# DP83848-EP PHYTER™军用级温度单端口 10/100Mbps 以太网物理层收发器

## 1 器件概述

### 1.1 特性

- 低功耗 3.3V、0.18µm CMOS 技术
- 低功耗典型值低于 270mW
- 3.3V MAC 接口
- 适用于 10/100Mbps 的自动 MDIX 功能
- 能量检测模式
- 25MHz 时钟输出
- SNI 接口（可配置）
- RMII 版本 1.2 接口（可配置）
- MII 串行管理接口（MDC 和 MDIO）
- IEEE 802.3u MII
- IEEE 802.3u 自动协商和并行检测
- IEEE 802.3u ENDEC、10BASE-T 收发器和滤波器
- IEEE 802.3u PCS、100BASE-TX 收发器和滤波器
- IEEE 1149.1 JTAG
- 集成了具有自适应均衡和基线漂移补偿功能且符合 ANSI X3.263 标准的 TP-PMD 物理子层
- 可实现长达 150m 的无错运行
- 可编程 LED 支持链路、10/100Mbps 模式、活动和碰撞检测
- 针对完整 PHY 状态的单寄存器访问
- 10/100Mbps 数据包 BIST（内置自检）
- 7mm × 7mm 无引线 48 引脚 PQFP 封装

### 1.2 应用

- 航空电子设备和国防
- 工业控制和工厂自动化
- 通用嵌入式 应用
- 支持国防、航天和医疗 应用
  - 受控基线
  - 一个组装和测试基地
  - 一个制造基地
  - 军用级温度范围（–55°C 至 125°C）
  - 延长了产品生命周期
  - 延长了产品变更通知
  - 产品可追溯性

### 1.3 说明

需要以太网连接的 应用 数量持续增长。随着此类市场需求的增加，应用要求也出现了变化。DP83848-EP 设计用于在最严苛的环境中实现以太网连接。我们的器件可在 –55°C 至 125°C 的军用级温度范围内满足 IEEE 802.3u 标准。此器件非常适合严苛环境，例如航空电子设备、国防和工业控制 应用。

DP83848-EP 是一款高度可靠、功能丰富的强大器件，包含了增强型 ESD 保护、MII 和 RMII，从而在 MPU 选择方面实现最大的灵活性，所有这些特性都融入于 48 引脚 PQFP 封装中。

DP83848-EP 配备 集成子层以支持 10BASE-T 和 100BASE-TX 以太网协议，这些协议确保了与基于其他标准的以太网解决方案的兼容性和互操作性。

器件信息(1)

| 器件型号 | 封装 | 封装尺寸（宽 × 长 × 高） |
|---|---|---|
| DP83848MPHPEP | PHP | 7.00mm × 7.00mm × 1.00mm |
| DP83848MPHPREP | | |
| DP83848MPTBEP | PTB | 7.00mm × 7.00mm × 1.40mm |
| DP83848MPTBREP | | |

## 2 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

**Changes from Revision D (December 2015) to Revision E** **Page**

- 将文档格式更新为当前数据表标准 ..... 1
- 已更改 将*订购信息* 表更改为*器件信息* 表 ..... 1
- Changed *Terminal Descriptions* section to *Pin Configuration and Functions* section ..... 4
- Added *Package Pin Assignments* section ..... 6
- Changed footnote in *Absolute Maximum Ratings* ..... 12
- Changed *Thermal Information* footnotes ..... 12
- 已更改 Design Guidelines to Application Information and updated ..... 75
- 已删除 ESD note, included in *Device and Documentation Support* section ..... 76
- 已添加 *Magnetics* section ..... 78
- 已添加 *Detailed Design Procedure* section ..... 79
- 已添加 *Power Supply Recommendations* section ..... 82
- 已添加 *Layout* section ..... 83

# 3 Pin Configuration and Functions

The DP83848-EP pins are classified into the following interface categories (each interface is described in the sections that follow):

- Serial management interface
- MAC data interface
- Clock interface
- LED interface
- Reset
- Strap options
- 10/100 Mbps PMD interface
- Special connect pins
- Power and ground pins

All DP83848-EP signal pins are I/O cells regardless of the particular use. The definitions below define the functionality of the I/O cells for each pin.

**NOTE**

Strapping pin option. See Table 3-8 for strap definitions.

**Type: I** Input

**Type: O** Output

**Type: I/O** Input/Output

**Type: OD** Open Drain

**Type: PD,PU** Internal Pulldown/Pullup

**Type: S** Strapping Pin (All strap pins have weak internal pullups or pulldowns. If the default strap value is to be changed then an external 2.2-kΩ resistor should be used. See Table 3-8 for details.)

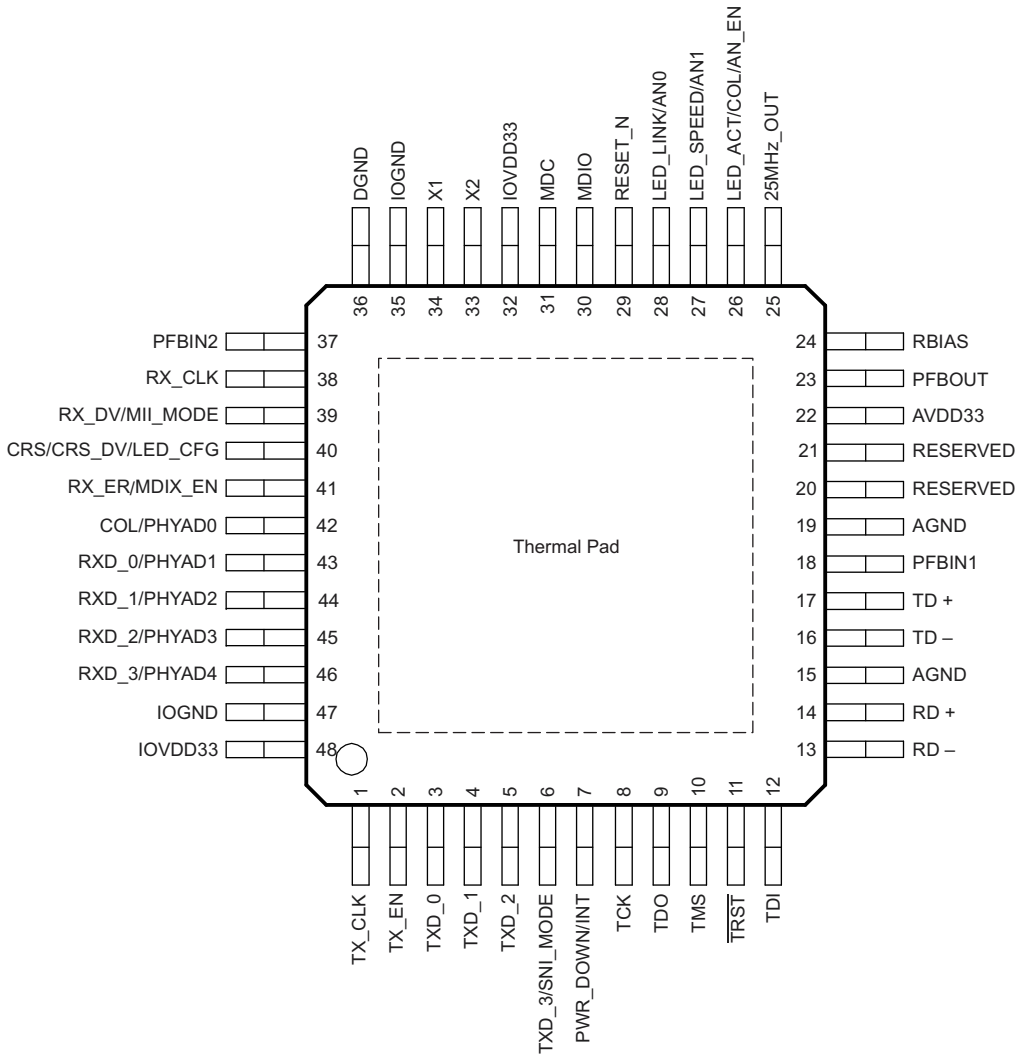

**Figure 3-1. PHP or PTB Package (Top View)**

## 3.1 Package Pin Assignments

**Table 3-1. Package Pin Assignments**

| PIN NUMBER | PIN NAME |
|---|---|
| 1 | TX_CLK |
| 2 | TX_EN |
| 3 | TXD_0 |
| 4 | TXD_1 |

| **48** | IOVDD33 |
| **49** | DAP (Die Attach Pad/Thermal Pad) |

**Table 3-2. Serial Management Interface**

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| MDC | 31 | I | **MANAGEMENT DATA CLOCK**: Synchronous clock to the MDIO management data input/output serial interface which may be asynchronous to transmit and receive clocks. The maximum clock rate is 25 MHz with no minimum clock rate. |
| MDIO | 30 | I/O | **MANAGEMENT DATA I/O**: Bi-directional management instruction/ data signal that may be sourced by the station management entity or the PHY. This pin requires a 1.5-kΩ pullup resistor. |

**Table 3-3. MAC Data Interface**

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| TX_CLK | 1 | O | **MII TRANSMIT CLOCK**: 25-MHz transmit clock output in 100-Mbps mode or 2.5 MHz in 10-Mbps mode derived from the 25-MHz reference clock.<br>Unused in RMII mode. The device uses the X1 reference clock input as the 50-MHz reference for both transmit and receive.<br>**SNI TRANSMIT CLOCK**: 10-MHz transmit clock output in 10-Mb SNI mode. The MAC should source TX_EN and TXD_0 using this clock. |
| TX_EN | 2 | I, PD | **MII TRANSMIT ENABLE**: Active high input indicates the presence of valid data inputs on TXD[3:0].<br>**RMII TRANSMIT ENABLE**: Active high input indicates the presence of valid data on TXD[1:0].<br>**SNI TRANSMIT ENABLE**: Active high input indicates the presence of valid data on TXD_0. |
| TXD_0<br>TXD_1<br>TXD_2<br>TXD_3 | 3<br>4<br>5<br>6 | I<br><br><br>S, I, PD | **MII TRANSMIT DATA**: Transmit data MII input pins, TXD[3:0], that accept data synchronous to the TX_CLK (2.5 MHz in 10-Mbps mode or 25 MHz in 100-Mbps mode).<br>**RMII TRANSMIT DATA**: Transmit data RMII input pins, TXD[1:0], that accept data synchronous to the 50-MHz reference clock.<br>**SNI TRANSMIT DATA**: Transmit data SNI input pin, TXD_0, that accept data synchronous to the TX_CLK (10 MHz in 10-Mbps SNI mode). |
| RX_CLK | 38 | O | **MII RECEIVE CLOCK**: Provides the 25-MHz recovered receive clocks for 100-Mbps mode and 2.5 MHz for 10-Mbps mode.<br>Unused in RMII mode. The device uses the X1 reference clock input as the 50-MHz reference for both transmit and receive.<br>**SNI RECEIVE CLOCK**: Provides the 10-MHz recovered receive clocks for 10-Mbps SNI mode. |
| RX_DV | 39 | S, O, PD | **MII RECEIVE DATA VALID**: Asserted high to indicate that valid data is present on the corresponding RXD[3:0]. MII mode by default with internal pulldown.<br>RMII Synchronous Receive Data Valid: This signal provides the RMII Receive Data Valid indication independent of Carrier Sense.<br>This pin is not used in SNI mode. |
| RX_ER | 41 | S, O, PU | **MII RECEIVE ERROR**: Asserted high synchronously to RX_CLK to indicate that an invalid symbol has been detected within a received packet in 100-Mbps mode.<br>**RMII RECEIVE ERROR**: Assert high synchronously to X1 whenever it detects a media error and RXDV is asserted in 100-Mbps mode.<br>This pin is not required to be used by a MAC, in either MII or RMII mode, since the Phy is required to corrupt data on a receive error.<br>This pin is not used in SNI mode. |
| RXD_0<br>RXD_1<br>RXD_2<br>RXD_3 | 43<br>44<br>45<br>46 | S, O, PD | **MII RECEIVE DATA**: Nibble-wide receive data signals driven synchronously to the RX_CLK (25 MHz for 100-Mbps mode, 2.5 MHz for 10-Mbps mode). RXD[3:0] signals contain valid data when RX_DV is asserted.<br>**RMII RECEIVE DATA**: 2-bits receive data signals, RXD[1:0], driven synchronously to the X1 clock, 50 MHz.<br>**SNI RECEIVE DATA**: Receive data signal, RXD_0, driven synchronously to the RX_CLK. RXD_0 contains valid data when CRS is asserted. RXD[3:1] are not used in this mode. |

**Table 3-3. MAC Data Interface (continued)**

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| CRS/CRS_DV | 40 | S, O, PU | **MII CARRIER SENSE**: Asserted high to indicate the receive medium is non-idle.<br>**RMII CARRIER SENSE/RECEIVE DATA VALID**: This signal combines the RMII Carrier and Receive Data Valid indications. For a detailed description of this signal, see the RMII Specification.<br>**SNI CARRIER SENSE**: Asserted high to indicate the receive medium is non-idle. It is used to frame valid receive data on the RXD_0 signal. |
| COL | 42 | S, O, PU | **MII COLLISION DETECT**: Asserted high to indicate detection of a collision condition (simultaneous transmit and receive activity) in 10-Mbps and 100-Mbps Half Duplex Modes.<br>While in 10BASE-T Half Duplex mode with heartbeat enabled this pin is also asserted for a duration of approximately 1 µs at the end of transmission to indicate heartbeat (SQE test).<br>In Full Duplex Mode, for 10-Mbps or 100-Mbps operation, this signal is always logic 0. There is no heartbeat function during 10-Mbps full duplex operation.<br>**RMII COLLISION DETECT**: Per the RMII Specification, no COL signal is required. The MAC will recover CRS from the CRS_DV signal and use that along with its TX_EN signal to determine collision.<br>**SNI COLLISION DETECT**: Asserted high to indicate detection of a collision condition (simultaneous transmit and receive activity) in 10-Mbps SNI mode. |

**Table 3-4. Clock Interface**

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| X1 | 34 | I | **CRYSTAL/OSCILLATOR INPUT**: This pin is the primary clock reference input for the DP83848-EP and must be connected to a 25-MHz 0.005% (±50 ppm) clock source. The DP83848-EP supports either an external crystal resonator connected across pins X1 and X2, or an external CMOS-level oscillator source connected to pin X1 only.<br>**RMII REFERENCE CLOCK**: This pin is the primary clock reference input for the RMII mode and must be connected to a 50-MHz 0.005% (±50 ppm) CMOS-level oscillator source. |
| X2 | 33 | O | **CRYSTAL OUTPUT**: This pin is the primary clock reference output to connect to an external 25-MHz crystal resonator device. This pin must be left unconnected if an external CMOS oscillator clock source is used. |
| 25MHz_OUT | 25 | O | **25-MHz CLOCK OUTPUT**:<br>In MII mode, this pin provides a 25-MHz clock output to the system.<br>In RMII mode, this pin provides a 50-MHz clock output to the system.<br>This allows other devices to use the reference clock from the DP83848-EP without requiring additional clock sources. |

### Table 3-5. LED Interface

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| LED_LINK | 28 | S, O, PU | **LINK LED**: In Mode 1, this pin indicates the status of the LINK. The LED will be ON when Link is good.<br>**LINK/ACT LED**: In Mode 2 and Mode 3, this pin indicates transmit and receive activity in addition to the status of the Link. The LED will be ON when Link is good. It will blink when the transmitter or receiver is active. |
| LED_SPEED | 27 | S, O, PU | **SPEED LED**: The LED is ON when device is in 100 Mbps and OFF when in 10 Mbps. Functionality of this LED is independent of mode selected. |
| LED_ACT/COL | 26 | S, O, PU | **ACTIVITY LED**: In Mode 1, this pin is the Activity LED which is ON when activity is present on either Transmit or Receive.<br>**COLLISION/DUPLEX LED**: In Mode 2, this pin by default indicates Collision detection. For Mode 3, this LED output may be programmed to indicate Full-duplex status instead of Collision. |

### Table 3-6. JTAG Interface

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| TCK | 8 | I, PU | **TEST CLOCK**: This pin has a weak internal pullup. |
| TDI | 12 | I, PU | **TEST DATA INPUT**: This pin has a weak internal pullup. |
| TDO | 9 | O | **TEST OUTPUT** |
| TMS | 10 | I, PU | **TEST MODE SELECT**: This pin has a weak internal pullup. |
| $\overline{\text{TRST}}$ | 11 | I, PU | **TEST RESET**: Active low asynchronous test reset. This pin has a weak internal pullup. |

### Table 3-7. Reset and Power Down

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| RESET_N | 29 | I, PU | **RESET**: Active Low input that initializes or re-initializes the DP83848-EP. Asserting this pin low for at least 1 µs will force a reset process to occur. All internal registers will re-initialize to their default states as specified for each bit in 节 5.6. All strap options are re-initialized as well. |
| PWR_DOWN/INT | 7 | I, OD, PU | The default function of this pin is POWER DOWN.<br>**POWER DOWN**: The pin is an active low input in this mode and should be asserted low to put the device in a Power Down mode.<br>**INTERRUPT**: The pin is an open drain output in this mode and will be asserted low when an interrupt condition occurs. Although the pin has a weak internal pullup, some applications may require an external pullup resister. Register access is required for the pin to be used as an interrupt mechanism. See 节 6.2.1.4.2 for more details on the interrupt mechanisms. |

## Table 3-8. Strap Options(1)(2)

<table>
<tr><th colspan="2">TERMINAL</th><th rowspan="2">I/O</th><th rowspan="2">DESCRIPTION</th></tr>
<tr><th>NAME</th><th>NO.</th></tr>
<tr><td>PHYAD0 (COL)</td><td>42</td><td>S, O, PU</td><td>PHY ADDRESS [4:0]: The DP83848-EP provides five PHY address pins, the state of which are latched into the PHYCTRL register at system Hardware-Reset.<br><br>The DP83848-EP supports PHY Address strapping values 0 (<00000>) through 31 (<11111>). A PHY Address of 0 puts the part into the MII Isolate Mode. The MII isolate mode must be selected by strapping Phy Address 0; changing to Address 0 by register write will not put the Phy in the MII isolate mode. Please refer to 节 5.4.4.1 for additional information.<br><br>PHYAD0: This pin has weak internal pullup resistor.<br><br>PHYAD[4:1]: These pins have weak internal pulldown resistors.</td></tr>
<tr><td>PHYAD1 (RXD_0)</td><td>43</td><td>S, O, PD</td><td></td></tr>
<tr><td>PHYAD2 (RXD_1)</td><td>44</td><td></td><td></td></tr>
<tr><td>PHYAD3 (RXD_2)</td><td>45</td><td></td><td></td></tr>
<tr><td>PHYAD4 (RXD_3)</td><td>46</td><td></td><td></td></tr>
<tr><td>AN_EN (LED_ACT/COL)</td><td>26</td><td>S, O, PU</td><td>Auto-Negotiation Enable: When high, this enables Auto-Negotiation with the capability set by ANO and AN1 pins. When low, this puts the part into Forced Mode with the capability set by AN0 and AN1 pins.<br><br>AN0 / AN1: These input pins control the forced or advertised operating mode of the DP83848-EP according to the following table. The value on these pins is set by connecting the input pins to GND (0) or VCC (1) through 2.2-kΩ resistors. These pins should NEVER be connected directly to GND or VCC.<br><br>The value set at this input is latched into the DP83848-EP at Hardware-Reset.<br><br>The float/pulldown status of these pins are latched into the Basic Mode Control Register and the Auto_Negotiation Advertisement Register during Hardware-Reset.<br><br>The default is 111 since these pins have internal pullups.<br><br>
<table>
<tr><th>AN_EN</th><th>AN1</th><th>AN0</th><th>Forced Mode</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>10BASE-T, Half-Duplex</td></tr>
<tr><td>0</td><td>0</td><td>1</td><td>10BASE-T, Full-Duplex</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>100BASE-TX, Half-Duplex</td></tr>
<tr><td>0</td><td>1</td><td>1</td><td>100BASE-TX, Full-Duplex</td></tr>
<tr><th>AN_EN</th><th>AN1</th><th>AN0</th><th>Advertised Mode</th></tr>
<tr><td>1</td><td>0</td><td>0</td><td>10BASE-T, Half/Full-Duplex</td></tr>
<tr><td>1</td><td>0</td><td>1</td><td>100BASE-TX, Half/Full-Duplex</td></tr>
<tr><td>1</td><td>1</td><td>0</td><td>10BASE-T Half-Duplex<br>100BASE-TX, Half-Duplex</td></tr>
<tr><td>1</td><td>1</td><td>1</td><td>10BASE-T, Half/Full-Duplex<br>100BASE-TX, Half/Full-Duplex</td></tr>
</table></td></tr>
<tr><td>AN_1 (LED_SPEED)</td><td>27</td><td></td><td></td></tr>
<tr><td>AN_0 (LED_LINK)</td><td>28</td><td></td><td></td></tr>
<tr><td>MII_MODE (RX_DV)</td><td>39</td><td>S, O, PD</td><td>MII MODE SELECT: This strapping option pair determines the operating mode of the MAC Data Interface. Default operation (No pullups) will enable normal MII Mode of operation. Strapping MII_MODE high will cause the device to be in RMII or SNI mode of operation, determined by the status of the SNI_MODE strap. Since the pins include internal pulldowns, the default values are 0.<br><br>The following table details the configurations:<br><br>
<table>
<tr><th>MII_MODE</th><th>SNI_MODE</th><th>MAC Interface Mode</th></tr>
<tr><td>0</td><td>X</td><td>MII Mode</td></tr>
<tr><td>1</td><td>0</td><td>RMII Mode</td></tr>
<tr><td>1</td><td>1</td><td>10-Mb SNI Mode</td></tr>
</table></td></tr>
<tr><td>SNI_MODE (TXD_3)</td><td>6</td><td></td><td></td></tr>
<tr><td>LED_CFG (CRS)</td><td>40</td><td>S, O, PU</td><td>LED CONFIGURATION: This strapping option determines the mode of operation of the LED pins. Default is Mode 1. Mode 1 and Mode 2 can be controlled via the strap option. All modes are configurable via register access.<br><br>See 表 5-2 for LED Mode Selection.</td></tr>
<tr><td>MDIX_EN (RX_ER)</td><td>41</td><td>S, O, PU</td><td>MDIX ENABLE: Default is to enable MDIX. This strapping option disables Auto-MDIX. An external pulldown will disable Auto- MDIX mode.</td></tr>
</table>

(1) The DP83848-EP uses many of the functional pins as strap options. The values of these pins are sampled during reset and used to strap the device into specific modes of operation. The functional pin name is indicated in parentheses.
(2) A 2.2-kΩ resistor should be used for pulldown or pullup to change the default strap option. If the default option is required, then there is no need for external pullup or pulldown resistors. Since these pins may have alternate functions after reset is deasserted, they should not be connected directly to $V_{CC}$ or GND.

### Table 3-9. 10-Mbps and 100-Mbps PMD Interface

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| TD–, TD+ | 16, 17 | I/O | Differential common driver transmit output (PMD Output Pair). These differential outputs are automatically configured to either 10BASE-T or 100BASE-TX signaling.<br>In Auto-MDIX mode of operation, this pair can be used as the Receive Input pair.<br>These pins require 3.3-V bias for operation. |
| RD–, RD+ | 13, 14 | I/O | Differential receive input (PMD Input Pair). These differential inputs are automatically configured to accept either 100BASE-TX or 10BASE-T signaling.<br>In Auto-MDIX mode of operation, this pair can be used as the Transmit Output pair.<br>These pins require 3.3-V bias for operation. |

### Table 3-10. Special Connections

| TERMINAL | | I/O | DESCRIPTION |
|---|---|---|---|
| NAME | NO. | | |
| RBIAS | 24 | I | Bias Resistor Connection. A 4.87-kΩ 1% resistor should be connected from RBIAS to GND. |
| PFBOUT | 23 | O | Power Feedback Output. Parallel caps, 10 µF (Tantalum preferred) and 0.1 µF, should be placed close to the PFBOUT. Connect this pin to PFBIN1 (pin 18) and PFBIN2 (pin 37). See 节 6.2.1.3 for proper placement pin. |
| PFBIN1<br>PFBIN2 | 18<br>37 | I | Power Feedback Input. These pins are fed with power from PFBOUT pin. A small capacitor of 0.1 µF should be connected close to each pin.<br>Note: Do not supply power to these pins other than from PFBOUT. |
| RESERVED | 20, 21 | I/O | **RESERVED**: These pins must be pulled-up through 2.2-kΩ resistors to AVDD33 supply. |

### Table 3-11. Power Supply Pins

| TERMINAL | | DESCRIPTION |
|---|---|---|
| NAME | NO. | |
| IOVDD33 | 32, 48 | I/O 3.3-V supply |
| IOGND | 35, 47 | I/O ground |
| DGND | 36 | Digital ground |
| AVDD33 | 22 | Analog 3.3-V supply |
| AGND | 15, 19 | Analog ground |
| GNDPAD | DAP | Thermal pad |

# 4 Specifications

## 4.1 Absolute Maximum Ratings(1)

over operating free-air temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|---|---|---|---|---|
| $V_{CC}$ | Supply voltage | –0.5 | 4.2 | V |
| $V_{IN}$ | DC input voltage | –0.5 | $V_{CC}$ + 0.5 | V |
| $V_{OUT}$ | DC output voltage | –0.5 | $V_{CC}$ + 0.5 | V |
| $T_{STG}$ | Storage temperature | –65 | 150 | °C |
| $T_J$ | Operating junction temperature | –55 | 150 | °C |
| TL | Lead temperature (soldering, 10 seconds) | | 260 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## 4.2 ESD Ratings

$R_{ZAP}$ = 1.5 kΩ, $C_{ZAP}$ = 100 pF

| | | | VALUE | UNIT |
|---|---|---|---|---|
| $V_{(ESD)}$ | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1) | ±4000 | V |
| | | Charged-device model (CDM), per JEDEC specification JESD22-C101(2) | ±1500 | |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 4.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|---|---|---|---|---|---|
| $V_{CC}$ | Supply voltage | 3 | | 3.6 | V |
| $T_A$ | Operating free-air temperature(1) | –55 | | 125 | °C |
| $P_D$ | Power dissipation | | 267 | | mW |

(1) Provided that Thermal Pad is soldered down.

## 4.4 Thermal Information

| THERMAL METRIC(1) | | DP83848-EP | | UNITS |
|---|---|---|---|---|
| | | PHP | PTB | |
| | | 48 PINS | | |
| $\theta_{JA}$ | Junction-to-ambient thermal resistance | 35.74 | 49.0 | °C/W |
| $\theta_{JCtop}$ | Junction-to-case (top) thermal resistance | 21.8 | 62.9 | °C/W |
| $\theta_{JB}$ | Junction-to-board thermal resistance | 19.5 | 30.4 | °C/W |
| $\psi_{JT}$ | Junction-to-top characterization parameter | 1.2 | 7.3 | °C/W |
| $\psi_{JB}$ | Junction-to-board characterization parameter | 19.4 | 30.3 | °C/W |
| $\theta_{JCbot}$ | Junction-to-case (bottom) thermal resistance | 3.2 | 9.5 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

## 4.5 DC Specifications

## 4.6 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| $V_{IH}$ | Input high voltage | Nominal $V_{CC}$ | 2 | | | V |
| $V_{IL}$ | Input low voltage | | | | 0.8 | V |
| $I_{IH}$ | Input high current | $V_{IN} = V_{CC}$ | | | 10 | µA |
| $I_{IL}$ | Input low current | $V_{IN}$ = GND | | | 10 | µA |
| $V_{OL}$ | Output low voltage | $I_{OL}$ = 4 mA | | | 0.4 | V |
| $V_{OH}$ | Output high voltage | $I_{OH}$ = –4 mA | $V_{CC}$ – 0.5 | | | V |

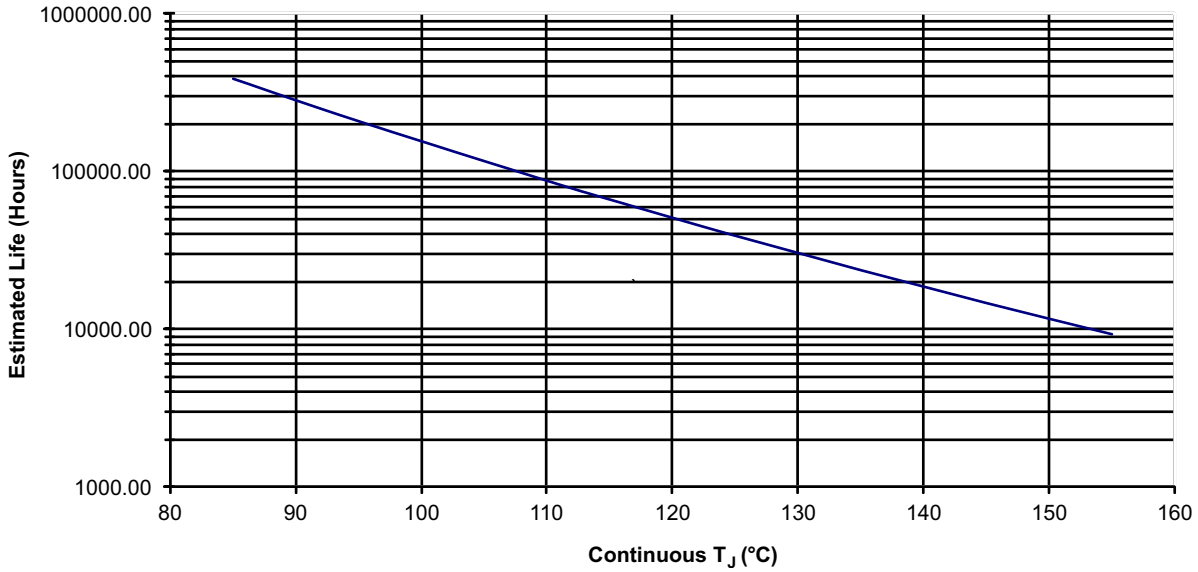
| $I_{dd}$ | Power down mode | | | 14 | | mA |



(1) See data sheet for absolute maximum and minimum recommended operating conditions.
(2) Silicon operating life design goal is 10 years at 105°C junction temperature (does not include package interconnect life).
(3) Enhanced plastic product disclaimer applies.

