ISO5852S 具有分离输出和有源保护特性的高 CMTI 2.5A 和 5A 增强型隔离式 IGBT、MOSFET 栅极驱动器

1 特性

- 在 V_{CM} = 1500V 时，共模瞬态抗扰度 (CMTI) 的最小值为 100kV/μs
- 分离输出，可提供 2.5A 峰值拉电流和 5A 峰值灌电流
- 短传播延迟：76ns（典型值），110ns（最大值）
- 2A 有源米勒钳位
- 输出短路钳位
- 短路期间的软关断 (STO)
- 在检测到去饱和故障时通过 $\overline{FLT}$ 发出故障报警并通过 $\overline{RST}$ 复位
- 具有就绪 (RDY) 引脚指示的输入和输出欠压锁定 (UVLO)
- 有源输出下拉特性，在低电源或输入悬空的情况下默认输出低电平
- 2.25V 至 5.5V 输入电源电压
- 15V 至 30V 输出驱动器电源电压
- 互补金属氧化物半导体 (CMOS) 兼容输入
- 抑制短于 20ns 的输入脉冲和瞬态噪声
- 工作温度：–40°C 至 +125°C（环境温度）
- 可承受的隔离浪涌电压 12800V_{PK}
- 安全相关认证：
  - 符合 DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 标准的 8000 V_{PK} V_{IOTM} 和 2121 V_{PK} V_{IORM} 增强型隔离
  - 符合 UL 1577 标准且长达 1 分钟的 5700 V_{RMS} 隔离
  - CSA 组件验收通知 5A，IEC 60950-1 和 IEC 60601-1 终端设备标准
  - 符合 EN 61010-1 和 EN 60950-1 标准的 TUV 认证
  - 经 GB4943.1-2011 CQC 认证

2 应用

- 隔离式绝缘栅双极型晶体管 (IGBT) 和金属氧化物半导体场效应晶体管 (MOSFET) 驱动器：
  - 工业电机控制驱动
  - 工业电源
  - 太阳能逆变器
  - HEV 和 EV 电源模块
  - 感应加热

3 说明

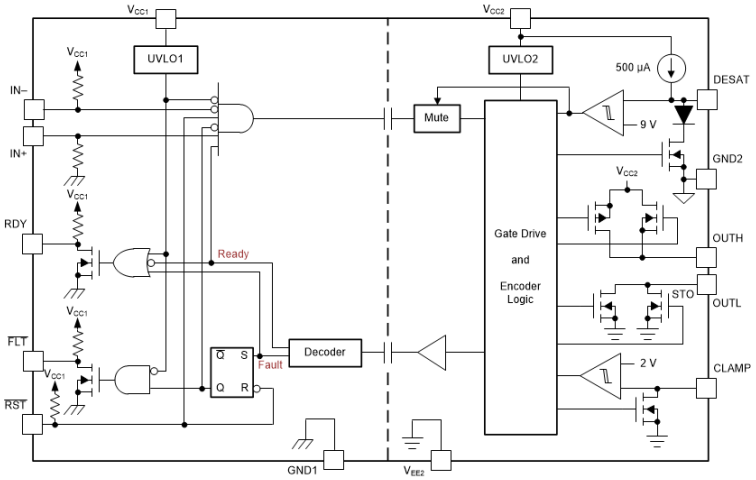
ISO5852S 器件是一款用于 IGBT 和 MOSFET 的 5.7 kV_{RMS} 增强型隔离栅极驱动器，具有分离输出（OUTH 和 OUTL）以及 2.5A 的拉电流能力和 5A 的灌电流能力。输入端可依靠 2.25V 到 5.5V 的单个电源供电运行。输出侧支持的电源电压范围为 15V 至 30V。两路互补 CMOS 输入控制栅极驱动器输出状态。76ns 的短暂传播时间保证了对于输出级的精确控制。

内置的去饱和 (DESAT) 故障检测功能可识别 IGBT 何时处于过流状态。检测到 DESAT 时，静音逻辑会立即阻断隔离器输出，并启动软关断过程以禁用 OUTH 引脚并将 OUTL 引脚拉至低电平持续 2μs。当 OUTL 引脚达到 2V 时（相对于最大负电源电势 V_{EE2}），栅极驱动器会被“硬”拉至 V_{EE2} 电势，从而立即将 IGBT 关断。

器件信息(1)

器件型号	封装	封装尺寸（标称值）
ISO5852S	SOIC (16)	10.30mm × 7.50mm

(1) 有关所有的可用封装，请参阅数据表末尾的可订购产品附录。



功能方框图

Table of Contents

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision B (January 2017) to Revision C (May 2023) — **Page**

- Added Additional manufacturing certification pending to Safety-Related Certifications table 9

Changes from Revision A (September 2015) to Revision B (January 2017) — **Page**

- 将数据表标题从 *有源安全特性* 更改为 *有源保护特性* 1
- 将“特性”从“浪涌抗扰度为 12800V_{PK} (根据 IEC 61000-4-5) ”更改为“可承受的隔离浪涌电压 12800V_{PK}” 1
- Changed the minimum external tracking (creepage) parameter to the external creepage parameter 8
- Changed the input-to-output test voltage parameter to the apparent charge parameter 8
- Added the climatic category to the *Insulation Specifications* table 8
- Changed the CSA status from planned to certified 9
- Added text ", but connecting CLAMP output of the gate driver to the IGBT gate is also not an issue." to *Supply and Active Miller Clamp* 23
- Changed the second paragraph of the *Typical Applications* 25
- Added text "and $\overline{RST}$ input signal" to the *Design Requirements* 26

Changes from Revision * (July 2015) to Revision A (September 2015) — **Page**

- 将 *特性* 部分的“100kV/ μ s 最小共模瞬态抗扰度...”移至列表顶部 1
- 将首页的“产品预发布”更改为完整数据表 1
- 将 *说明* 中的文本“3V 至 5.5V 的单电源”更改为“2.25V 至 5.5V 的单电源” 1
- 将 *说明* 中的文本“IGBT 处于过载状态”更改为“IGBT 处于过流状态” 1
- 将 *说明* 中的文本“并在最短 2 μ s 的时间跨度内降低 OUTL 上的电压”更改为“并在 2 μ s 的时间跨度内将 OUTL 拉至低电平” 1
- 更改了 *功能方框图* , 在引脚 OUTL 上添加了 STO 1
- 更改了 *说明* 的第 3 段 4

- Changed the minimum air gap (clearance) parameter to the external clearance parameter..... 8

5 说明（续）

当发生去饱和故障时，器件会通过隔离隔栅发送故障信号，以将输入端的 $\overline{\text{FLT}}$ 输出拉为低电平并阻断隔离器的输入。静音逻辑在软关断期间激活。$\overline{\text{FLT}}$ 的输出状态将被锁存，并只能在 RDY 引脚变为高电平后通过 $\overline{\text{RST}}$ 输入上的低电平有效脉冲复位。

