

# LMH6622 Dual Wideband, Low Noise, 160 MHz, Operational Amplifiers

## 1 Features

- $V_S = \pm 6\text{ V}$ ,  $T_A = 25^\circ\text{C}$ , Typical Values Unless Specified
- Bandwidth ( $A_V = +2$ ) 160 MHz
- Supply Voltage Range  $\pm 2.5\text{ V}$  to  $\pm 6\text{ V}$ ;  $+5\text{ V}$  to  $+12\text{ V}$
- Slew Rate  $85\text{ V}/\mu\text{s}$
- Supply Current  $4.3\text{ mA}/\text{amp}$
- Input Common Mode Voltage  $-4.75\text{ V}$  to  $+5.7\text{ V}$
- Output Voltage Swing ( $R_L = 100\ \Omega$ )  $\pm 4.6\text{ V}$
- Input Voltage Noise  $1.6\text{ nV}/\sqrt{\text{Hz}}$
- Input Current Noise  $1.5\text{ pA}/\sqrt{\text{Hz}}$
- Linear Output Current  $90\text{ mA}$
- Excellent Harmonic Distortion  $90\text{ dBc}$

## 2 Applications

- xDSL Receiver
- Low Noise Instrumentation Front End
- Ultrasound Preamp
- Active Filters
- Cellphone Basestation

