4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision D (October 2015) to Revision E (August 2023) Page

- Updated Thermal Characteristics, Safety Limiting Values, and Thermal Derating Curves to provide more accurate system-level thermal calculations..... **6**
- Updated electrical and switching characteristics to match device performance..... **8**

Changes from Revision C (July 2011) to Revision D (October 2015) Page

- 添加了引脚配置和功能部分、ESD 等级表、特性说明部分、器件功能模式、应用和实施部分、电源相关建议部分、布局部分、器件和文档支持部分以及机械、封装和可订购信息部分..... **1**
- 将 VDE 标准更改为 DIN V VDE V 0884-10 (VDE V 0884-10):2006-12..... **1**

Changes from Revision B (June 2011) to Revision C (July 2011) Page

Changes from Revision A (March 2011) to Revision B (May 2011) Page

- Changed pin 16 From: V_{CC1} To: V_{CC2} in the DW Package drawing..... **3**

Changes from Revision * (November 2010) to Revision A (March 2011) Page

- 将数据表从“产品预发布”更改为量产数据..... **1**
- Changed the designator of common mode voltage in Recommended operating condition to V_I **4**

5 Pin Configuration and Functions

图 5-1. DW Package 16-Pin SOIC Top View

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
A	14	I	Non-inverting Receiver Input
B	13	I	Inverting Receiver Input
D	8	I	Driver Input
D1	1	O	Transformer Driver Terminal 1, Open-Drain Output
D2	2	O	Transformer Driver Terminal 2, Open-Drain Output
DE	7	I	Driver Enable Input
GND1	3	–	Logic-side Ground
GND2	9, 15	–	Bus-side Ground. Both pins are internally connected.
NC	10	–	No Connect. This pin is not connected to any internal circuitry.
R	5	O	Receiver Output
RE	6	I	Receiver Enable Input. This pin has complementary logic.
V _{CC1}	4	–	Logic-side Power Supply
V _{CC2}	16	–	Bus-side Power Supply
Y	11	O	Non-inverting Driver Output
Z	12	O	Inverting Driver Output

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V_{CC} ⁽²⁾	Supply voltage, V_{CC1} , V_{CC2}	-0.3	6	V
V_A , V_B , V_Y , V_Z	Voltage at any bus I/O terminal (A,B,Y,Z)	-9	14	V
V_{D1} , V_{D2}	Voltage at D1, D2		14	V
$V_{(TRANS)}$	Voltage input, transient pulse, A, B, Y, and Z (through 100 Ω , see Figure 27)	-50	50	V
V_I	Voltage input at any D, DE or RE terminal	-0.5	6	V
I_O	Receiver output current	-10	10	mA
I_{D1} , I_{D2}	Transformer Driver Output Current		450	mA
T_J	Junction temperature		150	°C
T_{STG}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to network ground terminal and are peak voltage values.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	Bus pins and GND1	±6000	V
$V_{(ESD)}$	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	Bus pins and GND2	±16000	V
$V_{(ESD)}$	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	All pins	±4000	V
$V_{(ESD)}$	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾		±1500	V
$V_{(ESD)}$	Machine model (MM), ANSI/ESDS5.2-1996		±200	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	TYP	MAX	UNIT
V_{CC1}	Supply Voltage, Side 1	3	3.3	3.6	V
V_{CC2}	Supply Voltage, Side 2	3	3.3	3.6	V
V_I	Common Mode voltage at any bus terminal: A or B	-7		12	V
V_{IH}	High-level input voltage (D, DE, RE inputs)	2		V_{CC1}	V
V_{IL}	Low-level input voltage (D, DE, RE inputs)	0		0.8	V
V_{ID}	Differential input voltage, A with respect to B	-12		12	V
R_L	Differential load resistance	54	60		Ω
I_O	Output current, Driver	-60		60	mA
I_O	Output current, Receiver	-8		8	mA
T_A	Ambient temperature	-40		85	°C

		MIN	TYP	MAX	UNIT
$1/t_{UI}$	Signaling rate			1	Mbps

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ISO35T	UNIT
		DW (SOIC)	
		16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	80.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	43.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	49.7	°C/W
ψ_{JT}	Junction-to-top characterization parameter	13.8	°C/W
ψ_{JB}	Junction-to-board characterization parameter	41.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [no](#).