如果在由双极输出电源供电的正常运行期间关断 IGBT，输出电压会被硬钳位为 V_{EE2}。如果输出电源为单极，那么可采用有源米勒钳位，这种钳位会在一条低阻抗路径上灌入米勒电流，从而防止 IGBT 在高电压瞬态状态下发生动态导通。

栅极驱动器是否准备就绪待运行由两个欠压锁定电路控制，这两个电路会监视输入端和输出端的电源。如果任意一端电源不足，RDY 输出会变为低电平，否则该输出为高电平。

ISO5852S 采用 16 引脚小外形尺寸集成电路 (SOIC) 封装.此器件的额定工作环境温度范围为 -40°C 至 +125°C。

6 Pin Configuration and Function

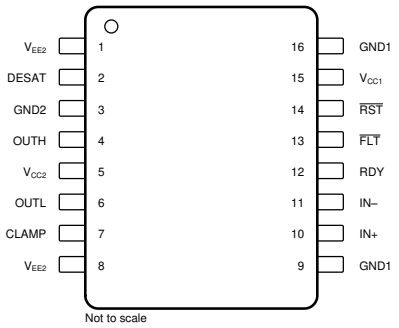


图 6-1. DWW Package 16-Pin SOIC Top View

表 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CLAMP	7	O	Miller clamp output
DESAT	2	I	Desaturation voltage input
$\overline{FLT}$	13	O	Fault output, active-low during DESAT condition
GND1	9	—	Input ground
	16		
GND2	3	—	Gate drive common. Connect to IGBT emitter.
IN+	10	I	Non-inverting gate drive voltage control input
IN –	11	I	Inverting gate drive voltage control input
OUTH	4	O	Positive gate drive voltage output
OUTL	6	O	Negative gate drive voltage output
RDY	12	O	Power-good output, active high when both supplies are good.
$\overline{RST}$	14	I	Reset input, apply a low pulse to reset fault latch.
V_{CC1}	15	—	Positive input supply (2.25 V to 5.5 V)
V_{CC2}	5	—	Most positive output supply potential.
V_{EE2}	1	—	Output negative supply. Connect to GND2 for unipolar supply application.
	8		

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)(1)

			MIN	MAX	UNIT
V_{CC1}	Supply-voltage input side		GND1 – 0.3	6	V
V_{CC2}	Positive supply-voltage output side	(V_{CC2} – GND2)	– 0.3	35	V
V_{EE2}	Negative supply-voltage output side	(V_{EE2} – GND2)	– 17.5	0.3	V
$V_{(SUP2)}$	Total-supply output voltage	(V_{CC2} – V_{EE2})	– 0.3	35	V
$V_{(OUTH)}$	Positive gate-driver output voltage		V_{EE2} – 0.3	V_{CC2} + 0.3	V
$V_{(OUTL)}$	Negative gate-driver output voltage		V_{EE2} – 0.3	V_{CC2} + 0.3	V
$I_{(OUTH)}$	Gate-driver high output current	Maximum pulse width = 10 μs, Maximum duty cycle = 0.2%)		2.7	A
$I_{(OUTL)}$	Gate-driver low output current	Maximum pulse width = 10 μs, Maximum duty cycle = 0.2%)		5.5	A
$V_{(LIP)}$	Voltage at IN+, IN –, $\overline{FLT}$, RDY, $\overline{RST}$		GND1 – 0.3	V_{CC1} + 0.3	V
$I_{(LOP)}$	Output current of $\overline{FLT}$, RDY			10	mA
$V_{(DESAT)}$	Voltage at DESAT		GND2 – 0.3	V_{CC2} + 0.3	V
$V_{(CLAMP)}$	Clamp voltage		V_{EE2} – 0.3	V_{CC2} + 0.3	V
T_J	Junction temperature		– 40	150	°C
T_{STG}	Storage temperature		– 65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC1}	Supply-voltage input side	2.25		5.5	V
V_{CC2}	Positive supply-voltage output side (V_{CC2} – GND2)	15		30	V
$V_{(EE2)}$	Negative supply-voltage output side (V_{EE2} – GND2)	– 15		0	V
$V_{(SUP2)}$	Total supply-voltage output side (V_{CC2} – V_{EE2})	15		30	V
$V_{(IH)}$	High-level input voltage (IN+, IN –, $\overline{RST}$)	0.7 × V_{CC1}		V_{CC1}	V
$V_{(IL)}$	Low-level input voltage (IN+, IN –, $\overline{RST}$)	0		0.3 × V_{CC1}	V
t_{UI}	Pulse width at IN+, IN – for full output (C_{LOAD} = 1 nF)	40			ns
t_{RST}	Pulse width at $\overline{RST}$ for resetting fault latch	800			ns
T_A	Ambient temperature	– 40		125	°C

7.4 Thermal Information

THERMAL METRIC[1]		ISO5852S DWW (SOIC) 16 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	99.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	48.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	56.5	°C/W
ψ_{JT}	Junction-to-top characterization parameter	29.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	56.5	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

7.5 Power Ratings

Full-chip power dissipation is derated 10.04 mW/°C beyond 25°C ambient temperature. At 125°C ambient temperature, a maximum of 251 mW total power dissipation is allowed. Power dissipation can be optimized depending on ambient temperature and board design, while ensuring that the junction temperature does not exceed 150°C.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_D	Maximum power dissipation (both sides)	V_{CC1} = 5.5 V, V_{CC2} = 30 V, T_A = 25°C			1255	mW
P_{ID}	Maximum input power dissipation	V_{CC1} = 5.5 V, V_{CC2} = 30 V, T_A = 25°C			175	mW
P_{OD}	Maximum output power dissipation	V_{CC1} = 5.5 V, V_{CC2} = 30 V, T_A = 25°C			1080	mW

7.6 Insulation Specifications

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance(1)	Shortest terminal-to-terminal distance through air	14.5	mm
CPG	External creepage(1)	Shortest terminal-to-terminal distance across the package surface	14.5	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	21	µm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112; UL 746A	>600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage Category	Rated mains voltage ⩽ 600 V_{RMS}	I-IV	
		Rated mains voltage ⩽ 1000 V_{RMS}	I-III	
DIN V VDE V 0884-10 (VDE V 0884-10):2006-12(2)				
V_{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	2828	V_{PK}
V_{IOWM}	Maximum isolation working voltage	AC voltage (sine wave) Time dependent dielectric breakdown (TDDB) test, see 图 7-1	2000	V_{RMS}
		DC voltage	2828	V_{DC}
V_{IOTM}	Maximum transient isolation voltage	V_{TEST} = V_{IOTM}; t = 60 s (qualification); t = 1 s (100% production)	8000	V_{PK}
V_{IOSM}	Maximum surge isolation voltage(3)	Test method per IEC 60065, 1.2/50 µs waveform, V_{TEST} = 1.6 × V_{IOSM} = 12800 V_{PK} (qualification)	8000	
q_{pd}	Apparent charge(4)	Method a: After I/O safety test subgroup 2/3, V_{ini} = V_{IOTM}, t_{ini} = 60 s; $V_{pd(m)}$ = 1.2 × V_{IORM} = 2545 V_{PK} , t_m = 10 s	⩽5	pC
		Method a: After environmental tests subgroup 1, V_{ini} = V_{IOTM}, t_{ini} = 60 s; $V_{pd(m)}$ = 1.6 × V_{IORM} = 3394 V_{PK} , t_m = 10 s	⩽5	
		Method b1: At routine test (100% production) and preconditioning (type test) V_{ini} = V_{IOTM}, t_{ini} = 60 s; $V_{pd(m)}$ = 1.875× V_{IORM} = 3977 V_{PK} , t_m = 10 s	⩽5	
C_{IO}	Barrier capacitance, input to output(5)	V_{IO} = 0.4 sin (2 π ft), f = 1 MHz	~1	pF
R_{IO}	Isolation resistance, input to output(5)	V_{IO} = 500 V, T_A = 25°C	> 10^{12}	Ω
		V_{IO} = 500 V, 100°C ⩽ T_A ⩽ 125°C	> 10^{11}	
		V_{IO} = 500 V at T_S = 150°C	> 10^9	
	Pollution degree		2	
	Climatic category		40/125/21	
UL 1577				
V_{ISO}	Withstand isolation voltage	V_{TEST} = V_{ISO} = 5700 V_{RMS}, t = 60 s (qualification); V_{TEST} = 1.2 × V_{ISO} = 6840 V_{RMS}, t = 1 s (100% production)	5700	V_{RMS}