## 3 Description

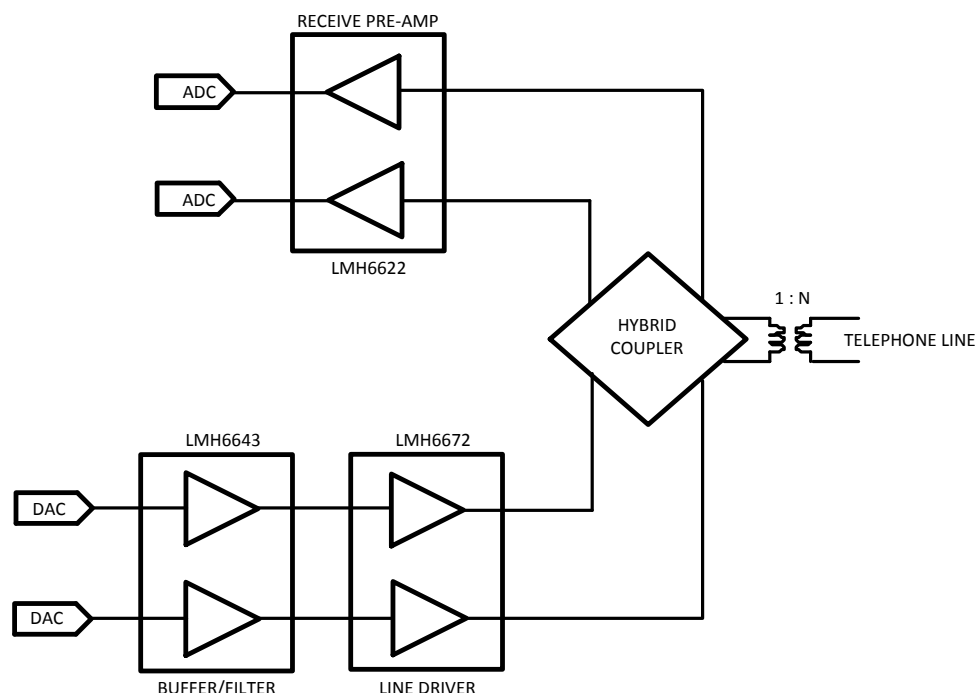

The LMH6622 is a dual high speed voltage feedback operational amplifier specifically optimized for low noise. A voltage noise specification of  $1.6\text{ nV}/\sqrt{\text{Hz}}$ , a current noise specification  $1.5\text{ pA}/\sqrt{\text{Hz}}$ , a bandwidth of  $160\text{ MHz}$ , and a harmonic distortion specification that exceeds  $90\text{ dBc}$  combine to make the LMH6622 an ideal choice for the receive channel amplifier in ADSL, VDSL, or other xDSL designs. The LMH6622 operates from  $\pm 2.5\text{ V}$  to  $\pm 6\text{ V}$  in dual supply mode and from  $+5\text{ V}$  to  $+12\text{ V}$  in single supply configuration. The LMH6622 is stable for  $A_V \geq 2$  or  $A_V \leq -1$ . The fabrication of the LMH6622 on TI's advanced VIP10 process enables excellent ( $160\text{ MHz}$ ) bandwidth at a current consumption of only  $4.3\text{ mA}/\text{amplifier}$ . Packages for this dual amplifier are the 8-lead SOIC and the 8-lead VSSOP.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMH6622	SOIC (8)	4.90 mm x 3.91 mm
LMH6622	VSSOP (8)	3.00 mm x 3.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 5 Pin Configuration and Functions

**Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
OUT A	1	O	ChA Output
-IN A	2	I	ChA Inverting Input
+IN A	3	I	ChA Non-inverting Input
V-	4	I	V- Supply Pin
+IN B	5	I	ChB Non-inverting Input
-IN B	6	I	ChB Inverting Input
OUT B	7	I	ChB Output
V+	8	I	V+ Supply Pin

## 6 Specifications

### 6.1 Absolute Maximum Ratings<sup>(1)(2)</sup>

	MIN	MAX	UNIT
V <sub>IN</sub> Differential		±1.2	V
Supply Voltage (V <sup>+</sup> – V <sup>–</sup> )		13.2	V
Voltage at Input Pins		V <sup>+</sup> +0.5, V <sup>–</sup> –0.5	V
<b>SOLDERING INFORMATION</b>			
Infrared or Convection (20 sec)		235	°C
Wave Soldering (10 sec)		260	°C
Junction Temperature <sup>(3)</sup>		+150	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub> and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> – T<sub>A</sub>)/R<sub>θJA</sub>. All numbers apply for packages soldered directly onto a PC board.

### 6.2 Handling Ratings

	MIN	MAX	UNIT
T <sub>stg</sub> Storage temperature range	–65°	+150	°C
V <sub>(ESD)</sub> Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	2000 <sup>(2)</sup>	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(3)</sup>	200 <sup>(2)</sup>	

- (1) JEDEC document JEP155 states that 2000-V HBM allows safe manufacturing with a standard ESD control process.
- (2) Human body model, 1.5 kΩ in series with 100 pF. Machine model, 0 Ω in series with 200 pF.
- (3) JEDEC document JEP157 states that 200-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions<sup>(1)</sup>

	MIN	MAX	UNIT
Supply Voltage (V <sup>+</sup> – V <sup>–</sup> )	±2.25	±6	V
Temperature Range <sup>(2)(3)</sup>	–40	+85	°C

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured. For ensured specifications and the test conditions, see the Electrical Characteristics.
- (2) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C.
- (3) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub> and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> – T<sub>A</sub>)/R<sub>θJA</sub>. All numbers apply for packages soldered directly onto a PC board.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LMH6622	LMH6622	UNIT
	Package D	Package DGK	
	8 PINS	8 PINS	
R <sub>θJA</sub> Junction-to-ambient thermal resistance <sup>(2)</sup>	166°	211°	°C/W

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub> and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> – T<sub>A</sub>)/R<sub>θJA</sub>. All numbers apply for packages soldered directly onto a PC board.

## 6.5 ±6 V Electrical Characteristics

Unless otherwise specified,  $T_J = 25^\circ\text{C}$ ,  $V^+ = 6\text{ V}$ ,  $V^- = -6\text{ V}$ ,  $V_{CM} = 0\text{ V}$ ,  $A_V = +2$ ,  $R_F = 500\ \Omega$ ,  $R_L = 100\ \Omega$ . Some limits apply at the temperature extremes as noted in the table.

