DRV8846 双路 H 桥步进电机驱动器

1 特性

- 脉宽调制 (PWM) 微步进电机驱动器
  - 内置微步进分度器
  - 最高 1/32 微步进
  - 步进/方向控制
- 多种衰减模式
  - AutoTune™技术
  - 混合衰减
  - 慢速衰减
  - 快速衰减
- 可配置关断时间脉宽调制 (PWM) 斩波
  - 10、20 或 30µs 关断时间
- 具有自适应消隐时间，可实现平滑步进
- 工作电源电压范围为 4V 至 18V
- 每个 H 桥的满标量程（最大驱动）电流为 1.4A（25°C 时）
- 低电流睡眠模式
- 使用 3 位扭矩 DAC 调节电机电流
- 耐热增强型表面贴装封装
- DRV8303 中的 功能
  - VM 欠压闭锁 (UVLO)
  - 过流保护 (OCP)
  - 热关断 (TSD)
  - 故障条件指示引脚 (nFAULT)

2 应用

- 打印机
- 扫描仪
- 视频安保摄像机
- 投影仪

3 说明

DRV8846 提供适用于摄像机、打印机、投影仪和其他自动化设备 应用的高度集成步进电机驱动器。此器件具有两个 H 桥和一个微步进分度器，并且专门用来驱动一个双极步进电机。每个 H 桥驱动器的输出块都包含配置为全 H 桥的 N 通道和 P 通道功率 MOSFET，用于驱动电机绕组。DRV8846 能够驱动高达 1.4A 的满标量程输出电流（在适当散热并且 T_A = 25°C 时）。

一个简单的步进/方向接口可轻松连接到控制器电路。引脚可实现全步进到 1/32 步进模式的电机配置。可以配置衰减模式以便可以使用自动调优、慢速衰减、快速衰减和混合衰减。还可以选择 PWM 电流斩波关闭时间。低功耗睡眠模式可将部分内部电路关断，从而实现极低的静态电流和功耗。这种睡眠模式可通过专用的 nSLEEP 引脚来设定。

为 UVLO、过流保护、短路保护和过热提供内部保护功能。通过一个 nFAULT 引脚来指示故障条件。

器件信息(1)

器件型号	封装	封装尺寸（标称值）
DRV8846	VQFN (24)	4.00mm × 4.00mm

(1) 要了解所有可用封装，请参见数据表末尾的可订购产品附录。

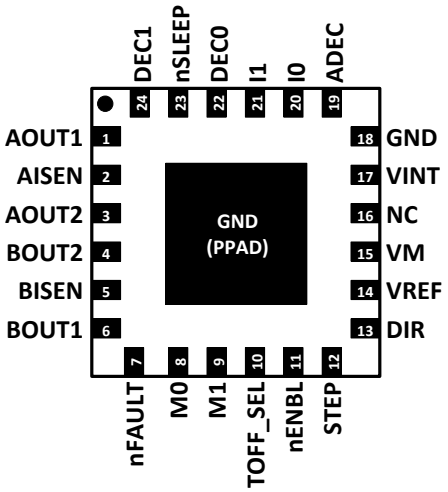
5 Pin Configuration and Functions

RGE Package
24-Pin VQFN With Exposed Thermal PAD
Top View



Pin Functions

PIN		I/O	DESCRIPTION	
NAME	NO.			
ADEC	19	I	AutoTune enable	Logic low sets decay modes by DEC0 and DEC1 pins; logic high – AutoTune operation is enabled; must be set prior to coming out of sleep; internal pulldown
AISEN	2	O	Winding A sense	Connect to current sense resistor for bridge A, or GND if current regulation is not required
AOUT1	1	O	Winding A output	
AOUT2	3			
BISEN	5	O	Winding B sense	Connect to current sense resistor for bridge B, or GND if current regulation is not required
BOUT1	6	O	Winding B output	
BOUT2	4			
DEC0	22	I	Decay mode setting pins	Sets the decay mode; see description section; tri-level pin
DEC1	24	I		
DIR	13	I	Direction input	Logic level sets the direction of stepping; internal pulldown
GND	18, PPAD	PWR	Device ground	Both the GND pin and device thermal pad must be connected to ground
I0	20	I	Torque DAC current scalar	Scales the current from 100% to 12.5% in 12.5% steps; tri-level pin
I1	21	I		
MO	8	I	Microstepping mode setting pins	Controls step mode (full, half, up to 1/32-step) and single- or dual-edge clocking; tri-level pin
M1	9	I		
NC	16	—	No connect	Unused pin not connected internally
nENBL	11	I	Enable driver output	Logic low to enable device outputs and internal indexer; logic high to disable; internal pulldown
nFAULT	7	OD	Fault indication pin	Pulled logic low with fault condition; open-drain output requires external pullup
nSLEEP	23	I	Sleep mode input	Logic high to enable device; logic low to enter low-power sleep mode; internal pulldown
STEP	12	I	Step input	A rising edge (or rising and falling depending on step mode) advances the indexer one step; internal pulldown
TOFF_SEL	10	I	Decay mode off time set	Sets the off-time during current chopping; tri-level pin

Pin Functions (continued)

PIN		I/O	DESCRIPTION	
NAME	NO.			
VINT	17	—	Internal regulator	Internal supply voltage; bypass to GND with 2.2-μF, 6.3-V capacitor
VM	15	PWR	Power supply	Connect to motor power supply; bypass to GND with a 0.1- and 10-μF (minimum) ceramic capacitor rated for VM
VREF	14	I	Full-scale current reference input	Voltage on this pin sets the full scale chopping current; short to VINT if not supplying an external reference voltage

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature referenced with respect to GND (unless otherwise noted)(1)

		MIN	MAX	UNIT
Power supply voltage (VM)		–0.3	20	V
Power supply voltage ramp rate (VM)		0	2	V/μs
Internal regulator voltage (VINT)		–0.3	3.6	V
Analog input pin voltage (VREF)		–0.3	3.6	V
Control pin voltage (nENABLE, STEP, DIR, I0, I1, M0, M1, DEC0, DEC1, TOFF_SEL, nSLEEP, nFAULT, ADEC)		–0.3	7.0	V
Continuous phase node pin voltage (AOUT1, AOUT2, BOUT1, BOUT2)		–0.3	VM + 0.6	V
Continuous shunt amplifier input pin voltage (AISEN, BISEN)(2)		–0.6	0.6	V
Peak drive current (AOUT1, AOUT2, BOUT1, BOUT2, AISEN, BISEN)		Internally limited		A
T_J	Operating junction temperature	–40	150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Transients of ±1 V for less than 25 ns are acceptable.

6.2 ESD Ratings

			MAX	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±4000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
VM	Power supply voltage range(1)	4	18	V
VREF	Reference rms voltage range(2)	1	3.3	V
f_{PWM}	Applied STEP signal	0	250	kHz
I_{VINT}	VINT external load current		1	mA
I_{FS}	Motor full-scale current per H-bridge(3)	0	1.4	A
T_A	Operating ambient temperature	–40	85	°C

(1) Note that $R_{DS(ON)}$ increases and maximum output current is reduced at VM supply voltages below 5 V
(2) Operational at VREF between 0 to 1 V, but accuracy is degraded
(3) Power dissipation and thermal limits must be observed

6.4 Thermal Information

THERMAL METRIC(1)		DRV8846 RGE (VQFN) 24 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	34	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	36.9	
$R_{\theta JB}$	Junction-to-board thermal resistance	12.5	
ψ_{JT}	Junction-to-top characterization parameter	0.4	
ψ_{JB}	Junction-to-board characterization parameter	12.5	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.5	

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

T_A = 25°C, over recommended operating conditions unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLIES (VM, VINT)						
VM	VM operating voltage		4		18	V
I_{VM}	VM operating supply current	VM = 12 V, excluding winding current, nSLEEP = 1, nENBL = 0 or 1	3.5	4.5	5.5	mA
I_{VMQ}	VM sleep mode supply current	VM = 12 V, nSLEEP = 0, nENBL = 0 or 1	0.5	1.2	3	µA
t_{SLEEP}	Sleep time	nSLEEP = 0 to sleep mode			1	ms
t_{WAKE}	Wake time	nSLEEP = 1 to output transition			1	ms
t_{ON}	Power-on time	VM > V_{UVLO} rising to output transition			1	ms
VINT	VINT voltage	VM > 4 V, I_{OUT} = 0 A to 1 mA	3.13	3.3	3.47	V
LOGIC-LEVEL INPUTS (STEP, DIR, nENBL, nSLEEP, ADEC)						
V_{IL}	Input logic low voltage		0		0.7	V
V_{IH}	Input logic high voltage		1.6		5.5	V
V_{HYS}	Input logic hysteresis			100		mV
I_{IL}	Input logic low current	VIN = 0 V	–1		1	µA
I_{IH}	Input logic high current	VIN = 5 V	1		30	µA
R_{PD}	Pulldown resistance	nENBL, STEP, DIR, ADEC		200		kΩ
		nSLEEP		500		
t_{DEG}	Input deglitch time			200		ns
t_{PROP}	Propagation delay	STEP edge to current change		600		ns
TRI-LEVEL INPUTS (I0, I1, M0, M1, DEC0, DEC1, TOFF_SEL)						
V_{IL}	Tri-level input logic low voltage		0		0.7	V
V_{IZ}	Tri-level input Hi-Z voltage			1.1		V
V_{IH}	Tri-level input logic high voltage		1.6		5.5	V
V_{HYS}	Tri-level input hysteresis		100			mV
I_{IL}	Tri-level input logic low current	V_{IN} = 0 V	–30		–1	µA
I_{IH}	Tri-level input logic high current	V_{IN} = 5 V	1		30	µA
R_{PD}	Tri-level pulldown resistance	To GND		170		kΩ
R_{PU}	Tri-level pullup resistance	To VINT		340		kΩ
CONTROL OUTPUTS (nFAULT)						
V_{OL}	Output logic low voltage	I_O = 5 mA			0.5	V
I_{OH}	Output logic high leakage	V_O = 3.3 V	–1		1	µA