6.5 Power Ratings

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_D	Maximum power dissipation (both sides) $V_{CC1} = V_{CC2} = 3.6\text{ V}$, $T_J = 150^\circ\text{C}$, $CL = 15\text{ pF}$, Input a 0.5 MHz 50% duty cycle square wave			373	mW

6.6 Insulation Specifications

PARAMETER		TEST CONDITIONS	VALUE	UNIT
			DW-16	
CLR	External clearance ⁽¹⁾	Shortest terminal-to-terminal distance through air	8	mm
CPG	External creepage ⁽¹⁾	Shortest terminal-to-terminal distance across the package surface	8	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	8	um
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	>400	V
	Material group	According to IEC 60664-1	II	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 150 V _{RMS}	I-IV	
		Rated mains voltage ≤ 300 V _{RMS}	I-III	
DIN EN IEC 60747-17 (VDE 0884-17) ⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	566	V _{PK}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 s (qualification); V _{TEST} = 1.2 x V _{IOTM} , t= 1 s (100% production)	4242	V _{PK}
q _{pd}	Apparent charge ⁽³⁾	Method b; At routine test (100% production) V _{ini} = 1.2 x V _{IOTM} , t _{ini} = 1 s; V _{pd(m)} = 1.5 x V _{IORM} , t _m = 1 s	≤5	pC
C _{IO}	Barrier capacitance, input to output ⁽⁴⁾	V _{IO} = 0.4 x sin (2 π ft), f = 1 MHz	2	pF
C _I	Input capacitance to ground	V _I = V _{CC} / 2 + 0.4×sin(2 π ft), f = 1 MHz, V _{CC} = 5 V	2	pF
R _{IO}	Isolation resistance ⁽⁴⁾	V _{IO} = 500 V, T _A = 25°C	>10 ¹²	Ω
		V _{IO} = 500 V, T _S = 150°C	>10 ⁹	
	Pollution degree		2	
	Climatic category		40/085/21	
UL 1577				

PARAMETER		TEST CONDITIONS	VALUE	UNIT
			DW-16	
V _{ISO}	Maximum withstanding isolation voltage	V _{TEST} = V _{ISO} , t = 60 s (qualification), V _{TEST} = 1.2 x V _{ISO} , t = 1 s (100% production)	2500	V _{RMS}

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed-circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *basic electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (4) All pins on each side of the barrier tied together creating a two-terminal device.

6.7 Safety-Related Certifications

VDE	CSA	UL
Certified according to DIN EN IEC 60747-17 (VDE 0884-17)	Certified according to IEC 60950-1 and IEC 61010-1	Certified according to UL 1577 Component Recognition Program
Basic insulation, Maximum Transient Isolation Voltage, 4242 V _{PK} Maximum Surge Isolation Voltage, 4000 V _{PK} Maximum repetitive peak Isolation Voltage, 566 V _{PK}	3000 V _{RMS} Isolation Rating; Reinforced insulation per CSA 61010-1 and IEC 61010-1 150 V _{RMS} working voltage; Basic insulation per CSA 61010-1 and IEC 61010-1 600 V _{RMS} working voltage; Basic insulation per CSA 60950-1 and IEC 60950-1 760 V _{RMS} working voltage	Single protection, 2500 V _{RMS}
Certificate number: 40047657	Master contract number: 220991	File number: E181974

6.8 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DW-16 PACKAGE						
I _S	Safety input, output, or supply current	R _{θJA} = 80.5°C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C, see #none#			431	mA
T _S	Maximum safety temperature				150	°C

- (1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power respectively. The maximum limits of I_S and P_S should not be exceeded. These limits vary with the ambient temperature, T_A.
The junction-to-air thermal resistance, R_{θJA}, in the table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:
T_J = T_A + R_{θJA} × P, where P is the power dissipated in the device.
T_{J(max)} = T_S = T_A + R_{θJA} × P_S, where T_{J(max)} is the maximum allowed junction temperature.
P_S = I_S × V_I, where V_I is the maximum input voltage.