PARAMETER		TEST CONDITIONS	TEMPERATURE EXTREMES			ROOM TEMPERATURE			UNIT	
			MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>		
DYNAMIC PERFORMANCE										
f <sub>CL</sub>	–3dB BW	V <sub>O</sub> = 200 mV <sub>PP</sub>				160			MHz	
BW <sub>0.1dB</sub>	0.1dB Gain Flatness	V <sub>O</sub> = 20 0mV <sub>PP</sub>				30			MHz	
SR	Slew Rate <sup>(3)</sup>	V <sub>O</sub> = 2 V <sub>PP</sub>				85			V/μs	
TS	Settling Time	V <sub>O</sub> = 2 V <sub>PP</sub> to ±0.1%				40			ns	
		V <sub>O</sub> = 2 V <sub>PP</sub> to ±1.0%				35				
Tr	Rise Time	V <sub>O</sub> = 0.2 V Step, 10% to 90%				2.3			ns	
Tf	Fall Time	V <sub>O</sub> = 0.2 V Step, 10% to 90%				2.3			ns	
DISTORTION and NOISE RESPONSE										
e <sub>n</sub>	Input Referred Voltage Noise	f = 100 kHz				1.6			nV/√Hz	
i <sub>n</sub>	Input Referred Current Noise	f = 100 kHz				1.5			pA/√Hz	
DG	Differential Gain	R <sub>L</sub> = 150 Ω, R <sub>F</sub> = 470 Ω, NTSC				0.03%				
DP	Differential Phase	R <sub>L</sub> = 150 Ω, R <sub>F</sub> = 470 Ω, NTSC				0.03			deg	
HD2	2 <sup>nd</sup> Harmonic Distortion	f <sub>c</sub> = 1 MHz, V <sub>O</sub> = 2 V <sub>PP</sub> , R <sub>L</sub> = 100 Ω				–90			dBc	
		f <sub>c</sub> = 1 MHz, V <sub>O</sub> = 2 V <sub>PP</sub> , R <sub>L</sub> = 500 Ω				–100				
HD3	3 <sup>rd</sup> Harmonic Distortion	f <sub>c</sub> = 1 MHz, V <sub>O</sub> = 2 V <sub>PP</sub> , R <sub>L</sub> = 100 Ω				–94			dBc	
		f <sub>c</sub> = 1 MHz, V <sub>O</sub> = 2 V <sub>PP</sub> , R <sub>L</sub> = 500 Ω				–100				
MTPR	Upstream	V <sub>O</sub> = 0.6 V <sub>RMS</sub> , 26 kHz to 132 kHz (see <a href="#">Figure 33</a> )				–78			dBc	
	Downstream	V <sub>O</sub> = 0.6 V <sub>RMS</sub> , 144 kHz to 1.1 MHz (see <a href="#">Figure 33</a> )				–70				
INPUT CHARACTERISTICS										
V <sub>OS</sub>	Input Offset Voltage	V <sub>CM</sub> = 0 V	–2		+2	–1.2	+0.2	+1.2	mV	
TC V <sub>OS</sub>	Input Offset Average Drift	V <sub>CM</sub> = 0 V <sup>(4)</sup>				–2.5			μV/°C	
I <sub>OS</sub>	Input Offset Current	V <sub>CM</sub> = 0V	–1.5		1.5	–1	–0.04	1	μA	
I <sub>B</sub>	Input Bias Current	V <sub>CM</sub> = 0V	15			4.7			10	μA
R <sub>IN</sub>	Input Resistance	Common Mode				17			MΩ	
		Differential Mode				12			kΩ	
C <sub>IN</sub>	Input Capacitance	Common Mode				0.9			pF	
		Differential Mode				1.0			pF	
CMVR	Input Common Mode Voltage Range	CMRR ≥ 60dB				–4.75			–4.5	V
						5.5			+5.7	
CMRR	Common-Mode Rejection Ratio	Input Referred, V <sub>CM</sub> = –4.2 V to +5.2 V	75			80			100	dB

(1) All limits are specified by testing or statistical analysis.

(2) Typical values represent the most likely parametric norm.

(3) Slew rate is the slowest of the rising and falling slew rates.

(4) Offset voltage average drift is determined by dividing the change in  $V_{OS}$  at temperature extremes into the total temperature change.

## ±6 V Electrical Characteristics (continued)

Unless otherwise specified,  $T_J = 25^\circ\text{C}$ ,  $V^+ = 6\text{ V}$ ,  $V^- = -6\text{ V}$ ,  $V_{CM} = 0\text{ V}$ ,  $A_V = +2$ ,  $R_F = 500\ \Omega$ ,  $R_L = 100\ \Omega$ . Some limits apply at the temperature extremes as noted in the table.