Electrical Characteristics (continued)

T_A = 25°C, over recommended operating conditions unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
MOTOR DRIVER OUTPUTS (AOUT1, AOUT2, BOUT1, BOUT2)						
$R_{DS(ON)}$	High-side FET on resistance	VM = 12 V, I = 0.5 A, T_J = 25°C		550		mΩ
		VM = 12 V, I = 0.5 A, T_J = 85°C (1)		660		
$R_{DS(ON)}$	Low-side FET on resistance	VM = 12 V, I = 0.5 A, T_J = 25°C		350		mΩ
		VM = 12 V, I = 0.5 A, T_J = 85°C (1)		420		
I_{OFF}	Off-state leakage current	VM = 5 V, T_J = 25°C	–1		1	µA
t_{RISE}	Output rise time			60		ns
t_{FALL}	Output fall time			60		ns
t_{DEAD}	Output dead time	Internal dead time		200		ns
PWM CURRENT CONTROL (VREF, AISEN, BISEN)						
I_{REF}	Externally applied VREF input current	VREF = 1 to 3.3 V			1	µA
V_{TRIP}	xISEN trip voltage	For 100% current step with VREF = 3.3 V		500		mV
A_{ISENSE}	Current sense amplifer gain	Reference only		6.6		V/V
t_{OFF}	Current control constant off time	TOFF_SEL = GND		20		µs
		TOFF_SEL = Hi-Z		10		
		TOFF_SEL = VINT		30		
PROTECTION CIRCUITS						
V_{UVLO}	VM undervoltage lockout	VM falling; UVLO report			2.9	V
		VM rising; UVLO recovery			3	
I_{OCP}	Overcurrent protection trip level		2			A
t_{OCP}	Overcurrent deglitch time			2.8		µs
t_{RETRY}	Overcurrent protection period			1.6		ms
T_{TSD}	Thermal shutdown temperature	Die temperature T_J	150	160	180	°C
T_{HYS}	Thermal shutdown hysteresis	Die temperature T_J		50		°C

(1) Not tested in production; limits are based on characterization data

6.6 Timing Requirements

T_A = 25°C, over recommended operating conditions unless otherwise noted

NO.			MIN	MAX	UNIT
1	f_{STEP}	Step frequency		250	kHz
2	$t_{WH(STEP)}$	Pulse duration, STEP high	1.9		µs
3	$t_{WL(STEP)}$	Pulse duration, STEP low	1.9		µs
4	$t_{SU(STEP)}$	Setup time, DIR or Mx to STEP rising	200		ns
5	$t_{H(STEP)}$	Hold time, DIR or Mx to STEP rising	200		ns

7 Detailed Description

7.1 Overview

The DRV8846 is an integrated motor driver solution for bipolar stepper motors. The device integrates 2 H-bridges that use NMOS low-side drivers and PMOS high-side drivers, current sense regulation circuitry, and a microstepping indexer. The DRV8846 can be powered with a supply range between 4 to 18 V and is capable of providing an output current to 1.4-A full scale per H-bridge.

A simple STEP/DIR interface allows easy interfacing to the controller circuit. The internal indexer is able to execute high-accuracy microstepping without requiring the processor to control the current level.

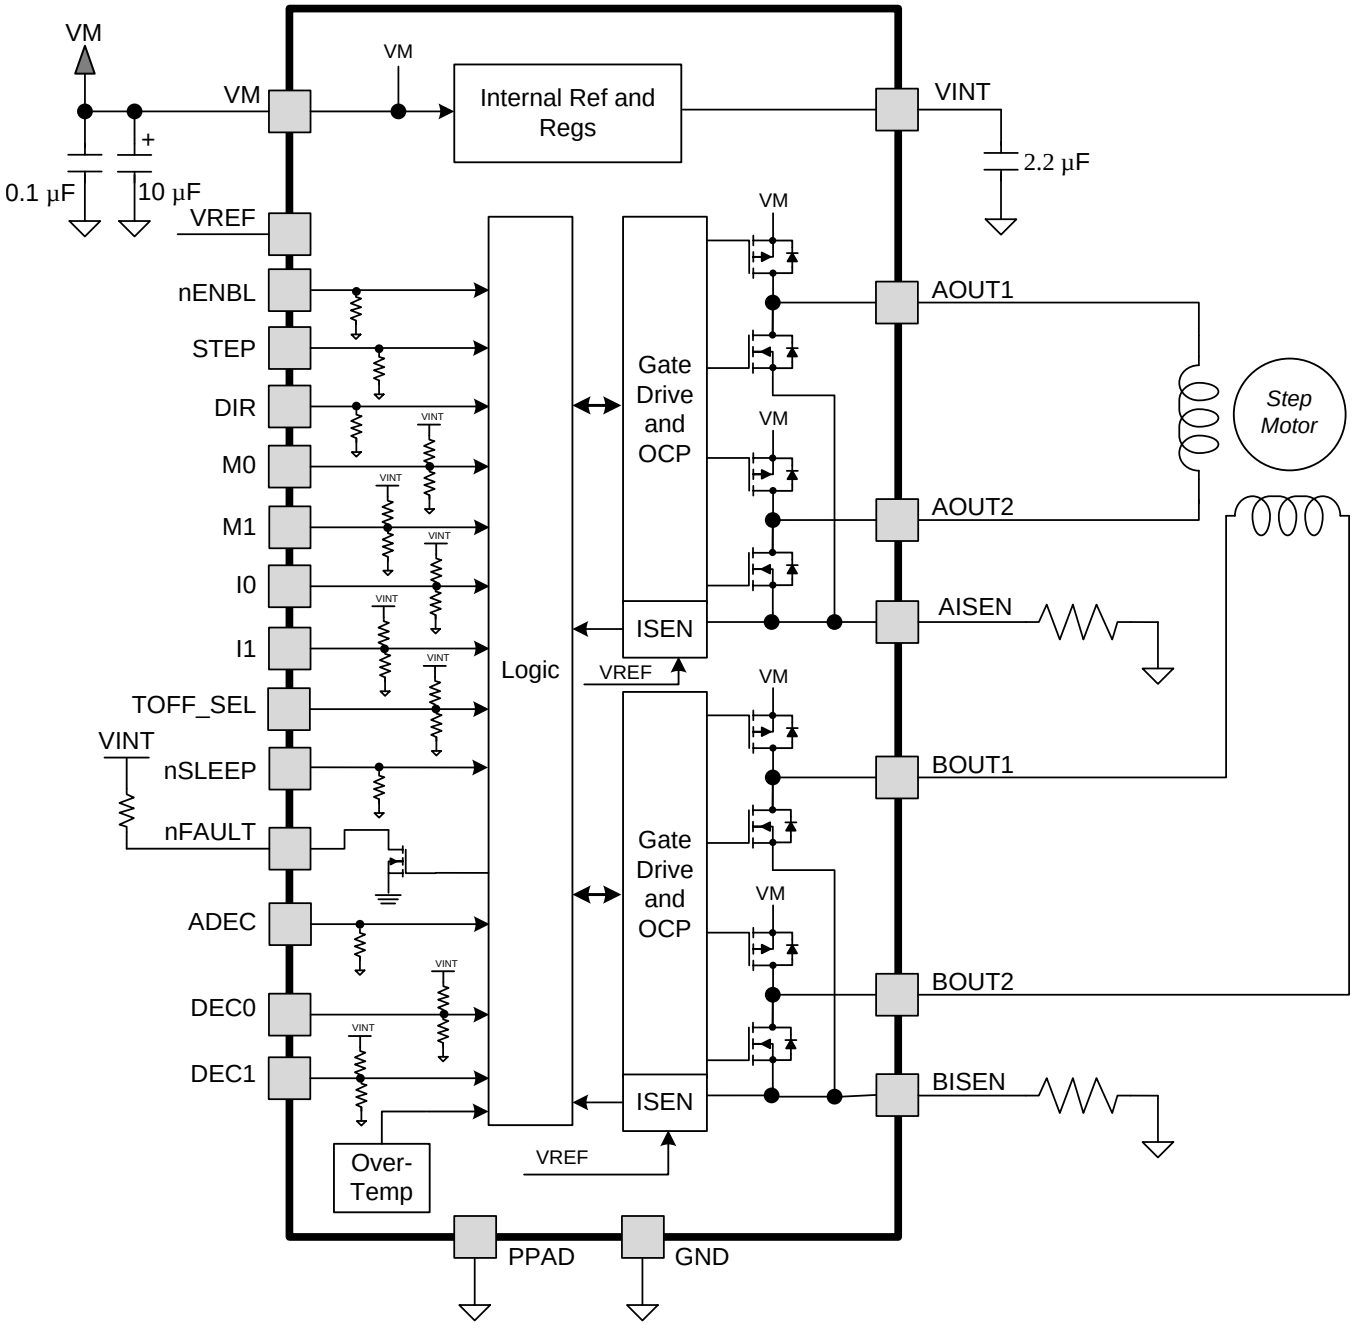
The PWM off-time, t_{OFF} can be adjusted to 10, 20, or 30 μs.