**图 4-1. DP83848-EP Operating Life Derating Chart**

## 4.7 AC Specifications

### 4.7.1 Power Up Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.1.1 | Post power up stabilization time prior to MDC preamble for register accesses | MDIO is pulled high for 32-bit serial management initialization.<br>X1 clock must be stable for a min. of 167 ms at power up. | 167 | | | ms |
| T2.1.2 | Hardware configuration latch-in time from power up | Hardware configuration pins are described in Section 3 and Table 3-8.<br>X1 clock must be stable for a min. of 167 ms at power up. | 167 | | | ms |
| T2.1.3 | Hardware configuration pins transition to output drivers | | | 50 | | ns |

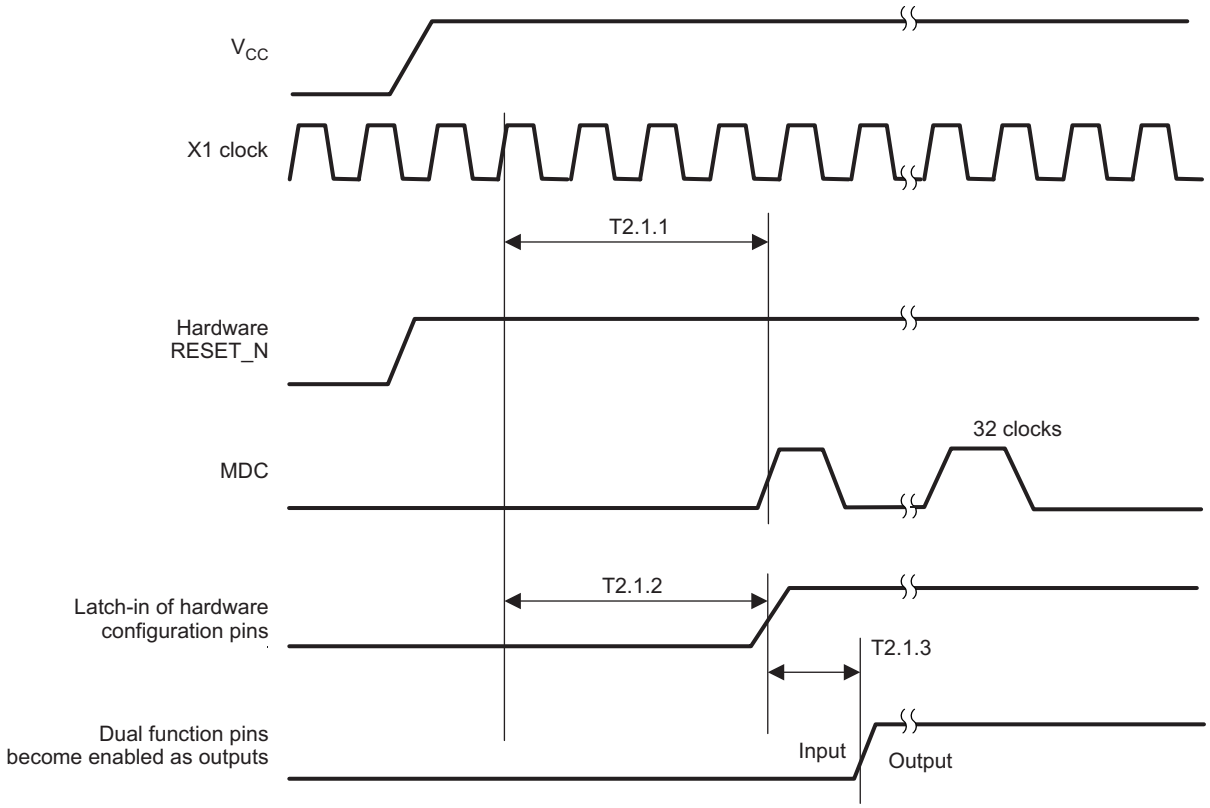


**图 4-2. Power Up Timing**

### 4.7.2 Reset Timing

| PARAMETER | DESCRIPTION | NOTES (1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.2.1 | Post RESET stabilization time prior to MDC preamble for register accesses | MDIO is pulled high for 32-bit serial management initialization. | | 3 | | µs |
| T2.2.2 | Hardware configuration latch-in time from the deassertion of RESET (either soft or hard) | Hardware configuration pins are described in Section 3 and Table 3-8. | | 3 | | µs |
| T2.2.3 | Hardware configuration pins transition to output drivers | | | 50 | | ns |
| T2.2.4 | RESET pulse width | X1 clock must be stable for at min. of 1 µs during RESET pulse low time. | 1 | | | µs |

(1) It is important to choose pullup and/or pulldown resistors for each of the hardware configuration pins that provide fast RC time constants in order to latch-in the proper value prior to the pin transitioning to an output driver.

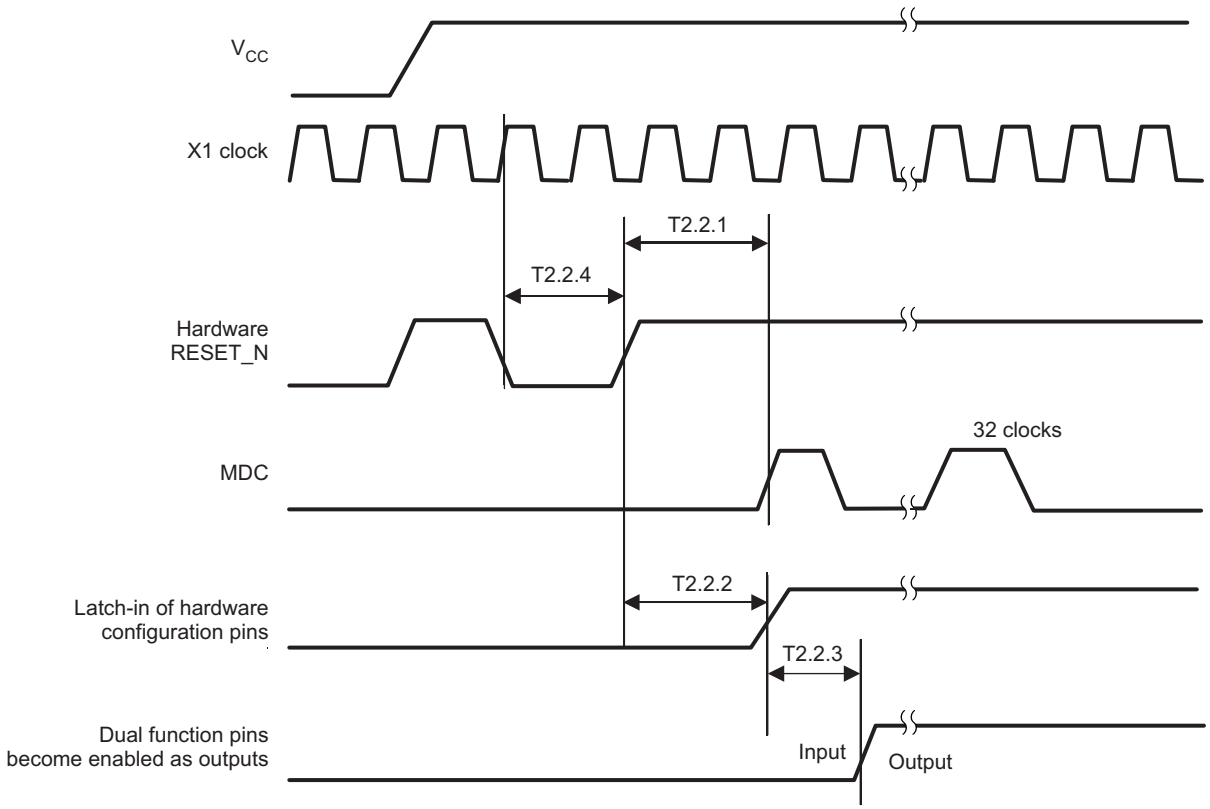

**图 4-3. Reset Timing**

### 4.7.3 MII Serial Management Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.3.1 | MDC to MDIO (output) delay time | | 0 | | 30 | ns |
| T2.3.2 | MDIO (input) to MDC setup time | | 10 | | | ns |
| T2.3.3 | MDIO (input) to MDC hold time | | 10 | | | ns |
| T2.3.4 | MDC frequency | | | 2.5 | 25 | MHz |

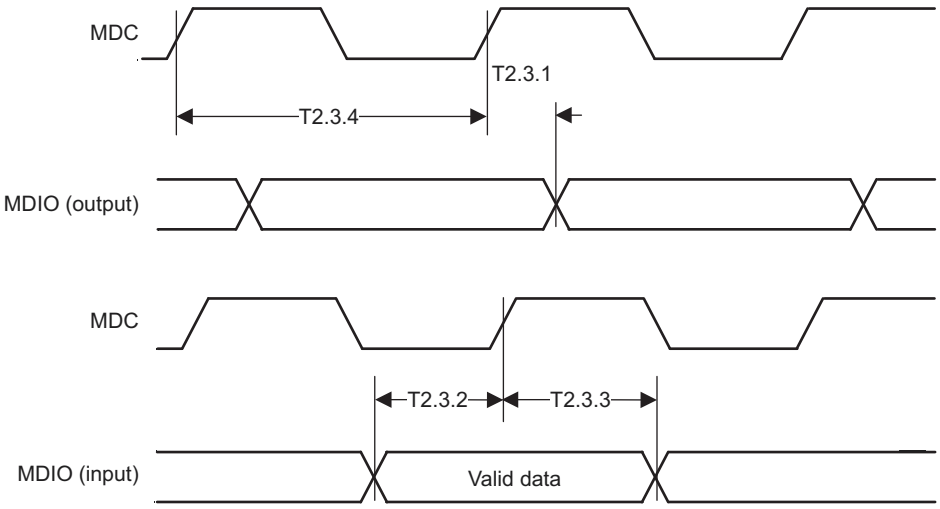

**图 4-4. MII Serial Management Timing**

### 4.7.4 100-Mbps MII Transmit Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.4.1 | TX_CLK high/low time | 100-Mbps Normal mode | 16 | 20 | 24 | ns |
| T2.4.2 | TXD[3:0], TX_EN data setup to TX_CLK | 100-Mbps Normal mode | 9.70 | | | ns |
| T2.4.3 | TXD[3:0], TX_EN data hold from TX_CLK | 100-Mbps Normal mode | 0 | | | ns |

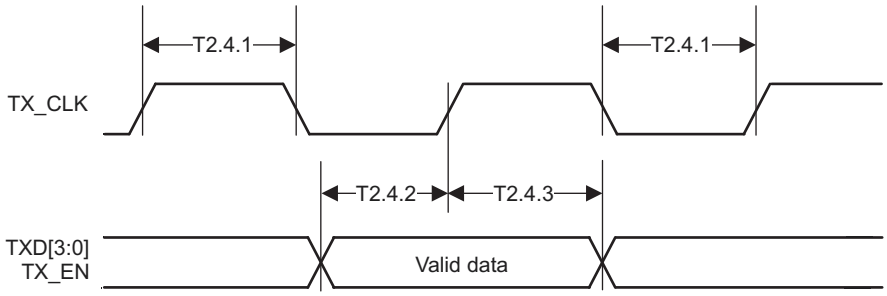

**图 4-5. 100-Mbps MII Transmit Timing**

### 4.7.5 100-Mbps MII Receive Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.5.1 | RX_CLK high/low time | 100-Mbps Normal mode | 16 | 20 | 24 | ns |
| T2.5.2 | RX_CLK to RXD[3:0], RX_DV, RX_ER delay | 100-Mbps Normal mode | 10 | | 30 | ns |

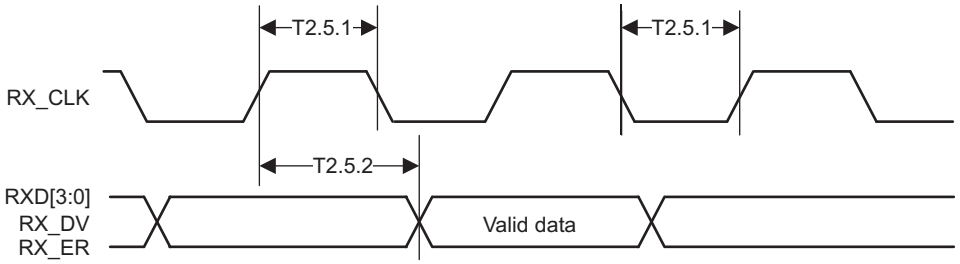

**图 4-6. 100-Mbps MII Receive Timing**

### 4.7.6 100BASE-TX Transmit Packet Latency Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.6.1 | TX_CLK to PMD output pair latency | 100-Mbps Normal mode | | 6 | | bits |

(1) For Normal mode, latency is determined by measuring the time from the first rising edge of TX_CLK occurring after the assertion of TX_EN to the first bit of the “J” code group as output from the PMD Output Pair. 1 bit time = 10 ns in 100-Mbps mode.

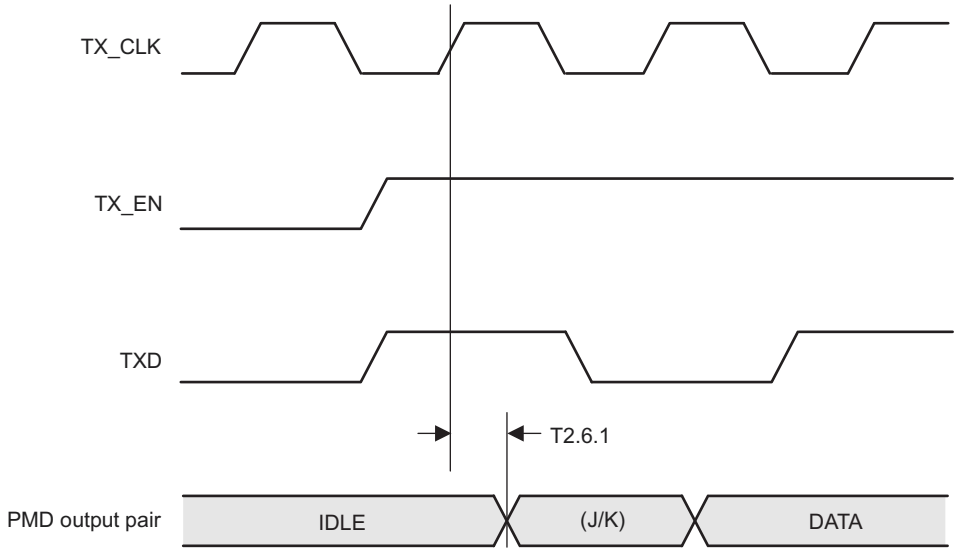

**图 4-7. 100BASE-TX Transmit Packet Latency Timing**

### 4.7.7 100BASE-TX Transmit Packet Deassertion Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.7.1 | TX_CLK to PMD output pair deassertion | 100-Mbps Normal mode | | 6 | | bits |

(1) For Normal mode, latency is determined by measuring the time from the first rising edge of TX_CLK occurring after the assertion of TX_EN to the first bit of the “J” code group as output from the PMD Output Pair. 1 bit time = 10 ns in 100-Mbps mode.

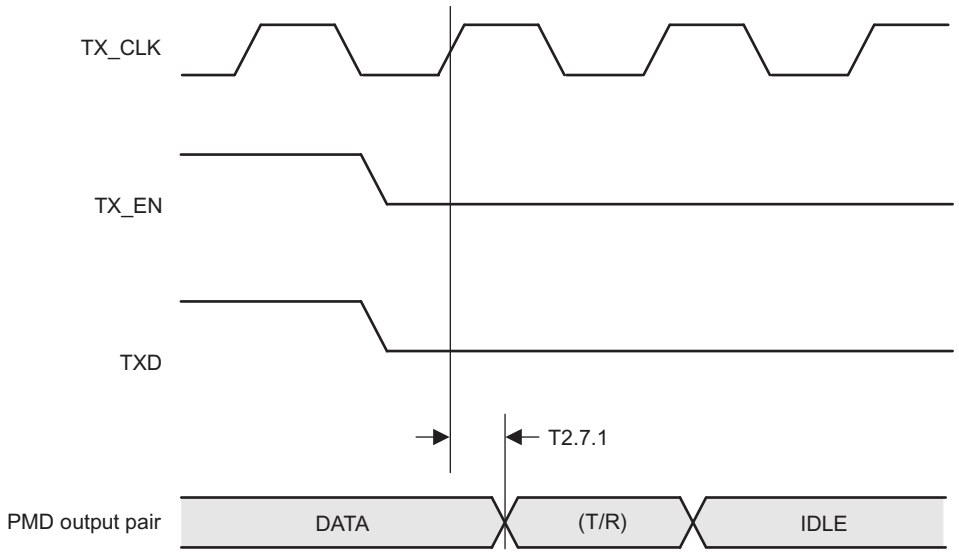

**图 4-8. 100BASE-TX Transmit Packet Deassertion Timing**

### 4.7.8 100BASE-TX Transmit Timing ($t_{R/F}$ and Jitter)

| PARAMETER | DESCRIPTION | NOTES(1) (2) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.8.1 | 100-Mbps PMD output pair $t_R$ and $t_F$ | | 2.6 | 4 | 5.5 | ns |
| | 100-Mbps $t_R$ and $t_F$ mismatch | | | | 500 | ps |
| T2.8.2(3) | 100-Mbps PMD output pair transmit jitter | | | | 1.4 | ns |

(1) Normal Mismatch is the difference between the maximum and minimum of all rise and fall times.
(2) Rise and fall times taken at 10% and 90% of the ±1 amplitude.
(3) Specified from –40°C to 125°C.

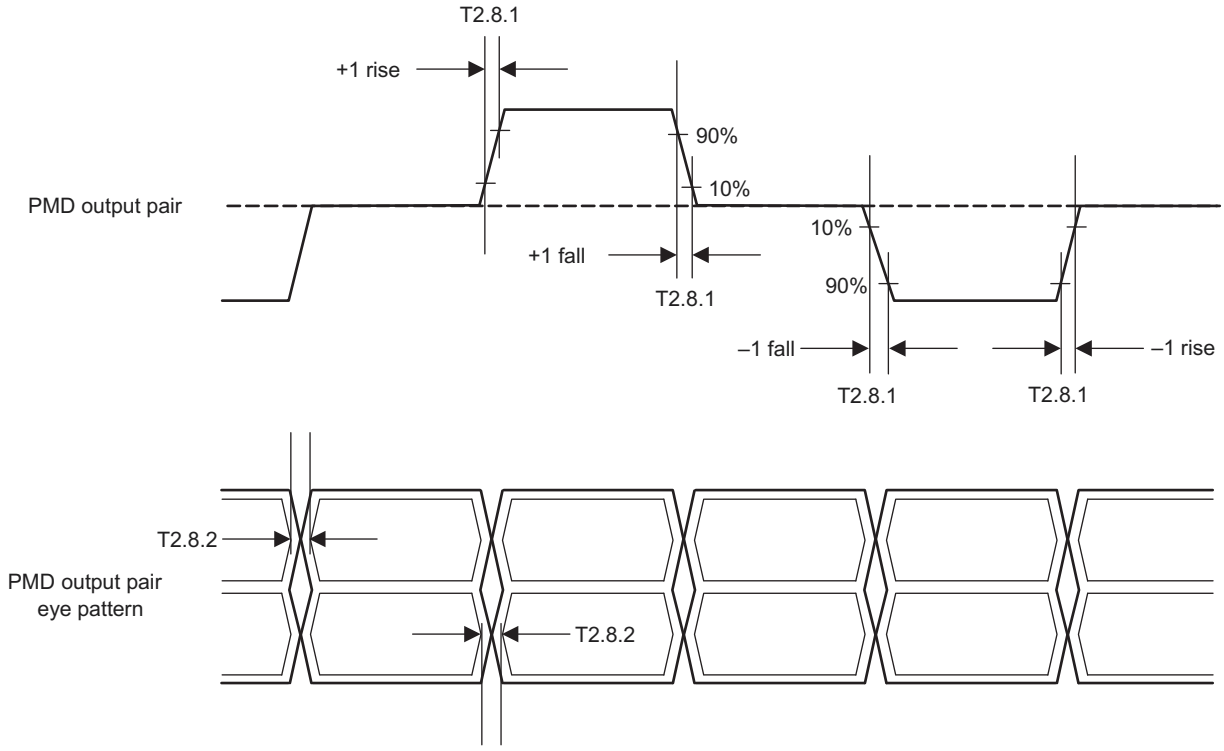

**图 4-9. 100BASE-TX Transmit Timing ($t_{R/F}$ and Jitter)**

### 4.7.9 100BASE-TX Receive Packet Latency Timing

| PARAMETER | DESCRIPTION(1) | NOTES(2) (3) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.9.1 | Carrier sense ON delay | 100-Mbps Normal mode | | 20 | | bits |
| T2.9.2 | Receive data latency | 100-Mbps Normal mode | | 24 | | bits |

(1) Carrier Sense On Delay is determined by measuring the time from the first bit of the “J” code group to the assertion of Carrier Sense.
(2) 1 bit time = 10 ns in 100-Mbps mode.
(3) PMD Input Pair voltage amplitude is greater than the Signal Detect Turn-On Threshold Value.

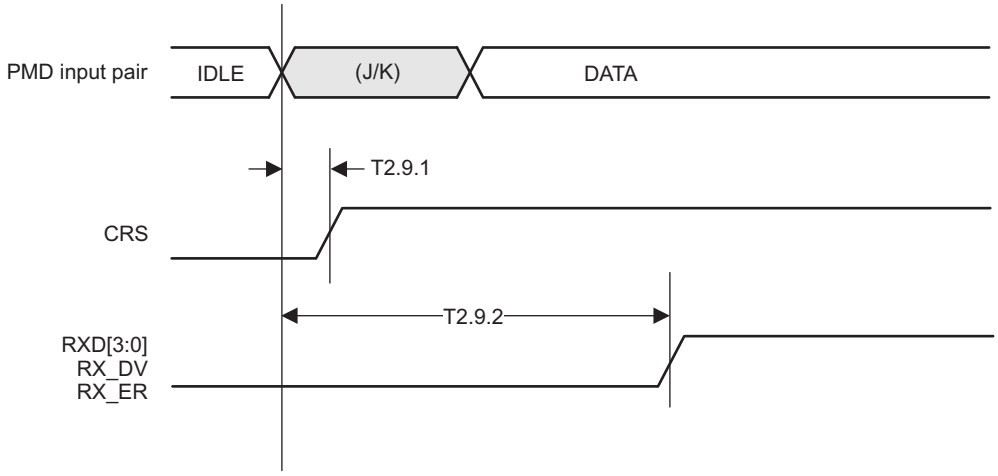

**图 4-10. 100BASE-TX Receive Packet Latency Timing**

### 4.7.10 100BASE-TX Receive Packet Deassertion Timing

| PARAMETER | DESCRIPTION | NOTES(1) (2) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.10.1 | Carrier sense OFF delay | 100-Mbps Normal mode | | 24 | | bits |

(1) Carrier Sense Off Delay is determined by measuring the time from the first bit of the “T” code group to the deassertion of Carrier Sense.
(2) 1 bit time = 10 ns in 100-Mbps mode.

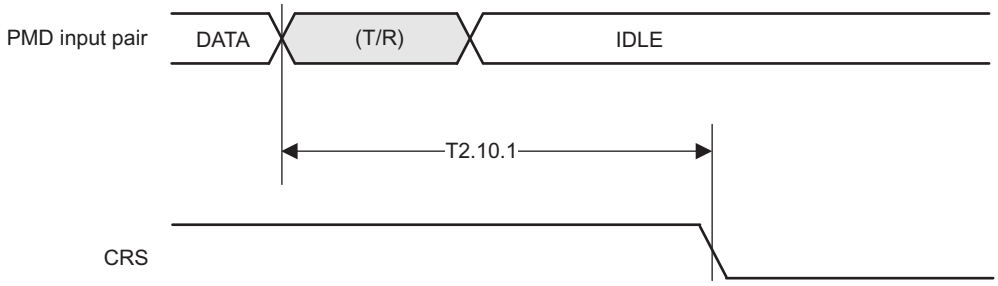

**图 4-11. 100BASE-TX Receive Packet Deassertion Timing**

### 4.7.11 10-Mbps MII Transmit Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.11.1 | TX_CLK high/low time | 10-Mbps MII mode | 190 | 200 | 210 | ns |
| T2.11.2 | TXD[3:0], TX_EN data setup to TX_CLK fall | 10-Mbps MII mode | 24.70 | | | ns |
| T2.11.3 | TXD[3:0], TX_EN data hold from TX_CLK rise | 10-Mbps MII mode | 0 | | | ns |

(1) An attached Mac should drive the transmit signals using the positive edge of TX_CLK. As shown above, the MII signals are sampled on the falling edge of TX_CLK.

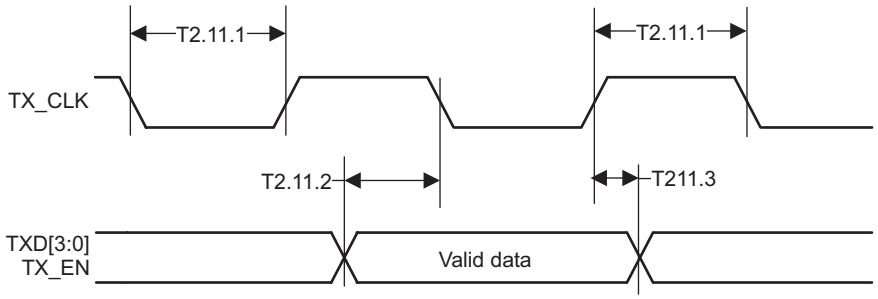

**图 4-12. 10-Mbps MII Transmit Timing**

### 4.7.12 10-Mbps MII Receive Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.12.1 | RX_CLK high/low time | | 160 | 200 | 240 | ns |
| T2.12.2 | RX_CLK to RXD[3:0], RX_DV delay | 10-Mbps MII mode | 100 | | | ns |
| T2.12.3 | RX_CLK rising edge delay from RXD[3:0], RX_DV valid | 10-Mbps MII mode | 100 | | | ns |

(1) RX_CLK may be held low for a longer period of time during transition between reference and recovered clocks. Minimum high and low times will not be violated.

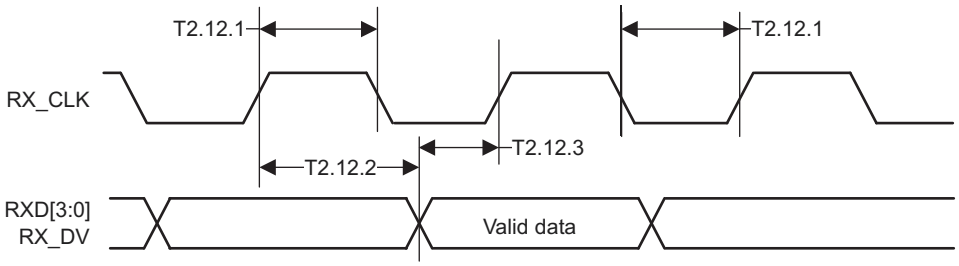

**图 4-13. 10-Mbps MII Receive Timing**

### 4.7.13 10-Mbps Serial Mode Transmit Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.13.1 | TX_CLK high time | 10-Mbps Serial mode | 20 | 25 | 30 | ns |
| T2.13.2 | TX_CLK low time | 10-Mbps Serial mode | 70 | 75 | 80 | ns |
| T2.13.3 | TXD_0, TX_EN data setup to TX_CLK rise | 10-Mbps Serial mode | 24.70 | | | ns |
| T2.13.4 | TXD_0, TX_EN data hold from TX_CLK rise | 10-Mbps Serial mode | 0 | | | ns |

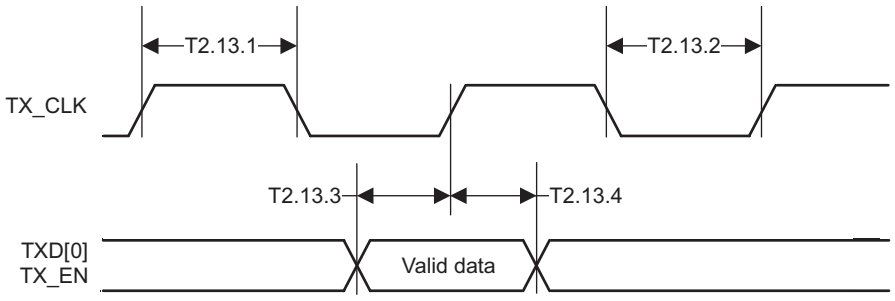

**图 4-14. 10-Mbps Serial Mode Transmit Timing**

### 4.7.14 10-Mbps Serial Mode Receive Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.14.1 | RX_CLK high/low time | | 35 | 50 | 65 | ns |
| T2.14.2 | RX_CLK fall to RXD_0, RX_DV delay | 10-Mbps Serial mode | –10 | | 10 | ns |

(1) RX_CLK may be held high for a longer period of time during transition between reference and recovered clocks. Minimum high and low times will not be violated.