6.9 Electrical Characteristics: Driver

All typical specs are at $V_{CC1}=3.3V$, $V_{CC2}=5V$, $T_A=27^{\circ}C$, (Min/Max specs are over recommended operating conditions unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OD} $	Driver differential-output voltage magnitude	$I_O = 0$ mA, no load	2.5		V_{CC2}	V
		$R_L = 54 \Omega$, See Figure 11	1.5	2		V
		$R_L = 100 \Omega$ (RS-422), See Figure 11	2	2.3		V
		V_{test} from -7 V to $+12$ V, See Figure 12	1.5			V
$\Delta V_{OD} $	Change in differential output voltage between two states	See Figure 11 and Figure 12	-200		200	mV
$V_{OC(SS)}$	Common-mode output voltage	See Figure 13	1	2.6	3	V
$\Delta V_{OC(SS)}$	change in steady-state common-mode output voltage between two states	See Figure 13	-100		100	mV
$V_{OC(PP)}$	Peak-to-peak common-mode output voltage	See Figure 13		0.5		V
I_I	Input current	D, DE, V_I at 0 V or V_{CC1}	-10		10	μA
I_{OZ}	High-impedance state output current	V_Y or $V_Z = 12$ V, $V_{CC} = 0V$ or $3V$, $DE = 0V$; other input at 0 V			90	μA
		V_Y or $V_Z = -7$ V, $V_{CC} = 0V$ or $3V$, $DE = 0V$; other input at 0 V	-10			μA
$I_{OS(P)}^{(1)}$	Short-circuit output current	V_Y or $V_Z = -7$ V to $+12$ V, Figure 14; Other input at 0 V		300		mA
$I_{OS(SS)}^{(1)}$	Short-circuit output current	V_Y or $V_Z = -7$ V to $+12$ V, Figure 14; Other input at 0 V	-250		250	mA
C_{OD}	Differential output capacitance	$V_I = 0.4 \sin(4E6 \pi t) + 0.5$ V, DE at 0 V		16		pF

(1) This device has thermal shutdown and output current-limiting features to protect in short-circuit fault condition.

6.10 Electrical Characteristics: Receiver

All typical specs are at $V_{CC1}=3.3V$, $V_{CC2}=5V$, $T_A=27^{\circ}C$, (Min/Max specs are over recommended operating conditions unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IT+}	Positive-going input threshold voltage	$I_O = -8$ mA			-20	mV
V_{IT-}	Negative-going input threshold voltage	$I_O = 8$ mA	-200			mV
V_{hys}	Input hysteresis ($V_{IT+} - V_{IT-}$)			50		mV
V_{OH}	High-level output voltage	$V_{ID} = 200$ mV, $I_O = -8$ mA	2.4			V
V_{OL}	Low-level output voltage	$V_{ID} = -200$ mV, $I_O = 8$ mA			0.4	V
$I_{O(Z)}$	Output high-impedance current	$V_O = 0$ or V_{CC1} , $RE = V_{CC1}$	-1		1	μA
I_A or I_B	Bus input current	V_A or $V_B = 12$ V, Other input at 0 V		50	100	μA
		V_A or $V_B = 12$ V, $V_{CC} = 0$, Other input at 0 V		60	100	μA
		V_A or $V_B = -7$ V, Other input at 0 V	-100	-40		μA
		V_A or $V_B = -7$ V, $V_{CC} = 0$, Other input at 0 V	-100	-30		μA
I_{IH}	High-level input current, RE	$V_{IH} = 2$ V	-10		10	μA

All typical specs are at $V_{CC1}=3.3V$, $V_{CC2}=5V$, $T_A=27^{\circ}C$, (Min/Max specs are over recommended operating conditions unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{IL}	Low-level input current, RE	$V_{IL} = 0.8 V$	-10		10	μA
R_{ID}	Differential input resistance	Measured between A & B	96			kohm
C_{ID}	Differential input capacitance	$V_I = 0.4 \sin(4E6 \pi t) + 0.5 V$		15		pF

6.11 Supply Current

Bus loaded or unloaded (over recommended operating conditions unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
DRIVER ENABLED, RECEIVER DISABLED					
I_{CC1} ⁽¹⁾	DE & RE = 0V or V_{CC1} (Driver and Receiver Enabled or Disabled), D = 0 V or V_{CC1} , No load		4.5	8	mA
I_{CC2} ⁽¹⁾	RE = 0 V or V_{CC1} , DE = 0 V (driver disabled), No load		7.5	13	mA
I_{CC2} ⁽¹⁾	RE = 0 V or V_{CC1} , DE = V_{CC1} (driver enabled), D = 0 V or V_{CC1} , No load		9	16	mA
CMTI	See Figure 23	25	50		kV/us

- (1) I_{CC1} and I_{CC2} are measured when device is connected to external power supplies, V_{CC1} & V_{CC2} . In this case, D1 & D2 are open and disconnected from external transformer.