The DRV8846 has an AutoTune feature that automatically adjusts the decay setting to minimize current ripple while still reacting quickly to step changes. This feature allows the DRV8846 to quickly be integrated into a system.

A torque DAC feature allows the controller to scale the output current without needing to scale the analog reference voltage input VREF. The torque DAC is accessed using digital input pins. This allows the controller to save power by decreasing the current consumption when not required.

A low-power sleep mode is included, which allows the system to save power when not driving the motor.

7.2 Functional Block Diagram



7.3 Feature Description

Table 1 lists the recommended external components for the device.

Table 1. External Components

COMPONENT	PIN 1	PIN 2	RECOMMENDED
C_{VM}	VM	GND	10-µF (minimum) ceramic capacitor rated for VM
C_{VM}	VM	GND	0.1-µF ceramic capacitor rated for VM
C_{VINT}	VINT	GND	6.3-V, 2.2-µF ceramic capacitor
R_{nFAULT}	VCC(1)	nFAULT	>5 kΩ
R_{AISEN}	AISEN	GND	Sense resistor, see applications section for sizing
R_{BISEN}	BISEN	GND	Sense resistor, see applications section for sizing

(1) VCC is not a pin on the DRV8846, but a VCC supply voltage pullup is required for open-drain output nFAULT; nFAULT may be pulled up to VINT through a resistor R_{nFAULT}

7.3.1 PWM Motor Drivers

DRV8846 contains two identical H-bridge motor drivers with current-control PWM circuitry. Figure 6 shows a block diagram of the circuitry.

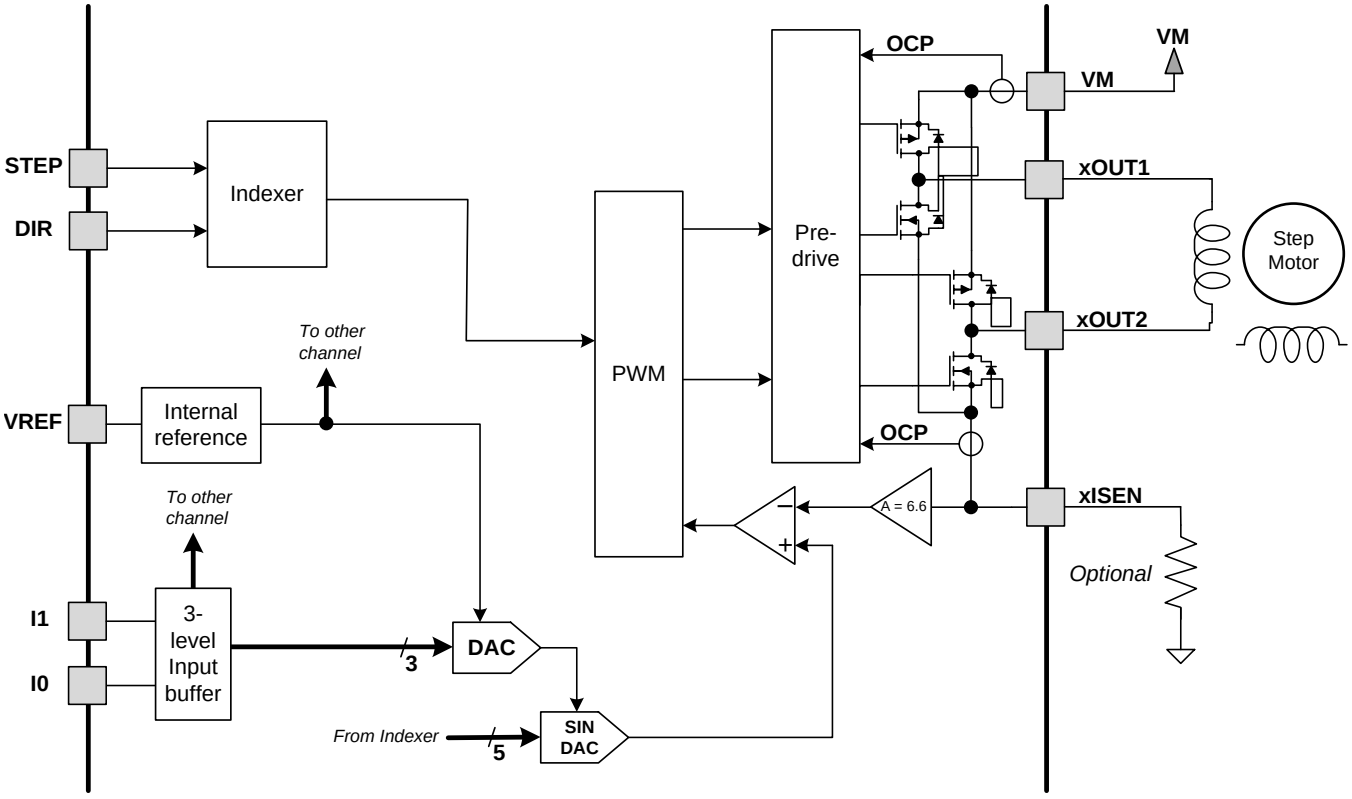


Figure 6. PWM Motor Driver Circuitry

7.3.2 Micro-Stepping Indexer

To allow a simple step and direction interface to control stepper motors, the DRV8846 contains a microstepping indexer. The indexer controls the state of the H-bridges automatically. When the correct transition is applied at the STEP input, the indexer moves to the next step, according to the direction set by the DIR pin. In 1/8, 1/16, and 1/32 step modes, both the rising and falling edges of the STEP input may be used to advance the indexer, depending on the M0 / M1 setting.

The nENBL pin disables the output stage in indexer mode. When nENBL = 1, the indexer inputs are still active and respond to the STEP and DIR input pins; only the output stage is disabled.

The indexer logic in the DRV8846 allows a number of different stepping configurations. The M0 and M1 pins configure the stepping format (see Table 2).

Table 2. Step Mode Settings

M1	M0	STEP MODE
0	0	Full step (2-phase excitation), rising-edge only
0	Z	1/2 step (1-2 phase excitation), rising-edge only
0	1	1/4 step (W1-2 phase excitation), rising-edge only
Z	0	8 microsteps/step, rising-edge only
Z	Z	8 microsteps/step, rising and falling edges
Z	1	16 microsteps/step, rising-edge only
1	0	16 microsteps/step, rising and falling edges
1	Z	32 microsteps/step, rising-edge only
1	1	32 microsteps/step, rising and falling edges

Note that the M0 and M1 pins are tri-level inputs. These pins can be driven logic low, logic high, or high-impedance (Z), like the I0 and I1 pins described previously.

For 1/8, 1/16, and 1/32-step modes, selections are available to advance the indexer only on the rising edge of the STEP input, or on both the rising and falling edges.

The step mode may be changed on-the-fly while the motor is moving. The indexer advances to the next valid state for the new M0 / M1 setting at the next rising edge of STEP.

The home state is 45°. The indexer enters the home state after power-up, after exiting UVLO, or after exiting sleep mode (see the yellow-shaded cells in Table 3 also indicated with a table note).

Table 3 shows the relative current and step directions for different step mode settings. At each rising edge of the STEP input, the indexer travels to the next state in the table. The direction is shown with the DIR pin high; if the DIR pin is low, the sequence is reversed. Positive current is defined as xOUT1 = positive with respect to xOUT2.

Table 3. Relative Current and Step Directions

1/32 STEP	1/16 STEP	1/8 STEP	1/4 STEP	1/2 STEP	FULL STEP 70%	WINDING CURRENT A	WINDING CURRENT B	ELECTRICAL ANGLE
1	1	1	1	1		100%	0%	0
2						100%	5%	3
3	2					100%	10%	6
4						99%	15%	8
5	3	2				98%	20%	11
6						97%	24%	14
7	4					96%	29%	17
8						94%	34%	20
9	5	3	2			92%	38%	23
10						90%	43%	25
11	6					88%	47%	28
12						86%	51%	31
13	7	4				83%	56%	34
14						80%	60%	37
15	8					77%	63%	39
16						74%	67%	42
17(1)	9(1)	5(1)	3(1)	2(1)	1(1)	71%	71%	45
18						67%	74%	48
19	10					63%	77%	51
20						60%	80%	53

(1) The indexer enters the home state after power-up, after exiting UVLO, or after exiting sleep mode.

Table 3. Relative Current and Step Directions (continued)

7.3.3 Current Regulation

The current through the motor windings is regulated by an adjustable fixed-off-time PWM current regulation circuit. When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage, inductance of the winding, and the magnitude of the back EMF present. After the current reaches the current chopping threshold, the bridge enters a decay mode for a fixed period of time to decrease the current, which is configurable between 10 to 30 µs through the tri-level input TOFF_SEL. After the time expires, the bridge is re-enabled, starting another PWM cycle.