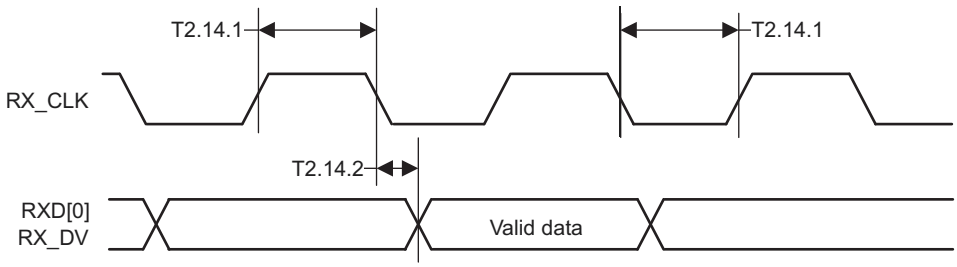

**图 4-15. 10-Mbps Serial Mode Receive Timing**

### 4.7.15 10BASE-T Transmit Timing (Start of Packet)

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.15.1 | Transmit output delay from the falling edge of TX_CLK | 10-Mbps MII mode | | 3.5 | | bits |
| T2.15.2 | Transmit output delay from the rising edge of TX_CLK | 10-Mbps Serial mode | | 3.5 | | bits |

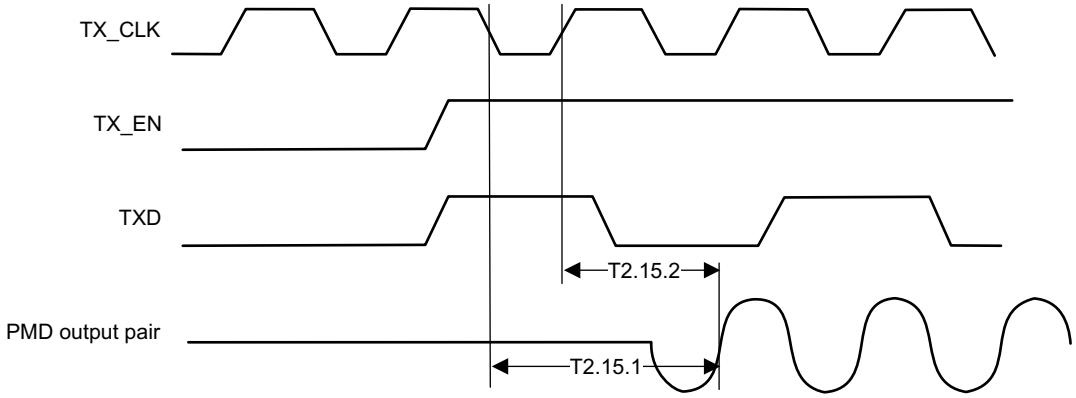

**图 4-16. 10BASE-T Transmit Timing (Start of Packet)**

### 4.7.16 10BASE-T Transmit Timing (End of Packet)

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.16.1 | End of packet high time (with '0' ending bit) | | 250 | 300 | | ns |
| T2.16.2 | End of packet high time (with '1' ending bit) | | 250 | 300 | | ns |

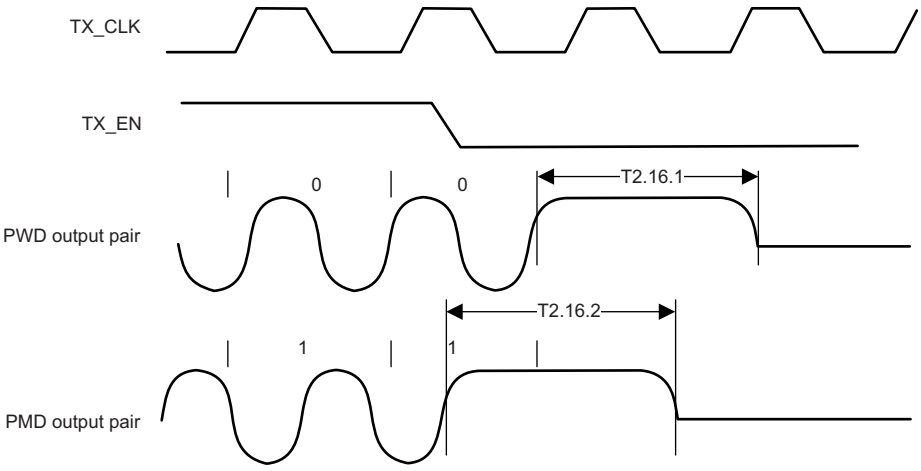

**图 4-17. 10BASE-T Transmit Timing (End of Packet)**

### 4.7.17 10BASE-T Receive Timing (Start of Packet)

| PARAMETER | DESCRIPTION | NOTES(1) (2) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.17.1 | Carrier sense turn on delay (PMD input pair to CRS) | | | 630 | 1000 | ns |
| T2.17.2 | RX_DV latency | | | 10 | | bits |
| T2.17.3 | Receive data latency | Measurement shown from SFD | | 8 | | bits |

(1) 10BASE-T RX_DV Latency is measured from first bit of preamble on the wire to the assertion of RX_DV.
(2) 1 bit time = 100 ns in 10-Mbps mode.

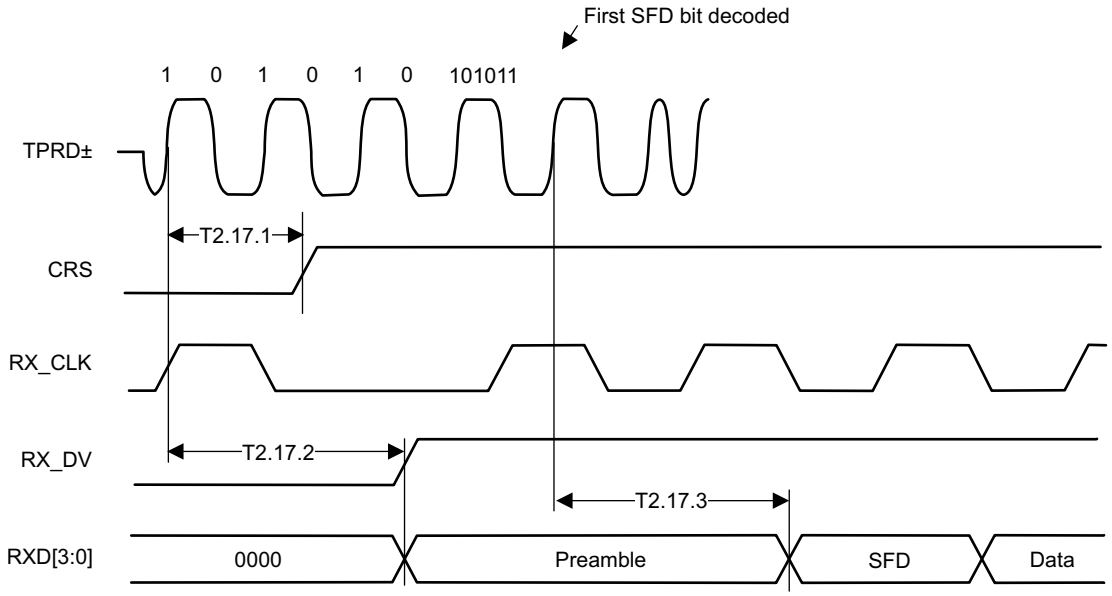

**图 4-18. 10BASE-T Receive Timing (Start of Packet)**

### 4.7.18 10BASE-T Receive Timing (End of Packet)

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.18.1 | Carrier sense turn off delay | | | | 1 | µs |

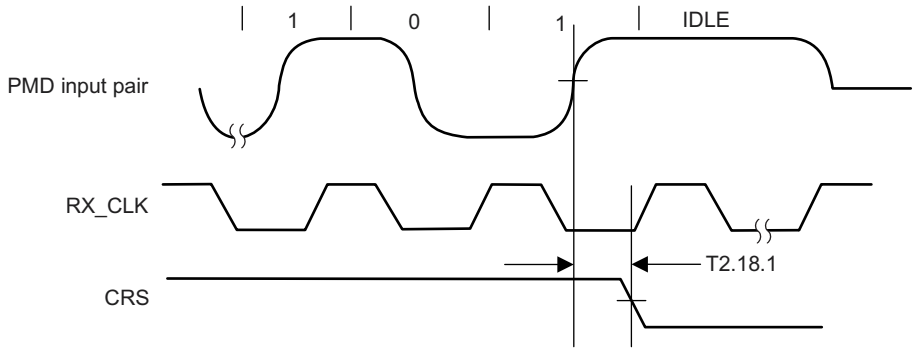

**图 4-19. 10BASE-T Receive Timing (End of Packet)**

### 4.7.19 10-Mbps Heartbeat Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.19.1 | CD heartbeat delay | All 10-Mbps modes | | 1200 | | ns |
| T2.19.2 | CD heartbeat duration | All 10-Mbps modes | | 1000 | | ns |

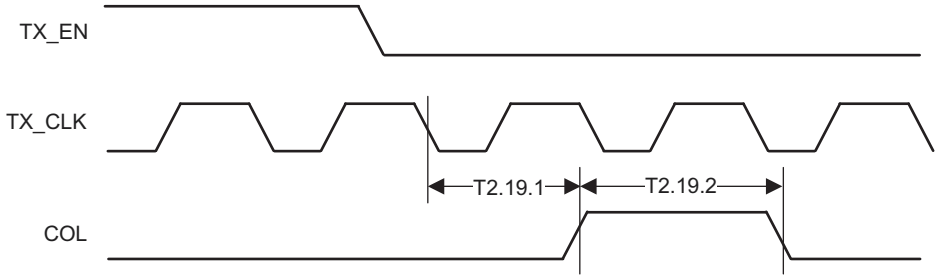

**图 4-20. 10-Mbps Heartbeat Timing**

### 4.7.20 10-Mbps Jabber Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.20.1 | Jabber activation time | | | 85 | | ms |
| T2.20.2 | Jabber deactivation time | | | 500 | | ms |

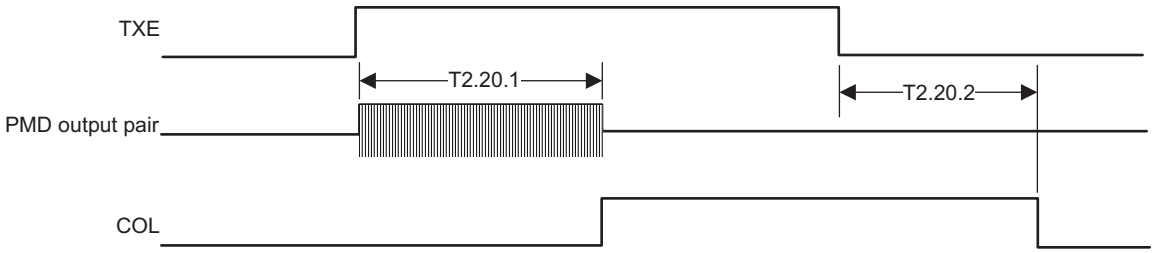

**图 4-21. 10-Mbps Jabber Timing**

### 4.7.21 10BASE-T Normal Link Pulse Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.21.1 | Pulse width | | | 100 | | ns |
| T2.21.2 | Pulse period | | | 16 | | ms |

(1) These specifications represent transmit timings.

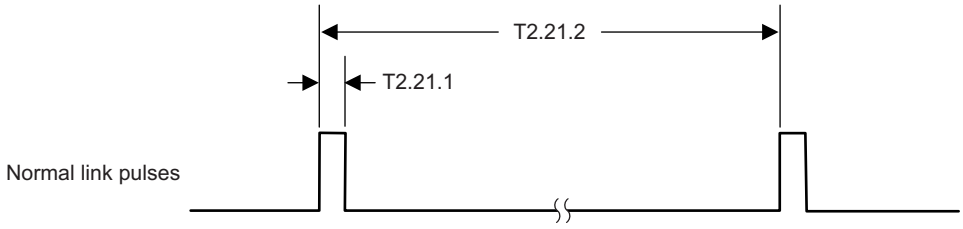

**图 4-22. 10BASE-T Normal Link Pulse Timing**

### 4.7.22 Auto-Negotiation Fast Link Pulse (FLP) Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.22.1 | Clock, data pulse width | | | 100 | | ns |
| T2.22.2 | Clock pulse to clock pulse period | | | 125 | | µs |
| T2.22.3 | Clock pulse to data pulse period | Data = 1 | | 62 | | µs |
| T2.22.4 | Burst width | | | 2 | | ms |
| T2.22.5 | FLP burst to FLP burst period | | | 16 | | ms |

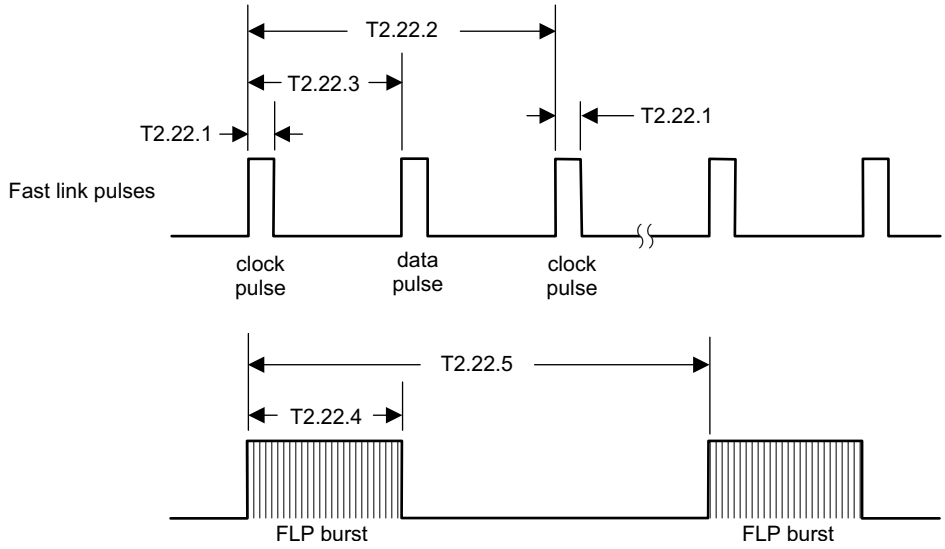

**图 4-23. Auto-Negotiation Fast Link Pulse (FLP) Timing**

### 4.7.23 100BASE-TX Signal Detect Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.23.1 | SD internal turn-on time | | | | 1 | ms |
| T2.23.2 | SD internal turn-off time | | | | 350 | µs |

(1) The signal amplitude on PMD Input Pair must be TP-PMD compliant.

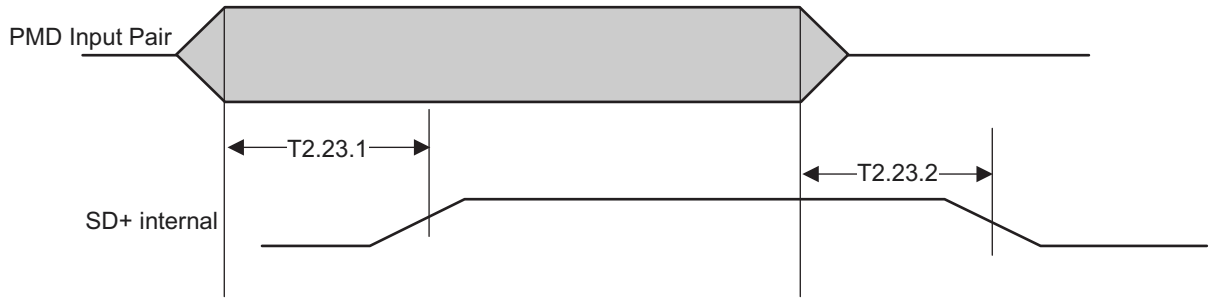

**图 4-24. 100BASE-TX Signal Detect Timing**

### 4.7.24 100-Mbps Internal Loopback Timing

| PARAMETER | DESCRIPTION | NOTES(1) (2) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.24.1 | TX_EN to RX_DV loopback | 100-Mbps internal loopback mode | | | 240 | ns |

(1) Due to the nature of the descrambler function, all 100BASE-TX Loopback modes will cause an initial dead time of up to 550 µs, during which no data will be present at the receive MII outputs. The 100BASE-TX timing specified is based on device delays after the initial 550-µs dead time.
(2) Measurement is made from the first rising edge of TX_CLK after assertion of TX_EN.

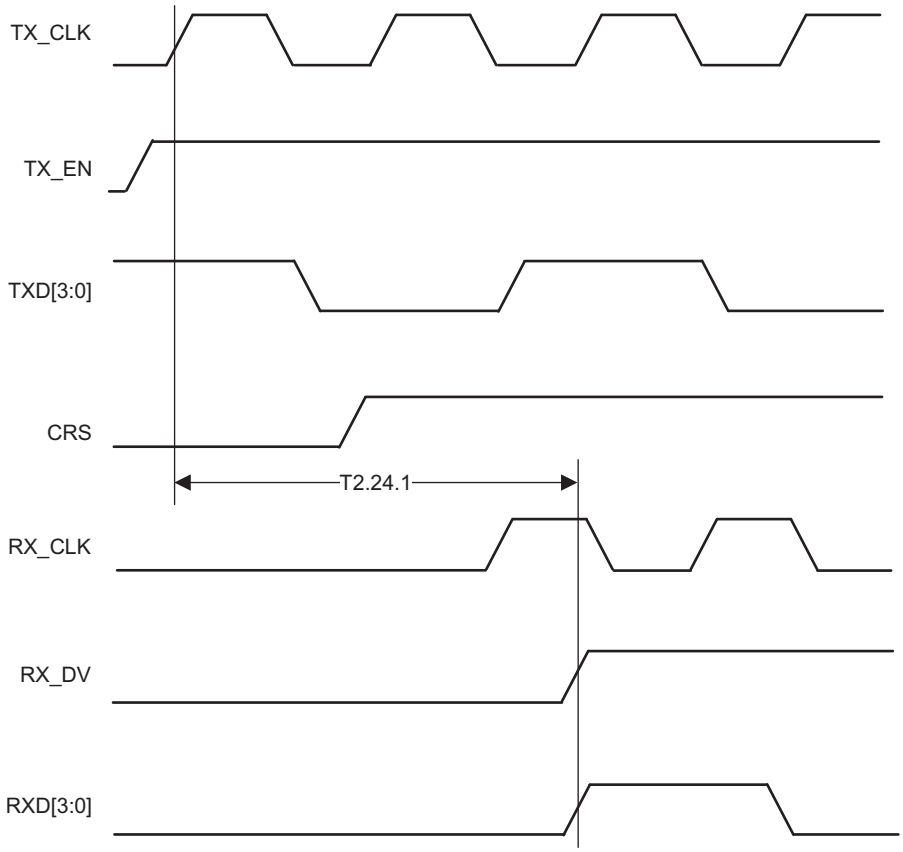

**图 4-25. 100-Mbps Internal Loopback Timing**

### 4.7.25 10-Mbps Internal Loopback Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.25.1 | TX_EN to RX_DV loopback | 10-Mbps internal loopback mode | | | 2 | µs |

(1) Measurement is made from the first rising edge of TX_CLK after assertion of TX_EN.

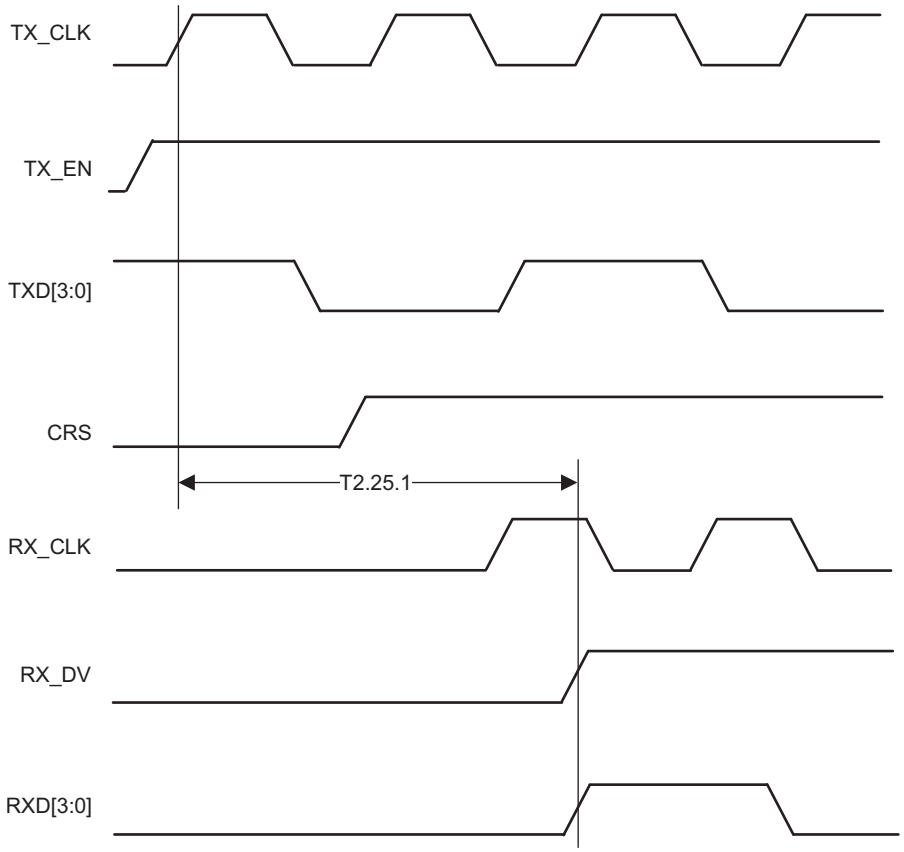

**图 4-26. 10-Mbps Internal Loopback Timing**

### 4.7.26 RMII Transmit Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.26.1 | X1 clock period | 50-MHz reference clock | | 20 | | ns |
| T2.26.2 | TXD[1:0], TX_EN, data setup to X1 rising | | 3.70 | | | ns |
| T2.26.3 | TXD[1:0], TX_EN, data hold from X1 rising | | 1.70 | | | ns |
| T2.26.4 | X1 clock to PMD output pair latency | From X1 rising edge to first bit of symbol | | 17 | | bits |

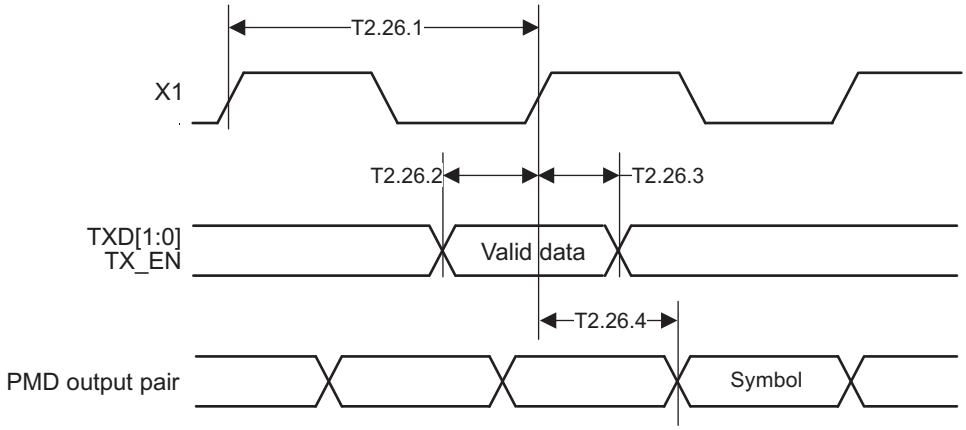

**图 4-27. RMII Transmit Timing**

### 4.7.27 RMII Receive Timing

| PARAMETER | DESCRIPTION | NOTES(1) (2) (3) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.27.1 | X1 clock period | 50-MHz reference clock | | 20 | | ns |
| T2.27.2 | RXD[1:0], CRS_DV, RX_DV and RX_ER output delay from X1 rising | | 2 | | 14 | ns |
| T2.27.3 | CRS ON delay | From JK symbol on PMD receive pair to initial assertion of CRS_DV | | 18.5 | | bits |
| T2.27.4 | CRS OFF delay | From TR symbol on PMD receive pair to initial deassertion of CRS_DV | | 27 | | bits |
| T2.27.5 | RXD[1:0] and RX_ER latency | From symbol on receive pair. Elasticity buffer set to default value (01). | | 38 | | bits |

(1) Per the RMII Specification, output delays assume a 25-pF load.
(2) CRS_DV is asserted asynchronously in order to minimize latency of control signals through the why. CRS_DV may toggle synchronously at the end of the packet to indicate CRS deassertion.
(3) RX_DV is synchronous to X1. While not part of the RMII specification, this signal is provided to simplify recovery of receive data.

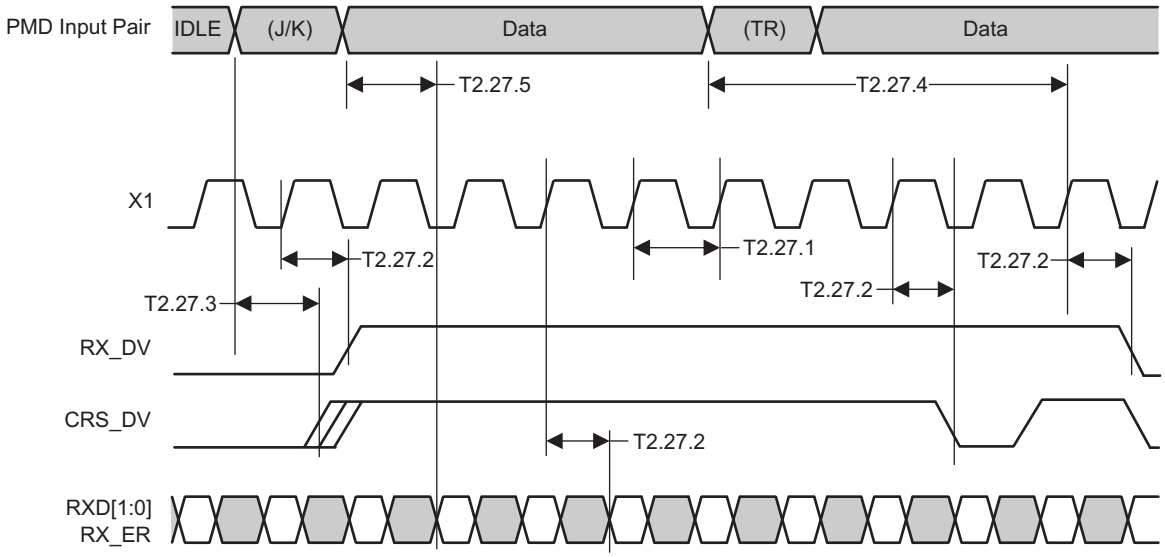

**图 4-28. RMII Receive Timing**

### 4.7.28 Isolation Timing

| PARAMETER | DESCRIPTION | NOTES | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.28.1 | From software clear of bit 10 in the BMCR register to the transition from Isolate to Normal Mode | | | | 100 | µs |
| T2.28.2 | From deassertion of S/W or H/W reset to transition from Isolate to Normal mode | | | | 500 | µs |

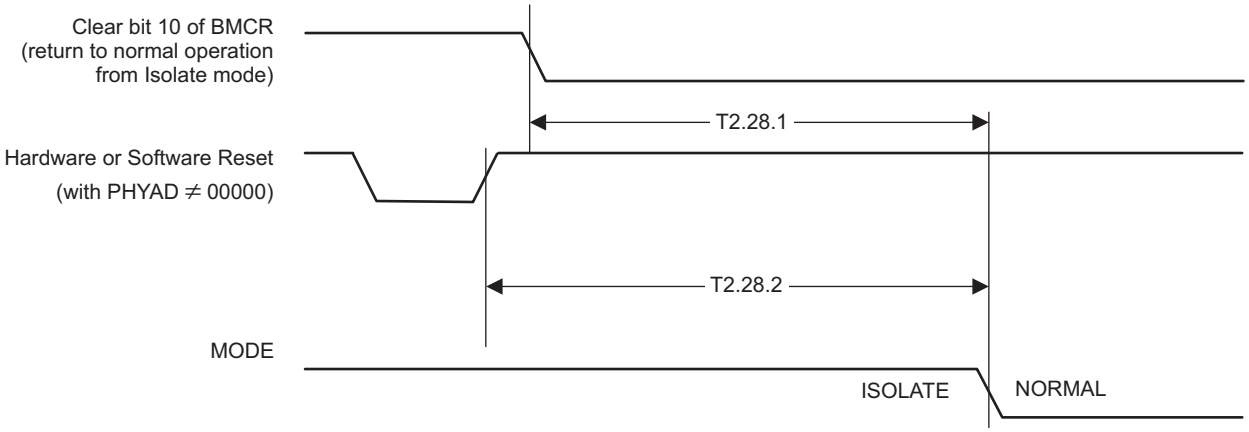

**图 4-29. Isolation Timing**

### 4.7.29 25MHz_OUT Timing

| PARAMETER | DESCRIPTION | NOTES(1) | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| T2.29.1 | 25MHz_OUT high/low time | MII mode | | 20 | | ns |
| | | RMII mode | | 10 | | |
| T2.29.2 | 25MHz_OUT propagation delay | Relative to X1 | | | 8 | ns |

(1) 25MHz_OUT characteristics are dependent upon the X1 input characteristics.