PARAMETER		TEST CONDITIONS	TEMPERATURE EXTREMES			ROOM TEMPERATURE			UNIT
			MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	
TRANSFER CHARACTERISTICS									
A <sub>VOL</sub>	Large Signal Voltage Gain	V <sub>O</sub> = 4 V <sub>PP</sub>	70			74	83		dB
X <sub>t</sub>	Crosstalk	f = 1 MHz				-75			dB
OUTPUT CHARACTERISTICS									
V <sub>O</sub>	Output Swing	No Load, Positive Swing	4.6			4.8	5.2		V
		No Load, Negative Swing	-4.4			-5.0	-4.6		
		R <sub>L</sub> = 100 Ω, Positive Swing	3.8			4.0	4.6		
		R <sub>L</sub> = 100 Ω, Negative Swing	-3.8			-4.6	-4		
R <sub>O</sub>	Output Impedance	f = 1 MHz				0.08			Ω
I <sub>SC</sub>	Output Short Circuit Current	Sourcing to Ground ΔV <sub>IN</sub> = 200 mV <sup>(5), (6)</sup>				100	135		mA
		Sinking to Ground ΔV <sub>IN</sub> = -200 mV <sup>(5), (6)</sup>				100	130		
I <sub>OUT</sub>	Output Current	Sourcing, V <sub>O</sub> = +4.3 V Sinking, V <sub>O</sub> = -4.3 V				90			mA
POWER SUPPLY									
+PSRR	Positive Power Supply Rejection Ratio	Input Referred, V <sub>S</sub> = +5 V to +6 V	74			80	95		dB
-PSRR	Negative Power Supply Rejection Ratio	Input Referred, V <sub>S</sub> = -5 V to -6 V	69			75	90		
I <sub>S</sub>	Supply Current (per amplifier)	No Load	6.5			4.3	6		mA

(5) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ .

(6) Short circuit test is a momentary test. Output short circuit duration is infinite for  $V_S \leq \pm 2.5\text{ V}$ , at room temperature and below. For  $V_S > \pm 2.5\text{ V}$ , allowable short circuit duration is 1.5ms.

## 6.6 ±2.5 V Electrical Characteristics

Unless otherwise specified,  $T_J = 25^\circ\text{C}$ ,  $V^+ = 2.5\text{ V}$ ,  $V^- = -2.5\text{ V}$ ,  $V_{CM} = 0\text{ V}$ ,  $A_V = +2$ ,  $R_F = 500\ \Omega$ ,  $R_L = 100\ \Omega$ . Some limits apply at the temperature extremes as noted in the table.

PARAMETER		TEST CONDITIONS	TEMPERATURE EXTREMES			ROOM TEMPERATURE			UNIT
			MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	
DYNAMIC PERFORMANCE									
f <sub>CL</sub>	-3 dB BW	V <sub>O</sub> = 200 mV <sub>PP</sub>				150			MHz
BW <sub>0.1dB</sub>	0.1dB Gain Flatness	V <sub>O</sub> = 200 mV <sub>PP</sub>				20			MHz
SR	Slew Rate <sup>(3)</sup>	V <sub>O</sub> = 2 V <sub>PP</sub>				80			V/μs
T <sub>S</sub>	Settling Time	V <sub>O</sub> = 2 V <sub>PP</sub> to ±0.1%				45			ns
		V <sub>O</sub> = 2 V <sub>PP</sub> to ±1.0%				40			
T <sub>r</sub>	Rise Time	V <sub>O</sub> = 0.2 V Step, 10% to 90%				2.5			ns
T <sub>f</sub>	Fall Time	V <sub>O</sub> = 0.2 V Step, 10% to 90%				2.5			ns

(1) All limits are specified by testing or statistical analysis.

(2) Typical values represent the most likely parametric norm.

(3) Slew rate is the slowest of the rising and falling slew rates.