Table 4. Fixed Off-Time Selection

TOFF_SEL	TOFF Duration
0	20 µs
Z	10 µs
1	30 µs

The PWM chopping current is set by a comparator which compares the voltage across a current sense resistor connected to the xISEN pin, with a reference voltage. The reference voltage can be supplied by an internal reference of 3.3 V (which requires VINT to be connected to VREF), or externally supplied to the VREF pin. The reference voltage is then scaled first by the 3-bit torque DAC, then by the output of a sine lookup table that is applied to a sine-weighted DAC (sine DAC). The voltage is attenuated by a factor of 6.6.

The full-scale (100%) chopping current is calculated as follows:

$$I_{FS} = \frac{VREF}{6.6 \times R_{ISENSE}} \times TORQUE \quad (1)$$

where

- I_{FS} is the full scale regulated current
- VREF is the voltage on the VREF pin
- R_{ISENSE} is the resistance of the sense resistor
- TORQUE is the scaling percentage from the torque DAC.

Example: Using VREF is 3.3 V, torque DAC = 100%, and a 500-mΩ sense resistor, the full-scale chopping current is 3.3 V / (6.6 × 500 mΩ) × 100% = 1 A.

The current for both motor windings is scaled depending on the I0 and I1 pins, which drive a 3-bit linear DAC, as in Table 5.

Table 5. Torque DAC Settings

I1	I0	CURRENT SCALING (TORQUE)
0	0	100%
0	Z	87.5%
0	1	75%
Z	0	62.5%
Z	Z	50%
Z	1	37.5%
1	0	25%
1	Z	12.5%
1	1	0% (outputs disabled)

Table 6 gives the xISEN trip voltage at a given DAC code and I[1:0] setting.

7.3.4 Decay Mode

After the chopping current threshold is reached, the drive current is interrupted, but due to the inductive nature of the motor, current must continue to flow for some period of time (called recirculation current). To handle this recirculation current, the H-bridge can operate in two different states, fast decay or slow decay (or a mixture of fast and slow decay).

In fast-decay mode, after the PWM chopping current level is reached, the H-bridge reverses state to allow winding current to flow through the opposing FETs. As the winding current approaches 0, the bridge is disabled to prevent any reverse current flow. For fast-decay mode, see number 2 in Figure 7.

In slow-decay mode, winding current is recirculated by enabling both of the low-side FETs in the bridge. For slow-decay mode, see number 3 in Figure 7.

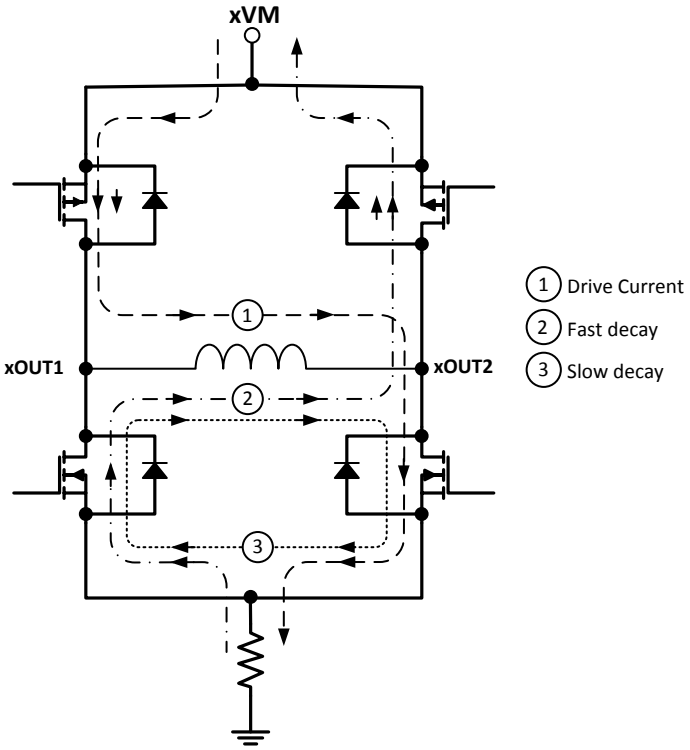

Figure 7. Decay Modes

The DRV8846 supports fast, slow, mixed, and AutoTune modes. With stepper motors, the decay mode is chosen for a given stepper motor and operating conditions to minimize mechanical noise and vibration.

In mixed decay mode, the current recirculation begins as fast decay, but at a fixed period of time (determined by the state of the DEC1 and DEC0 pins shown in Table 7) the current recirculation switches to slow decay mode for the remainder of the fixed PWM period. Note that the DEC1 and DEC0 pins are tri-level inputs; these pins can be driven logic low, logic high, or high-impedance (Z).

Figure 8 shows the current waveforms in slow, fast, and 25% and 1 t_{BLANK} mixed decay modes.

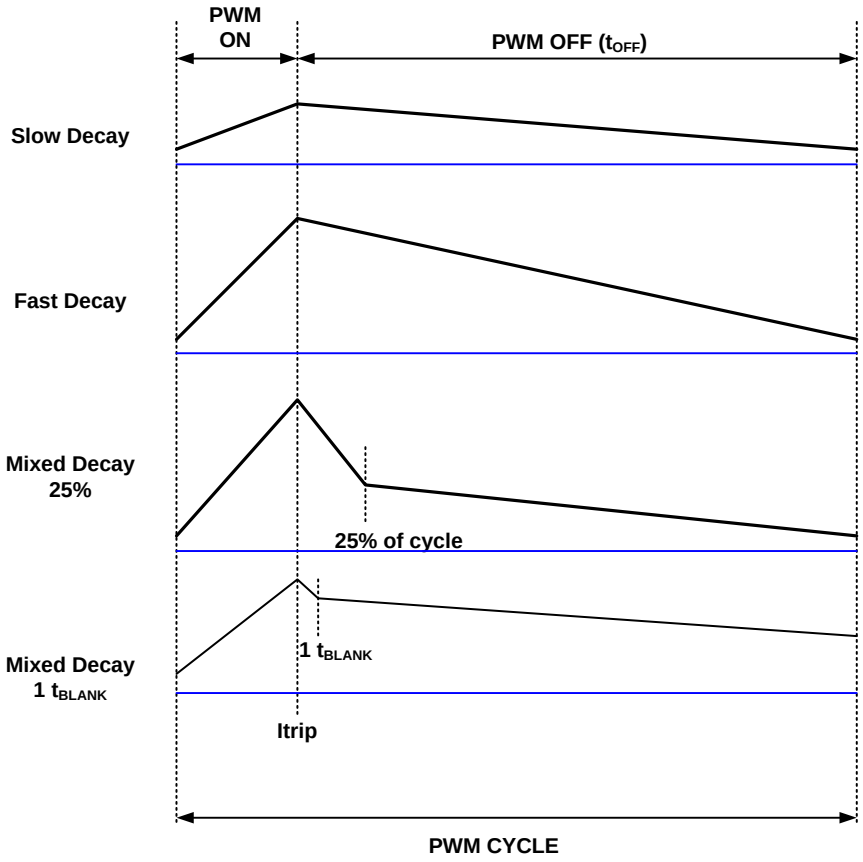

Figure 8. Decay Behavior

Table 7. Decay Pins Configuration

DEC1	DEC0	Decay Mode (Increasing Current)	Decay Mode (Decreasing Current)
0	0	Slow decay	Slow decay
0	Z	Slow decay	Mixed decay: 25% fast
0	1	Slow decay	Mixed decay: 1 t_{BLANK}
Z	0	Mixed decay: 1 t_{BLANK}	Mixed decay: 1 t_{BLANK}
Z	Z	Mixed decay: 50% fast	Mixed decay: 50% fast
Z	1	Mixed decay: 25% fast	Mixed decay: 25% fast
1	0	Slow decay	Mixed decay: 50% fast
1	Z	Slow decay	Mixed decay: 12.5% fast
1	1	Slow decay	Fast decay

Figure 9 shows increasing and decreasing current. When current is decreasing, the decay mode used is fast, slow, or mixed as commanded by the DEC1 and DEC0 pins. Three DEC pin selections allow for mixed decay during increasing current.