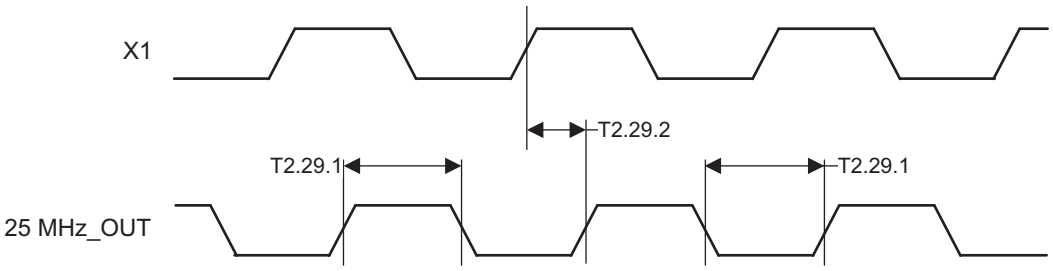

**图 4-30. 25MHz_OUT Timing**

# 5 Detailed Description

## 5.1 Overview

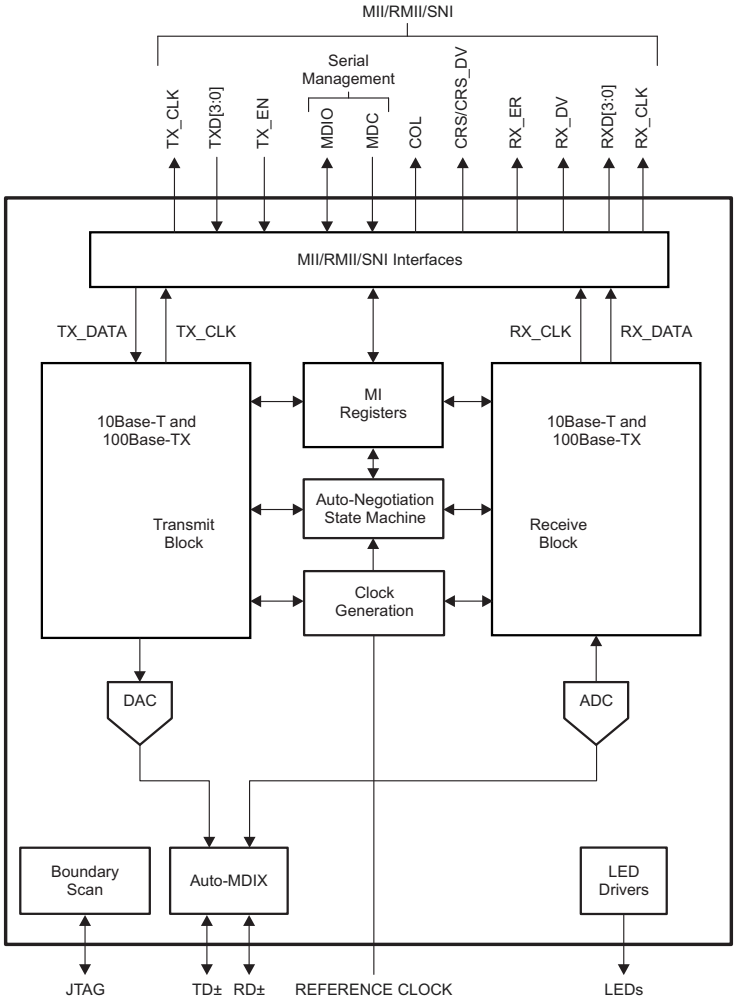
The device is 10/100 Mbps Ethernet transceiver with an extended temperature range of –55°C to 125°C. The ability to perform over extreme temperatures makes this device ideal for demanding environments like automotive, transportation and industrial applications.

The DP83848-EP operates on a 3.3-V supply voltage with a typical 270-mW typical power consumption making this device suitable for low power applications.

The device has Auto MDIX capability to select MDI or MDIX automatically. The device supports Auto-Negotiation for selecting the highest performance mode of operation. This functionality can be turned off if a particular mode is to be forced.

The device supports MII, RMII, and SNI interfaces thus being more flexible and increasing the number of compatible MPU. Interface options can be selected using strap options or register control. The device operates with 25-MHz clock when in MII mode and requires a 50-MHz clock when in RMII mode.

## 5.2 Functional Block Diagram



## 5.3 Feature Description

### 5.3.1 Auto-Negotiation

The Auto-Negotiation function provides a mechanism for exchanging configuration information between two ends of a link segment and automatically selecting the highest performance mode of operation supported by both devices. Fast Link Pulse (FLP) Bursts provide the signalling used to communicate Auto-Negotiation abilities between two devices at each end of a link segment. For further detail regarding Auto-Negotiation, refer to Clause 28 of the IEEE 802.3u specification. The DP83848-EP supports four different Ethernet protocols (10-Mbps Half Duplex, 10-Mbps Full Duplex, 100-Mbps Half Duplex, and 100-Mbps Full Duplex), so the inclusion of Auto-Negotiation ensures that the highest performance protocol will be selected based on the advertised ability of the Link Partner. The Auto-Negotiation function within the DP83848-EP can be controlled either by internal register access or by the use of the AN0 pin.

#### 5.3.1.1 Auto-Negotiation Pin Control

The state of AN_EN, AN0 and AN1 determines whether the DP83848-EP is forced into a specific mode or auto-negotiation will advertise a specific ability (or set of abilities) as given in 表 5-1. These pins allow configuration options to be selected without requiring internal register access.

The state of AN_EN, AN0 and AN1, upon power-up/reset, determines the state of bits [8:5] of the ANAR register.

The auto-negotiation function selected at power-up or reset can be changed at any time by writing to the basic mode control register (BMCR) at address 0x00h.

**表 5-1. Auto-Negotiation Modes**

| AN_EN | AN1 | AN0 | Forced Mode |
|---|---|---|---|
| 0 | 0 | 0 | 10BASE-T, Half Duplex |
| 0 | 0 | 1 | 10BASE-T, Full Duplex |
| 0 | 1 | 0 | 100BASE-TX, Half Duplex |
| 0 | 1 | 1 | 100BASE-TX, Full Duplex |
| **AN_EN** | **AN1** | **AN0** | **Advertised Mode** |
| 1 | 0 | 0 | 10BASE-T, Half or Full Duplex |
| 1 | 0 | 1 | 100BASE-TX, Half or Full Duplex |
| 1 | 1 | 0 | 10BASE-T Half Duplex<br>100BASE-TX, Half Duplex |
| 1 | 1 | 1 | 10BASE-T, Half/Full Duplex<br>100BASE-TX, Half/Full Duplex+ |

#### 5.3.1.2 Auto-Negotiation Register Control

When Auto-Negotiation is enabled, the DP83848-EP transmits the abilities programmed into the Auto-Negotiation Advertisement register (ANAR) at address 04h via FLP Bursts. Any combination of 10 Mbps, 100 Mbps, Half-Duplex, and Full Duplex modes may be selected.

Auto-Negotiation Priority Resolution:

1. 100BASE-TX Full Duplex (Highest Priority)
2. 100BASE-TX Half Duplex
3. 10BASE-T Full Duplex
4. 10BASE-T Half Duplex (Lowest Priority)

The Basic Mode Control Register (BMCR) at address 00h provides control for enabling, disabling, and restarting the Auto-Negotiation process. When Auto-Negotiation is disabled, the Speed Selection bit in the BMCR controls switching between 10-Mbps or 100-Mbps operation, and the Duplex Mode bit controls switching between full duplex operation and half duplex operation. The Speed Selection and Duplex Mode bits have no effect on the mode of operation when the Auto-Negotiation Enable bit is set.

The Link Speed can be examined through the PHY Status Register (PHYSTS) at address 10h after a Link is achieved.

The Basic Mode Status Register (BMSR) indicates the set of available abilities for technology types, Auto-Negotiation ability, and Extended Register Capability. These bits are permanently set to indicate the full functionality of the DP83848-EP (only the 100BASE-T4 bit is not set because the DP83848-EP does not support that function).

The BMSR also provides status on:

- Whether or not Auto-Negotiation is complete
- Whether or not the Link Partner is advertising that a remote fault has occurred
- Whether or not valid link has been established
- Support for Management Frame Preamble suppression

The Auto-Negotiation Advertisement Register (ANAR) indicates the Auto-Negotiation abilities to be advertised by the DP83848-EP. All available abilities are transmitted by default, but any ability can be suppressed by writing to the ANAR. Updating the ANAR to suppress an ability is one way for a management agent to change (restrict) the technology that is used.

The Auto-Negotiation Link Partner Ability Register (ANLPAR) at address 0x05h is used to receive the base link code word as well as all next page code words during the negotiation. Furthermore, the ANLPAR will be updated to either 0081h or 0021h for parallel detection to either 100 Mbps or 10 Mbps, respectively.

The Auto-Negotiation Expansion Register (ANER) indicates additional Auto-Negotiation status. The ANER provides status on:

- Whether or not a Parallel Detect Fault has occurred
- Whether or not the Link Partner supports the Next Page function
- Whether or not the DP83848-EP supports the Next Page function
- Whether or not the current page being exchanged by Auto-Negotiation has been received
- Whether or not the Link Partner supports Auto-Negotiation

#### 5.3.1.3 Auto-Negotiation Parallel Detection

The DP83848-EP supports the Parallel Detection function as defined in the IEEE 802.3u specification. Parallel Detection requires both the 10 Mbps and 100 Mbps receivers to monitor the receive signal and report link status to the Auto-Negotiation function. Auto-Negotiation uses this information to configure the correct technology in the event that the Link Partner does not support Auto-Negotiation but is transmitting link signals that the 100BASE-TX or 10BASE-T PMAs recognize as valid link signals.

If the DP83848-EP completes Auto-Negotiation as a result of Parallel Detection, bits 5 and 7 within the ANLPAR register will be set to reflect the mode of operation present in the Link Partner. Note that bits 4:0 of the ANLPAR will also be set to 00001 based on a successful parallel detection to indicate a valid 802.3 selector field. Software may determine that negotiation completed via Parallel Detection by reading a zero in the Link Partner Auto-Negotiation Able bit once the Auto-Negotiation Complete bit is set. If configured for parallel detect mode and any condition other than a single good link occurs then the parallel detect fault bit will be set.

#### 5.3.1.4 Auto-Negotiation Restart

Once Auto-Negotiation has completed, it may be restarted at any time by setting bit 9 (Restart Auto-Negotiation) of the BMCR to one. If the mode configured by a successful Auto-Negotiation loses a valid link, then the Auto-Negotiation process will resume and attempt to determine the configuration for the link. This function ensures that a valid configuration is maintained if the cable becomes disconnected.

A renegotiation request from any entity, such as a management agent, will cause the DP83848-EP to halt any transmit data and link pulse activity until the break_link_timer expires (~1500 ms). Consequently, the Link Partner will go into link fail and normal Auto-Negotiation resumes. The DP83848-EP will resume Auto-Negotiation after the break_link_timer has expired by issuing FLP (Fast Link Pulse) bursts.

#### 5.3.1.5 Enabling Auto-Negotiation via Software

It is important to note that if the DP83848-EP has been initialized upon power-up as a non-auto-negotiating device (forced technology), and it is then required that Auto-Negotiation or re-Auto-Negotiation be initiated via software, bit 12 (Auto-Negotiation Enable) of the Basic Mode Control Register (BMCR) must first be cleared and then set for any Auto-Negotiation function to take effect.

#### 5.3.1.6 Auto-Negotiation Complete Time

Parallel detection and Auto-Negotiation take approximately 2-3 seconds to complete. In addition, Auto-Negotiation with next page should take approximately 2-3 seconds to complete, depending on the number of next pages sent.

Refer to Clause 28 of the IEEE 802.3u standard for a full description of the individual timers related to Auto-Negotiation.

### *5.3.2 Auto-MDIX*

When enabled, this function uses Auto-Negotiation to determine the proper configuration for transmission and reception of data and subsequently selects the appropriate MDI pair for MDI/MDIX operation. The function uses a random seed to control switching of the crossover circuitry. This implementation complies with the corresponding IEEE 802.3 Auto-Negotiation and Crossover Specifications.

Auto-MDIX is enabled by default and can be configured via strap or via PHYCR (19h) register, bits [15:14].

Neither Auto-Negotiation nor Auto-MDIX is required to be enabled in forcing crossover of the MDI pairs. Forced crossover can be achieved through the FORCE_MDIX bit, bit 14 of PHYCR (19h) register.

Note: Auto-MDIX will not work in a forced mode of operation.

### *5.3.3 LED Interface*

The DP83848-EP supports three configurable light emitting diode (LED) pins. The device supports three LED configurations: Link, Speed, Activity and Collision. Functions are multiplexed among the LEDs. The PHYCR for the LEDs can also be selected through address 19h, bits [6:5].

**表 5-2. LED Mode Select**

| MODE | LED_CGF[1] (BIT 6) | LED_CFG[0] (BIT 5) or (PIN 40) | LED_LINK | LED_SPEED | LED_ACT/COL |
|---|---|---|---|---|---|
| 1 | don't care | 1 | ON for Good Link<br>OFF for No Link | ON in 100 Mbps<br>OFF in 10 Mbps | ON for Activity<br>OFF for No Activity |
| 2 | 0 | 0 | ON for Good Link<br>BLINK for Activity | ON in 100 Mbps<br>OFF in 10 Mbps | ON for Collision<br>OFF for No Collision |
| 3 | 1 | 0 | ON for Good Link<br>BLINK for Activity | ON in 100 Mbps<br>OFF in 10 Mbps | ON for Full Duplex<br>OFF for Half Duplex |

The LED_LINK pin in Mode 1 indicates the link status of the port. In 100BASE-T mode, link is established as a result of input receive amplitude compliant with the TPPMD specifications which will result in internal generation of signal detect. A 10 Mbps Link is established as a result of the reception of at least seven consecutive normal link pulses or the reception of a valid 10BASE-T packet. This will cause the assertion of LED_LINK. LED_LINK will deassert in accordance with the Link Loss Timer as specified in the IEEE 802.3 specification.

The LED_LINK pin in Mode 1 will be OFF when no LINK is present.

The LED_LINK pin in Mode 2 and Mode 3 will be ON to indicate Link is good and BLINK to indicate activity is present on either transmit or receive activity.

The LED_SPEED pin indicates 10 or 100 Mbps data rate of the port. The standard CMOS driver goes high when operating in 100 Mbps operation. The functionality of this LED is independent of mode selected.

The LED_ACT/COL pin in Mode 1 indicates the presence of either transmit or receive activity. The LED will be ON for Activity and OFF for No Activity. In Mode 2, this pin indicates the Collision status of the port. The LED will be ON for Collision and OFF for No Collision.

The LED_ACT/COL pin in Mode 3 indicates the presence of duplex status for 10-Mbps or 100-Mbps operation. The LED will be ON for full duplex and OFF for half duplex.

In 10 Mbps half duplex mode, the collision LED is based on the COL signal.

Since these LED pins are also used as strap options, the polarity of the LED is dependent on whether the pin is pulled up or down.

#### 5.3.3.1 LEDs

Since the auto-negotiation (AN) strap options share the LED output pins, the external components required for strapping and LED usage must be considered in order to avoid contention.

Specifically, when the LED outputs are used to drive LEDs directly, the active state of each output driver is dependent on the logic level sampled by the corresponding AN input upon power-up/reset. For example, if a given AN input is resistively pulled low then the corresponding output will be configured as an active high driver. Conversely, if a given AN input is resistively pulled high, then the corresponding output will be configured as an active low driver.

Refer to 图 5-1 for an example of AN connections to external components. In this example, the AN strapping results in auto-negotiation with 10/100 half or full duplex advertised.

The adaptive nature of the LED outputs helps to simplify potential implementation issues of these dual purpose pins.

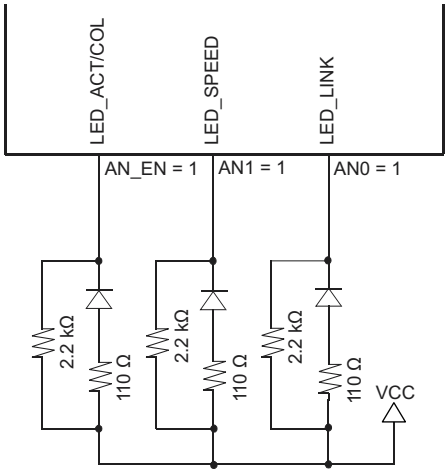


**图 5-1. AN Strapping and LED Loading Example**

#### 5.3.3.2 LED Direct Control

The DP83848-EP provides another option to directly control any or all LED outputs through the LED direct control register (LEDCR), address 18h. The register does not provide read access to LEDs.

### *5.3.4 Internal Loopback*

The DP83848-EP includes a Loopback Test mode for facilitating system diagnostics. The Loopback mode is selected through bit 14 (Loopback) of the Basic Mode Control Register (BMCR). Writing 1 to this bit enables MII transmit data to be routed to the MII receive outputs. Loopback status may be checked in bit 3 of the PHY Status Register (PHYSTS). While in Loopback mode the data will not be transmitted onto the media. To ensure that the desired operating mode is maintained, Auto-Negotiation should be disabled before selecting the Loopback mode.

### *5.3.5 BIST*

The DP83848-EP incorporates an internal Built-in Self Test (BIST) circuit to accommodate in-circuit testing or diagnostics. The BIST circuit can be used to test the integrity of the transmit and receive data paths. BIST testing can be performed with the part in the internal loopback mode or externally looped back using a loopback cable fixture.

The BIST is implemented with independent transmit and receive paths, with the transmit block generating a continuous stream of a pseudo random sequence. The user can select a 9 bit or 15 bit pseudo random sequence from the PSR_15 bit in the PHY Control Register (PHYCR). The received data is compared to the generated pseudo-random data by the BIST Linear Feedback Shift Register (LFSR) to determine the BIST pass/fail status.

The pass/fail status of the BIST is stored in the BIST status bit in the PHYCR register. The status bit defaults to 0 (BIST fail) and will transition on a successful comparison. If an error (mis-compare) occurs, the status bit is latched and is cleared upon a subsequent write to the Start/Stop bit.

For transmit VOD testing, the Packet BIST Continuous Mode can be used to allow continuous data transmission, setting BIST_CONT_MODE, bit 5, of CDCTRL1 (0x1Bh).

The number of BIST errors can be monitored through the BIST Error Count in the CDCTRL1 (0x1Bh), bits [15:8].

### 5.3.6 Energy Detect Mode

When Energy Detect is enabled and there is no activity on the cable, the DP83848-EP will remain in a low power mode while monitoring the transmission line. Activity on the line will cause the DP83848-EP to go through a normal power up sequence. Regardless of cable activity, the DP83848-EP will occasionally wake up the transmitter to put ED pulses on the line, but will otherwise draw as little power as possible. Energy detect functionality is controlled via register Energy Detect Control (EDCR), address 0x1Dh.

## 5.4 Device Functional Modes

The DP83848-EP supports several modes of operation using the MII interface pins. The options are defined in the following sections and include:

- MII mode
- RMII mode
- 10-Mb serial network interface (SNI)

The modes of operation can be selected by strap options or register control. For RMII mode, it is required to use the strap option, since it requires a 50-MHz clock instead of the normal 25 MHz.

In each of these modes, the IEEE 802.3 serial management interface is operational for device configuration and status. The serial management interface of the MII allows for the configuration and control of multiple PHY devices, gathering of status, error information, and the determination of the type and capabilities of the attached PHY(s).

### 5.4.1 MII Interface

The DP83848-EP incorporates the Media Independent Interface (MII) as specified in Clause 22 of the IEEE 802.3u standard. This interface may be used to connect PHY devices to a MAC in 10/100-Mbps systems. This section describes the nibble-wide MII data interface.

The nibble-wide MII data interface consists of a receive bus and a transmit bus each with control signals to facilitate data transfer between the PHY and the upper layer (MAC).

#### 5.4.1.1 Nibble-wide MII Data Interface

Clause 22 of the IEEE 802.3u specification defines the Media Independent Interface. This interface includes a dedicated receive bus and a dedicated transmit bus. These two data buses, along with various control and status signals, allow for the simultaneous exchange of data between the DP83848-EP and the upper layer agent (MAC).

The receive interface consists of a nibble-wide data bus RXD[3:0], a receive error signal RX_ER, a receive data valid flag RX_DV, and a receive clock RX_CLK for synchronous transfer of the data. The receive clock operates at either 2.5 MHz to support 10-Mbps operation modes or at 25 MHz to support 100-Mbps operational modes.

The transmit interface consists of a nibble-wide data bus TXD[3:0], a transmit enable control signal TX_EN, and a transmit clock TX_CLK which runs at either 2.5 MHz or 25 MHz.

Additionally, the MII includes the carrier sense signal CRS, as well as a collision detect signal COL. The CRS signal asserts to indicate the reception of data from the network or as a function of transmit data in Half Duplex mode. The COL signal asserts as an indication of a collision which can occur during half-duplex operation when both a transmit and receive operation occur simultaneously.

#### 5.4.1.2 Collision Detect

For Half Duplex, a 10BASE-T or 100BASE-TX collision is detected when the receive and transmit channels are active simultaneously. Collisions are reported by the COL signal on the MII.

If the DP83848-EP is transmitting in 10 Mbps mode when a collision is detected, the collision is not reported until seven bits have been received while in the collision state. This prevents a collision being reported incorrectly due to noise on the network. The COL signal remains set for the duration of the collision.

If a collision occurs during a receive operation, it is immediately reported by the COL signal.

When heartbeat is enabled (only applicable to 10 Mbps operation), approximately 1 µs after the transmission of each packet, a Signal Quality Error (SQE) signal of approximately 10 bit times is generated (internally) to indicate successful transmission. SQE is reported as a pulse on the COL signal of the MII.

#### 5.4.1.3 Carrier Sense

Carrier Sense (CRS) is asserted due to receive activity, once valid data is detected via the squelch function during 10 Mbps operation. During 100 Mbps operation CRS is asserted when a valid link (SD) and two non-contiguous zeros are detected on the line.

For 10 or 100 Mbps Half Duplex operation, CRS is asserted during either packet transmission or reception.

For 10 or 100 Mbps Full Duplex operation, CRS is asserted only due to receive activity.

CRS is deasserted following an end of packet.

### *5.4.2 Reduced MII Interface*

The DP83848-EP incorporates the Reduced Media Independent Interface (RMII) as specified in the RMII specification (rev1.2) from the RMII Consortium. This interface may be used to connect PHY devices to a MAC in 10/100 Mbps systems using a reduced number of pins. In this mode, data is transferred 2-bits at a time using the 50-MHz RMII_REF clock for both transmit and receive. The following pins are used in RMII mode:

- TX_EN
- TXD[1:0]
- RX_ER (optional for MAC)
- CRS_DV
- RXD[1:0]
- X1 (RMII Reference clock is 50 MHz)

In addition, the RMII mode supplies an RX_DV signal which allows for a simpler method of recovering receive data without having to separate RX_DV from the CRS_DV indication. This is especially useful for diagnostic testing where it may be desirable to externally loop Receive MII data directly to the transmitter.

Because the reference clock operates at 10 times the data rate for 10 Mbps operation, transmit data is sampled every 10 clocks. Likewise, receive data will be generated every 10th clock so that an attached device can sample the data every 10 clocks.

RMII mode requires a 50-MHz oscillator be connected to the device X1 pin. A 50-MHz crystal is not supported.

To tolerate potential frequency differences between the 50-MHz reference clock and the recovered receive clock, the receive RMII function includes a programmable elasticity buffer. The elasticity buffer is programmable to minimize propagation delay based on expected packet size and clock accuracy. This allows for supporting a range of packet sizes including jumbo frames.

The elasticity buffer will force Frame Check Sequence errors for packets which overrun or underrun the FIFO. Underrun and Overrun conditions can be reported in the RMII and Bypass Register (RBR). 表 5-3 indicates how to program the elasticity buffer fifo (in 4-bit increments) based on expected max packet size and clock accuracy. It assumes both clocks (RMII Reference clock and far-end Transmitter clock) have the same accuracy.

**表 5-3. Supported Packet Sizes at ±50 ppm ±100 ppm for Each Clock**

| Start Threshold RBR[1:0] | Latency Tolerance | Recommended Packet Size at ±50 ppm | Recommended Packet Size at ±100 ppm |
|---|---|---|---|
| 1 (4-bits) | 2 bits | 2,400 bytes | 1,200 bytes |
| 2 (8-bits) | 6 bits | 7,200 bytes | 3,600 bytes |
| 3 (12-bits) | 10 bits | 12,000 bytes | 6,000 bytes |
| 0 (16-bits) | 14 bits | 16,800 bytes | 8,400 bytes |

#### 5.4.2.1 10 Mb Serial Network Interface (SNI)

The DP83848-EP incorporates a 10-Mb serial network interface (SNI) which allows a simple serial data interface for 10-Mb only devices. This is also referred to as a 7-wire interface. While there is no defined standard for this interface, it is based on early 10-Mb physical layer devices. Data is clocked serially at 10 MHz using separate transmit and receive paths. The following pins are used in SNI mode:

- TX_CLK
- TX_EN
- TXD[0]
- RX_CLK
- RXD[0]
- CRS
- COL

### *5.4.3 802.3u MII Serial Management Interface*

#### 5.4.3.1 Serial Management Register Access

The serial management MII specification defines a set of thirty-two 16-bit status and control registers that are accessible through the management interface pins MDC and MDIO. The DP83848-EP implements all the required MII registers as well as several optional registers. These registers are fully described in 节 5.6.

#### 5.4.3.2 Serial Management Access Protocol

The serial control interface consists of two pins, Management Data Clock (MDC) and Management Data Input/Output (MDIO). MDC has a maximum clock rate of 25 MHz and no minimum rate. The MDIO line is bi-directional and may be shared by up to 32 devices. The MDIO frame format is shown below in 表 5-4.

**表 5-4. Typical MDIO Frame Format**

| MII Management Serial Protocol | <idle><start><op code><device addr><reg addr><turnaround><data><idle> |
|---|---|
| Read Operation | <idle><01><10><AAAAA><RRRRR><Z0><xxxx xxxx xxxx xxxx><idle> |
| Write Operation | <idle><01><01><AAAAA><RRRRR><10><xxxx xxxx xxxx xxxx><idle> |

The MDIO pin requires a pullup resistor (1.5 kΩ) which, during IDLE and turnaround, will pull MDIO high. In order to initialize the MDIO interface, the station management entity sends a sequence of 32 contiguous logic ones on MDIO to provide the DP83848-EP with a sequence that can be used to establish synchronization. This preamble may be generated either by driving MDIO high for 32 consecutive MDC clock cycles, or by simply allowing the MDIO pullup resistor to pull the MDIO pin high during which time 32 MDC clock cycles are provided. In addition 32 MDC clock cycles should be used to re-sync the device if an invalid start, opcode, or turnaround bit is detected.

The DP83848-EP waits until it has received this preamble sequence before responding to any other transaction. Once the DP83848-EP serial management port has been initialized no further preamble sequencing is required until after a power-on/reset, invalid Start, invalid Opcode, or invalid turnaround bit has occurred.

The Start code is indicated by a <01> pattern. This assures the MDIO line transitions from the default idle line state.

Turnaround is defined as an idle bit time inserted between the Register Address field and the Data field. To avoid contention during a read transaction, no device shall actively drive the MDIO signal during the first bit of Turnaround. The addressed DP83848-EP drives the MDIO with a zero for the second bit of turnaround and follows this with the required data. 图 5-2 shows the timing relationship between MDC and the MDIO as driven/received by the Station (STA) and the DP83848-EP (PHY) for a typical register read access.

