

## DRV5012 超低功耗数字锁存器霍尔效应传感器

### 1 特性

- 行业领先的低功耗特性
- 可通过引脚选择的采样率：
  - SEL = 低电平：使用 1.3 $\mu$ A (1.8V) 时为 20Hz
  - SEL = 高电平：使用 142 $\mu$ A (1.8V) 时为 2.5kHz
- V<sub>CC</sub> 工作电压范围为 1.65V 至 5.5V
- 高磁性灵敏度：±2mT（典型值）
- 可靠磁滞：4mT（典型值）
- 推挽式 CMOS 输出
- 小型纤薄 X2SON 封装
- 运行温度范围：-40°C 至 +85°C

### 2 应用

- 无刷直流电机传感器
- 增量旋转编码：
  - 电机速度
  - 机械行程
  - 流体测量
  - 旋钮转动
  - 轮速
- 便携式医疗设备
- 电子锁、电动自行车、电动百叶窗
- 流量计
- 非接触式激活

### 3 说明

DRV5012 器件是可通过引脚选择采样率的超低功耗数字锁存器霍尔效应传感器。

当南磁极靠近封装顶部并且超出 B<sub>OP</sub> 阈值时，该器件会驱动低电压。输出会保持低电平，直到应用北极并且超出 B<sub>RP</sub> 阈值，这将使输出驱动高电压。必须交换北极和南极才能切换输出，且集成的磁滞会分开 B<sub>OP</sub> 和 B<sub>RP</sub> 以提供可靠切换。

通过使用内部振荡器，DRV5012 器件对磁场进行采样，并根据 SEL 引脚以 20Hz 或 2.5kHz 的速率更新输出。这种双带宽特性可让系统在使用最小功率的情况下监控移动变化。

此器件通过 1.65V 至 5.5V 的 V<sub>CC</sub> 工作，并采用小型 X2SON 封装。

器件信息<sup>(1)</sup>

| 器件型号    | 封装        | 封装尺寸（标称值）       |
|---------|-----------|-----------------|
| DRV5012 | X2SON (4) | 1.10mm × 1.40mm |

(1) 如需了解所有可用封装，请参阅产品说明书末尾的可订购产品附录。

## 5 Pin Configuration and Functions

**DMR Package**  
**4-Pin X2SON With Exposed Thermal Pad**  
**Top View**

**Pin Functions**

| PIN         |     | I/O | DESCRIPTION                                                                                                                            |
|-------------|-----|-----|----------------------------------------------------------------------------------------------------------------------------------------|
| NAME        | NO. |     |                                                                                                                                        |
| GND         | 2   | —   | Ground reference                                                                                                                       |
| OUT         | 3   | O   | Push-pull CMOS output. Drives a $V_{CC}$ or ground level.                                                                              |
| SEL         | 4   | I   | CMOS input that selects the sampling rate: a low voltage sets 20 Hz; a high voltage sets 2.5 kHz.                                      |
| $V_{CC}$    | 1   | —   | 1.65-V to 5.5-V power supply. TI recommends connecting this pin to a ceramic capacitor to ground with a value of at least 0.1 $\mu$ F. |
| Thermal Pad | PAD | —   | No-connect. This pin should be left floating or tied to ground. It should be soldered to the board for mechanical support.             |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                                  |          | MIN       | MAX            | UNIT        |
|----------------------------------|----------|-----------|----------------|-------------|
| Power supply voltage             | $V_{CC}$ | −0.3      | 5.5            | V           |
| Power supply voltage slew rate   | $V_{CC}$ | Unlimited |                | V / $\mu$ s |
| Output voltage                   | OUT      | −0.3      | $V_{CC} + 0.3$ | V           |
| Output current                   | OUT      | −5        | 5              | mA          |
| Input voltage                    | SEL      | −0.3      | $V_{CC} + 0.3$ | V           |
| Magnetic flux density, $B_{MAX}$ |          | Unlimited |                | T           |
| Junction temperature, $T_J$      |          | 105       |                | °C          |
| Storage temperature, $T_{stg}$   |          | −65       | 150            | °C          |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

|                                     |                                                                                | VALUE | UNIT |
|-------------------------------------|--------------------------------------------------------------------------------|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±6000 | V    |
|                                     | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±750  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                 |                               | MIN  | MAX             | UNIT |
|-----------------|-------------------------------|------|-----------------|------|
| V <sub>CC</sub> | Power supply voltage (VCC)    | 1.65 | 5.5             | V    |
| V <sub>O</sub>  | Output voltage (OUT)          | 0    | V <sub>CC</sub> | V    |
| I <sub>O</sub>  | Output current (OUT)          | –5   | 5               | mA   |
| V <sub>I</sub>  | Input voltage (SEL)           | 0    | V <sub>CC</sub> | V    |
| T <sub>A</sub>  | Operating ambient temperature | –40  | 85              | °C   |

## 7 Detailed Description

### 7.1 Overview

The DRV5012 device is a magnetic sensor with a digital output that latches the most recent pole measured. Applying a south magnetic pole near the top of the package causes the output to drive low, a north pole causes the output to drive high, and the absence of a magnetic field causes the output to continue to drive the previous state, whether low or high.