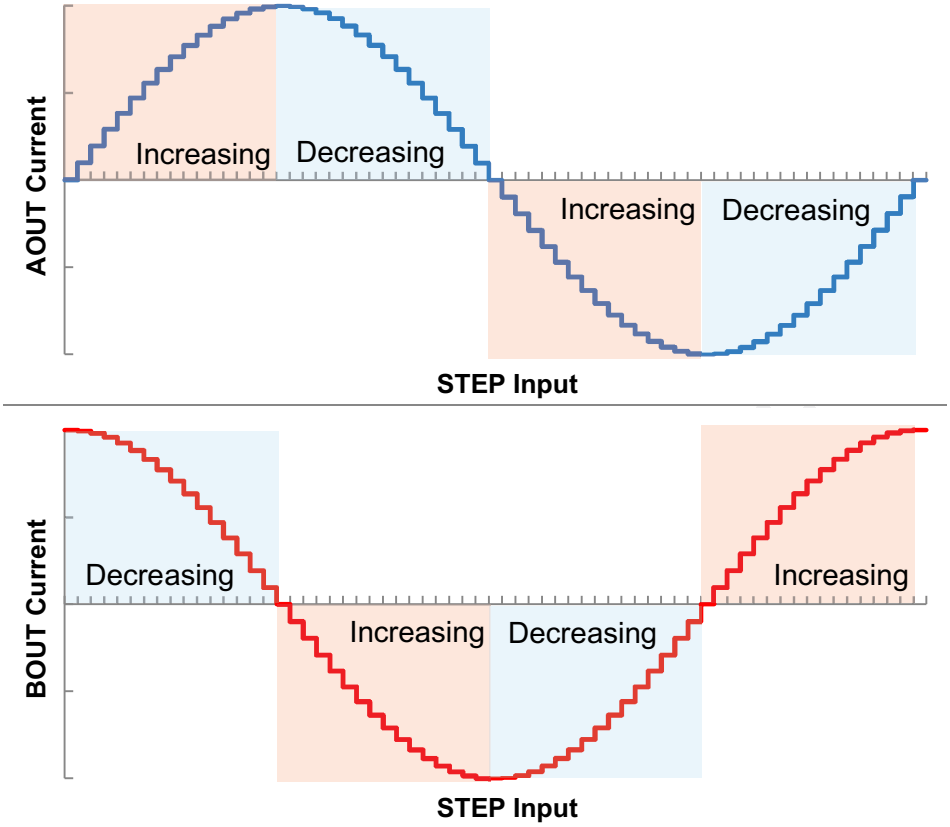

Figure 9. Increasing and Decreasing Current

AutoTune mode simplifies the decay mode selection by dynamically changing to adjust for current level, step change, supply variation, BEMF, and load. To enable AutoTune mode, pull the ADEC pin to logic high and pull DEC0 and DEC1 pins to logic high. The state of the ADEC pin is only evaluated when exiting sleep mode. (ADEC pin must be high before exiting sleep to enable AutoTune mode.)

AutoTune adjusts the time spent in fast decay to minimize current ripple and quickly adjust to current-step changes. If the drive time is longer than the minimum (t_{BLANK}), in order to reach the current trip point, the decay mode applied is slow decay (see Figure 10).

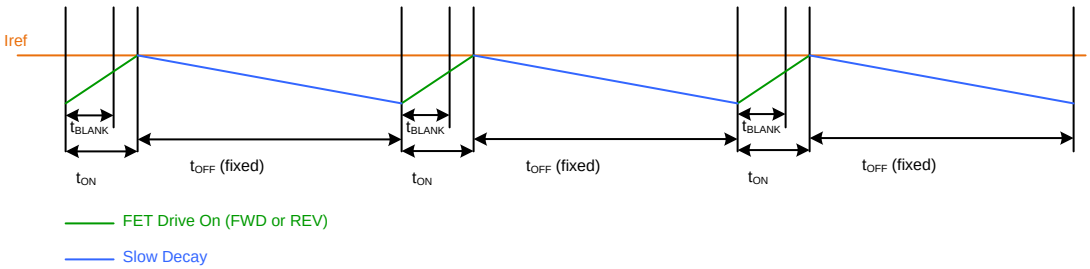

Figure 10. AutoTune – Slow Decay Operation

When the minimum drive time (t_{BLANK}) provides more current than the regulation point, fast decay of 1- t_{BLANK} is applied. If the second drive period also provides more current than the regulation point, fast decay of 2 t_{BLANK} is applied. If a third (or more) consecutive period provides more current than the regulation point, fast decay using 25% of t_{OFF} time is applied. When the minimum drive time is insufficient to reach the current regulation level, slow decay is applied until the current exceeds the current reference level (see Figure 11).

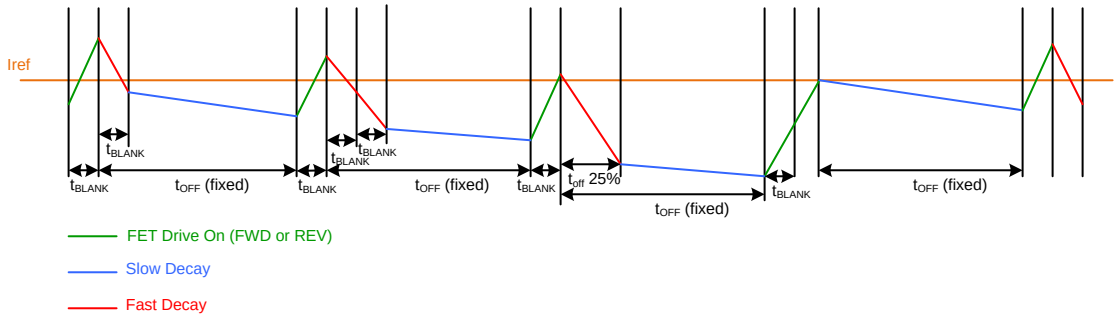

Figure 11. AutoTune – Mixed Decay Operation

Figure 12 shows a case for AutoTune where a step occurs. The system starts with 1 t_{BLANK} of fast decay and works up to 25% of t_{OFF} time for fast decay until the current is regulated again.

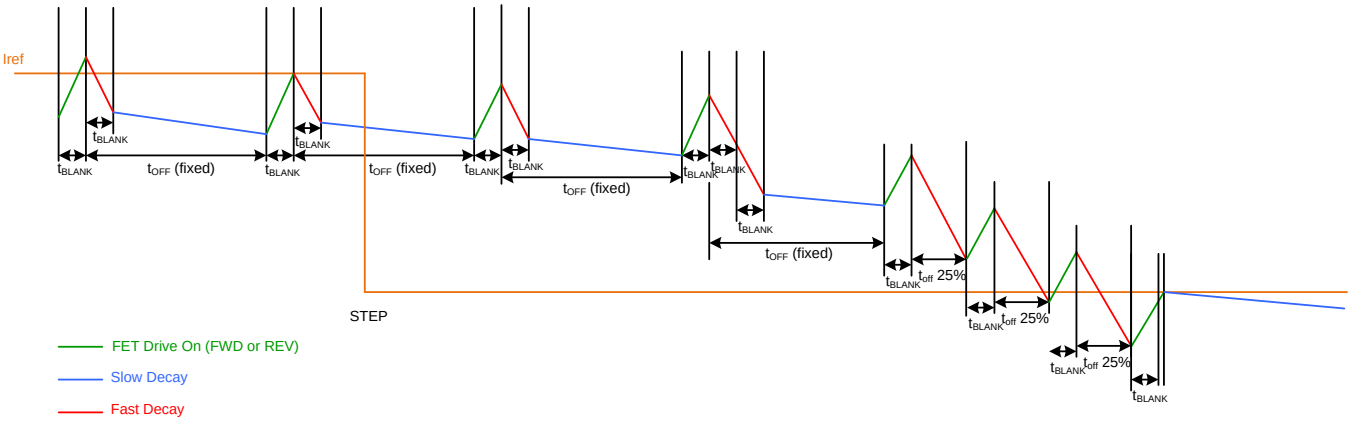

Figure 12. AutoTune – Step Operation

7.3.5 Blanking Time

After the current is enabled in an H-bridge, the voltage on the xISEN pin is ignored for a period of time before enabling the current sense circuitry. Note that the blanking time also sets the minimum drive time of the PWM.

The time, t_{BLANK}, is determined by the sine DAC code and the torque DAC setting. The timing information for t_{BLANK} is given in Table 8.

Table 8. t_{BLANK} Settings

Sine DAC Code	Torque DAC I[1:0] Setting							
	00 - 100%	0Z - 87.5%	01 - 75%	Z0 - 62.5%	ZZ - 50%	Z1 - 37.5%	10 - 25%	1Z - 12.5%

7.3.6 Protection Circuits

The DRV8846 is fully protected against undervoltage, overcurrent, and overtemperature events.

7.3.6.1 Overcurrent Protection (OCP)

An analog current limit circuit on each FET limits the current through the FET by limiting the gate drive. If this analog current limit persists for longer than the OCP deglitch time t_{OCP}, all FETs in the H-bridge are disabled and the nFAULT pin is driven low. The device remains disabled until the retry time, t_{RETRY}, occurs. The OCP is independent for each H-bridge.

Overcurrent conditions are detected independently on both high-side and low-side devices; that is, a short to ground, supply, or across the motor winding all result in an OCP event. Note that OCP does not use the current sense circuitry used for PWM current control, so OCP functions without the presence of the xISEN resistors.

7.3.6.2 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge are disabled and the nFAULT pin is driven low. After the die temperature falls to a safe level, operation automatically resumes. The nFAULT pin is released after operation has resumed.

7.3.6.3 Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the UVLO falling threshold voltage, V_{UVLO}, all circuitry in the device is disabled, and all internal logic is reset. Operation resumes when VM rises above the UVLO rising threshold. The nFAULT pin is driven low during an undervoltage condition and is released after operation has resumed.

Table 9. Fault Behavior

Fault	Error Report	H-Bridge	Internal Circuits	Recovery
VM UVLO	nFAULT unlatched	Disabled	Shut down	System and fault clears on recovery
OCP	nFAULT unlatched	Disabled	Operating	System and fault clears on recovery and motor is driven after time, t_{RETRY}
TSD	nFAULT unlatched	Disabled	Operating	System and fault clears on recovery

7.4 Device Functional Modes

The DRV8846 device is active unless the nSLEEP pin is driven low. In sleep mode, the VINT regulator is disabled and the H-bridge FETs are disabled (Hi-Z). The time t_{SLEEP} must elapse after a falling edge on the nSLEEP pin before the device enters sleep mode. The DRV8846 is brought out of sleep mode by bringing the nSLEEP pin high. The time t_{WAKE} must elapse, after nSLEEP is brought high, before the outputs change state.