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
(2) This coupler is suitable for *safe electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
(3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
(4) Apparent charge is electrical discharge caused by a partial discharge (pd).
(5) All pins on each side of the barrier tied together creating a two-terminal device

7.7 Safety-Related Certifications

7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	$R_{\theta JA}$ = 99.6°C/W, V_I = 2.75 V, T_J = 150°C, T_A = 25°C, see 图 7-2			456	mA
		$R_{\theta JA}$ = 99.6°C/W, V_I = 3.6 V, T_J = 150°C, T_A = 25°C, see 图 7-2			346	
		$R_{\theta JA}$ = 99.6°C/W, V_I = 5.5 V, T_J = 150°C, T_A = 25°C, see 图 7-2			228	
		$R_{\theta JA}$ = 99.6°C/W, V_I = 15 V, T_J = 150°C, T_A = 25°C, see 图 7-2			84	
		$R_{\theta JA}$ = 99.6°C/W, V_I = 30 V, T_J = 150°C, T_A = 25°C, see 图 7-2			42	
P_S	Safety input, output, or total power	$R_{\theta JA}$ = 99.6°C/W, T_J = 150°C, T_A = 25°C, see 图 7-3			255(1)	mW
T_S	Maximum ambient safety temperature				150	°C

(1) Input, output, or the sum of input and output power should not exceed this value

The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the 节 7.4 table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7.9 Electrical Characteristics

Over recommended operating conditions unless otherwise noted. All typical values are at T_A = 25°C, V_{CC1} = 5 V, V_{CC2} – GND2 = 15 V, GND2 – V_{EE2} = 8 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
VOLTAGE SUPPLY						
$V_{IT+(UVLO1)}$	Positive-going UVLO1 threshold-voltage input side (V_{CC1} – GND1)				2.25	V

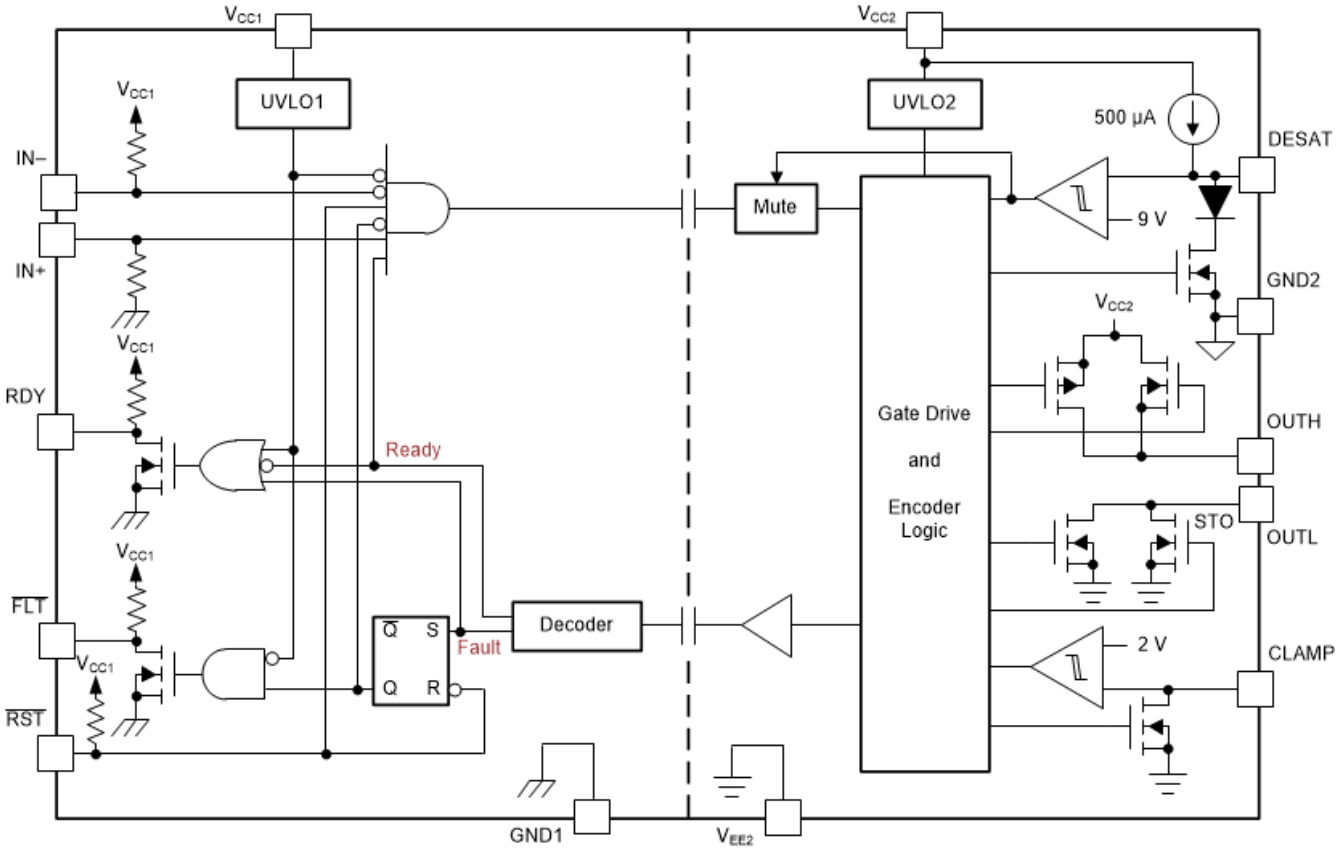
9 Detailed Description

9.1 Overview

The ISO5852S is an isolated gate driver for IGBTs and MOSFETs. Input CMOS logic and output power stage are separated by a Silicon dioxide (SiO_2) capacitive isolation.