6.12 Transformer Driver Characteristics

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{OSC}	Oscillator frequency $V_{CC1} = 3.3 \text{ V} \pm 10\%$, D1 and D2 connected to transformer	300	400	550	kHz
R_{ON}	Switch on resistance D1 and D2 connected to 50- Ω pullup resistors		1	2.5	ohm
t_{r_D}	D1, D2 output rise time $V_{CC1} = 3.3 \text{ V} \pm 10\%$, See Figure 28, D1 and D2 connected to 50- Ω pullup resistors		70		ns
t_{f_D}	D1, D2 output fall time $V_{CC1} = 3.3 \text{ V} \pm 10\%$, See Figure 28, D1 and D2 connected to 50- Ω pullup resistors		80		ns
f_{st}	Startup frequency $V_{CC1} = 2.4 \text{ V}$, D1 and D2 connected to transformer		350		kHz
t_{BBM}	Break before make time delay $V_{CC1} = 3.3 \text{ V} \pm 10\%$, See Figure 28, D1 and D2 connected to 50- Ω pullup resistors		140		ns

6.13 Switching Characteristics: Driver

All typical specs are at $V_{CC1}=3.3V$, $V_{CC2}=5V$, $T_A=27^{\circ}C$, (Min/Max specs are over recommended operating conditions unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
500-kbps DEVICES					
t_{PHL} , t_{PLH}	Propagation delay	See Figure 15	205	340	ns
PWD	Pulse width distortion ⁽¹⁾ , $ t_{PHL} - t_{PLH} $	See Figure 15	1.5		ns
t_r , t_f	Differential output rise time and fall time	See Figure 15	120	180	300
t_{PZH}	Propagation delay, high-impedance-to-high-level output	See Figure 16		530	ns
t_{PHZ}	Propagation delay, high-level-to-high-impedance output	See Figure 16		205	ns
t_{PLZ}	Propagation delay, low-level to high-impedance output	See Figure 17		330	ns
t_{PZL}	Propagation delay, standby-to-low-level output	See Figure 17		530	ns

(1) Also known as pulse skew.

6.14 Switching Characteristics: Receiver

All typical specs are at $V_{CC1}=3.3V$, $V_{CC2}=5V$, $T_A=27^{\circ}C$, (Min/Max specs are over recommended operating conditions unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
500-kbps DEVICES					
t_{PHL} , t_{PLH}	Propagation delay	See Figure 19	85	115	ns
PWD	Pulse Skew, $ t_{PHL} - t_{PLH} $	See Figure 19		13	ns
t_r , t_f	Differential output rise time and fall time	See Figure 19	1	4	ns
t_{PHZ} , t_{PLZ}	Propagation delay, high-impedance-to-high-level output, Propagation delay, high-impedance-to-low-level output	See Figure 20, DE at 0 V	13	25	ns
t_{PZH} , t_{PZL}	Propagation delay, high-level-to-high-impedance output, Propagation delay, low-level to high-impedance output	See Figure 21, DE at 0 V	13	25	ns

8 Detailed Description

8.1 Overview

ISO35T is an isolated full-duplex differential transceiver with integrated transformer driver. The integrated transformer driver supports elegant secondary power supply design. This device is rated to provide galvanic isolation up to 4242 V_{PK} per VDE and 2500 V_{RMS} per UL. It has active-high driver enable and active-low receiver enable to control the data flow. It is suitable for data transmission up to 1 Mbps.

When the driver enable pin, DE, is logic high, the differential outputs Y and Z follow the logic states at data input D. A logic high at D causes Y to turn high and Z to turn low. In this case the differential output voltage defined as $V_{OD} = V_{(Y)} - V_{(Z)}$ is positive. When D is low, the output states reverse, Z turns high, Y becomes low, and V_{OD} is negative. When DE is low, both outputs turn high-impedance. In this condition the logic state at D is irrelevant. The DE pin has an internal pulldown resistor to ground, thus when left open the driver is disabled (high-impedance) by default. The D pin has an internal pullup resistor to V_{CC}, thus, when left open while the driver is enabled, output Y turns high and Z turns low.

When the receiver enable pin, $\overline{RE}$, is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_{(A)} - V_{(B)}$ is positive and higher than the positive input threshold, V_{IT+} , the receiver output, R, turns high. When V_{ID} is negative and lower than the negative input threshold, V_{IT-} , the receiver output, R, turns low. If V_{ID} is between V_{IT+} and V_{IT-} the output is indeterminate. When $\overline{RE}$ is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

8.2 Functional Block Diagram

9 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Application Information

ISO35T is a full-duplex RS-485 transceiver commonly used for asynchronous data transmission. Full-duplex implementation requires two signal pairs (four wires), and allows each node to transmit data on one pair while simultaneously receiving data on the other pair. To eliminate line reflections, each cable end is terminated with a termination resistor, $R(T)$, whose value matches the characteristic impedance, Z_0 , of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length.