If the nENBL pin is brought high, the H-bridge outputs are disabled, but the internal logic is still active. An appropriate edge on STEP (depending on the step mode) advances the indexer, but the outputs do not change state until nENBL is driven low.

Table 10. Operating Modes

Mode	Condition	H-Bridge	VINT	Indexer
Operating	4 V < VM < 18 V nSLEEP pin = 1 nENBL = 0	Operating	Operating	Operating
Disabled	4 V < VM < 18 V nSLEEP pin = 1 nENBL = 1	Disabled	Operating	Operating
Sleep	4 V < VM < 18 V nSLEEP pin = 0	Disabled	Disabled	Disabled
Fault	Any fault condition met	Disabled	Depends on fault	Depends on fault

8 Application and Implementation

NOTE

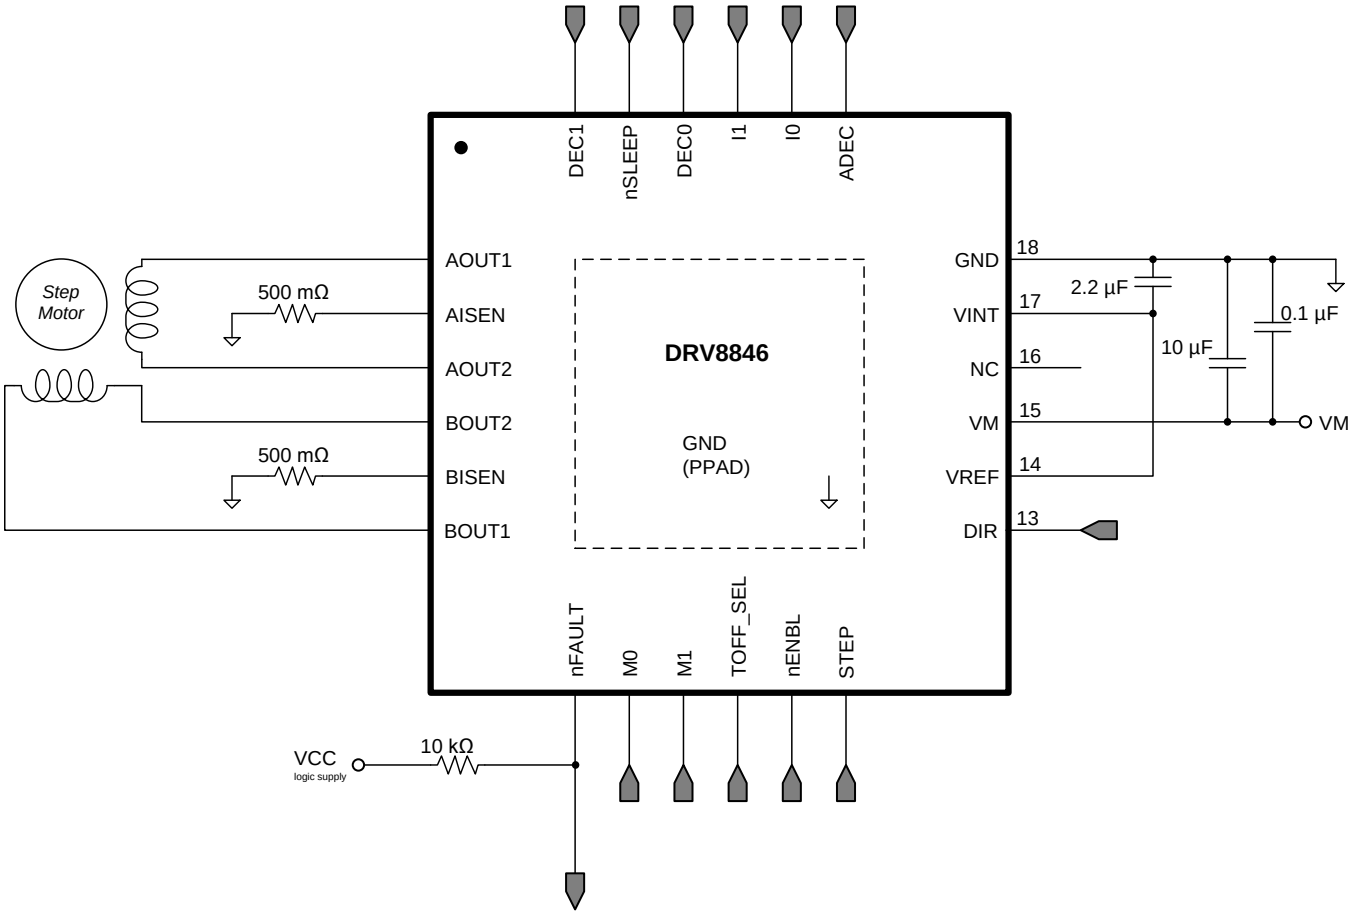
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8846 is used in stepper motor control.

8.2 Typical Application

The following design procedure can be used to configure the DRV8846.



Typical Application (continued)

8.2.1 Design Requirements

Table 11 gives design input parameters for system design.

Table 11. System Design Input Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Nominal supply voltage	VM	12 V
Supply voltage range		4 to 18 V
Motor winding resistance	R_L	3.0 Ω/phase
Motor winding inductance	L_L	330 µH/phase
Motor full step angle	θ_{step}	1.8°/step
Target stepping level	nm	1/8 step
Target motor speed	v	400 rpm
Target chopping current	I_{CHOP}	500 mA
Chopping current reference voltage	VREF	3.3 V
Current scaling	TORQUE	100%

8.2.2 Detailed Design Procedure

8.2.2.1 Stepper Motor Speed

The first step in configuring the DRV8846 requires the desired motor speed and stepping level. The DRV8846 can support from full step to 1/32 step mode.

If the target motor speed is too high, the motor will not spin. Make sure that the motor can support the target speed.

For a desired motor speed (v), microstepping level (nm), and motor full step angle (θ_{step}),

$$f_{step}\ (\text{steps/ s}) = \frac{\text{v(rpm)} \times n_m\text{(steps)} \times 6}{\theta_{step}\ (^\circ / \text{step})} \tag{2}$$

θ_{step} can be found in the stepper motor data sheet or often written on the motor itself.

For DRV8846, the microstepping levels are set by the M0/M1 pins and can be any of the settings in Table 2. Higher microstepping means a smoother motor motion and less audible noise, but increases the switching losses and requires a higher f_{step} to achieve the same motor speed.

8.2.2.2 Current Regulation

The chopping current (I_{CHOP}) is the maximum current driven through either winding. This quantity will depend on the sense resistor value (R_{XISEN}).

$$I_{CHOP} = \frac{\text{VREF}}{6.6 \times R_{ISENSE}} \times \text{TORQUE} \tag{3}$$

I_{CHOP} is set by a comparator which compares the voltage across R_{XISEN} to a reference voltage. Note that I_{CHOP} must follow Equation 4 to avoid saturating the motor.

$$I_{CHOP}\ (\text{A}) < \frac{\text{VM (V)}}{R_L\ (\Omega) + 2 \times R_{DS(ON)}\ (\Omega) + R_{SENSE}\ (\Omega)} \tag{4}$$

where

- VM is the motor supply voltage.
- R_L is the motor winding resistance.

8.2.2.3 Decay Modes

The DRV8846 supports four different decay modes: slow decay, fast decay, mixed decay, and AutoTune. The first selection to try is the AutoTune mode, which adjusts the decay mode automatically to improve current regulation. The current through the motor windings is regulated using a fixed-off-time PWM scheme. This means that after any drive phase, when a motor has reached the current chopping threshold (I_{CHOP}), the DRV8846 places the motor in one of the four decay modes until the PWM cycle has expired. Afterward, a new drive phase starts.

The blanking time, t_{BLANK}, defines the minimum drive time for the current chopping. I_{CHOP} is ignored during t_{BLANK}, so the winding current may overshoot the trip level during this blanking period.

8.2.3 Application Curves

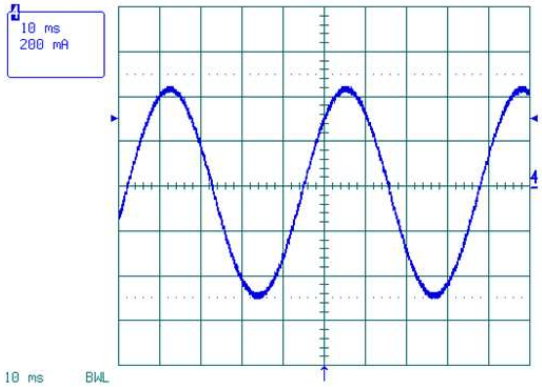


Figure 13. Microstepping Waveform, Phase A, AutoTune

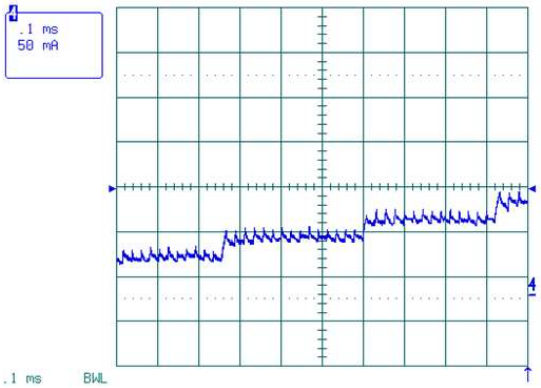

Figure 14. Microstepping Waveform, AutoTune, Step Current Regulation

9 Power Supply Recommendations

The DRV8846 is designed to operate from an input voltage supply (VM) range between 4 and 18 V. A 0.1-μF ceramic capacitor rated for VM must be placed as close to the DRV8846 as possible. In addition, a bulk 10-μF capacitor must be included on VM.