The IO circuitry on the input side interfaces with a micro controller and consists of gate drive control and RESET ($\overline{RST}$) inputs, READY (RDY) and FAULT ($\overline{FLT}$) alarm outputs. The power stage consists of power transistors to supply 2.5-A pullup and 5-A pulldown currents to drive the capacitive load of the external power transistors, as well as DESAT detection circuitry to monitor IGBT collector-emitter overvoltage under short circuit events. The capacitive isolation core consists of transmit circuitry to couple signals across the capacitive isolation barrier, and receive circuitry to convert the resulting low-swing signals into CMOS levels. The ISO5852S also contains under voltage lockout circuitry to prevent insufficient gate drive to the external IGBT, and active output pulldown feature which ensures that the gate-driver output is held low, if the output supply voltage is absent. The ISO5852S also has an active Miller clamp function which can be used to prevent parasitic turn-on of the external power transistor, due to Miller effect, for unipolar supply operation.

9.2 Functional Block Diagram



9.3 Feature Description

9.3.1 Supply and Active Miller Clamp

The ISO5852S supports both bipolar and unipolar power supply with active Miller clamp.

For operation with bipolar supplies, the IGBT is turned off with a negative voltage on its gate with respect to its emitter. This prevents the IGBT from unintentionally turning on because of current induced from its collector to its gate due to Miller effect. In this condition it is not necessary to connect CLAMP output of the gate driver to the IGBT gate, but connecting CLAMP output of the gate driver to the IGBT gate is also not an issue. Typical values of V_{CC2} and V_{EE2} for bipolar operation are 15-V and -8-V with respect to GND2.

For operation with unipolar supply, typically, V_{CC2} is connected to 15-V with respect to GND2, and V_{EE2} is connected to GND2. In this use case, the IGBT can turn on due to additional charge from IGBT Miller capacitance caused by a high voltage slew rate transition on the IGBT collector. To prevent IGBT to turn on, the CLAMP pin is connected to IGBT gate and Miller current is sinked through a low impedance CLAMP transistor.

Miller CLAMP is designed for Miller current up to 2-A. When the IGBT is turned-off and the gate voltage transitions below 2-V the CLAMP current output is activated.

9.3.2 Active Output Pulldown

The Active output pulldown feature ensures that the IGBT gate OUTH/L is clamped to V_{EE2} to ensure safe IGBT off-state, when the output side is not connected to the power supply.

9.3.3 Undervoltage Lockout (UVLO) With Ready (RDY) Pin Indication Output

Undervoltage Lockout (UVLO) ensures correct switching of IGBT. The IGBT is turned-off, if the supply V_{CC1} drops below $V_{IT-(UVLO1)}$, irrespective of IN+, IN – and RST input till V_{CC1} goes above $V_{IT+(UVLO1)}$.

In similar manner, the IGBT is turned-off, if the supply V_{CC2} drops below $V_{IT-(UVLO2)}$, irrespective of IN+, IN – and RST input till V_{CC2} goes above $V_{IT+(UVLO2)}$.

Ready (RDY) pin indicates status of input and output side Under Voltage Lock-Out (UVLO) internal protection feature. If either side of device have insufficient supply (V_{CC1} or V_{CC2}), the RDY pin output goes low; otherwise, RDY pin output is high. RDY pin also serves as an indication to the micro-controller that the device is ready for operation.

9.3.4 Soft Turnoff, Fault ($\overline{\text{FLT}}$) and Reset ($\overline{\text{RST}}$)

During IGBT overcurrent condition, a mute logic initiates a soft-turn-off procedure which disables, OUTH, and pulls OUTL to low over a time span of 2 µs. When desaturation is active, a fault signal is sent across the isolation barrier pulling the $\overline{\text{FLT}}$ output at the input side low and blocking the isolator input. mute logic is activated through the soft-turn-off period. The $\overline{\text{FLT}}$ output condition is latched and can be reset only after RDY goes high, through a active-low pulse at the $\overline{\text{RST}}$ input. $\overline{\text{RST}}$ has an internal filter to reject noise and glitches. By asserting $\overline{\text{RST}}$ for at-least the specified minimum duration (800 ns), device input logic can be enabled or disabled.

9.3.5 Short Circuit Clamp

Under short circuit events it is possible that currents are induced back into the gate-driver OUTH/L and CLAMP pins due to parasitic Miller capacitance between the IGBT collector and gate terminals. Internal protection diodes on OUTH/L and CLAMP help to sink these currents while clamping the voltages on these pins to values slightly higher than the output side supply.

9.4 Device Functional Modes

In ISO5852S OUTH/L to follow IN+ in normal functional mode, $\overline{FLT}$ pin must be in the high state. 表 9-1 lists the device functions.

表 9-1. Function Table(1)

10 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

10.1 Application Information

The ISO5852S device is an isolated gate driver for power semiconductor devices such as IGBTs and MOSFETs. It is intended for use in applications such as motor control, industrial inverters and switched mode power supplies. In these applications, sophisticated PWM control signals are required to turn the power devices on and off, which at the system level eventually may determine, for example, the speed, position, and torque of the motor or the output voltage, frequency and phase of the inverter. These control signals are usually the outputs of a microcontroller, and are at low voltage levels such as 2.5 V, 3.3 V or 5 V. The gate controls required by the MOSFETs and IGBTs, however, are in the range of 30-V (using unipolar output supply) to 15-V (using bipolar output supply), and require high-current capability to drive the large capacitive loads offered by those power transistors. The gate drive must also be applied with reference to the emitter of the IGBT (source for MOSFET), and by construction, the emitter node in a gate-drive system may swing between 0 to the DC-bus voltage, which can be several 100s of volts in magnitude.

The ISO5852S device is therefore used to level shift the incoming 2.5-V, 3.3-V, and 5-V control signals from the microcontroller to the 30-V (using unipolar output supply) to 15-V (using bipolar output supply) drive required by the power transistors while ensuring high-voltage isolation between the driver side and the microcontroller side.

10.2 Typical Applications

图 10-1 shows the typical application of a three-phase inverter using six ISO5852S isolated gate drivers. Three-phase inverters are used for variable-frequency drives to control the operating speed and torque of AC motors and for high-power applications such as high-voltage DC (HVDC) power transmission.

The basic three-phase inverter consists of six power switches, and each switch is driven by one SO5852S. The switches are driven on and off at high switching frequency with specific patterns that to converter dc bus voltage to three-phase AC voltages.