9.2 Typical Application

图 9-2. Typical Application Circuit

9.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

表 9-1. Design Parameters

PARAMETER	VALUE
Pullup and Pulldown Resistors	1 kΩ to 10 kΩ
Decoupling Capacitors	100 nF

9.2.2 Detailed Design Procedure

9.2.2.1 Transient Voltages

Isolation of a circuit insulates it from other circuits and earth so that noise develops across the insulation rather than circuit components. The most common noise threat to data-line circuits is voltage surges or electrical fast transients that occur after installation and the transient ratings of ISO35T are sufficient for all but the most severe installations. However, some equipment manufacturers use their ESD generators to test transient susceptibility of their equipment and can easily exceed insulation ratings. ESD generators simulate static discharges that may occur during device or equipment handling with low-energy but very high voltage transients.

图 9-3 models the ISO35T bus IO connected to a noise generator. C_{IN} and R_{IN} is the device and any other stray or added capacitance or resistance across the A or B pin to GND2, C_{ISO} and R_{ISO} is the capacitance and resistance between GND1 and GND2 of ISO35T plus those of any other insulation (transformer, etc.), and we assume stray inductance negligible. From this model, the voltage at the isolated bus return is shown in 方程式 1 and will always be less than 16 V from V_N .

$$V_{GND2} = V_N \frac{Z_{ISO}}{Z_{ISO} + Z_{IN}} \quad (1)$$

If ISO35T is tested as a stand-alone device, $R_{IN} = 6 \times 10^4 \Omega$, $C_{IN} = 16 \times 10^{-12} \text{ F}$, $R_{ISO} = 10^9 \Omega$ and $C_{ISO} = 10^{-12} \text{ F}$.

In 图 9-3 the resistor ratio determines the voltage ratio at low frequency and it is the inverse capacitance ratio at high frequency. In the stand-alone case and for low frequency, use 方程式 2, or essentially all noise appears across the barrier.

$$\frac{V_{GND2}}{V_N} = \frac{R_{ISO}}{R_{ISO} + R_{IN}} = \frac{10^9}{10^9 + 6 \times 10^4} \quad (2)$$

At very high frequency, 方程式 3 is true and 94% of V_N appears across the barrier.

$$\frac{V_{GND2}}{V_N} = \frac{\frac{1}{C_{ISO}}}{\frac{1}{C_{ISO}} + \frac{1}{C_{IN}}} = \frac{1}{1 + \frac{C_{ISO}}{C_{IN}}} = \frac{1}{1 + \frac{1}{16}} = 0.94 \quad (3)$$

As long as R_{ISO} is greater than R_{IN} and C_{ISO} is less than C_{IN} , most of transient noise appears across the isolation barrier, as it should.

We recommend the reader not test equipment transient susceptibility with ESD generators or consider product claims of ESD ratings above the barrier transient ratings of an isolated interface. ESD is best managed through recessing or covering connector pins in a conductive connector shell and installer training.

10 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, TI recommends a 0.1- μ F bypass capacitor at input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. This device is used in applications where only a single primary-side power supply is available. Isolated power can be generated for the secondary-side with the help of integrated transformer driver.

11 Layout

11.1 Layout Guidelines

ON-chip IEC-ESD protection is good for laboratory and portable equipment but never sufficient for EFT and surge transients occurring in industrial environments. Therefore, robust and reliable bus node design requires the use of external transient protection devices. Because ESD and EFT transients have a wide frequency bandwidth from approximately 3-MHz to 3-GHz, high-frequency layout techniques must be applied during PCB design. A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 11-1](#)).

- Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane, and low-frequency signal layer.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- Place the protection circuitry close to the bus connector to prevent noise transients from penetrating your board.
- Use V_{CC} and ground planes to provide low-inductance. High-frequency currents might follow the path of least inductance and not necessarily the path of least resistance.
- Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
- Apply 0.1- μ F bypass capacitors as close as possible to the V_{CC} -pins of transceiver, UART, and controller ICs on the board.
- Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize effective via-inductance.
- Use 1-k Ω to 10-k Ω pullup and pulldown resistors for enable lines to limit noise currents in these lines during transient events.
- Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
- While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.
- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.

If an additional supply voltage plane or signal layer is needed, add a second power and ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

备注

For detailed layout recommendations, see Application Note *Digital Isolator Design Guide*, [SLLA284](#).

12.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