10 Layout

10.1 Layout Guidelines

The VM terminal should be bypassed to GND using a low-ESR ceramic bypass capacitor with a recommended value of 10 μF rated for VM. This capacitor should be placed as close to the VM pin as possible with a thick trace or ground plane connection to the device GND pin.

Bypass VINT to ground with a ceramic capacitor rated 6.3 V. Place this bypassing capacitor as close to the pin as possible.

10.2 Layout Example

All other trademarks are the property of their respective owners.

11.5 静电放电警告

这些装置包含有限的内置 ESD 保护。 存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

11.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
DRV8846RGER	Active	Production	VQFN (RGE) | 24	3000 | LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	DRV8846
DRV8846RGER.A	Active	Production	VQFN (RGE) | 24	3000 | LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	DRV8846
DRV8846RGER.B	Active	Production	VQFN (RGE) | 24	3000 | LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 85	DRV8846
DRV8846RGET	Obsolete	Production	VQFN (RGE) | 24	-	-	Call TI	Call TI	-40 to 85	DRV8846
DRV8846RGET.B	Obsolete	Production	VQFN (RGE) | 24	-	-	Call TI	Call TI	-40 to 85	DRV8846

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

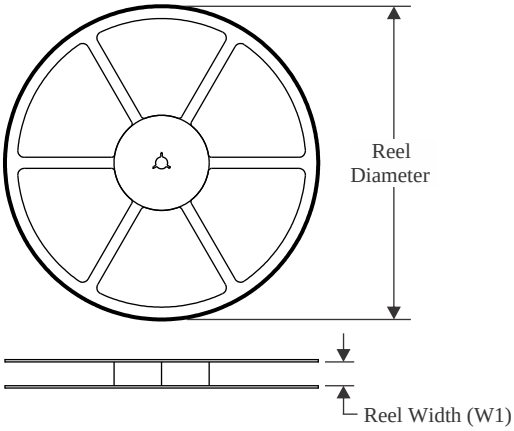
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

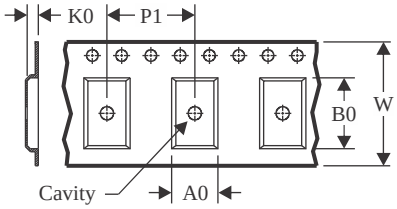
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

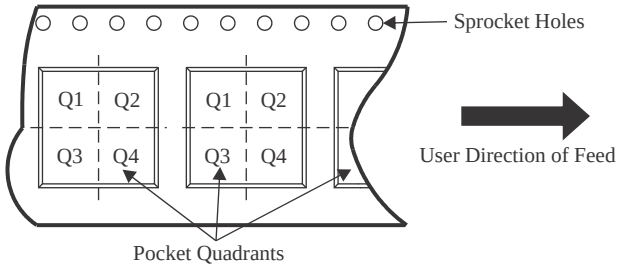


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

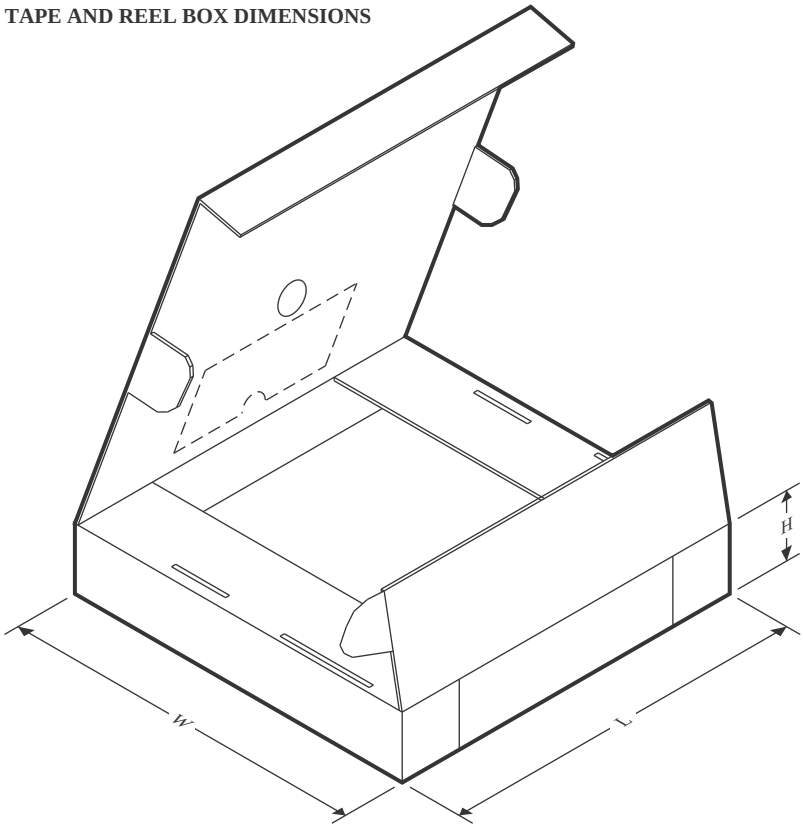
QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
DRV8846RGER	VQFN	RGE	24	3000	330.0	12.4	4.25	4.25	1.15	8.0	12.0	Q2

TAPE AND REEL BOX DIMENSIONS



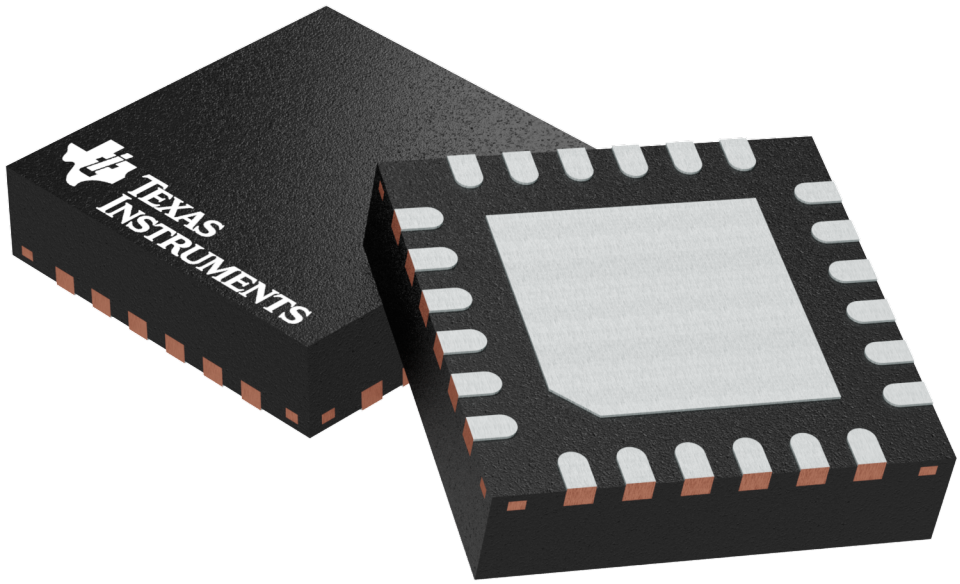
*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
DRV8846RGER	VQFN	RGE	24	3000	346.0	346.0	33.0