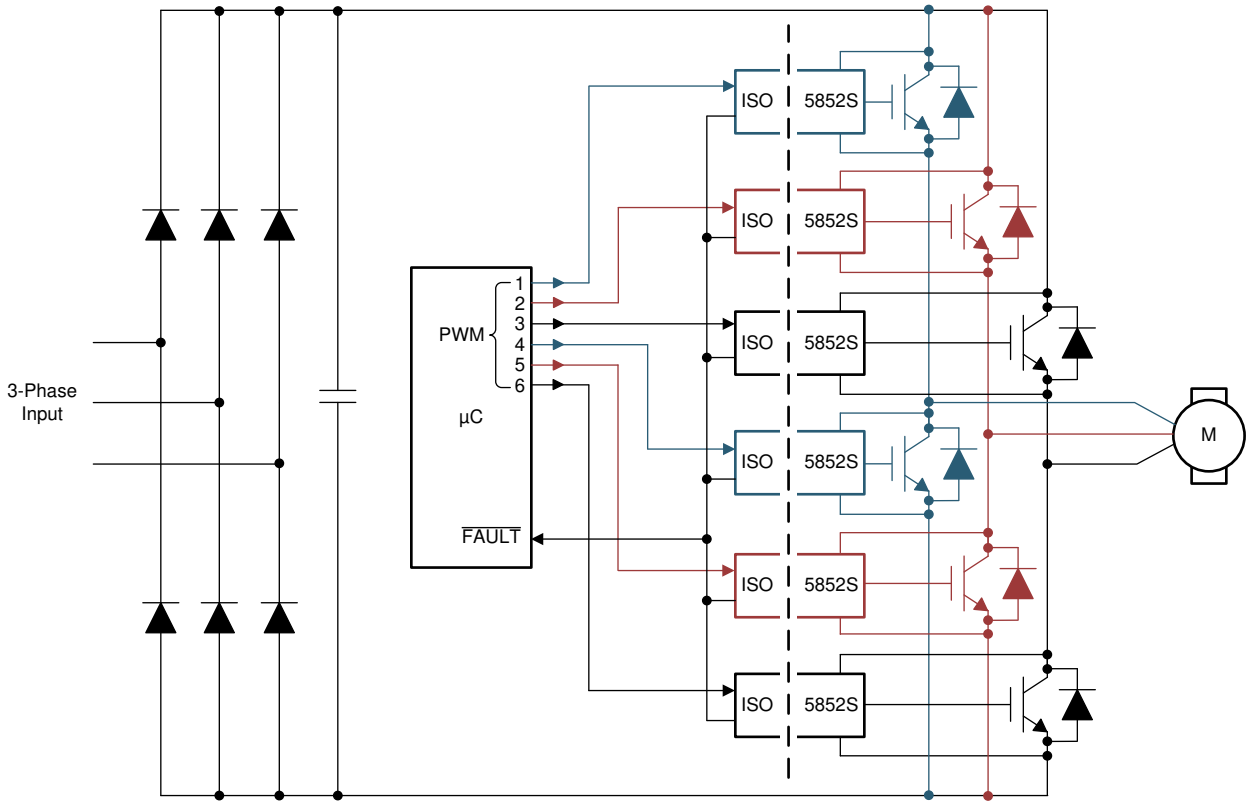

图 10-1. Typical Motor-Drive Application

10.2.1 Design Requirements

Unlike optocoupler-based gate drivers which required external current drivers and biasing circuitry to provide the input control signals, the input control to the device is CMOS and can be directly driven by the microcontroller. Other design requirements include decoupling capacitors on the input and output supplies, a pullup resistor on the common-drain $\overline{FLT}$ output signal and $\overline{RST}$ input signal, and a high-voltage protection diode between the IGBT collector and the DESAT input. Further details are explained in the subsequent sections. 表 10-1 lists the allowed range for input and output supply voltage, and the typical current output available from the gate-driver.

表 10-1. Design Parameters

PARAMETER	VALUE
Input supply voltage	2.25 V to 5.5 V
Unipolar output-supply voltage (V_{CC2} – GND2 = V_{CC2} – V_{EE2})	15 V to 30 V
Bipolar output-supply voltage (V_{CC2} – V_{EE2})	15 V to 30 V
Bipolar output-supply voltage (GND2 – V_{EE2})	0 V to 15 V
Output current	2.5 A

10.2.2 Detailed Design Procedure

10.2.2.1 Recommended ISO5852S Application Circuit

The ISO5852S device has both, inverting and noninverting gate-control inputs, an active-low reset input, and an open-drain fault output suitable for wired-OR applications. The recommended application circuit in 图 10-2 shows a typical gate-driver implementation with unipolar output supply. 图 10-3 shows a typical gate-driver implementation with bipolar output supply using the ISO5852S device.

A 0.1-µF bypass capacitor, recommended at the input supply pin V_{CC1}, and 1-µF bypass capacitor, recommended at the V_{CC2} output supply pin, provide the large transient currents required during a switching

transition to ensure reliable operation. The 220-pF blanking capacitor disables DESAT detection during the off-to-on transition of the power device. The DESAT diode (D_{DST}) and the 1-kΩ series resistor on the DESAT pin are external protection components. The R_G gate resistor limits the gate-charge current and indirectly controls the rise and fall times of the IGBT collector voltage. The open-drain $\overline{FLT}$ output and RDY output have a passive 10-kΩ pullup resistor. In this application, the IGBT gate driver is disabled when a fault is detected and does not resume switching until the microcontroller applies a reset signal.

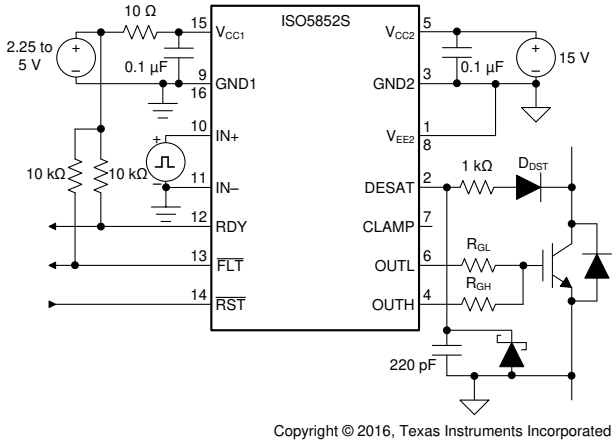

图 10-2. Unipolar Output Supply

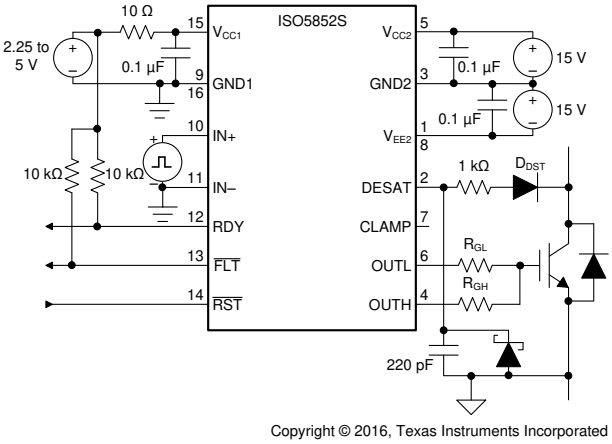

图 10-3. Bipolar Output Supply

10.2.2.2 $\overline{FLT}$ and RDY Pin Circuitry

A is 50-kΩ pullup resistor exists internally on $\overline{FLT}$ and RDY pins. The $\overline{FLT}$ and RDY pins are an open-drain output. A 10-kΩ pullup resistor can be used to make it faster rise and to provide logic high when $\overline{FLT}$ and RDY is inactive, as shown in 图 10-4.