The device integrates a Hall effect element, analog signal conditioning, and a low-frequency oscillator that enables ultra-low average power consumption. By operating from a 1.65-V to 5.5-V supply, the device periodically measures magnetic flux density, updates the output, and enters a low-power sleep state. A logic input pin, SEL, sets the sampling frequency to 20 Hz or 2.5 kHz with a tradeoff in power consumption.

### 7.2 Functional Block Diagram

Copyright © 2017, Texas Instruments Incorporated

### 7.3 Feature Description

#### 7.3.1 Magnetic Flux Direction

The DRV5012 device is sensitive to the magnetic field component that is perpendicular to the top of the package (as shown in [Figure 7](#)).

**图 7. Direction of Sensitivity**

## Feature Description (接下页)

Magnetic flux that travels from the bottom to the top of the package is considered positive in this data sheet. This condition exists when a south magnetic pole is near the top of the package. Magnetic flux that travels from the top to the bottom of the package results in negative millitesla values.

图 8. Flux Direction Polarity

### 7.3.2 Magnetic Response

图 9 shows the device functionality and hysteresis.

图 9. Device Functionality

## Feature Description (接下页)

### 7.3.3 Output Driver

The device features a push-pull CMOS output that can drive a  $V_{CC}$  or ground level.

图 10. Push-Pull Output (Simplified)

### 7.3.4 Sampling Rate

When the DRV5012 device powers up, it measures the first magnetic sample and sets the output within the  $t_{ON}$  time. The output is latched, and the device enters an ultra-low-power sleep state. After each  $t_s$  time has passed, the device measures a new sample and updates the output if necessary. If the magnetic field does not change between periods, the output also does not change.

图 11. Timing Diagram

## Feature Description (接下页)

### 7.3.5 SEL Pin

The SEL pin is a CMOS input that selects between two sampling rates. When the pin is low, the device samples at 20 Hz and uses low power. When the pin is high, the device samples at 2500 Hz and uses more power. The SEL pin can be tied directly high or low, or it can be changed during device operation. If the SEL voltage changes, the device detects the new voltage during the next  $t_{ACTIVE}$  time.

### 7.3.6 Hall Element Location

The sensing element inside the device is in the center of the package when viewed from the top. 图 12 shows the tolerances and side-view dimensions.

图 12. Hall Element Location

## 7.4 Device Functional Modes

The DRV5012 device has two operating modes, 20 Hz and 2.5 kHz, as set by the SEL pin. In both cases the *Recommended Operating Conditions* must be met.

## 8 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The DRV5012 device is typically used in rotary applications for brushless DC (BLDC) motor sensors or incremental rotary encoding.

To ensure reliable functionality, the magnet should apply a flux density at the sensor greater than the maximum  $B_{OP}$  and less than the minimum  $B_{RP}$  thresholds. It is good practice to add additional margin to account for mechanical tolerance, temperature effects, and magnet variation.

### 8.2 Typical Applications

#### 8.2.1 BLDC Motor Sensors Application

Copyright © 2017, Texas Instruments Incorporated

图 13. BLDC Motor System

##### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 1.

表 1. Design Parameters

| DESIGN PARAMETER                               | EXAMPLE VALUE    |
|------------------------------------------------|------------------|
| Number of motor phases                         | 3                |
| Motor RPM                                      | 3000             |
| Number of magnet poles on the rotor            | 6                |
| Magnetic material                              | Bonded Neodymium |
| Peak magnetic flux density at the Hall sensors | $\pm 15$ mT      |
| Battery voltage range ( $V_{BAT}$ )            | 2 to 3.5 V       |

### 8.2.1.2 Detailed Design Procedure

Three-phase brushless DC motors often use 3 Hall effect latch devices to measure the electrical angle of the rotor and tell the controller how to drive the 3 wires. These wires connect to electromagnet windings, which generate magnetic fields that apply forces to the permanent magnets on the rotor.

The 3 Hall sensors should be spaced across the printed-circuit board (PCB) so that they are 120° electrical degrees apart. This configuration creates six 3-bit states with equal time duration for each electrical cycle, which consists of 1 north and 1 south magnetic pole. From the center of the motor axis, the number of degrees each sensor should be spaced equals  $2 / [\text{number of poles}] \times 120^\circ$ . In this design example, 1 sensor is placed at 0°, 1 sensor is placed 40° rotated, and 1 sensor is placed 80° rotated. Alternatively, a 3× degree offset can be added or subtracted to any sensor, meaning the third sensor could alternatively be placed at  $80^\circ - (3 \times 40^\circ) = -40^\circ$ .