For write transactions, the station management entity writes data to the addressed DP83848-EP thus eliminating the requirement for MDIO Turnaround. The Turnaround time is filled by the management entity by inserting <10>. 图 5-3 shows the timing relationship for a typical MII register write access.

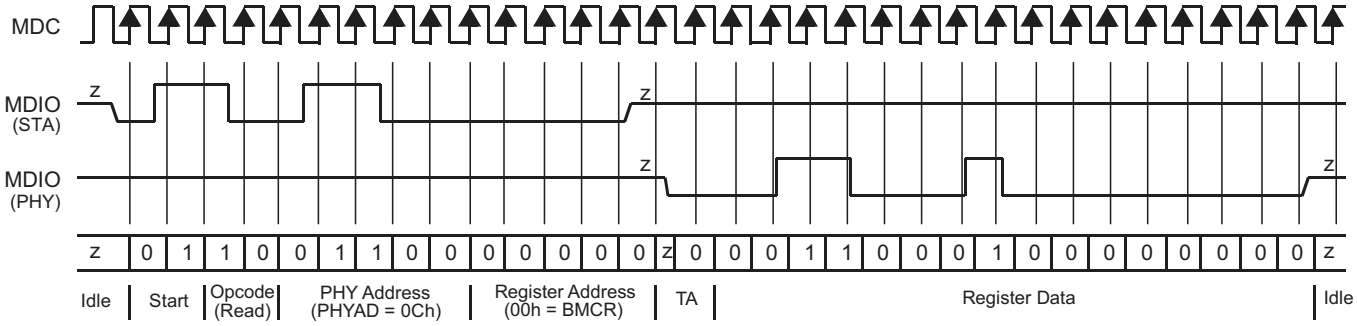

**图 5-2. Typical MDC/MDIO Read Operation**

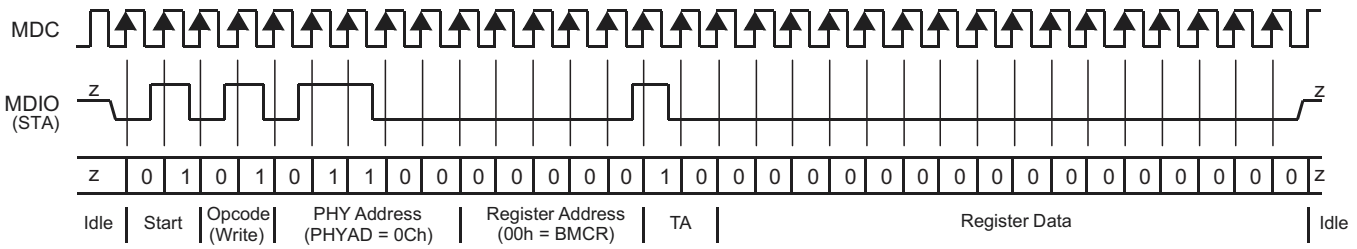

**图 5-3. Typical MDC/MDIO Write Operation**

### 5.4.3.3 Serial Management Preamble Suppression

The DP83848-EP supports a Preamble Suppression mode as indicated by a one in bit 6 of the Basic Mode Status Register (BMSR, address 01h.) If the station management entity (i.e. MAC or other management controller) determines that all PHYs in the system support Preamble Suppression by returning a one in this bit, then the station management entity need not generate preamble for each management transaction.

The DP83848-EP requires a single initialization sequence of 32 bits of preamble following hardware/software reset. This requirement is generally met by the mandatory pullup resistor on MDIO in conjunction with a continuous MDC, or the management access made to determine whether Preamble Suppression is supported.

While the DP83848-EP requires an initial preamble sequence of 32 bits for management initialization, it does not require a full 32-bit sequence between each subsequent transaction. A minimum of one idle bit between management transactions is required as specified in the IEEE 802.3u specification.

### 5.4.4 PHY Address

The 5 PHY address inputs pins are shared with the RXD[3:0] pins and COL pin are shown below.

**表 5-5. PHY Address Mapping**

| Pin No. | PHYAD Function | RXD Function |
|---|---|---|
| 42 | PHYAD0 | COL |
| 43 | PHYAD1 | RXD_0 |
| 44 | PHYAD2 | RXD_1 |
| 45 | PHYAD3 | RXD_2 |
| 46 | PHYAD4 | RXD_3 |

The DP83848-EP can be set to respond to any of 32 possible PHY addresses via strap pins. The information is latched into the PHYCR register (address 19h, bits [4:0]) at device power-up and hardware reset. The PHY Address pins are shared with the RXD and COL pins. Each DP83848-EP or port sharing an MDIO bus in a system must have a unique physical address.

The DP83848-EP supports PHY Address strapping values 0 (<00000>) through 31 (<11111>). Strapping PHY Address 0 puts the part into Isolate Mode. It should also be noted that selecting PHY Address 0 via an MDIO write to PHYCR will not put the device in Isolate Mode. See 节 5.4.4.1 for more information.

For further detail relating to the latch-in timing requirements of the PHY Address pins, as well as the other hardware configuration pins, refer to the Reset summary in 节 5.4.6.

Because the PHYAD[0] pin has weak internal pullup resistor and PHYAD[4:1] pins have weak internal pulldown resistors, the default setting for the PHY address is 00001 (0x01h).

Refer to 图 5-4 for an example of a PHYAD connection to external components. In this example, the PHYAD strapping results in address 000101 (0x03h).

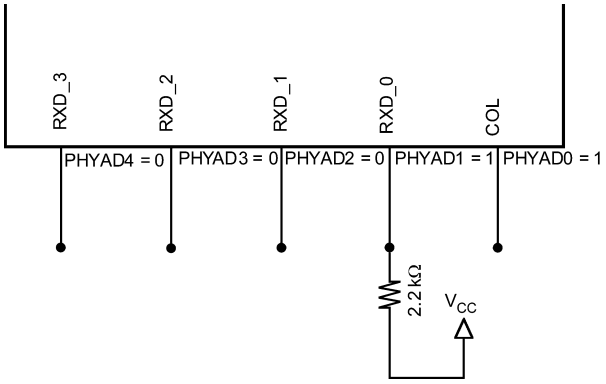

**图 5-4. PHYAD Strapping Example**

#### 5.4.4.1 MII Isolate Mode

The DP83848-EP can be put into MII Isolate mode by writing to bit 10 of the BMCR register or by strapping in Physical Address 0. It should be noted that selecting Physical Address 0 via an MDIO write to PHYCR will not put the device in the MII isolate mode.

When in the MII isolate mode, the DP83848-EP does not respond to packet data present at TXD[3:0], TX_EN inputs and presents a high impedance on the TX_CLK, RX_CLK, RX_DV, RX_ER, RXD[3:0], COL, and CRS outputs. When in Isolate mode, the DP83848-EP will continue to respond to all management transactions.

While in Isolate mode, the PMD output pair will not transmit packet data but will continue to source 100BASE-TX scrambled idles or 10BASE-T normal link pulses.

The DP83848-EP can Auto-Negotiate or parallel detect to a specific technology depending on the receive signal at the PMD input pair. A valid link can be established for the receiver even when the DP83848-EP is in Isolate mode.

### 5.4.5 Half Duplex vs Full Duplex

The DP83848-EP supports both half and full duplex operation at both 10 Mbps and 100 Mbps speeds.

Half-duplex relies on the CSMA/CD protocol to handle collisions and network access. In Half-Duplex mode, CRS responds to both transmit and receive activity in order to maintain compliance with the IEEE 802.3 specification.

Because the DP83848-EP is designed to support simultaneous transmit and receive activity, it is capable of supporting full-duplex switched applications with a throughput of up to 200 Mbps per port when operating in 100BASE-TX. CSMA/CD protocol does not apply to full-duplex operation so DP83848-EP disables its own internal collision sensing and reporting functions and modifies the behavior of Carrier Sense (CRS) such that it indicates only receive activity. This allows a full-duplex capable MAC to operate properly.

All modes of operation (100BASE-TX and 10BASE-T) can run either half-duplex or full-duplex. Additionally, other than CRS and Collision reporting, all remaining MII signaling remains the same regardless of the selected duplex mode.

It is important to understand that while Auto-Negotiation with the use of Fast Link Pulse code words can interpret and configure to full-duplex operation, parallel detection can not recognize the difference between full and half-duplex from a fixed 10-Mbps or 100-Mbps link partner over twisted pair. As specified in the 802.3u specification, if a far-end link partner is configured to a forced full duplex 100BASE-TX ability, the parallel detection state machine in the partner would be unable to detect the full duplex capability of the far-end link partner. This link segment would negotiate to a half duplex 100BASE-TX configuration (same scenario for 10 Mbps).

### 5.4.6 Reset Operation

The DP83848-EP includes an internal power-on reset (POR) function and does not need to be explicitly reset for normal operation after power up. If required during normal operation, the device can be reset by a hardware or software reset.

#### 5.4.6.1 Hardware Reset

A hardware reset is accomplished by applying a low pulse (TTL level), with a duration of at least 1 µs, to the RESET_N pin. This will reset the device such that all registers will be reinitialized to default values and the hardware configuration values will be re-latched into the device (similar to the power-up/reset operation).

#### 5.4.6.2 Software Reset

A software reset is accomplished by setting the reset bit (bit 15) of the Basic Mode Control Register (BMCR). The period from the point in time when the reset bit is set to the point in time when software reset has concluded is approximately 1 µs.

A software reset will reset the device such that all the registers will be re-initialized to default values and the hardware configuration values will be re-latched into the device. Software driver code must wait 3 µs following a software reset before allowing further serial MII operations with the DP83848-EP

## 5.5 Programming

### 5.5.1 Architecture

This section describes the operations within each transceiver module, 100BASE-TX and 10BASE-T. Each operation consists of several functional blocks and described in the following:

- 100BASE-TX Transmitter
- 100BASE-TX Receiver
- 10BASE-T Transceiver Module

#### 5.5.1.1 100BASE-TX Transmitter

The 100BASE-TX transmitter consists of several functional blocks which convert synchronous 4-bit nibble data, as provided by the MII, to a scrambled MLT-3 125-Mbps serial data stream. Because the 100BASE-TX TP-PMD is integrated, the differential output pins, PMD Output Pair, can be directly routed to the magnetics. The block diagram in 图 5-5 provides an overview of each functional block within the 100BASE-TX transmit section.

The Transmitter section consists of the following functional blocks:

- Code-group Encoder and Injection block
- Scrambler block (bypass option)
- NRZ to NRZI encoder block
- Binary to MLT-3 converter / Common Driver

The bypass option for the functional blocks within the 100BASE-TX transmitter provides flexibility for applications where data conversion is not always required. The DP83848-EP implements the 100BASE-TX transmit state machine diagram as specified in the IEEE 802.3u Standard, Clause 24.

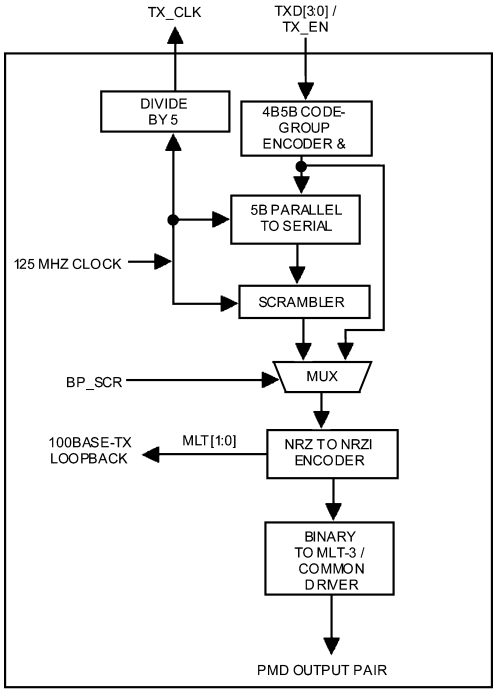

**图 5-5. 100BASE-TX Transmit Block Diagram**

| V | 01000 | |
| V | 01100 | |

(1) Control code-groups I, J, K, T, and R in data fields will be mapped as invalid codes, together with RX_ER asserted.

#### *5.5.1.1.1 Code-Group Encoding and Injection*

The code-group encoder converts 4-bit (4B) nibble data generated by the MAC into 5-bit (5B) code-groups for transmission. This conversion is required to allow control data to be combined with packet data code-groups. See 表 5-6 for 4B to 5B code-group mapping details.

The code-group encoder substitutes the first 8-bits of the MAC preamble with a J/K code-group pair (11000 10001) upon transmission. The code-group encoder continues to replace subsequent 4B preamble and data nibbles with corresponding 5B code-groups. At the end of the transmit packet, upon the deassertion of Transmit Enable signal from the MAC, the code-group encoder injects the T/R code-group pair (01101 00111) indicating the end of the frame.

After the T/R code-group pair, the code-group encoder continuously injects IDLEs into the transmit data stream until the next transmit packet is detected (reassertion of Transmit Enable).

#### 5.5.1.1.2 Scrambler

The scrambler is required to control the radiated emissions at the media connector and on the twisted-pair cable (for 100BASE-TX applications). By scrambling the data, the total energy launched onto the cable is randomly distributed over a wide frequency range. Without the scrambler, energy levels at the PMD and on the cable could peak beyond FCC limitations at frequencies related to repeating 5B sequences (that is, continuous transmission of IDLEs).

The scrambler is configured as a closed loop linear feedback shift register (LFSR) with an 11-bit polynomial. The output of the closed loop LFSR is X-ORd with the serial NRZ data from the code-group encoder. The result is a scrambled data stream with sufficient randomization to decrease radiated emissions at certain frequencies by as much as 20 dB. The DP83848-EP uses the PHY_ID (pins PHYAD [4:1]) to set a unique seed value.

#### 5.5.1.1.3 NRZ to NRZI Encoder

After the transmit data stream has been serialized and scrambled, the data must be NRZI encoded in order to comply with the TP-PMD standard for 100BASE-TX transmission over Category-5 Unshielded twisted-pair cable.

#### 5.5.1.1.4 Binary to MLT-3 Convertor

The Binary to MLT-3 conversion is accomplished by converting the serial binary data stream output from the NRZI encoder into two binary data streams with alternately phased logic one events. These two binary streams are then fed to the twisted-pair output driver which converts the voltage to current and alternately drives either side of the transmit transformer primary winding, resulting in a MLT-3 signal.

The 100BASE-TX MLT-3 signal sourced by the PMD Output Pair common driver is slew rate controlled. This should be considered when selecting AC coupling magnetics to ensure TP-PMD Standard compliant transition times (3 ns < Tr < 5 ns).

The 100BASE-TX transmit TP-PMD function within the DP83848-EP is capable of sourcing only MLT-3 encoded data. Binary output from the PMD Output Pair is not possible in 100 Mbps mode.

### 5.5.1.2 100BASE-TX Receiver

The 100BASE-TX receiver consists of several functional blocks which convert the scrambled MLT-3 125 Mbps serial data stream to synchronous 4-bit nibble data that is provided to the MII. Because the 100BASE-TX TP-PMD is integrated, the differential input pins, RD±, can be directly routed from the AC coupling magnetics.

See 图 5-6 for a block diagram of the 100BASE-TX receive function. This provides an overview of each functional block within the 100BASE-TX receive section.

The Receive section consists of the following functional blocks:

- Analog Front End
- Digital Signal Processor
- Signal Detect
- MLT-3 to Binary Decoder
- NRZI to NRZ Decoder
- Serial to Parallel
- Descrambler
- Code Group Alignment
- 4B/5B Decoder
- Link Integrity Monitor
- Bad SSD Detection

#### 5.5.1.2.1 Analog Front End

In addition to the Digital Equalization and Gain Control, the DP83848-EP includes Analog Equalization and Gain Control in the Analog Front End. The Analog Equalization reduces the amount of Digital Equalization required in the DSP.

#### 5.5.1.2.2 Digital Signal Processor

The Digital Signal Processor includes Adaptive Equalization with Gain Control and Base Line Wander Compensation.

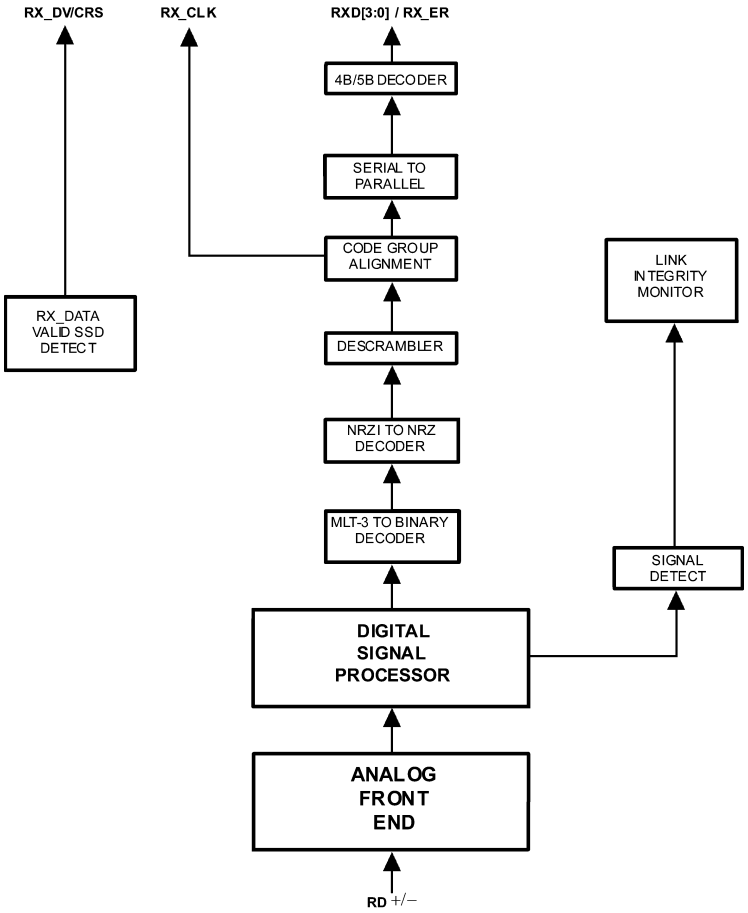

**图 5-6. 100BASE-TX Receive Block Diagram**

#### 5.5.1.2.2.1 Digital Adaptive Equalization and Gain Control

When transmitting data at high speeds over copper twisted-pair cable, frequency dependent attenuation becomes a concern. In high-speed twisted-pair signalling, the frequency content of the transmitted signal can vary greatly during normal operation based primarily on the randomness of the scrambled data stream. This variation in signal attenuation caused by frequency variations must be compensated to ensure the integrity of the transmission.

To ensure quality transmission when employing MLT-3 encoding, the compensation must be able to adapt to various cable lengths and cable types depending on the installed environment. The selection of long cable lengths for a given implementation, requires significant compensation which will over-compensate for shorter, less attenuating lengths. Conversely, the selection of short or intermediate cable lengths requiring less compensation will cause serious under-compensation for longer length cables. The compensation or equalization must be adaptive to ensure proper conditioning of the received signal independent of the cable length.

The DP83848-EP uses an extremely robust equalization scheme referred as 'Digital Adaptive Equalization.'

The Digital Equalizer removes ISI (inter symbol interference) from the receive data stream by continuously adapting to provide a filter with the inverse frequency response of the channel. Equalization is combined with an adaptive gain control stage. This enables the receive 'eye pattern' to be opened sufficiently to allow very reliable data recovery.

The curves given in 图 5-8 illustrate attenuation at certain frequencies for given cable lengths. This is derived from the worst case frequency vs attenuation figures as specified in the EIA/TIA Bulletin TSB-36. These curves indicate the significant variations in signal attenuation that must be compensated for by the receive adaptive equalization circuit.

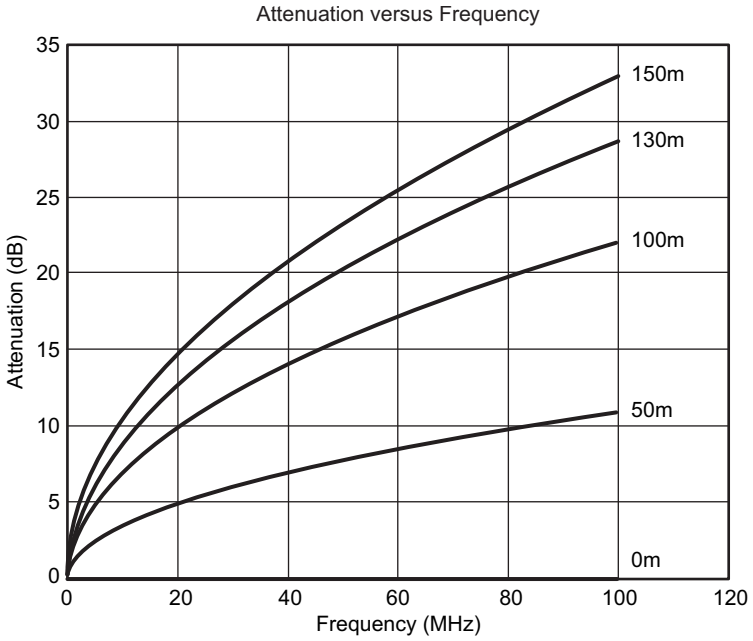

**图 5-7. EIA/TIA Attenuation vs Frequency for 0, 50, 100, 130, and 150 M of CAT 5 Cable**

#### *5.5.1.2.2.2 Base Line Wander Compensation*

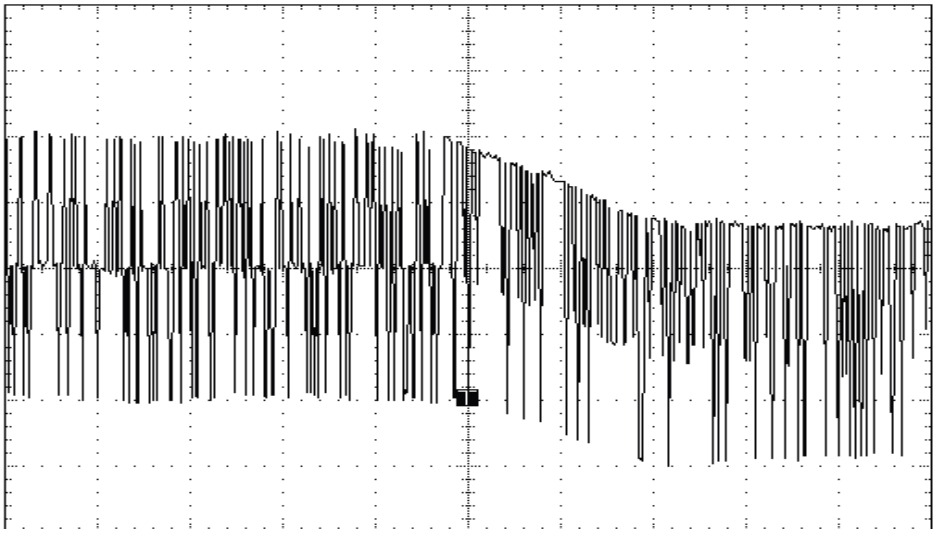

**图 5-8. 100BASE-TX BLW Event**

The DP83848-EP is completely ANSI TP-PMD compliant and includes Base Line Wander (BLW) compensation. The BLW compensation block can successfully recover the TP-PMD defined “killer” pattern.

BLW can generally be defined as the change in the average DC content, relatively short period over time, of an AC coupled digital transmission over a given transmission medium. (that is, copper wire).

BLW results from the interaction between the low frequency components of a transmitted bit stream and the frequency response of the AC coupling component(s) within the transmission system. If the low frequency content of the digital bit stream goes below the low frequency pole of the AC coupling transformers then the droop characteristics of the transformers will dominate resulting in potentially serious BLW.

The digital oscilloscope plot provided in 图 5-9 illustrates the severity of the BLW event that can theoretically be generated during 100BASE-TX packet transmission. This event consists of approximately 800 mV of DC offset for a period of 120 ms. Left uncompensated, events such as this can cause packet loss.

#### *5.5.1.2.3 Signal Detect*

The signal detect function of the DP83848-EP is incorporated to meet the specifications mandated by the ANSI FDDI TP-PMD Standard as well as the IEEE 802.3 100BASE-TX Standard for both voltage thresholds and timing parameters.

Note that the reception of normal 10BASE-T link pulses and fast link pulses per IEEE 802.3u Auto-Negotiation by the 100BASE-TX receiver do not cause the DP83848-EP to assert signal detect.

#### *5.5.1.2.4 MLT-3 to NRZI Decoder*

The DP83848-EP decodes the MLT-3 information from the Digital Adaptive Equalizer block to binary NRZI data.

#### *5.5.1.2.5 NRZI to NRZ*

In a typical application, the NRZI to NRZ decoder is required in order to present NRZ formatted data to the descrambler.

#### *5.5.1.2.6 Serial to Parallel*

The 100BASE-TX receiver includes a Serial to Parallel converter which supplies 5-bit wide data symbols to the PCS Rx state machine.

#### *5.5.1.2.7 Descrambler*

A serial descrambler is used to de-scramble the received NRZ data. The descrambler has to generate an identical data scrambling sequence (N) in order to recover the original unscrambled data (UD) from the scrambled data (SD) as represented in the equations:

$$SD = (UD \oplus N)$$
$$UD = (SD \oplus N) \quad (1)$$

Synchronization of the descrambler to the original scrambling sequence (N) is achieved based on the knowledge that the incoming scrambled data stream consists of scrambled IDLE data. After the descrambler has recognized 12 consecutive IDLE code-groups, where an unscrambled IDLE code-group in 5B NRZ is equal to five consecutive ones (11111), it will synchronize to the receive data stream and generate unscrambled data in the form of unaligned 5B code-groups.

In order to maintain synchronization, the descrambler must continuously monitor the validity of the unscrambled data that it generates. To ensure this, a line state monitor and a hold timer are used to constantly monitor the synchronization status. Upon synchronization of the descrambler the hold timer starts a 722-µs countdown. Upon detection of sufficient IDLE code-groups (58 bit times) within the 722-µs period, the hold timer will reset and begin a new countdown. This monitoring operation will continue indefinitely given a properly operating network connection with good signal integrity. If the line state monitor does not recognize sufficient unscrambled IDLE code-groups within the 722-µs period, the entire descrambler will be forced out of the current state of synchronization and reset in order to re-acquire synchronization.

#### *5.5.1.2.8 Code-group Alignment*

The code-group alignment module operates on unaligned 5-bit data from the descrambler (or, if the descrambler is bypassed, directly from the NRZI/NRZ decoder) and converts it into 5B code-group data (5 bits). Code-group alignment occurs after the J/K code-group pair is detected. Once the J/K code-group pair (11000 10001) is detected, subsequent data is aligned on a fixed boundary.

#### *5.5.1.2.9 4B/5B Decoder*

The code-group decoder functions as a look up table that translates incoming 5B code-groups into 4B nibbles. The code-group decoder first detects the J/K code-group pair preceded by IDLE code-groups and replaces the J/K with MAC preamble. Specifically, the J/K 10-bit code-group pair is replaced by the nibble pair (0101 0101). All subsequent 5B code-groups are converted to the corresponding 4B nibbles for the duration of the entire packet. This conversion ceases upon the detection of the T/R code-group pair denoting the End of Stream Delimiter (ESD) or with the reception of a minimum of two IDLE code-groups.

#### *5.5.1.2.10 100BASE-TX Link Integrity Monitor*

The 100 Base TX Link monitor ensures that a valid and stable link is established before enabling both the Transmit and Receive PCS layer.

Signal detect must be valid for 395 µs to allow the link monitor to enter the 'Link Up' state, and enable the transmit and receive functions.

#### *5.5.1.2.11 Bad SSD Detection*

A Bad Start of Stream Delimiter (Bad SSD) is any transition from consecutive idle code-groups to non-idle code-groups which is not prefixed by the code-group pair /J/K.

If this condition is detected, the DP83848-EP will assert RX_ER and present RXD[3:0] = 1110 to the MII for the cycles that correspond to received 5B code-groups until at least two IDLE code groups are detected. In addition, the False Carrier Sense Counter register (FCSCR) will be incremented by one.

Once at least two IDLE code groups are detected, RX_ER and CRS become de-asserted.

### 5.5.1.3 10BASE-T Transceiver Module

The 10BASE-T Transceiver Module is IEEE 802.3 compliant. It includes the receiver, transmitter, collision, heartbeat, loopback, jabber, and link integrity functions, as defined in the standard. An external filter is not required on the 10BASE-T interface because this is integrated inside the DP83848-EP. This section focuses on the general 10BASE-T system level operation.

#### *5.5.1.3.1 Operational Modes*

The DP83848-EP has two basic 10BASE-T operational modes:

- Half Duplex mode
- Full Duplex mode

#### 5.5.1.3.1.1 Half Duplex Mode

In Half Duplex mode the DP83848-EP functions as a standard IEEE 802.3 10BASE-T transceiver supporting the CSMA/CD protocol.

#### 5.5.1.3.1.2 Full Duplex Mode

In Full Duplex mode the DP83848-EP can simultaneously transmit and receive without asserting the collision signal. The 10-Mbps ENDEC is designed to encode and decode simultaneously.