Fast common-mode transients can inject noise and glitches on $\overline{FLT}$ and RDY pins because of parasitic coupling. The injection of noise and glitches is dependent on board layout. If required, additional capacitance (100 pF to 300 pF) can be included on the $\overline{FLT}$ and RDY pins.

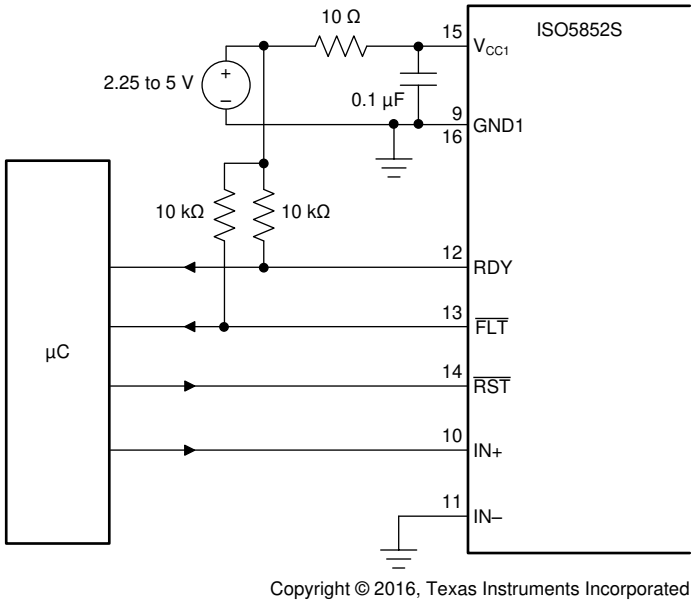

图 10-4. $\overline{FLT}$ and RDY Pin Circuitry for High CMTI

10.2.2.3 Driving the Control Inputs

The amount of common-mode transient immunity (CMTI) can be curtailed by the capacitive coupling from the high-voltage output circuit to the low-voltage input side of the ISO5852S device. For maximum CMTI performance, the digital control inputs, IN+ and IN –, must be actively driven by standard CMOS, push-pull drive circuits. This type of low-impedance signal source provides active drive signals that prevent unwanted switching of the ISO5852S output under extreme common-mode transient conditions. Passive drive circuits, such as open-drain configurations using pullup resistors, must be avoided. A 20-ns glitch filter exists that can filter a glitch up to 20 ns on IN+ or IN –.

10.2.2.4 Local Shutdown and Reset

In applications with local shutdown and reset, the $\overline{\text{FLT}}$ output of each gate driver is polled separately, and the individual reset lines are independently asserted low to reset the motor controller after a fault condition.

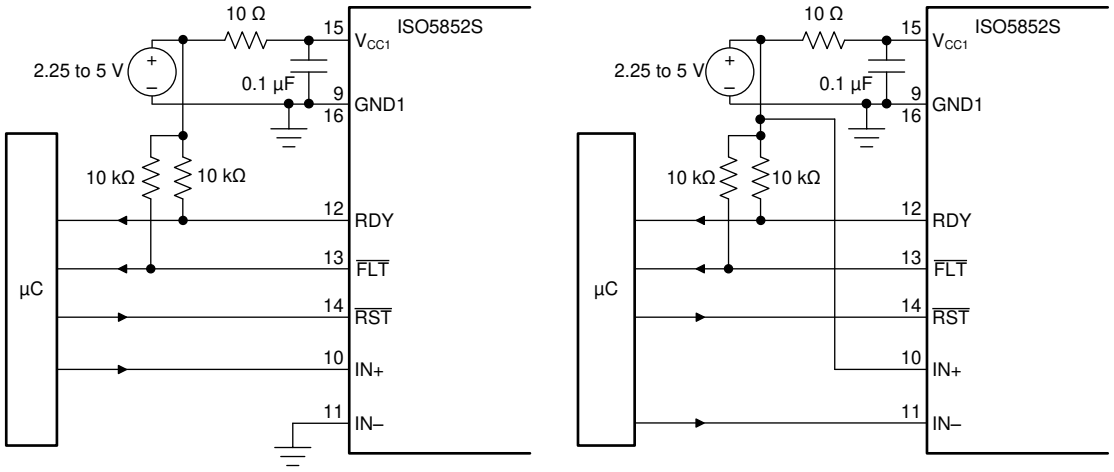

图 10-5. Local Shutdown and Reset for Noninverting (left) and Inverting Input Configuration (right)

10.2.2.5 Global-Shutdown and Reset

When configured for inverting operation, the ISO5852S device can be configured to shutdown automatically in the event of a fault condition by tying the $\overline{\text{FLT}}$ output to IN+. For high reliability drives, the open drain $\overline{\text{FLT}}$ outputs of multiple ISO5852S devices can be wired together forming a single, common fault bus for interfacing directly to the microcontroller. When any of the six gate drivers of a three-phase inverter detects a fault, the active-low $\overline{\text{FLT}}$ output disables all six gate drivers simultaneously.

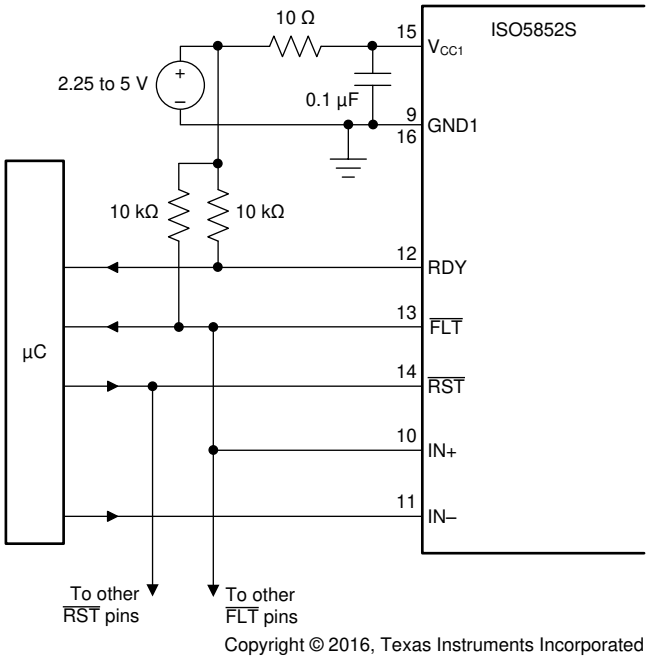

图 10-6. Global Shutdown With Inverting Input Configuration

10.2.2.6 Auto-Reset

In this case, the gate control signal at IN+ is also applied to the $\overline{RST}$ input to reset the fault latch every switching cycle. Incorrect $\overline{RST}$ makes output go low. A fault condition, however, the gate driver remains in the latched fault state until the gate control signal changes to the *gate-low* state and resets the fault latch.

If the gate control signal is a continuous PWM signal, the fault latch is always reset before IN+ goes high again. This configuration protects the IGBT on a cycle-by-cycle basis and automatically resets before the next *on* cycle.