## ±2.5 V Electrical Characteristics (continued)

Unless otherwise specified,  $T_J = 25^\circ\text{C}$ ,  $V_+ = 2.5\text{ V}$ ,  $V_- = -2.5\text{ V}$ ,  $V_{CM} = 0\text{ V}$ ,  $A_V = +2$ ,  $R_F = 500\ \Omega$ ,  $R_L = 100\ \Omega$ . Some limits apply at the temperature extremes as noted in the table.

## LMH6622

SNOS986E – DECEMBER 2001 – REVISED JULY 2014

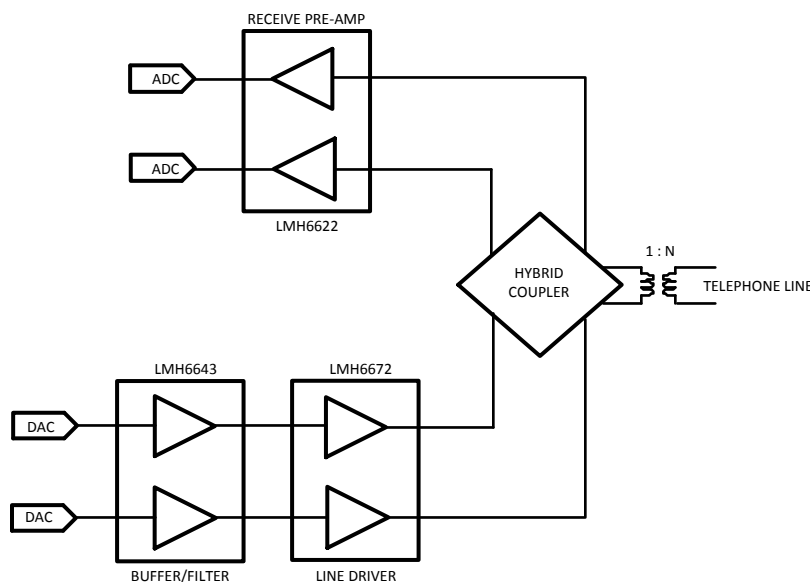

[www.ti.com](http://www.ti.com)

## 8 Detailed Description

### 8.1 Overview

The LMH6622 is a dual high speed voltage operational amplifier specifically optimized for low noise. The LMH6622 operates from  $\pm 2.5$  V to  $\pm 6$  V in dual supply mode and from +5 V to +12 V in single supply configuration.

### 8.2 Functional Block Diagram

**Figure 34. xDSL Analog Front End**

### 8.3 Feature Description

- 4.5 V to 12 V supply range
- Large linear output current of 90 mA
- Excellent harmonic distortion of 90 dBc

### 8.4 Device Functional Modes

- Single or dual supplies
- Traditional voltage feedback topology for maximum flexibility