### 5.5.1.3.2 Smart Squelch

The smart squelch is responsible for determining when valid data is present on the differential receive inputs. The DP83848-EP implements an intelligent receive squelch to ensure that impulse noise on the receive inputs will not be mistaken for a valid signal. Smart squelch operation is independent of the 10BASE-T operational mode.

The squelch circuitry employs a combination of amplitude and timing measurements (as specified in the IEEE 802.3 10BSE-T standard) to determine the validity of data on the twisted-pair inputs (see 图 5-9).

The signal at the start of a packet is checked by the smart squelch and any pulses not exceeding the squelch level (either positive or negative, depending upon polarity) will be rejected. Once this first squelch level is overcome correctly, the opposite squelch level must then be exceeded within 150 ns. Finally the signal must again exceed the original squelch level within 150 ns to ensure that the input waveform will not be rejected. This checking procedure results in the loss of typically three preamble bits at the beginning of each packet.

Only after all these conditions have been satisfied will a control signal be generated to indicate to the remainder of the circuitry that valid data is present. At this time, the smart squelch circuitry is reset.

Valid data is considered to be present until the squelch level has not been generated for a time longer than 150 ns, indicating the End of Packet. Once good data has been detected, the squelch levels are reduced to minimize the effect of noise causing premature End of Packet detection.

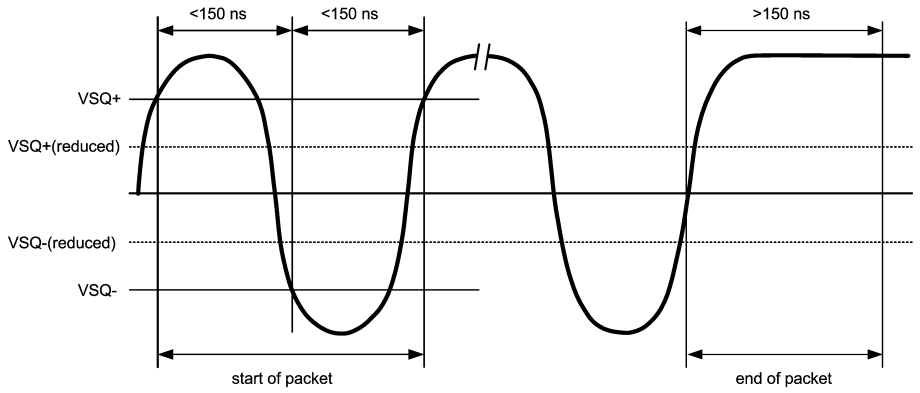

**图 5-9. 10BASE-T Twisted-Pair Smart Squelch Operation**

### 5.5.1.3.3 Collision Detection and SQE

When in Half Duplex, a 10BASE-T collision is detected when the receive and transmit channels are active simultaneously. Collisions are reported by the COL signal on the MII. Collisions are also reported when a jabber condition is detected.

The COL signal remains set for the duration of the collision. If the PHY is receiving when a collision is detected it is reported immediately (through the COL pin).

When heartbeat is enabled, approximately 1 µs after the transmission of each packet, a Signal Quality Error (SQE) signal of approximately 10-bit times is generated to indicate successful transmission. SQE is reported as a pulse on the COL signal of the MII.

The SQE test is inhibited when the PHY is set in full duplex mode. SQE can also be inhibited by setting the HEARTBEAT_DIS bit in the 10BTSCR register.

#### 5.5.1.3.4 Carrier Sense

Carrier Sense (CRS) may be asserted due to receive activity once valid data is detected via the squelch function.

For 10-Mbps Half Duplex operation, CRS is asserted during either packet transmission or reception.

For 10-Mbps Full Duplex operation, CRS is asserted only during receive activity.

CRS is deasserted following an end of packet.

#### 5.5.1.3.5 Normal Link Pulse Detection and Generation

The link pulse generator produces pulses as defined in the IEEE 802.3 10BASE-T standard. Each link pulse is nominally 100 ns in duration and transmitted every 16 ms in the absence of transmit data.

Link pulses are used to check the integrity of the connection with the remote end. If valid link pulses are not received, the link detector disables the 10BASE-T twisted-pair transmitter, receiver and collision detection functions.

When the link integrity function is disabled (FORCE_LINK_10 of the 10BTSCR register), a good link is forced and the 10BASE-T transceiver will operate regardless of the presence of link pulses.

#### 5.5.1.3.6 Jabber Function

The jabber function monitors the output of DP83848-EP and disables the transmitter if it tries to transmit a packet of longer than legal size. A jabber timer monitors the transmitter and disables the transmission if the transmitter is active for approximately 85 ms.

Once disabled by the Jabber function, the transmitter stays disabled for the entire time that the ENDEC module's internal transmit enable is asserted. This signal has to be de-asserted for approximately 500 ms (the “unjab” time) before the Jabber function re-enables the transmit outputs.

The Jabber function is only relevant in 10BASE-T mode.

#### 5.5.1.3.7 Automatic Link Polarity Detection and Correction

The DP83848-EP's 10BASE-T transceiver module incorporates an automatic link polarity detection circuit. When three consecutive inverted link pulses are received, bad polarity is reported.

A polarity reversal can be caused by a wiring error at either end of the cable, usually at the Main Distribution Frame (MDF) or patch panel in the wiring closet.

The bad polarity condition is latched in the 10BTSCR register. The DP83848-EP's 10BASE-T transceiver module corrects for this error internally and will continue to decode received data correctly. This eliminates the need to correct the wiring error immediately.

#### 5.5.1.3.8 Transmit and Receive Filtering

External 10BASE-T filters are not required when using the DP83848-EP, as the required signal conditioning is integrated into the device.

Only isolation transformers and impedance matching resistors are required for the 10BASE-T transmit and receive interface. The internal transmit filtering ensures that all the harmonics in the transmit signal are attenuated by at least 30 dB.

#### 5.5.1.3.9 Transmitter

The encoder begins operation when the Transmit Enable input (TX_EN) goes high and converts NRZ data to pre-emphasized Manchester data for the transceiver. For the duration of TX_EN, the serialized Transmit Data (TXD) is encoded for the transmit-driver pair (PMD Output Pair). TXD must be valid on the rising edge of Transmit Clock (TX_CLK). Transmission ends when TX_EN deasserts. The last transition is always positive; it occurs at the center of the bit cell if the last bit is a one, or at the end of the bit cell if the last bit is a zero.

#### 5.5.1.3.10 Receiver

The decoder detects the end of a frame when no additional mid-bit transitions are detected. Within one and a half bit times after the last bit, carrier sense is de-asserted. Receive clock stays active for five more bit times after CRS goes low, to ensure the receive timings of the controller.

## 5.6 Memory

### 5.6.1 Register Definition

In the register definitions under the 'Default' heading, the following definitions hold true:

- RW = Read Write access
- SC = Register sets on event occurrence and Self-Clears when event ends
- RW/SC = Read Write access/Self-Clearing bit
- RO = Read Only access
- COR = Clear on Read
- RO/COR = Read Only, Clear on Read
- RO/P = Read Only, Permanently set to a default value
- LL = Latched Low and held until read, based upon the occurrence of the corresponding event
- LH = Latched High and held until read, based upon the occurrence of the corresponding event

#### 5.6.1.1 Basic Mode Control Register (BMCR)

**表 5-9. Basic Mode Control Register (BMCR), Address 0x00**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | Reset | 0, RW/SC | Reset:<br>1 = Initiate software Reset/Reset in Process.<br>0 = Normal operation.<br>This bit, which is self-clearing, returns a value of one until the reset process is complete. The configuration is re-strapped. |
| 14 | Loopback | 0, RW | Loopback:<br>1 = Loopback enabled.<br>0 = Normal operation.<br>The loopback function enables MII transmit data to be routed to the MII receive data path.<br>Setting this bit may cause the descrambler to lose synchronization and produce a 500-µs dead time before any valid data will appear at the MII receive outputs. |
| 13 | Speed Selection | Strap, RW | Speed Select:<br>When auto-negotiation is disabled writing to this bit allows the port speed to be selected.<br>1 = 100 Mbps.<br>0 = 10 Mbps. |
| 12 | Auto-Negotiation Enable | Strap, RW | Auto-Negotiation Enable:<br>Strap controls initial value at reset.<br>1 = Auto-Negotiation Enabled - bits 8 and 13 of this register are ignored when this bit is set.<br>0 = Auto-Negotiation Disabled - bits 8 and 13 determine the port speed and duplex mode. |
| 11 | Power Down | 0, RW | Power Down:<br>1 = Power down.<br>0 = Normal operation.<br>Setting this bit powers down the PHY. Only the register block is enabled during a power down condition. This bit is OR'd with the input from the PWR_DOWN/INT pin. When the active low PWR_DOWN/INT pin is asserted, this bit will be set. |
| 10 | Isolate | 0, RW | Isolate:<br>1 = Isolates the Port from the MII with the exception of the serial management.<br>0 = Normal operation. |

**表 5-9. Basic Mode Control Register (BMCR), Address 0x00 (continued)**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 9 | Restart Auto-Negotiation | 0, RW/SC | Restart Auto-Negotiation:<br>1 = Restart Auto-Negotiation. Re-initiates the Auto-Negotiation process. If Auto-Negotiation is disabled (bit 12 = 0), this bit is ignored. This bit is self-clearing and will return a value of 1 until Auto-Negotiation is initiated, whereupon it will self-clear. Operation of the Auto-Negotiation process is not affected by the management entity clearing this bit.<br>0 = Normal operation. |
| 8 | Duplex Mode | Strap, RW | Duplex Mode:<br>When auto-negotiation is disabled writing to this bit allows the port Duplex capability to be selected.<br>1 = Full Duplex operation.<br>0 = Half Duplex operation. |
| 7 | Collision Test | 0, RW | Collision Test:<br>1 = Collision test enabled.<br>0 = Normal operation.<br>When set, this bit will cause the COL signal to be asserted in response to the assertion of TX_EN within 512-bit times. The COL signal will be de-asserted within 4-bit times in response to the de-assertion of TX_EN. |
| 6:00 | RESERVED | 0, RO | RESERVED: Write ignored, read as 0. |

### 5.6.1.2 Basic Mode Status Register (BMSR)

**表 5-10. Basic Mode Status Register (BMSR), Address 0x01**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | 100BASE-T4 | 0, RO/P | 100BASE-T4 Capable:<br>0 = Device not able to perform 100BASE-T4 mode |
| 14 | 100BASE-T Full Duplex | 1, RO/P | 100BASE-TX Full Duplex Capable:<br>1 = Device able to perform 100BASE-TX in full duplex mode |
| 13 | 100BASE-T Half Duplex | 1, RO/P | 100BASE-TX Half Duplex Capable:<br>1 = Device able to perform 100BASE-TX in half duplex mode |
| 12 | 10BASE-T Full Duplex | 1, RO/P | 10BASE-T Full Duplex Capable:<br>1 = Device able to perform 10BASE-T in full duplex mode |
| 11 | 10BASE-T Half Duplex | 1, RO/P | 10BASE-T Half Duplex Capable:<br>1 = Device able to perform 10BASE-T in half duplex mode |
| 10:07 | RESERVED | 0, RO | RESERVED: Write as 0, read as 0 |
| 6 | MF Preamble Suppression | 1, RO/P | Preamble suppression Capable:<br>1 = Device able to perform management transaction with preamble suppressed, 32-bits of preamble needed only once after reset, invalid opcode or invalid turnaround.<br>0 = Normal management operation |
| 5 | Auto-Negotiation Com- plete | 0, RO | Auto-Negotiation Complete:<br>1 = Auto-Negotiation process complete<br>0 = Auto-Negotiation process not complete |
| 4 | Remote Fault | 0, RO/LH | Remote Fault:<br>1 = Remote Fault condition detected (cleared on read or by reset). Fault criteria: Far End Fault Indication or notification from Link Partner of Remote Fault.<br>0 = No remote fault condition detected |
| 3 | Auto-Negotiation Ability | 1, RO/P | Auto Negotiation Ability:<br>1 = Device is able to perform Auto-Negotiation<br>0 = Device is not able to perform Auto-Negotiation |

**表 5-10. Basic Mode Status Register (BMSR), Address 0x01 (continued)**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 2 | Link Status | 0, RO/LL | Link Status:<br>1 = Valid link established (for either 10 or 100 Mbps operation)<br>0 = Link not established<br>The criteria for link validity is implementation specific. The occurrence of a link failure condition will causes the Link Status bit to clear. Once cleared, this bit may only be set by establishing a good link condition and a read via the management interface. |
| 1 | Jabber Detect | 0, RO/LH | Jabber Detect: This bit only has meaning in 10 Mbps mode<br>1 = Jabber condition detected<br>0 = No Jabber<br>This bit is implemented with a latching function, such that the occurrence of a jabber condition causes it to set until it is cleared by a read to this register by the management interface or by a reset. |
| 0 | Extended Capability | 1, RO/P | Extended Capability:<br>1 = Extended register capabilities<br>0 = Basic register set capabilities only |

### 5.6.1.3 PHY Identifier Register #1 (PHYIDR1)

The PHY Identifier Registers #1 and #2 together form a unique identifier for the DP83848-EP. The Identifier consists of a concatenation of the Organizationally Unique Identifier (OUI), the vendor's model number and the model revision number. A PHY may return a value of zero in each of the 32 bits of the PHY Identifier if desired. The PHY Identifier is intended to support network management. National's IEEE assigned OUI is 080017h.

**表 5-11. PHY Identifier Register #1 (PHYIDR1), Address 0x02**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15:0 | OUI_MSB | <0010 0000 0000 0000>, RO/P | OUI Most Significant Bits: Bits 3 to 18 of the OUI (080017h) are stored in bits 15 to 0 of this register. The most significant two bits of the OUI are ignored (the IEEE standard refers to these as bits 1 and 2). |

### 5.6.1.4 PHY Identifier Register #2 (PHYIDR2)

**表 5-12. PHY Identifier Register #2 (PHYIDR2), Address 0x03**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15:10 | OUI_LSB | <0101 11>, RO/P | OUI Least Significant Bits:<br>Bits 19 to 24 of the OUI (080017h) are mapped from bits 15 to 10 of this register respectively. |
| 9:4 | VNDR_MDL | <00 1001 >, RO/P | Vendor Model Number:<br>The six bits of vendor model number are mapped from bits 9 to 4 (most significant bit to bit 9). |
| 3:0 | MDL_REV | <0000>, RO/P | Model Revision Number:<br>Four bits of the vendor model revision number are mapped from bits 3 to 0 (most significant bit to bit 3). This field will be incremented for all major device changes. |

#### 5.6.1.5 Auto-Negotiation Advertisement Register (ANAR)

This register contains the advertised abilities of this device as they will be transmitted to its link partner during Auto-Negotiation.

**表 5-13. Negotiation Advertisement Register (ANAR), Address 0x04**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | NP | 0, RW | Next Page Indication:<br>0 = Next Page Transfer not desired<br>1 = Next Page Transfer desired |
| 14 | RESERVED | 0, RO/P | RESERVED by IEEE: Writes ignored, Read as 0 |
| 13 | RF | 0, RW | Remote Fault:<br>1 = Advertises that this device has detected a Remote Fault<br>0 = No Remote Fault detected |
| 12 | RESERVED | 0, RW | RESERVED for Future IEEE use: Write as 0, Read as 0 |
| 11 | ASM_DIR | 0, RW | Asymmetric PAUSE Support for Full Duplex Links:<br>The ASM_DIR bit indicates that asymmetric PAUSE is supported.<br>Encoding and resolution of PAUSE bits is defined in IEEE 802.3 Annex 28B, Tables 28B-2 and 28B-3, respectively. Pause resolution status is reported in PHYCR[13:12].<br>1 = Advertise that the DTE (MAC) has implemented both the optional MAC control sublayer and the pause function as specified in clause 31 and annex 31B of 802.3u.<br>0 = No MAC based full duplex flow control |
| 10 | PAUSE | 0, RW | PAUSE Support for Full Duplex Links:<br>The PAUSE bit indicates that the device is capable of providing the symmetric PAUSE functions as defined in Annex 31B.<br>Encoding and resolution of PAUSE bits is defined in IEEE 802.3 Annex 28B, Tables 28B-2 and 28B-3, respectively. Pause resolution status is reported in PHYCR[13:12].<br>1 = Advertise that the DTE (MAC) has implemented both the optional MAC control sublayer and the pause function as specified in clause 31 and annex 31B of 802.3u.<br>0= No MAC based full duplex flow control |
| 9 | T4 | 0, RO/P | 100BASE-T4 Support:<br>1 = 100BASE-T4 is supported by the local device<br>0 = 100BASE-T4 not supported |
| 8 | TX_FD | Strap, RW | 100BASE-TX Full Duplex Support:<br>1 = 100BASE-TX Full Duplex is supported by the local device<br>0 = 100BASE-TX Full Duplex not supported |
| 7 | TX | Strap, RW | 100BASE-TX Support:<br>1 = 100BASE-TX is supported by the local device<br>0 = 100BASE-TX not supported |
| 6 | 10_FD | Strap, RW | 10BASE-T Full Duplex Support:<br>1 = 10BASE-T Full Duplex is supported by the local device<br>0 = 10BASE-T Full Duplex not supported |
| 5 | 10 | Strap, RW | 10BASE-T Support:<br>1 = 10BASE-T is supported by the local device<br>0 = 10BASE-T not supported |
| 4:0 | Selector | <00001>, RW | Protocol Selection Bits:<br>These bits contain the binary encoded protocol selector supported by this port. <00001> indicates that this device supports IEEE 802.3u. |

#### 5.6.1.6 Auto-Negotiation Link Partner Ability Register (ANLPAR) (BASE Page)

This register contains the advertised abilities of the link partner as received during auto-negotiation. The content changes after the successful auto-negotiation if next-pages are supported.

**表 5-14. Auto-Negotiation Link Partner Ability Register (ANLPAR) (BASE Page), Address 0x05**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | NP | 0, RO | Next Page Indication:<br>0 = Link Partner does not desire Next Page Transfer<br>1 = Link Partner desires Next Page Transfer |
| 14 | ACK | 0, RO | Acknowledge:<br>1 = Link Partner acknowledges reception of the ability data word<br>0 = Not acknowledged<br>The Auto-Negotiation state machine will automatically control the this bit based on the incoming FLP bursts. |
| 13 | RF | 0, RO | Remote Fault:<br>1 = Remote Fault indicated by Link Partner<br>0 = No Remote Fault indicated by Link Partner |
| 12 | RESERVED | 0, RO | RESERVED for Future IEEE use: Write as 0, read as 0 |
| 11 | ASM_DIR | 0, RO | ASYMMETRIC PAUSE:<br>1 = Asymmetric pause is supported by the Link Partner<br>0 = Asymmetric pause is not supported by the Link Partner |
| 10 | PAUSE | 0, RO | PAUSE:<br>1 = Pause function is supported by the Link Partner<br>0 = Pause function is not supported by the Link Partner |
| 9 | T4 | 0, RO | 100BASE-T4 Support:<br>1 = 100BASE-T4 is supported by the Link Partner<br>0 = 100BASE-T4 not supported by the Link Partner |
| 8 | TX_FD | 0, RO | 100BASE-TX Full Duplex Support:<br>1 = 100BASE-TX Full Duplex is supported by the Link Partner<br>0 = 100BASE-TX Full Duplex not supported by the Link Partner |
| 7 | TX | 0, RO | 100BASE-TX Support:<br>1 = 100BASE-TX is supported by the Link Partner<br>0 = 100BASE-TX not supported by the Link Partner |
| 6 | 10_FD | 0, RO | 10BASE-T Full Duplex Support:<br>1 = 10BASE-T Full Duplex is supported by the Link Partner<br>0 = 10BASE-T Full Duplex not supported by the Link Partner |
| 5 | 10 | 0, RO | 10BASE-T Support:<br>1 = 10BASE-T is supported by the Link Partner<br>0 = 10BASE-T not supported by the Link Partner |
| 4:0 | Selector | <0 0000>, RO | Protocol Selection Bits:<br>Link Partner's binary encoded protocol selector |

#### 5.6.1.7 Auto-Negotiation Link Partner Ability Register (ANLPAR) (Next Page)

**表 5-15. Auto-Negotiation Link Partner Ability Register (ANLPAR) (Next Page), Address 0x05**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | NP | 0, RO | Next Page Indication:<br>1 = Link Partner desires Next Page Transfer<br>0 = Link Partner does not desire Next Page Transfer |

**表 5-15. Auto-Negotiation Link Partner Ability Register (ANLPAR) (Next Page), Address 0x05 (continued)**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 14 | ACK | 0, RO | Acknowledge:<br>1 = Link Partner acknowledges reception of the ability data word<br>0 = Not acknowledged<br>The Auto-Negotiation state machine will automatically control the this bit based on the incoming FLP bursts. Software should not attempt to write to this bit. |
| 13 | MP | 0, RO | Message Page:<br>1 = Message Page<br>0 = Unformatted Page |
| 12 | ACK2 | 0, RO | Acknowledge 2:<br>1 = Link Partner does have the ability to comply to next page message<br>0 = Link Partner does not have the ability to comply to next page message |
| 11 | Toggle | 0, RO | Toggle:<br>1 = Previous value of the transmitted Link Code word equalled 0<br>0 = Previous value of the transmitted Link Code word equalled 1 |
| 10:0 | CODE | <000 0000 0000>, RO | Code:<br>This field represents the code field of the next page transmission. If the MP bit is set (bit 13 of this register), then the code shall be interpreted as a “Message Page,” as defined in annex 28C of Clause 28. Otherwise, the code shall be interpreted as an “Unformatted Page,” and the interpretation is application specific. |

### 5.6.1.8 Auto-Negotiate Expansion Register (ANER)

This register contains additional local device and link partner status information.

**表 5-16. Auto-Negotiate Expansion Register (ANER), Address 0x06**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15:5 | RESERVED | 0, RO | RESERVED: Writes ignored, Read as 0 |
| 4 | PDF | 0, RO | Parallel Detection Fault:<br>1 = A fault has been detected via the Parallel Detection function<br>0 = A fault has not been detected |
| 3 | LP_NP_ABLE | 0, RO | Link Partner Next Page Able:<br>1 = Link Partner does support Next Page<br>0 = Link Partner does not support Next Page |
| 2 | NP_ABLE | 1, RO/P | Next Page Able:<br>1 = Indicates local device is able to send additional “Next Pages” |
| 1 | PAGE_RX | 0, RO/COR | Link Code Word Page Received:<br>1 = Link Code Word has been received, cleared on a read<br>0 = Link Code Word has not been received |
| 0 | LP_AN_ABLE | 0, RO | Link Partner Auto-Negotiation Able:<br>1 = indicates that the Link Partner supports Auto-Negotiation<br>0 = indicates that the Link Partner does not support Auto-Negotiation |

#### 5.6.1.9 Auto-Negotiation Next Page Transmit Register (ANNPTR)

This register contains the next page information sent by this device to its link partner during auto-negotiation.

**表 5-17. Auto-Negotiation Next Page Transmit Register (ANNPTR), Address 0x07**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | NP | 0, RW | Next Page Indication:<br>0 = No other Next Page Transfer desired<br>1 = Another Next Page desired |
| 14 | RESERVED | 0, RO | RESERVED: Writes ignored, read as 0 |
| 13 | MP | 1, RW | Message Page:<br>1 = Message Page<br>0 = Unformatted Page |
| 12 | ACK2 | 0, RW | Acknowledge2:<br>1 = Will comply with message<br>0 = Cannot comply with message<br>Acknowledge2 is used by the next page function to indicate that Local Device has the ability to comply with the message received. |
| 11 | TOG_TX | 0, RO | Toggle:<br>1 = Value of toggle bit in previously transmitted Link Code Word was 0<br>0 = Value of toggle bit in previously transmitted Link Code Word was 1<br>Toggle is used by the Arbitration function within Auto-Negotiation to ensure synchronization with the Link Partner during Next Page exchange. This bit shall always take the opposite value of the Toggle bit in the previously exchanged Link Code Word. |
| 10:0 | CODE | <000 0000 0001>, RW | This field represents the code field of the next page transmission. If the MP bit is set (bit 13 of this register), then the code shall be interpreted as a "Message Page", as defined in annex 28C of IEEE 802.3u. Otherwise, the code shall be interpreted as an "Unformatted Page", and the interpretation is application specific.<br>The default value of the CODE represents a Null Page as defined in Annex 28C of IEEE 802.3u. |

### 5.6.2 Extended Registers

#### 5.6.2.1 PHY Status Register (PHYSTS)

This register provides a single location within the register set for quick access to commonly accessed information.

**表 5-18. PHY Status Register (PHYSTS), Address 0x10**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | RESERVED | 0, RO | RESERVED: Write ignored, read as 0 |
| 14 | MDI-X Mode | 0, RO | MDI-X mode as reported by the Auto-Negotiation logic:<br>This bit will be affected by the settings of the MDIX_EN and FORCE_MDIX bits in the PHYCR register. When MDIX is enabled, but not forced, this bit will update dynamically as the Auto-MDIX algorithm swaps between MDI and MDI-X configurations.<br>1 = MDI pairs swapped<br>(Receive on TPTD pair, Transmit on TPRD pair)<br>0 = MDI pairs normal<br>(Receive on TRD pair, Transmit on TPTD pair) |
| 13 | Receive Error Latch | 0, RO/LH | Receive Error Latch:<br>This bit will be cleared upon a read of the RECR register.<br>1 = Receive error event has occurred since last read of RXERCNT (address 0x15, Page 0)<br>0 = No receive error event has occurred |
| 12 | Polarity Status | 0, RO | Polarity Status:<br>This bit is a duplication of bit 4 in the 10BTSCR register. This bit will be cleared upon a read of the 10BTSCR register, but not upon a read of the PHYSTS register.<br>1 = Inverted Polarity detected<br>0 = Correct Polarity detected |
| 11 | False Carrier Sense Latch | 0, RO/LH | False Carrier Sense Latch:<br>This bit will be cleared upon a read of the FCSR register.<br>1 = False Carrier event has occurred since last read of FCSCR (address 0x14)<br>0 = No False Carrier event has occurred |
| 10 | Signal Detect | 0, RO/LL | 100Base-TX unconditional Signal Detect from PMD |
| 9 | Descrambler Lock | 0, RO/LL | 100Base-TX Descrambler Lock from PMD |
| 8 | Page Received | 0, RO | Link Code Word Page Received:<br>This is a duplicate of the Page Received bit in the ANER register, but this bit will not be cleared upon a read of the PHYSTS register.<br>1 = A new Link Code Word Page has been received. Cleared on read of the ANER (address 0x06, bit 1)<br>0 = Link Code Word Page has not been received |
| 7 | MII Interrupt | 0, RO | MII Interrupt Pending:<br>1 = Indicates that an internal interrupt is pending. Interrupt source can be determined by reading the MISR Register (0x12h). Reading the MISR will clear the Interrupt.<br>0= No interrupt pending |
| 6 | Remote Fault | 0, RO | Remote Fault:<br>1 = Remote Fault condition detected (cleared on read of BMSR (address 01h) register or by reset). Fault criteria: notification from Link Partner of Remote Fault via Auto-Negotiation.<br>0 = No remote fault condition detected |

**表 5-18. PHY Status Register (PHYSTS), Address 0x10 (continued)**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 5 | Jabber Detect | 0, RO | Jabber Detect: This bit only has meaning in 10 Mbps mode<br>This bit is a duplicate of the Jabber Detect bit in the BMSR register, except that it is not cleared upon a read of the PHYSTS register.<br>1 = Jabber condition detected<br>0 = No Jabber |
| 4 | Auto-Neg Complete | 0, RO | Auto-Negotiation Complete:<br>1 = Auto-Negotiation complete<br>0 = Auto-Negotiation not complete |
| 3 | Loopback Status | 0, RO | Loopback:<br>1 = Loopback enabled<br>0 = Normal operation |
| 2 | Duplex Status | 0, RO | Duplex:<br>This bit indicates duplex status and is determined from Auto-Negotiation or Forced Modes.<br>1 = Full duplex mode<br>0 = Half duplex mode<br>Note: This bit is only valid if Auto-Negotiation is enabled and complete and there is a valid link or if Auto-Negotiation is disabled and there is a valid link. |
| 1 | Speed Status | 0, RO | Speed10:<br>This bit indicates the status of the speed and is determined from Auto-Negotiation or Forced Modes.<br>1 = 10 Mbps mode<br>0 = 100 Mbps mode<br>Note: This bit is only valid if Auto-Negotiation is enabled and complete and there is a valid link or if Auto-Negotiation is disabled and there is a valid link. |
| 0 | Link Status | 0, RO | Link Status:<br>This bit is a duplicate of the Link Status bit in the BMSR register, except that it will not be cleared upon a read of the PHYSTS register.<br>1 = Valid link established (for either 10 or 100 Mbps operation)<br>0 = Link not established |

#### 5.6.2.2 MII Interrupt Control Register (MICR)

This register implements the MII interrupt PHY specific control register. Sources for interrupt generation include: energy detect state change, link state change, speed status change, duplex status change, auto-negotiation complete or any of the counters becoming half-full. The individual interrupt events must be enabled by setting bits in the MII interrupt status and event control register (MISR).