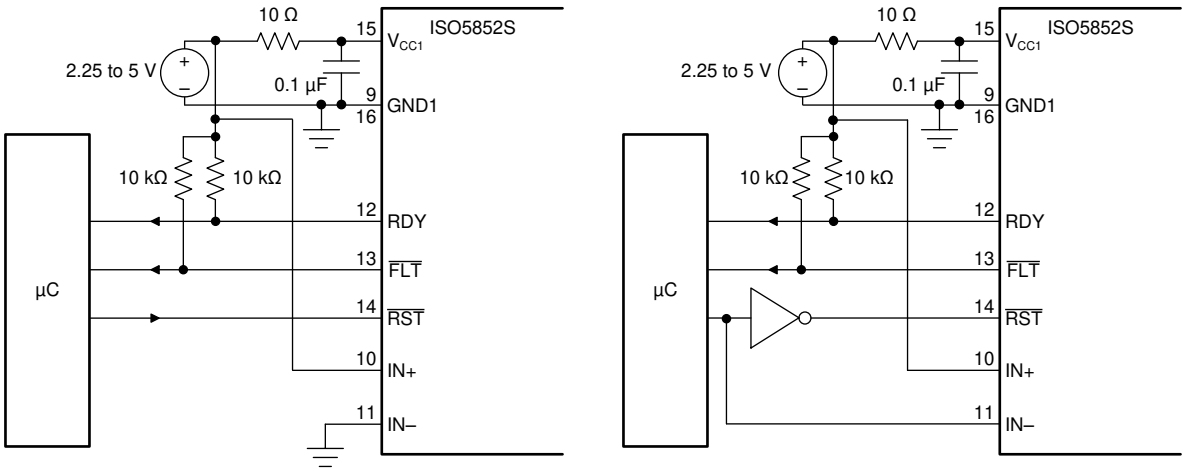

图 10-7. Auto Reset for Noninverting and Inverting Input Configuration

10.2.2.7 DESAT Pin Protection

Switching inductive loads causes large, instantaneous forward-voltage transients across the freewheeling diodes of the IGBTs. These transients result in large negative-voltage spikes on the DESAT pin which draw substantial current out of the device. To limit this current below damaging levels, a 100-Ω to 1-kΩ resistor is connected in series with the DESAT diode.

Further protection is possible through an optional Schottky diode, whose low-forward voltage assures clamping of the DESAT input to GND2 potential at low-voltage levels.

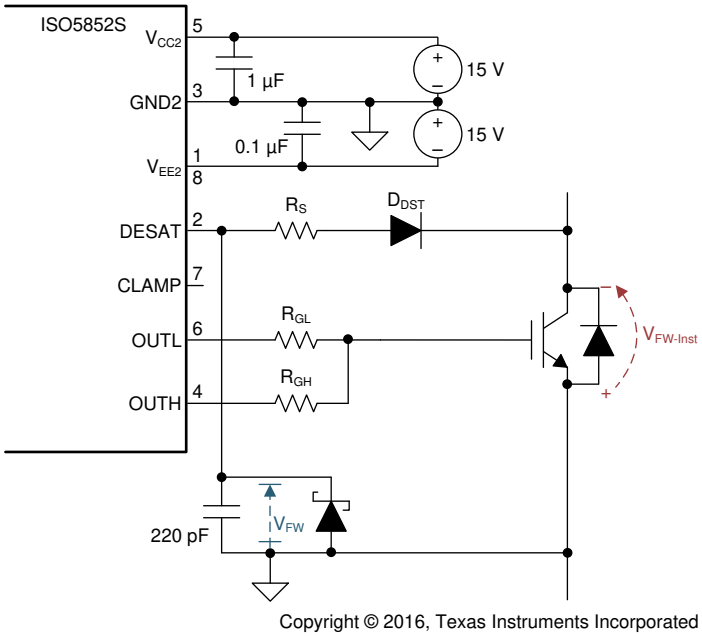

图 10-8. DESAT Pin Protection With Series Resistor and Schottky Diode

10.2.2.8 DESAT Diode and DESAT Threshold

The function of the DESAT diode is to conduct forward current, allowing sensing of the saturated collector-to-emitter voltage of the IGBT, $V_{(DESAT)}$, (when the IGBT is *on*), and to block high voltages (when the IGBT is *off*). During the short transition time when the IGBT is switching, a commonly high dV_{CE}/dt voltage ramp rate occurs across the IGBT. This ramp rate results in a charging current $I_{(CHARGE)} = C_{(D\text{-}DESAT)} \times d_{VCE}/dt$, charging the blanking capacitor. $C_{(D\text{-}DESAT)}$ is the diode capacitance at DESAT.

To minimize this current and avoid false DESAT triggering, fast switching diodes with low capacitance are recommended. As the diode capacitance builds a voltage divider with the blanking capacitor, large collector voltage transients appear at DESAT attenuated by the ratio of $1+ C_{(BLANK)} / C_{(D\text{-}DESAT)}$.

Because the sum of the DESAT diode forward-voltage and the IGBT collector-emitter voltage make up the voltage at the DESAT-pin, $V_F + V_{CE} = V_{(DESAT)}$, the V_{CE} level, which triggers a fault condition, can be modified by adding multiple DESAT diodes in series: $V_{CE\text{-}FAULT(TH)} = 9\ V - n \times VF$ (where n is the number of DESAT diodes).

When using two diodes instead of one, diodes with half the required maximum reverse-voltage rating can be selected.

10.2.2.9 Determining the Maximum Available, Dynamic Output Power, $P_{OD\text{-}max}$

The ISO5852S maximum-allowed total power consumption of $P_D = 251$ mW consists of the total input power, P_{ID}, the total output power, P_{OD}, and the output power under load, P_{OL}:

$$P_D = P_{ID} + P_{OD} + P_{OL} \quad (1)$$

With:

$$P_{ID} = V_{CC1\text{-}max} \times I_{CC1\text{-}max} = 5.5\ V \times 4.5\ mA = 24.75\ mW \quad (2)$$

and:

$$P_{OD} = (V_{CC2} - V_{EE2}) \times I_{CC2\text{-}max} = (15\ V - [-8\ V]) \times 6\ mA = 138\ mW \quad (3)$$

then:

$$P_{OL} = P_D - P_{ID} - P_{OD} = 251\ mW - 24.75\ mW - 138\ mW = 88.25\ mW \quad (4)$$

In comparison to P_{OL}, the actual dynamic output power under worst case condition, $P_{OL\text{-}WC}$, depends on a variety of parameters:

$$P_{OL\text{-}WC} = 0.5 \times f_{INP} \times Q_G \times (V_{CC2} - V_{EE2}) \times \left(\frac{r_{on\text{-}max}}{r_{on\text{-}max} + R_G} + \frac{r_{off\text{-}max}}{r_{off\text{-}max} + R_G} \right) \quad (5)$$

where

- f_{INP} = signal frequency at the control input IN+
- Q_G = power device gate charge
- V_{CC2} = positive output supply with respect to GND2
- V_{EE2} = negative output supply with respect to GND2
- $r_{on\text{-}max}$ = worst case output resistance in the on-state: 4 Ω
- $r_{off\text{-}max}$ = worst case output resistance in the off-state: 2.5 Ω
- R_G = gate resistor

When R_G is determined, 方程式 5 is to be used to verify whether $P_{OL\text{-}WC} < P_{OL}$. 图 10-9 shows a simplified output stage model for calculating $P_{OL\text{-}WC}$.