GENERIC PACKAGE VIEW

RGE 24 VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD



Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

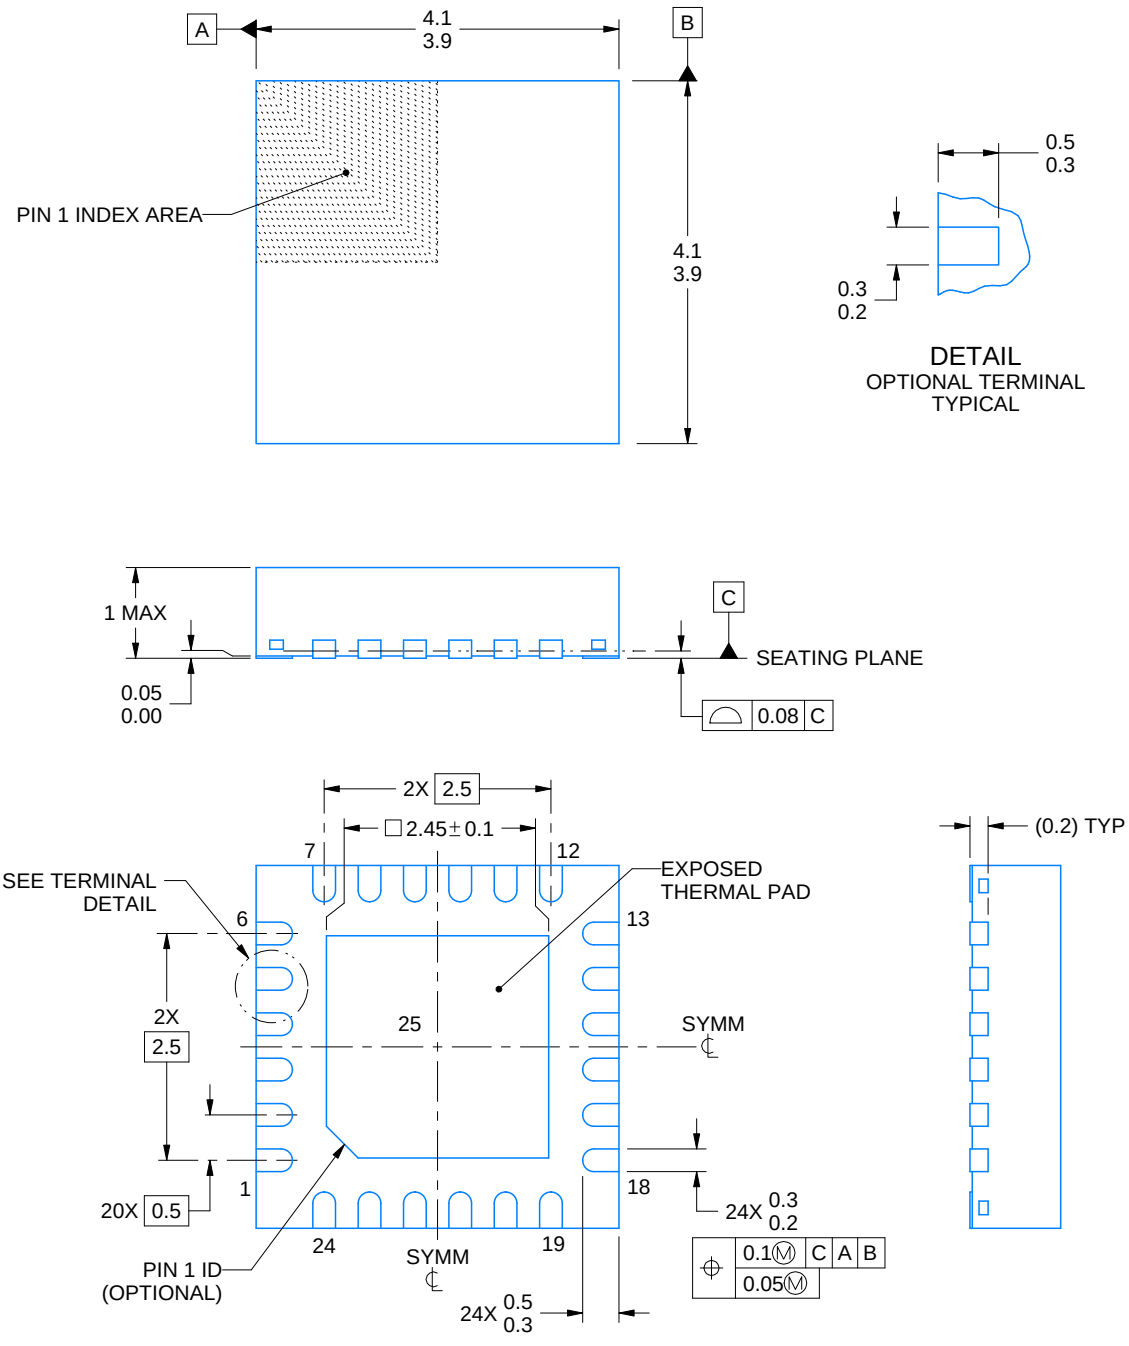
4204104/H

PACKAGE OUTLINE

RGE0024B

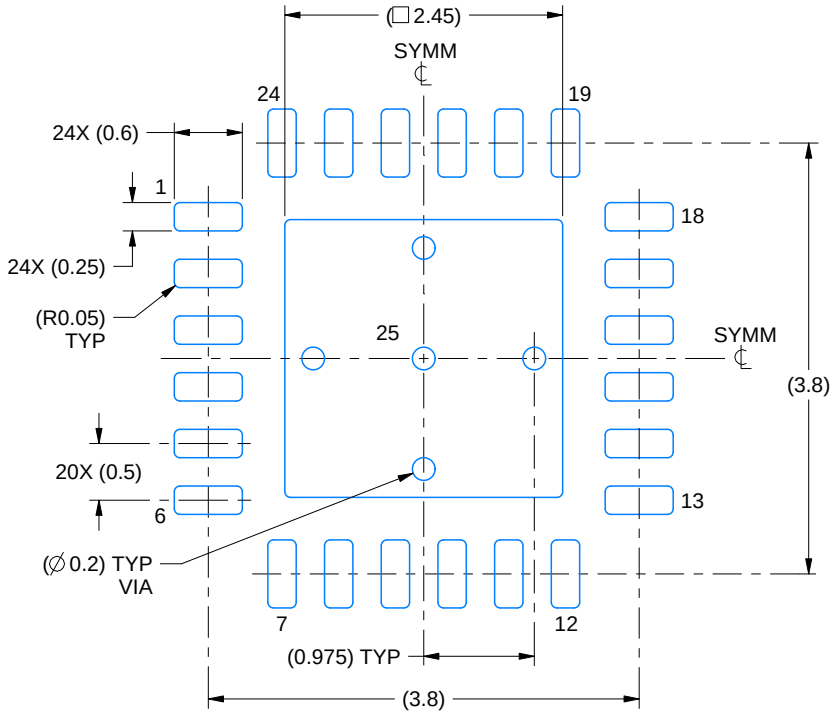
VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

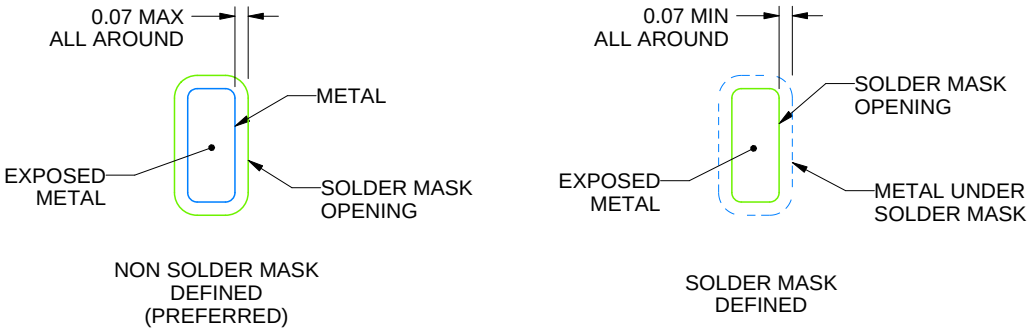


NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

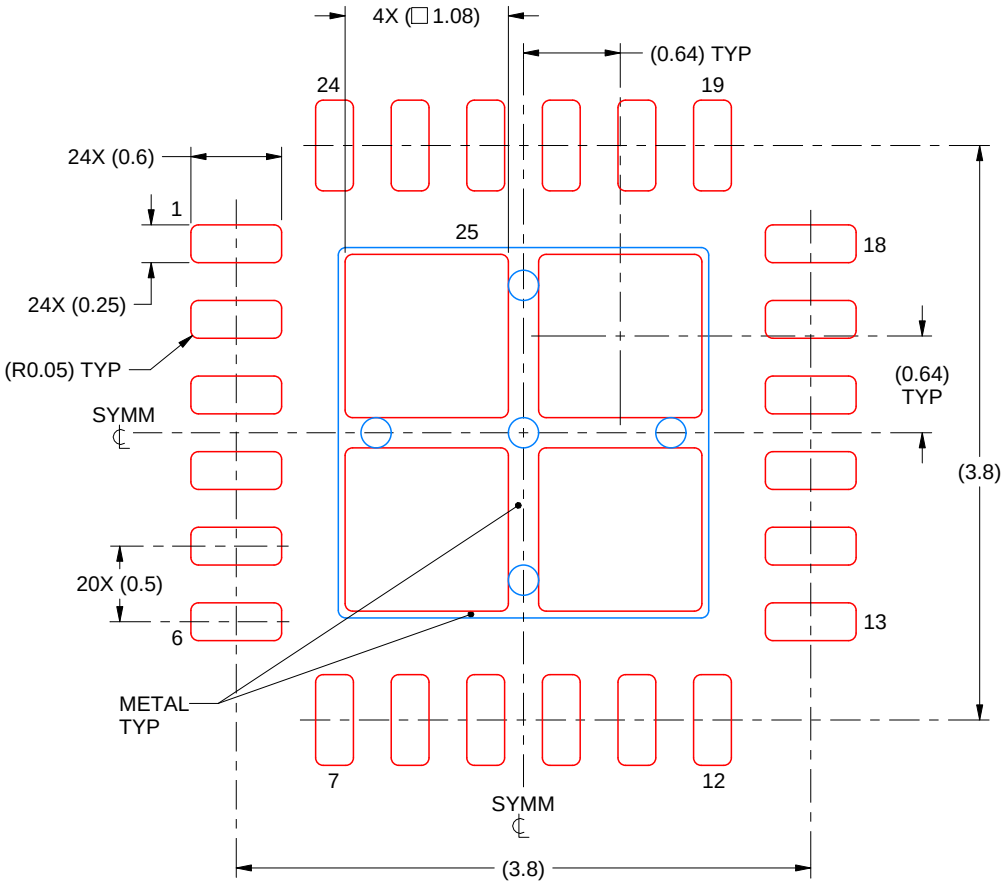


SOLDER MASK DETAILS

4219013/A 05/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 25
78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:20X

4219013/A 05/2017

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要通知和免责声明