While an ideal BLDC motor would energize the phases at the exact correct times, the DRV5012 device introduces variable lag because of the sampling architecture that achieves low power. An acceptable amount of lag can be measured by the sampling time error as a percentage of the electrical period. This design example uses 3000 RPM, which is 50 revolutions per second. Each revolution has 6 poles (3 electrical cycles), so the electrical frequency is 150 Hz, a period of 6.7 ms. The DRV5012 device in 2.5 kHz mode has a sampling period of 0.4 ms, which is 6% of the electrical period. Generally, the maximum timing error should be kept under 10% to ensure the BLDC motor spins, and timing error can reduce motor efficiency.

When the motor in this example is not driven, the SEL pins of the DRV5012 devices are set to a low voltage, and the sensor outputs are monitored for changes. If a change occurs, the microcontroller wakes the system into a higher power state and takes other appropriate action.

### 8.2.1.3 Application Curve

图 14. 3-Phase BLDC Motor Phase Voltages and Hall Signals

## 8.2.2 Incremental Rotary Encoding Application

图 15. Incremental Rotary Encoding System

### 8.2.2.1 Design Requirements

For this design example, use the parameters listed in 表 2.

表 2. Design Parameters

| DESIGN PARAMETER                          | EXAMPLE VALUE |
|-------------------------------------------|---------------|
| RPM range                                 | 0 to 4000     |
| Number of magnet poles                    | 8             |
| Magnetic material                         | Ferrite       |
| Air gap above the Hall sensors            | 2.5 mm        |
| Peak magnetic flux density at the sensors | ±7 mT         |

### 8.2.2.2 Detailed Design Procedure

Incremental encoders are used on knobs, wheels, motors, and flow meters to measure relative rotary movement. By attaching a ring magnet to the rotating component and placing a DRV5012 device nearby, the sensor generates voltage pulses as the magnet turns. If directional information is also needed (clockwise versus counterclockwise), a second DRV5012 device can be added with a phase offset, and then the order of transitions between the two signals describes the direction.

Creating this phase offset requires spacing the two sensors apart on the PCB, and an ideal 90° quadrature offset is attained when the sensors are separated by half the length of each magnet pole, plus any integer number of pole lengths. 图 15 shows this configuration, as the sensors are 1.5 pole lengths apart. One of the sensors changes its output every  $360^\circ / 8 \text{ poles} / 2 \text{ sensors} = 22.5^\circ$  of rotation. For reference, the TI Design [TIDA-00480](#) uses a 66-pole magnet with changes every  $2.7^\circ$ .

Because the DRV5012 device periodically samples the magnetic field, there is a limit to the maximum rotational speed that can be measured. Generally, the device sampling rate should be faster than 2 times the number of poles per second. In this design example, the maximum speed is 4000 RPM, which involves 533 poles per second. The DRV5012 has a minimum sampling frequency of 1665 Hz (when the SEL pin is high), which is approximately  $3 \times 533$  poles per second.

In systems where the sensor sampling rate is close to 2 times the number of poles per second, most of the samples will measure a magnetic field that is significantly lower than the peak value, since the peaks only occur when the sensor and pole are perfectly aligned. In this case, margin should be added by applying a stronger magnetic field that has peaks significantly higher than the maximum  $B_{OP}$  of the DRV5012 device.

### 8.2.2.3 Application Curve

Two signals in quadrature provide movement and direction information. Each 2-bit state has unique adjacent 2-bit states for clockwise and counterclockwise.

图 16. 2-bit Quadrature Output

### 8.3 Do's and Don'ts

Because the Hall element is sensitive to magnetic fields that are perpendicular to the top of the package, a correct magnet orientation must be used for the sensor to detect the field. 图 17 shows correct and incorrect orientations when using a ring magnet.

图 17. Correct and Incorrect Magnet Orientations

## 9 Power Supply Recommendations

The DRV5012 device is powered from 1.65-V to 5.5-V DC power supplies. A decoupling capacitor close to the device must be used to provide local energy with minimal inductance. TI recommends using a ceramic capacitor with a value of at least 0.1  $\mu\text{F}$ .

## 10 Layout

### 10.1 Layout Guidelines

Magnetic fields pass through most nonferromagnetic materials with no significant disturbance. Embedding Hall effect sensors within plastic or aluminum enclosures and sensing magnets on the outside is common practice. Magnetic fields also easily pass through most PCBs, which makes placing the magnet on the opposite side possible.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