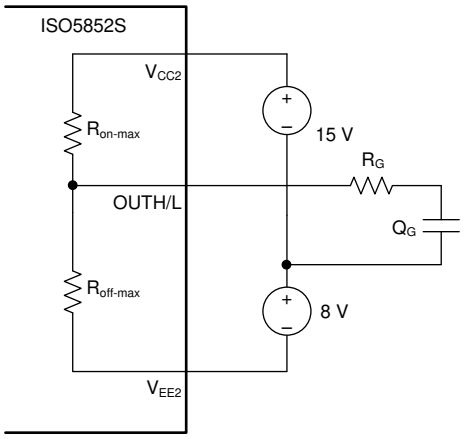

图 10-9. Simplified Output Model for Calculating $P_{OL\text{-}WC}$

10.2.2.10 Example

This examples considers an IGBT drive with the following parameters:

- $I_{ON\text{-}PK}$ = 2 A
- Q_G = 650 nC
- f_{INP} = 20 kHz
- V_{CC2} = 15 V
- V_{EE2} = – 8 V

Applying the value of the gate resistor R_G = 10 Ω.

Then, calculating the worst-case output-power consumption as a function of R_G, using 方程式 5 r_{on-max} = worst case output resistance in the on-state: 4 Ω, $r_{off-max}$ = worst case output resistance in the off-state: 2.5 Ω, R_G = gate resistor yields

$$P_{OL-WC} = 0.5 \times 20\ kHz \times 650\ nC \times (15\ V - (-8\ V)) \times \left(\frac{4\ \Omega}{4\ \Omega + 10\ \Omega} + \frac{2.5\ \Omega}{2.5\ \Omega + 10\ \Omega} \right) = 72.61\ mW \quad (6)$$

Because P_{OL-WC} = 72.61 mW is less than the calculated maximum of P_{OL} = 88.25 mW, the resistor value of R_G = 10 Ω is suitable for this application.

10.2.2.11 Higher Output Current Using an External Current Buffer

To increase the IGBT gate drive current, a non-inverting current buffer (such as the npn/pnp buffer shown in 图 10-10) can be used. Inverting types are not compatible with the desaturation fault protection circuitry and must be avoided. The MJD44H11/MJD45H11 pair is appropriate for currents up to 8 A, the D44VH10/ D45VH10 pair for up to 15 A maximum.

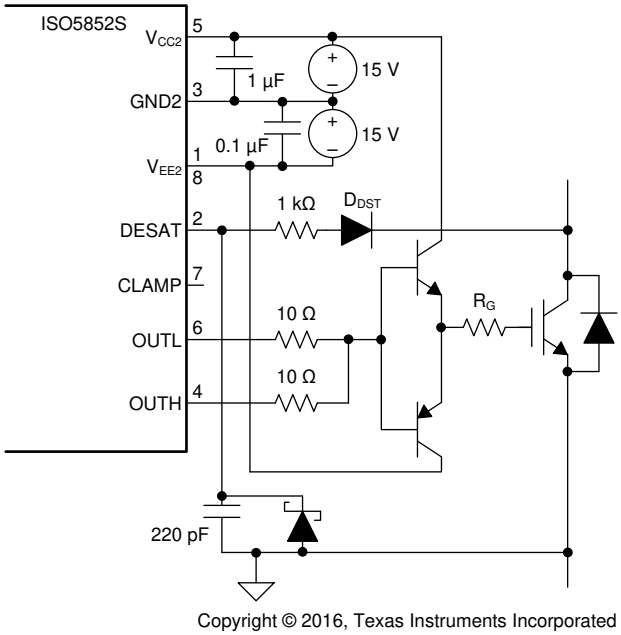

图 10-10. Current Buffer for Increased Drive Current

图 10-12. Normal Operation - Unipolar Supply

11 Power Supply Recommendations

To help ensure reliable operation at all data rates and supply voltages, a 0.1-μF bypass capacitor is recommended at the V_{CC1} input supply pin and a 1-μF bypass capacitor is recommended at the V_{CC2}output supply pin. The capacitors should be placed as close to the supply pins as possible. The recommended placement of the capacitors is 2 mm (maximum) from the input and output power supply pins (V_{CC1} and V_{CC2}).

12 Layout

12.1 Layout Guidelines

minimum of four layers is required to accomplish a low EMI PCB design (see 图 12-1). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-current or sensitive traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the gate driver and the microcontroller and power transistors. Gate driver control input, Gate driver output OUTH/L and DESAT should be routed in the top layer.
- Placing a solid ground plane next to the sensitive signal layer provides an excellent low-inductance path for the return current flow. On the driver side, use GND2 as the ground plane.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/inch^2. On the gate-driver V_{EE2} and V_{CC2} can be used as power planes. They can share the same layer on the PCB as long as they are not connected together.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

For more detailed layout recommendations, including placement of capacitors, impact of vias, reference planes, routing, and other details, refer to the *Digital Isolator Design Guide* (SLLA284).

12.2 Layout Example

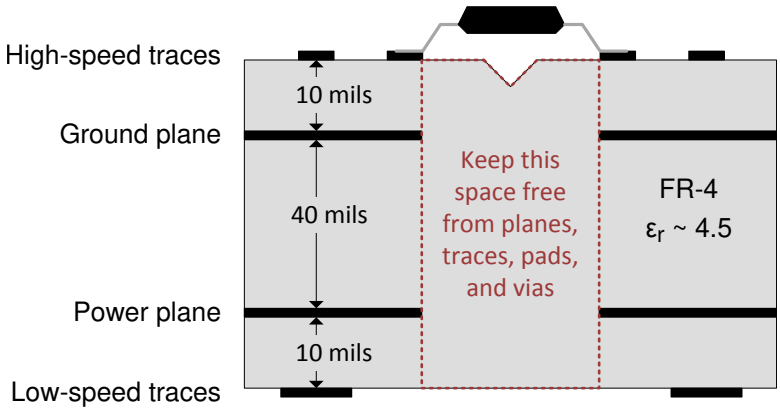

图 12-1. Recommended Layer Stack

12.3 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

13 Device and Documentation Support

13.1 Device Support

13.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

13.2 Documentation Support

13.2.1 Related Documentation

For related documentation see the following:

- *Digital Isolator Design Guide*
- *ISO5852S Evaluation Module (EVM) User's Guide*
- *Isolation Glossary*

13.3 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 *订阅更新* 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

13.4 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

13.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

13.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

13.7 术语表

TI 术语表　　本术语表列出并解释了术语、首字母缩略词和定义。

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

OTHER QUALIFIED VERSIONS OF ISO5852S :

- Automotive : ISO5852S-Q1
- Enhanced Product : ISO5852S-EP

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects
- Enhanced Product - Supports Defense, Aerospace and Medical Applications

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
5. Reference JEDEC registration MS-013.