**表 5-19. MII Interrupt Control Register (MICR), Address 0x11**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15:3 | RESERVED | 0, RO | Reserved: Write ignored, Read as 0 |
| 2 | TINT | 0, RW | Test Interrupt:<br>Forces the PHY to generate an interrupt to facilitate interrupt testing. Interrupts will continue to be generated as long as this bit remains set.<br>1 = Generate an interrupt<br>0 = Do not generate interrupt |

**表 5-19. MII Interrupt Control Register (MICR), Address 0x11 (continued)**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 1 | INTEN | 0, RW | Interrupt Enable:<br>Enable interrupt dependent on the event enables in the MISR register.<br>1 = Enable event based interrupts<br>0 = Disable event based interrupts |
| 0 | INT_OE | 0, RW | Interrupt Output Enable:<br>Enable interrupt events to signal via the PWR_DOWN/INT pin by configuring the PWR_DOWN/INT pin as an output.<br>1 = PWR_DOWN/INT is an Interrupt Output<br>0 = PWR_DOWN/INT is a Power Down Input |

#### 5.6.2.3 MII Interrupt Status and Miscellaneous Control Register (MISR)

This register contains event status and enables for the interrupt function. If an event has occurred since the last read of this register, the corresponding status bit will be set. If the corresponding enable bit in the register is set, an interrupt will be generated if the event occurs. The MICR register controls must also be set to allow interrupts. The status indications in this register will be set even if the interrupt is not enabled.

**表 5-20. MII Interrupt Status and Miscellaneous Control Register (MISR), Address 0x12**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | RESERVED | 0, RO | RESERVED: Writes ignored, Read as 0 |
| 14 | ED_INT | 0, RO/COR | Energy Detect interrupt:<br>1 = Energy detect interrupt is pending and is cleared by the current read<br>0 = No energy detect interrupt pending |
| 13 | LINK_INT | 0, RO/COR | Change of Link Status interrupt:<br>1 = Change of link status interrupt is pending and is cleared by the current read<br>0 = No change of link status interrupt pending |
| 12 | SPD_INT | 0, RO/COR | Change of speed status interrupt:<br>1 = Speed status change interrupt is pending and is cleared by the current read<br>0 = No speed status change interrupt pending |
| 11 | DUP_INT | 0, RO/COR | Change of duplex status interrupt:<br>1 = Duplex status change interrupt is pending and is cleared by the current read<br>0 = No duplex status change interrupt pending |
| 10 | ANC_INT | 0, RO/COR | Auto-Negotiation Complete interrupt:<br>1 = Auto-negotiation complete interrupt is pending and is cleared by the current read<br>0 = No Auto-negotiation complete interrupt pending |

| 4 | SPD_INT_EN | 0, RW | Enable Interrupt on change of speed status |
| 3 | DUP_INT_EN | 0, RW | Enable Interrupt on change of duplex status |
| 2 | ANC_INT_EN | 0, RW | Enable Interrupt on Auto-negotiation complete event |
| 1 | FHF_INT_EN | 0, RW | Enable Interrupt on False Carrier Counter Register half-full event |
| 0 | RHF_INT_EN | 0, RW | Enable Interrupt on Receive Error Counter Register half-full event |

#### 5.6.2.4 False Carrier Sense Counter Register (FCSCR)

This counter provides information required to implement the “False Carriers” attribute within the MAU managed object class of Clause 30 of the IEEE 802.3u specification.

表 5-21. False Carrier Sense Counter Register (FCSCR), Address 0x14

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15:8 | RESERVED | 0, RO | RESERVED: Writes ignored, Read as 0 |
| 7:0 | FCSCNT[7:0] | 0, RO/COR | False Carrier Event Counter:<br>This 8-bit counter increments on every false carrier event. This counter sticks when it reaches its max count (FFh). |

#### 5.6.2.5 Receiver Error Counter Register (RECR)

This counter provides information required to implement the “Symbol Error During Carrier” attribute within the PHY managed object class of Clause 30 of the IEEE 802.3u specification.

表 5-22. Receiver Error Counter Register (RECR), Address 0x15

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15:8 | RESERVED | 0, RO | RESERVED: Writes ignored, Read as 0 |
| 7:0 | RXERCNT[7:0] | 0, RO/COR | RX_ER Counter:<br>When a valid carrier is present and there is at least one occurrence of an invalid data symbol, this 8-bit counter increments for each receive error detected. This event can increment only once per valid carrier event. If a collision is present, the attribute will not increment. The counter sticks when it reaches its max count. |

#### 5.6.2.6 100 Mbps PCS Configuration and Status Register (PCSR)

This register contains event status and enables for the interrupt function. If an event has occurred since the last read of this register, the corresponding status bit will be set. If the corresponding enable bit in the register is set, an interrupt will be generated if the event occurs. The MICR register controls must also be set to allow interrupts. The status indications in this register will be set even if the interrupt is not enabled.

表 5-23. 100 Mbps PCS Configuration and Status Register (PCSR), Address 0x16

### 5.6.2.12 Energy Detect Control (EDCR)

**表 5-29. Energy Detect Control (EDCR), Address 0x1D**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 15 | ED_EN | 0, RW | Energy Detect Enable:<br>Allow Energy Detect Mode.<br>When Energy Detect is enabled and Auto-Negotiation is disabled via the BMCR register, Auto-MDIX should be disabled via the PHYCR register. |
| 14 | ED_AUTO_UP | 1, RW | Energy Detect Automatic Power Up:<br>Automatically begin power up sequence when Energy Detect Data Threshold value (EDCR[3:0]) is reached. Alternatively, device could be powered up manually using the ED_MAN bit (ECDR[12]). |
| 13 | ED_AUTO_DOWN | 1, RW | Energy Detect Automatic Power Down:<br>Automatically begin power down sequence when no energy is detected. Alternatively, device could be powered down using the ED_MAN bit (EDCR[12]). |
| 12 | ED_MAN | 0, RW/SC | Energy Detect Manual Power Up/Down:<br>Begin power up/down sequence when this bit is asserted. When set, the Energy Detect algorithm will initiate a change of Energy Detect state regardless of threshold (error or data) and timer values. In managed applications, this bit can be set after clearing the Energy Detect interrupt to control the timing of changing the power state. |

**表 5-29. Energy Detect Control (EDCR), Address 0x1D (continued)**

| BIT | BIT NAME | DEFAULT | DESCRIPTION |
|---|---|---|---|
| 11 | ED_BURST_DIS | 0, RW | Energy Detect Bust Disable:<br>Disable bursting of energy detect data pulses. By default, Energy Detect (ED) transmits a burst of 4 ED data pulses each time the CD is powered up. When bursting is disabled, only a single ED data pulse will be send each time the CD is powered up. |
| 10 | ED_PWR_STATE | 0, RO | Energy Detect Power State:<br>Indicates current Energy Detect Power state. When set, Energy Detect is in the powered up state. When cleared, Energy Detect is in the powered down state. This bit is invalid when Energy Detect is not enabled. |
| 9 | ED_ERR_MET | 0, RO/COR | Energy Detect Error Threshold Met:<br>No action is automatically taken upon receipt of error events. This bit is informational only and would be cleared on a read. |
| 8 | ED_DATA_MET | 0, RO/COR | Energy Detect Data Threshold Met:<br>The number of data events that occurred met or surpassed the Energy Detect Data Threshold. This bit is cleared on a read. |
| 7:4 | ED_ERR_COUNT | 0001, RW | Energy Detect Error Threshold:<br>Threshold to determine the number of energy detect error events that should cause the device to take action. Intended to allow averaging of noise that may be on the line. Counter will reset after approximately 2 seconds without any energy detect data events. |
| 3:0 | ED_DATA_COUNT | 0001, RW | Energy Detect Data Threshold:<br>Threshold to determine the number of energy detect events that should cause the device to take actions. Intended to allow averaging of noise that may be on the line. Counter will reset after approximately 2 seconds without any energy detect data events. |

# 6 Application and Implementation

**注**

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 6.1 Application Information

The device is a physical layer Ethernet transceiver. Typical operating voltage is 3.3 V with typical power consumption less than 270 mW. When using the device for Ethernet application, it is necessary to meet certain requirements for normal operation of device. Following typical application and design requirements can be used for selecting appropriate component values for DP83848-EP.

## 6.2 Typical Application

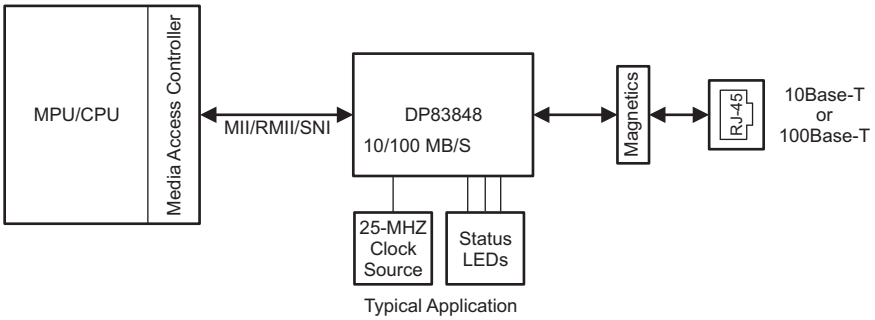

**图 6-1. Typical Application**

### *6.2.1 Design Requirements*

The design requirements for DP83848-EP are:

- Vin = 3.3 V
- Vout = Vcc – 0.5 V
- Clock input = 25 MHz for MII and 50 MHz for RMII

#### 6.2.1.1 TPI Network Circuit

图 6-2 shows the recommended circuit for a 10/100 Mbps twisted pair interface. It is important that the user realize that variations with PCB and component characteristics requires that the application be tested to ensure that the circuit meets the requirements of the intended application.

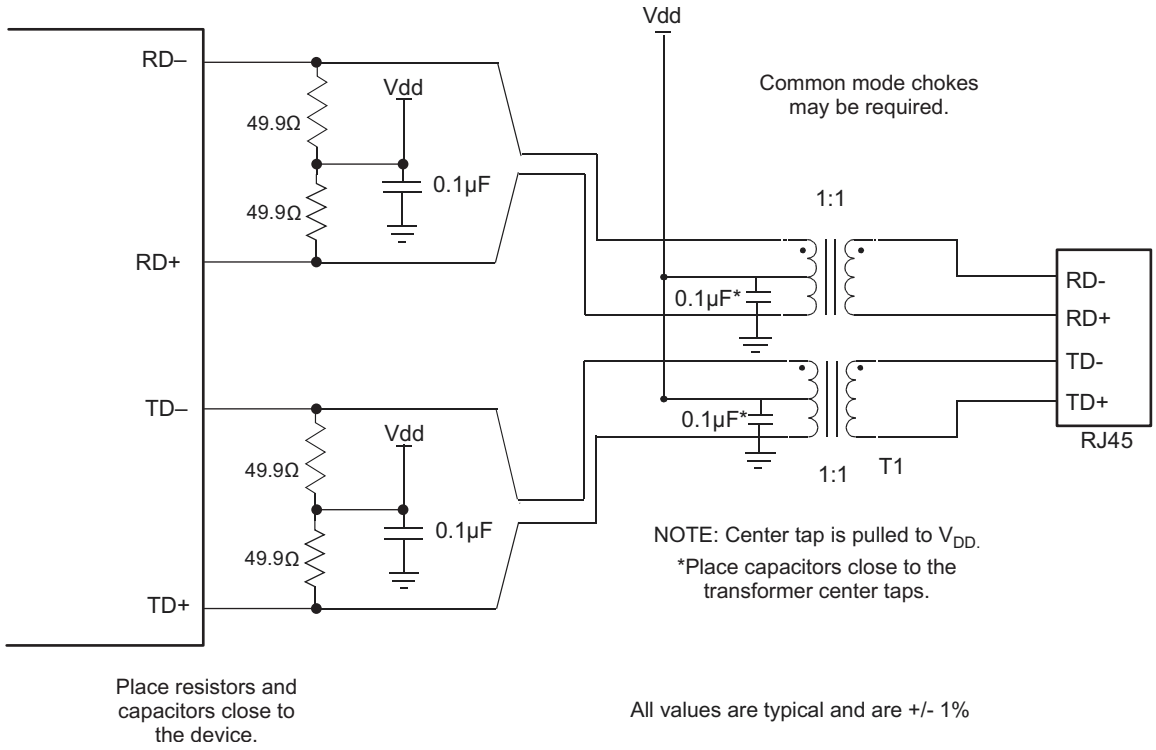

**图 6-2. 10/100 Mbps Twisted Pair Interface**

### 6.2.1.2 Clock IN (X1) Requirements

The DP83848-EP supports an external CMOS level oscillator source or a crystal resonator device.

**Oscillator**

If an external clock source is used, X1 should be tied to the clock source and X2 should be left floating.

Specifications for CMOS oscillators: 25 MHz in MII Mode and 50 MHz in RMII Mode are listed in 表 6-1 and 表 6-2.

**Crystal**

A 25-MHz, parallel, 20-pF load crystal resonator should be used if a crystal source is desired. 图 6-4 shows a typical connection for a crystal resonator circuit. The load capacitor values will vary with the crystal vendors; check with the vendor for the recommended loads.

The oscillator circuit is designed to drive a parallel resonance AT cut crystal with a minimum drive level of 100 mW and a maximum of 500 µW. If a crystal is specified for a lower drive level, a current limiting resistor should be placed in series between X2 and the crystal.

As a starting point for evaluating an oscillator circuit, if the requirements for the crystal are not known, $C_{L1}$ and $C_{L2}$ should be set at 33 pF, and $R_1$ should be set at 0 Ω.

Specification for 25-MHz crystal are listed in 表 6-3.

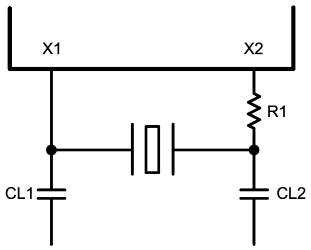

**图 6-3. Crystal Oscillator Circuit**

**表 6-1. 25-MHz Oscillator Specification**

| PARAMETER | MIN | TYP | MAX | UNIT | CONDITION |
|---|---|---|---|---|---|
| Frequency | | 25 | | MHz | |
| Frequency Tolerance | | | ±50 | ppm | Operational Temperature |
| Frequency Stability | | | ±50 | ppm | 1 year aging |
| Rise / Fall Time | | | 6 | nsec | 20% - 80% |
| Jitter | | | 800(1) | psec | Short term |
| Jitter | | | 800(1) | psec | Long term |
| Symmetry | 40% | | 60% | | Duty Cycle |

(1) This limit is provided as a guideline for component selection and not specified by production testing. Refer to SNLA091, *PHYTER 100 Base-TX Reference Clock Jitter Tolerance*, for details on jitter performance.

**表 6-2. 50-MHz Oscillator Specification**

| PARAMETER | MIN | TYP | MAX | UNIT | CONDITION |
|---|---|---|---|---|---|
| Frequency | | 50 | | MHz | |
| Frequency Tolerance | | | ±50 | ppm | Operational Temperature |
| Frequency Stability | | | ±50 | ppm | Operational Temperature |
| Rise / Fall Time | | | 6 | nsec | 20% - 80% |
| Jitter | | | 800(1) | psec | Short term |
| Jitter | | | 800(1) | psec | Long term |
| Symmetry | 40% | | 60% | | Duty Cycle |

(1) This limit is provided as a guideline for component selection and not specified by production testing. Refer to SNLA091, *PHYTER 100 Base-TX Reference Clock Jitter Tolerance*, for details on jitter performance.

**表 6-3. 25-MHz Crystal Specification**

| PARAMETER | MIN | TYP | MAX | UNIT | CONDITION |
|---|---|---|---|---|---|
| Frequency | | 25 | | MHz | |
| Frequency Tolerance | | | ±50 | ppm | Operational Temperature |
| Frequency Stability | | | ±50 | ppm | 1 year aging |
| Load Capacitance | 25 | | 40 | pF | |

#### 6.2.1.3 Power Feedback Circuit

To ensure correct operation for the DP83848-EP, parallel caps with values of 10 µF and 0.1 µF should be placed close to pin 23 (**PFBOUT**) of the device.

Pin 18 (**PFBIN1**), pin 37 (**PFBIN2**), pin 23 (**PFBIN3**) and pin 54 (**PFBIN4**) must be connected to pin 31 (**PFBOUT**), each pin requires a small capacitor (0.1 µF). See 图 6-4 below for proper connections.

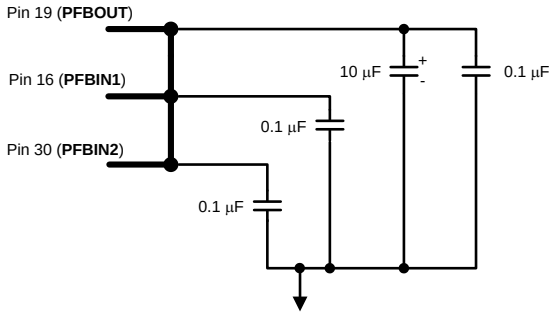

**图 6-4. Power Feedback Connection**

#### 6.2.1.4 Power Down and Interrupt

The power down and interrupt functions are multiplexed on pin 7 of the device. By default, this pin functions as a power down input and the interrupt function is disabled. Setting bit 0 (INT_OE) of MICR (0x11h) will configure the pin as an active low interrupt output.

##### *6.2.1.4.1 Power Down Control Mode*

The PWR_DOWN/INT pin can be asserted low to put the device in a power down mode. This is equivalent to setting bit 11 (power down) in the basic mode control register, BMCR (0x00h). An external control signal can be used to drive the pin low, overcoming the weak internal pullup resistor. Alternatively, the device can be configured to initialize into a power down state by use of an external pulldown resistor on the PWR_DOWN/INT pin. Since the device will still respond to management register accesses, setting the INT_OE bit in the MICR register will disable the PWR_DOWN/INT input, allowing the device to exit the power down state.

##### *6.2.1.4.2 Interrupt Mechanisms*

The interrupt function is controlled via register access. All interrupt sources are disabled by default. Setting bit 1 (INTEN) of MICR (0x11h) will enable interrupts to be output, dependent on the interrupt mask set in the lower byte of the MISR (0x12h). The PWR_DOWN/INT pin is asynchronously asserted low when an interrupt condition occurs. The source of the interrupt can be determined by reading the upper byte of the MISR. One or more bits in the MISR will be set, denoting all currently pending interrupts. Reading of the MISR clears ALL pending interrupts.

Example: To generate an interrupt on a change of link status or on a change of energy detect power state, the steps would be:

- Write 0003h to MICR to set INTEN and INT_OE
- Write 0060h to MISR to set ED_INT_EN and LINK_INT_EN
- Monitor PWR_DOWN/INT pin

When PWR_DOWN/INT pin asserts low, user would read the MISR register to see if the ED_INT or LINK_INT bits are set, i.e. which source caused the interrupt. After reading the MISR, the interrupt bits should clear and the PWR_DOWN/INT pin will deassert.

#### 6.2.1.5 Magnetics

The magnetics have a large impact on the PHY performance as well. While several components are listed below, others may be compatible following the requirements listed in 表 6-4. It is recommended that the magnetics include both an isolation transformer and an integrated common mode choke to reduce EMI. When doing the layout, do not run signals under the magnetics. This could cause unwanted noise crosstalk. Likewise void the planes under discrete magnetics, this will help prevent common mode noise coupling. To save board space and reduce component count, an RJ-45 with integrated magnetics may be used.

**表 6-4. Magnetics Requirements**

| PARAMETER | TYP | UNIT | CONDITION |
|---|---|---|---|
| Turn Ratio | 1:1 | — | ±2% |
| Insertion Loss | –1 | dB | 1 MHz to 100 MHz |
| Return Loss | –16 | dB | 1 MHz to 30 MHz |
| | –12 | dB | 30 MHz to 60 MHz |
| | –10 | dB | 60 MHz to 80 MHz |
| Differential to Common Rejection Ratio | –30 | dB | 1 MHz to 50 MHz |
| | –20 | dB | 50 MHz to 150 MHz |
| Crosstalk | –35 | dB | 30 MHz |
| | –30 | dB | 60 MHz |
| Isolation | 1500 | Vrms | HPOT |

## *6.2.2 Detailed Design Procedure*

### 6.2.2.1 MAC Interface (MII/RMII)

The Media Independent Interface (MII) connects the PHYTER component to the Media Access Controller (MAC). The MAC may in fact be a discrete device, integrated into a microprocessor, CPU or FPGA. On the MII signals, the IEEE specification states the bus should be 68-Ω impedance. For space critical designs, the PHYTER family of products also support Reduced MII (RMII). For additional information on this mode of operation, refer to the *AN-1405 DP83848 Single 10/100 Mbps Ethernet Transceiver Reduced Media Independent Interface (RMII) Mode* Application Report (SNLA076).

### 6.2.2.2 Termination Requirement

To reduce digital signal energy, 50-Ω series termination resistors are recommended for all MII output signals (including RXCLK, TXCLK, and RX Data signals).

### 6.2.2.3 Recommended Maximum Trace Length

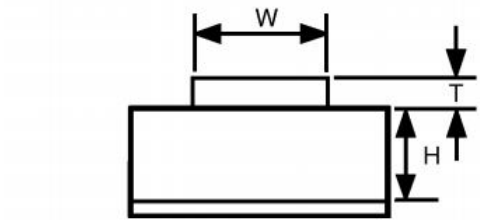
Although RMII and MII are synchronous bus architectures, there are a number of factors limiting signal trace lengths. With a longer trace, the signal becomes more attenuated at the destination and thus more susceptible to noise interference. Longer traces also act as antennas, and if run on the surface layer, can increase EMI radiation. If a long trace is running near and adjacent to a noisy signal, the unwanted signals could be coupled in as crosstalk. TI recommends keeping the signal trace lengths as short as possible. Ideally, keep the traces under 6 inches. Trace length matching, to within 2 inches on the MII or RMII bus is also recommended. Significant differences in the trace lengths can cause data timing issues. As with any high-speed data signal, good design practices dictate that impedance should be maintained and stubs should be avoided throughout the entire data path.

### 6.2.2.4 Calculating Impedance

公式 2 through 公式 5 can be used to calculate the differential impedance of the board. For microstrip traces, a solid ground plane is needed under the signal traces. The ground plane helps keep the EMI localized and the trace impedance continuous. Because stripline traces are typically sandwiched between the ground/supply planes, they have the advantage of lower EMI radiation and less noise coupling. The trade off of using strip line is lower propagation speed.

Microstrip Impedance - Single-Ended:

$$Z_o = \left(\frac{87}{\sqrt{E_r + (1.41)}}\right) \ln\left(5.98\frac{H}{0.8W + T}\right) \quad (2)$$

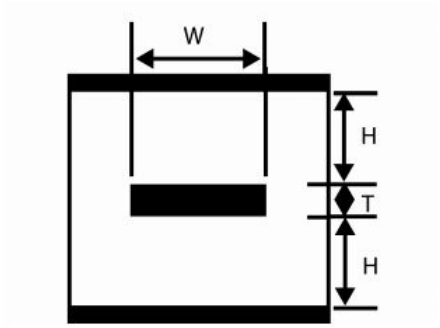


W = Width of the trace H = Height of dielectric above the return plane T = Trace thickness Er = Relative permittivity of the dielectric

**图 6-5. Microstrip Impedance - Single-Ended**

Stripline Impedance - Single-Ended:

$$Z_o = \left(\frac{60}{\sqrt{E_r}}\right) \ln\left(1.98 \frac{2H + T}{0.8W + T}\right) \quad (3)$$

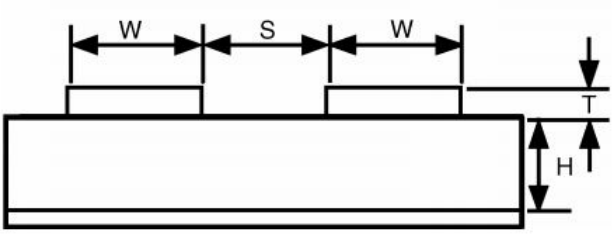


W = Width of the trace H = Height of dielectric above the return plane T = Trace thickness Er = Relative permittivity of the dielectric

**图 6-6. Stripline Impedance – Single Ended**

Microstrip Impedance - Differential:

$$Z_{diff} = 2Z_o(1 - 0.48(e^{\left(-0.96\frac{S}{H}\right)}) \quad (4)$$

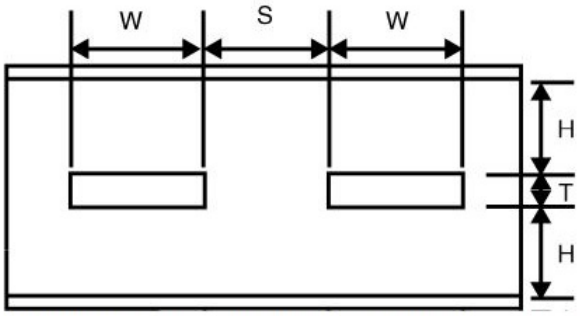


W = Width of the trace H = Height of dielectric above the return plane T = Trace thickness S = Space between traces Er = Relative permittivity of the dielectric

**图 6-7. Microstrip Impedance - Differential**

Stripline Impedance - Differential:

$$Z_{diff} = 2Z_o(1 - 0.347(e^{\left(-2.9\frac{S}{H}\right)}) \quad (5)$$



W = Width of the trace H = Height of dielectric above the return plane T = Trace thickness S = space between traces Er = Relative permittivity of the dielectric

**图 6-8. Stripline Impedance - Differential**

### 6.2.3 Application Curves

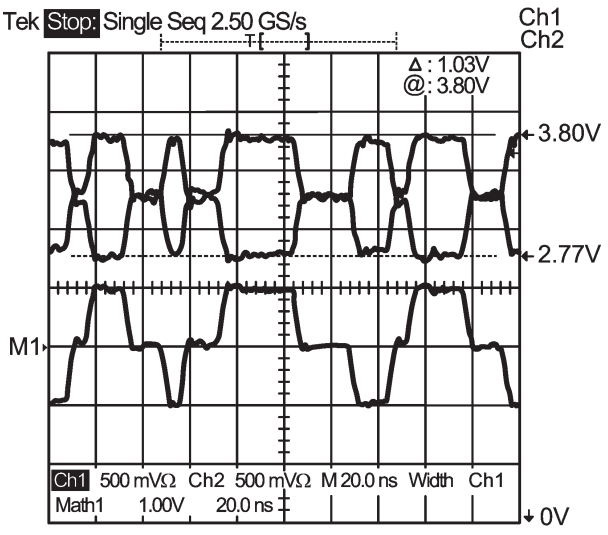


**图 6-9. Sample 100-Mbps Waveform (MLT-3)**

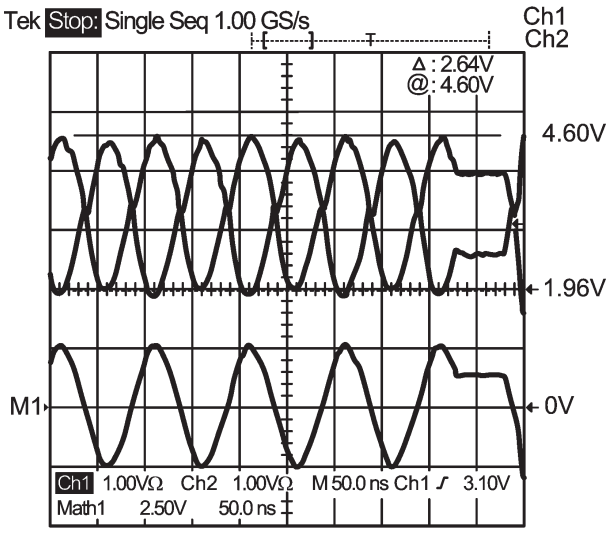

**图 6-10. Sample 10-Mbps Waveform**

# 7 Power Supply Recommendations

The device Vdd supply pins should be bypassed with low impedance 0.1-µF surface mount capacitors. To reduce EMI, the capacitors should be places as close as possible to the component Vdd supply pins, preferably between the supply pins and the vias connecting to the power plane. In some systems it may be desirable to add 0-Ω resistors in series with supply pins, as the resistor pads provide flexibility if adding EMI beads becomes necessary to meet system level certification testing requirements. (See 图 7-1) It is recommended the PCB have at least one solid ground plane and one solid Vdd plane to provide a low impedance power source to the component. This also provides a low impedance return path for non-differential digital MII and clock signals. A 10-µF capacitor should also be placed near the PHY component for local bulk bypassing between the Vdd and ground planes.

