

Ground plane slots are strongly discouraged.

## 10.6 Trace Length Matching Recommendations

[表 10-4](#) 和 [表 10-5](#) describe recommended signal trace length matching requirements. Follow these guidelines to avoid routing long traces over large areas of the PCB:

- Match the trace lengths so that longer signals route in a serpentine pattern
- Minimize the number of turns.
- Ensure that the turn angles no sharper than 45 degrees.

[图 10-1](#) shows an example of the HSSI signal pair routing.

Signals listed in [表 10-4](#) are specified for data rate operation at up to 3.2 Gbps. Minimize the layer changes for these signals. Minimize the number of vias. Avoid sharp turns and layer switching while minimizing the lengths. When layer changes are necessary, place GND vias around the signal vias to provide a signal return path. The distance from one pair of differential signals to another must be at least 2 times the distance within the pair.

表 10-4. HSSI High Speed DMD Data Signals

SIGNAL NAME	REFERENCE SIGNAL	ROUTING SPECIFICATION	UNIT
DMD_HSSI0_N(0...7), DMD_HSSI0_P(0...7)	DMD_HSSI0_CLK_N, DMD_HSSI_CLK_P	$\pm 0.25$	inch
DMD_HSSI1_N(0...7), DMD_HSSI1_P(0...7)	DMD_HSSI0_CLK_N, DMD_HSSI_CLK_P	$\pm 0.25$	inch
DMD_HSSI0_CLK_P	DMD_HSSI1_CLK_P	$\pm 0.05$	inch
Intra-pair P	Intra-pair N	$\pm 0.01$	inch

表 10-5. Other Timing Critical Signals

SIGNAL NAME	Constraints	Routing Layers
LS_CLK_P, LS_CLK_N LS_WDATA_P, LS_WDATA_N LS_RDATA_A	Intra-pair (P to N) Matched to 0.01 inches Signal-to-signal Matched to +/- 0.25 inches	Layers 3, 8

图 10-1. Example HSSI PCB Routing

## 11 Device and Documentation Support

### 11.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

### 11.2 Device Support

#### 11.2.1 Device Nomenclature

图 11-1. Part Number Description

#### 11.2.2 Device Markings

The device marking includes both human-readable information and a 2-dimensional matrix code. The human-readable information is described in 图 11-2. The 2-dimensional matrix code is an alpha-numeric string that contains the DMD part number, Part 1 and Part 2 of the serial number.

Example:

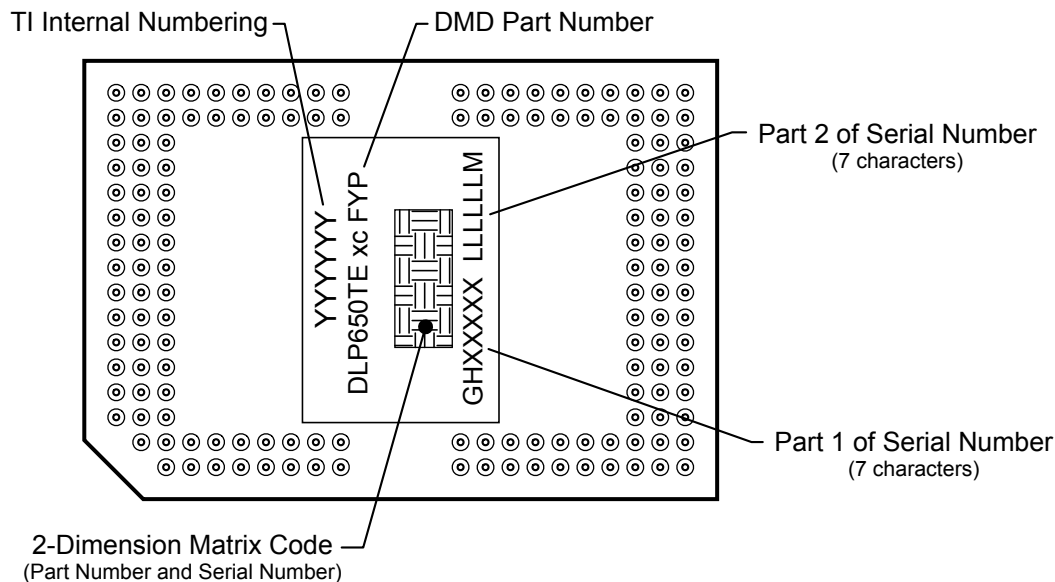

图 11-2. DMD Marking Locations

## 11.3 Documentation Support

### 11.3.1 Related Documentation

The following documents contain additional information related to the chipset components used with the DMD.

- [DLPC7540 Display Controller Data Sheet](#)
- [TPS65145 Data Sheet](#)
- [DLPA100 Power and Motor Driver Data Sheet](#)

## 11.4 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](https://www.ti.com) 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

## 11.5 支持资源

**TI E2E™ 支持论坛** 是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

## 11.6 Trademarks

TI E2E™ is a trademark of Texas Instruments.

DLP® is a registered trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

## 11.7 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 11.8 术语表

### TI 术语表

本术语表列出并解释了术语、首字母缩略词和定义。

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## 12.1 Package Option Addendum

### 12.1.1 Packaging Information

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish <sup>(4)</sup>	MSL Peak Temp <sup>(3)</sup>	Op Temp (°C)	Device Marking <sup>(5)</sup> (6)
DLP650TEA0FYP	ACTIVE	CPGA	FYP	149	33	RoHS & Green	Call TI	Call TI		see 图 11-2

- (1) The marketing status values are defined as follows:  
**ACTIVE:** Product device recommended for new designs.  
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.  
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.  
**PRE\_PROD** Unannounced device, not in production, not available for mass market, nor on the web, samples not available.  
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.  
**OBSOLETE:** TI has discontinued the production of the device.
- (2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.  
**TBD:** The Pb-Free/Green conversion plan has not been defined.  
**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.  
**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.  
**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)
- (3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
- (6) Multiple Device markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.  
**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.  
 In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">DLP650TEA0FYP</a>	Active	Production	CPGA (FYP)   149	33   JEDEC TRAY (5+1)	Yes	NI-AU	N/A for Pkg Type	0 to 70	
DLP650TEA0FYP.A	Active	Production	CPGA (FYP)   149	33   JEDEC TRAY (5+1)	Yes	NI-AU	N/A for Pkg Type	0 to 70	
DLP650TEA0FYP.B	Active	Production	CPGA (FYP)   149	33   JEDEC TRAY (5+1)	-	Call TI	Call TI	0 to 70	

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