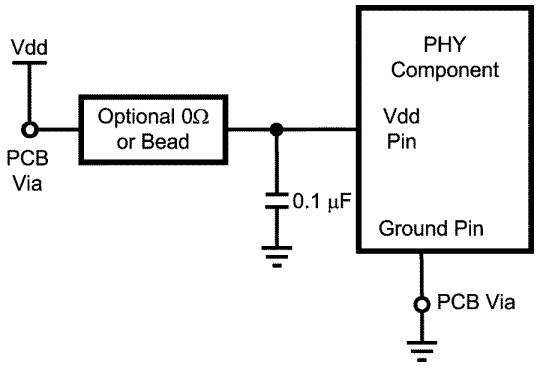

**图 7-1. Vdd Bypass Layout**

# 8 Layout

## 8.1 Layout Guidelines

### 8.1.1 PCB Layout Considerations

Place the 49.9-Ω,1% resistors, and 0.1-µF decoupling capacitor, near the PHYTER TD± and RD± pins and via directly to the Vdd plane. Stubs should be avoided on all signal traces, especially the differential signal pairs. See 图 8-1. Within the pairs (for example, TD+ and TD–) the trace lengths should be run parallel to each other and matched in length. Matched lengths minimize delay differences, avoiding an increase in common mode noise and increased EMI. See 图 8-1.

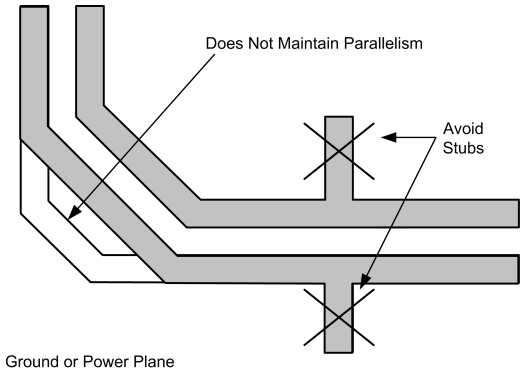

**图 8-1. Differential Signal Pair – Stubs**

Ideally there should be no crossover or via on the signal paths. Vias present impedance discontinuities and should be minimized. Route an entire trace pair on a single layer if possible. PCB trace lengths should be kept as short as possible. Signal traces should not be run such that they cross a plane split. See 图 8-2. A signal crossing a plane split may cause unpredictable return path currents and would likely impact signal quality as well, potentially creating EMI problems.

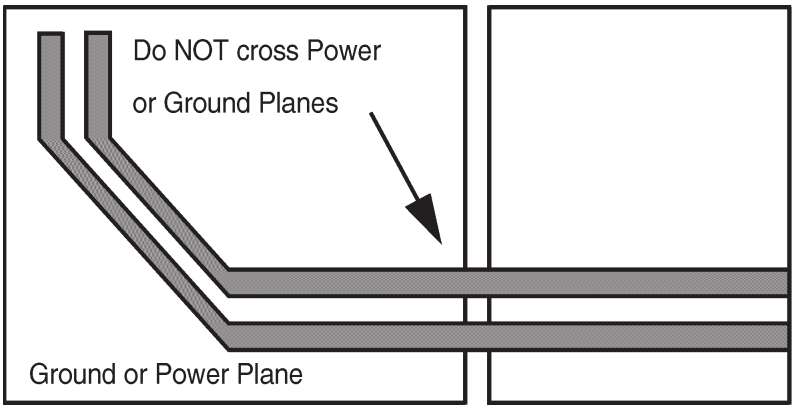

**图 8-2. Differential Signal Pair-Plane Crossing**

MDI signal traces should have 50 Ω to ground or 100-Ω differential controlled impedance. Many tools are available online to calculate this.

### 8.1.2 PCB Layer Stacking

To meet signal integrity and performance requirements, at minimum a four layer PCB is recommended for implementing PHYTER components in end user systems. The following layer stack-ups are recommended for four, six, and eight-layer boards, although other options are possible.

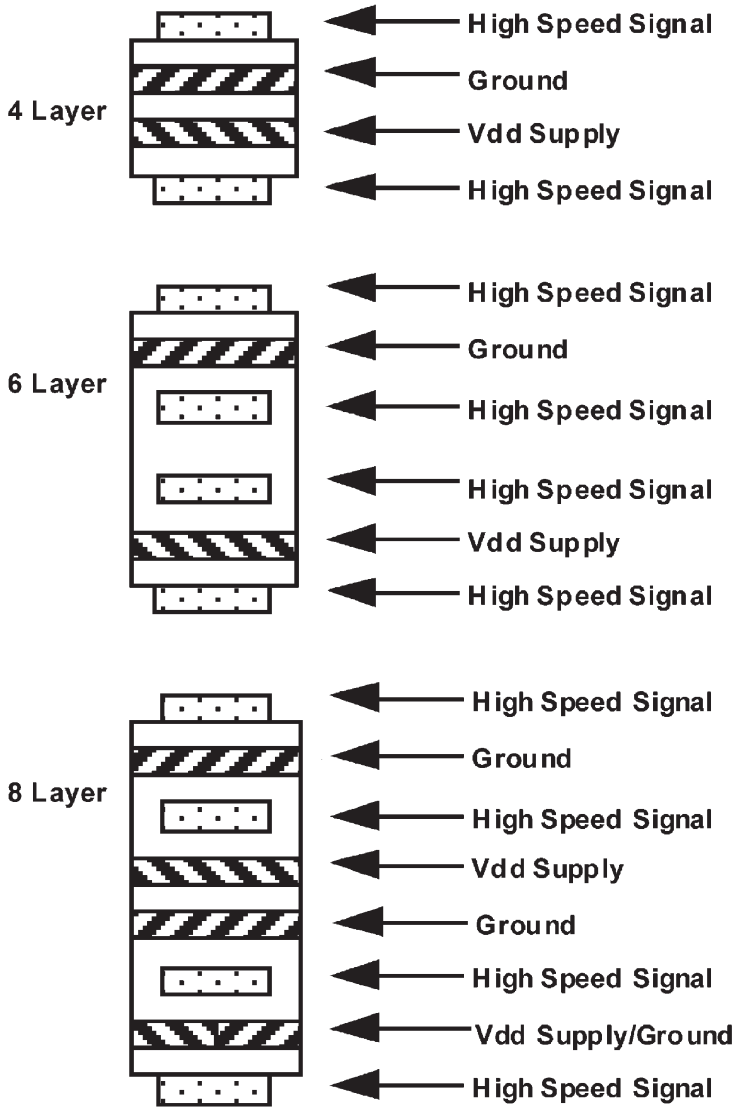

**图 8-3. PCB Stripline Layer Stacking**

Within a PCB it may be desirable to run traces using different methods, microstrip vs stripline, depending on the location of the signal on the PCB. For example, it may be desirable to change layer stacking where an isolated chassis ground plane is used. 图 8-4 illustrates alternative PCB stacking options.

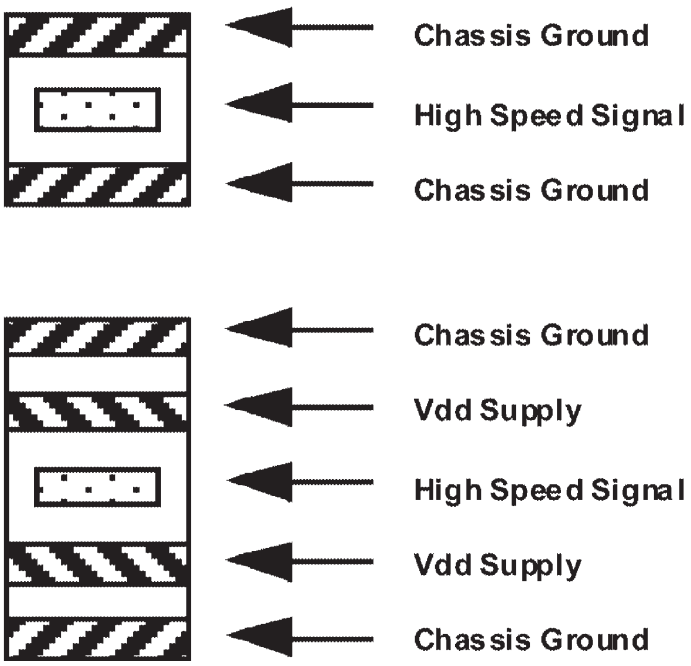

**图 8-4. Alternative PCB Stripline Layer Stacking**

## 8.2 Layout Example

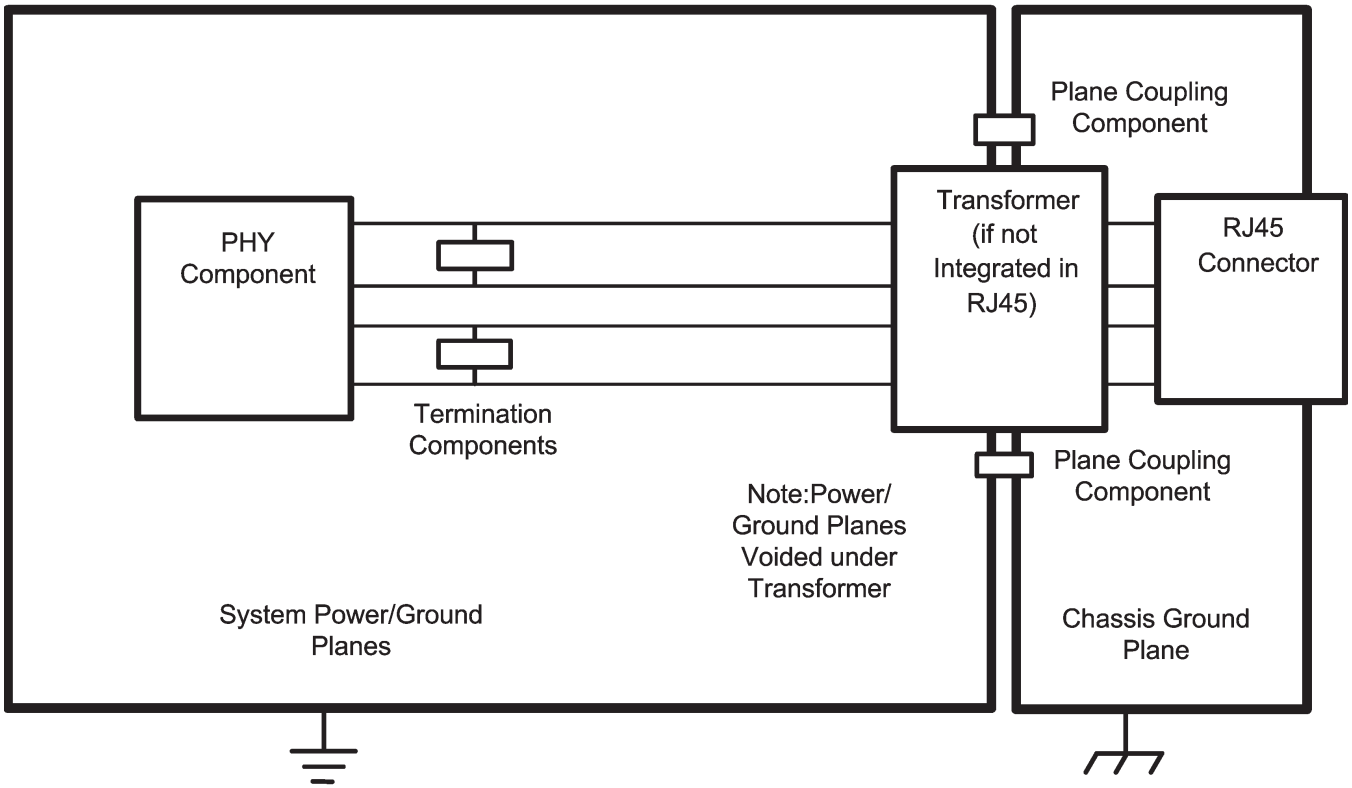

**图 8-5. Layout Example**

## 8.3 Thermal Vias Recommendation

The following thermal via guidelines apply to GNDPAD, pin 49:

1. Thermal via size = 0.2 mm
2. Recommend 4 vias
3. Vias have a center to center separation of 2 mm

Adherence to this guideline is required to achieve the intended operating temperature range of the device.

图 8-6 illustrates an example layout.

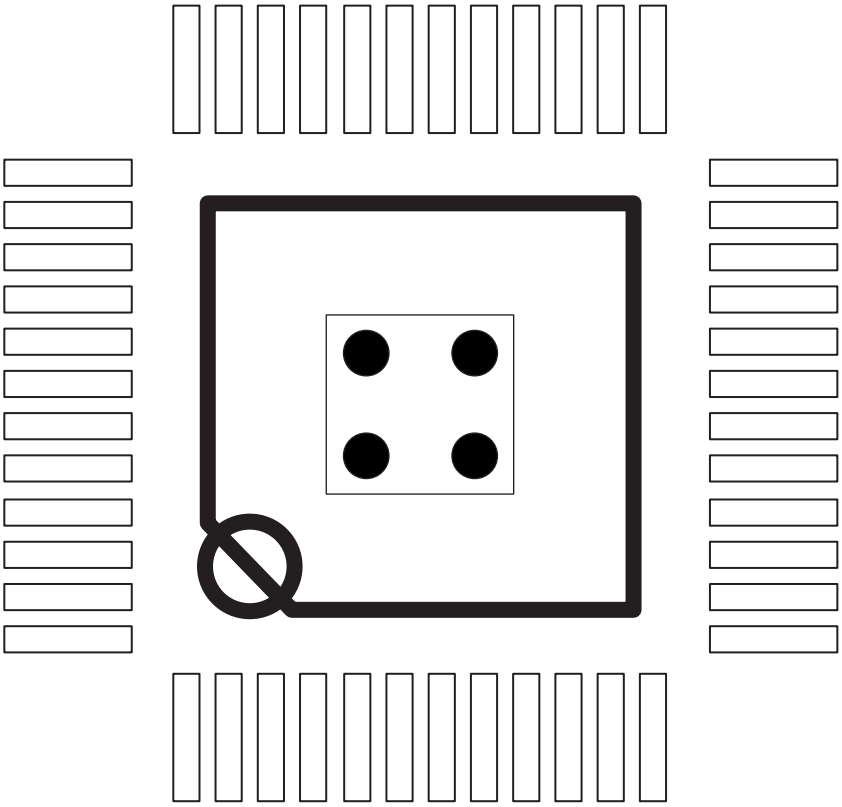

**图 8-6. Top View, Thermal Vias for GNDPAD, Pin 49**

# 9 器件和文档支持

TI 提供大量的开发工具。下面列出了用于评估器件性能、生成代码和开发解决方案的工具和软件。

## 9.1 文档支持

### 9.1.1 相关文档

- 《*AN-1405 DP83848 单路 10/100Mb/s 以太网收发器简化媒体独立接口™ (RMII™) 模式*》，SNLA076
- 《*PHYTER 100 Base-TX 参考时钟抖动容限*》，SNLA091

## 9.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

**TI E2E™ Online Community** The TI engineer-to-engineer (E2E) community was created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**TI Embedded Processors Wiki** Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

## 9.3 商标

PHYTER, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

## 9.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。 精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

## 9.5 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

## 9.6 Glossary

**TI Glossary** This glossary lists and explains terms, acronyms, and definitions.

# 10 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**(5) MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

**(6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

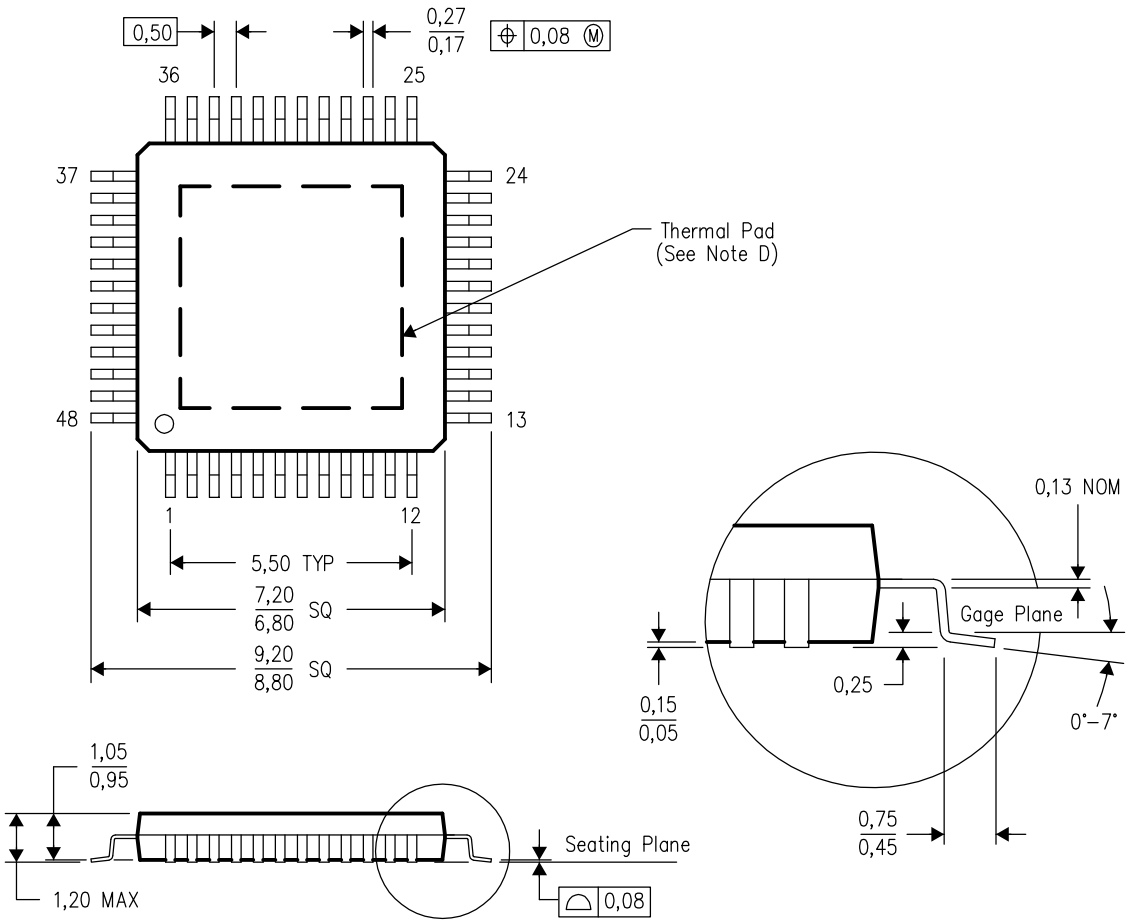
## PHP (S–PQFP–G48) PowerPAD™ PLASTIC QUAD FLATPACK



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. Falls within JEDEC MS–026

**PowerPAD is a trademark of Texas Instruments.**

PHP (S–PQFP–G48) PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

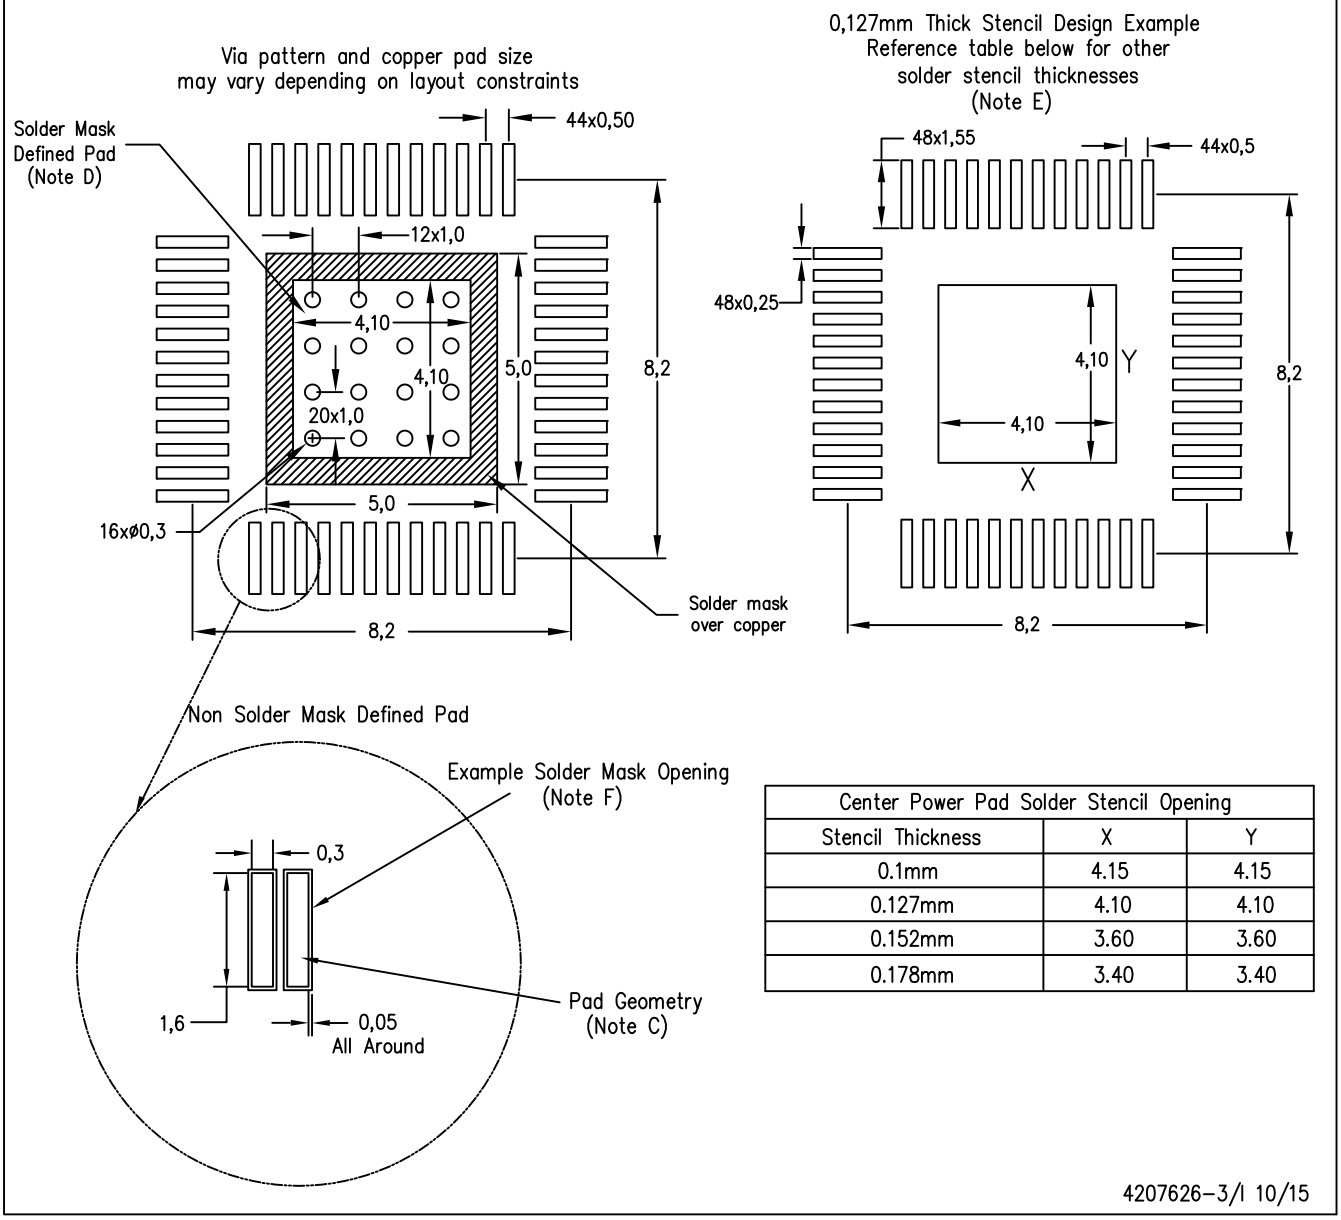
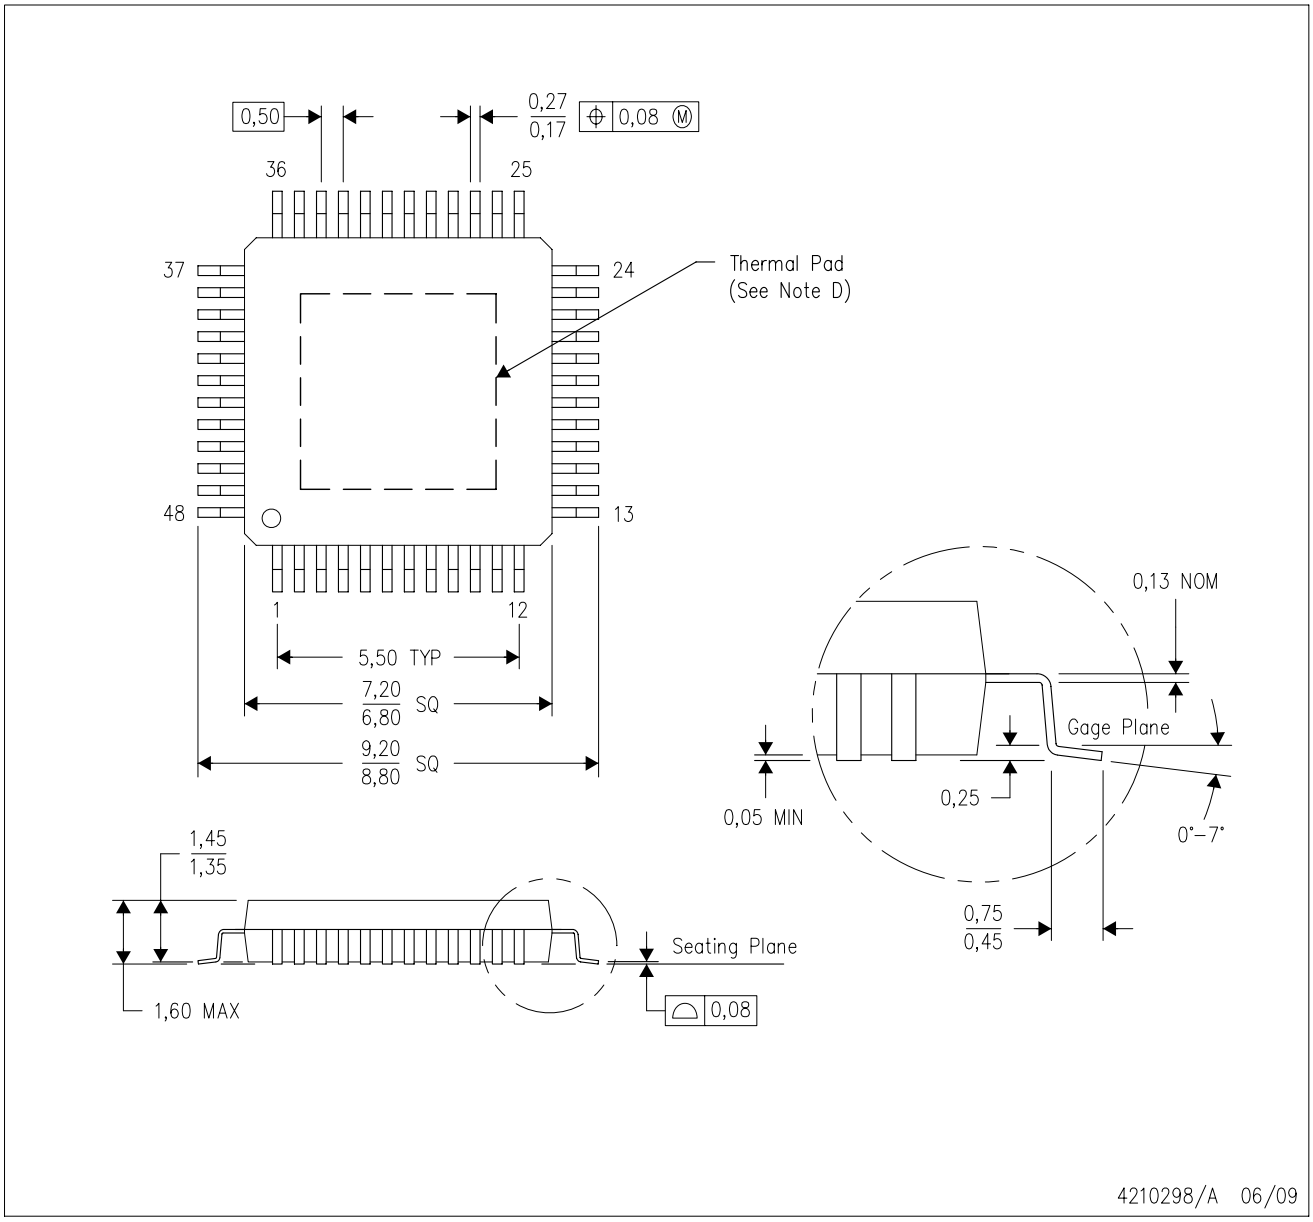
# PHP (S–PQFP–G48) PowerPAD™ PLASTIC QUAD FLATPACK



| Center Power Pad Solder Stencil Opening | | |
|---|---|---|
| Stencil Thickness | X | Y |
| 0.1mm | 4.15 | 4.15 |
| 0.127mm | 4.10 | 4.10 |
| 0.152mm | 3.60 | 3.60 |
| 0.178mm | 3.40 | 3.40 |

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting options for vias placed in the thermal pad.

PTB (S–HLQFP–G48) PLASTIC QUAD FLATPACK



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Also may be thermally enhanced plastic package with leads connected to the die pads.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