## 9 Application and Implementation

### 9.1 DSL Receive Channel Applications

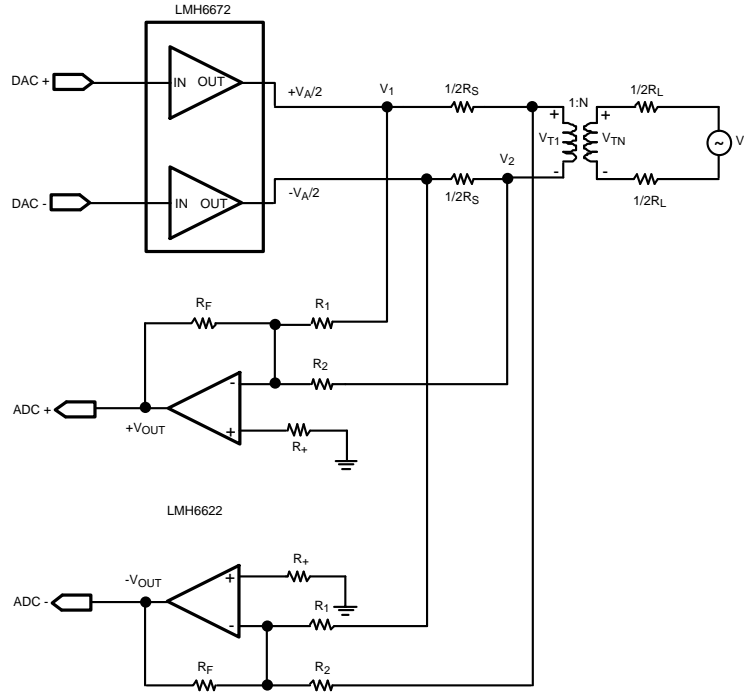

**Figure 35. ADSL Signal Description**

The LMH6622 is a dual, wideband operational amplifier designed for use as a DSL line receiver. In the receive band of a Customer Premises Equipment (CPE) ADSL modem it is possible that as many as 255 Discrete Multi-Tone (DMT) QAM signals will be present, each with its own carrier frequency, modulation, and signal level. The ADSL standard requires a line referred noise power density of -140 dBm/Hz within the CPE receive band of 100 KHz to 1.1 MHz. The CPE driver output signal will leak into the receive path because of full duplex operation and the imperfections of the hybrid coupler circuit. The DSL analog front end must incorporate a receiver pre-amp which is both low noise and highly linear for ADSL-standard operation. The LMH6622 is designed for the twin performance parameters of low noise and high linearity.

## DSL Receive Channel Applications (continued)

Applications ranging from +5 V to +12 V or  $\pm 2.5$  V to  $\pm 6$  V are fully supported by the LMH6622. In Figure 36, the LMH6622 is used as an inverting summing amplifier to provide both received pre-amp channel gain and driver output signal cancellation, that is, the function of a hybrid coupler.

**Figure 36. ADSL Receive Applications Circuit**

The two  $R_S$  resistors are used to provide impedance matching through the 1:N transformer.

$$R_S = \frac{R_L}{N^2}$$

where

- $R_L$  is the impedance of the twisted pair line
- $N$  is the turns ratio of the transformer

(1)

The resistors  $R_2$  and  $R_F$  are used to set the receive gain of the pre-amp. The receive gain is selected to meet the ADC full-scale requirement of a DSL chipset.

Resistor  $R_1$  and  $R_2$  along with  $R_F$  are used to achieve cancellation of the output driver signal at the output of the receiver.

Since the LMH6622 is configured as an inverting summing amplifier,  $V_{OUT}$  is found to be,

$$V_{OUT} = -R_F \left[ \frac{V_1}{R_1} + \frac{V_2}{R_2} \right] \quad (2)$$

The expression for  $V_1$  and  $V_2$  can be found by using superposition principle.

When  $V_S = 0$ ,

$$V_1 = \frac{1}{2} V_A \quad \text{and} \quad V_2 = -\frac{1}{4} V_A \quad (3)$$

When  $V_A = 0$ ,

$$V_1 = 0 \quad \text{and} \quad V_2 = -\frac{1}{2} V_{T1} \quad (4)$$

## DSL Receive Channel Applications (continued)

Therefore,

$$V_1 = \frac{1}{2}V_A \quad \text{and} \quad V_2 = -\frac{1}{4}V_A - \frac{1}{2}V_{T1} \quad (5)$$

And then,

$$V_{OUT} = -R_F \left[ \frac{V_A}{2R_1} - \frac{V_A}{4R_2} - \frac{V_{T1}}{2R_2} \right] \quad (6)$$

Setting  $R_1 = 2 \cdot R_2$  to cancel unwanted driver signal in the receive path, then we have

$$V_{OUT} = \frac{R_F}{2R_2} V_{T1} \quad (7)$$

We can also find that,

$$V_{TN} = \frac{1}{2} V_S \quad \text{and} \quad V_{T1} = \frac{1}{N} V_{TN} = \frac{1}{2N} V_S \quad (8)$$

And then

$$V_{OUT} = \frac{R_F}{4NR_2} V_S \quad (9)$$

In conclusion, the peak-to-peak voltage to the ADC would be,

$$2 V_{OUT} = \frac{R_F}{2NR_2} V_S \quad (10)$$

## 9.2 Receive Channel Noise Calculation

The circuit of [Figure 36](#) also has the characteristic that it cancels noise power from the drive channel.

The noise gain of the receive pre-amp is found to be:

$$A_n = 1 + \frac{R_F}{R_1/R_2} \quad (11)$$

Noise power at each of the output of LMH6622:

$$e_o^2 = A_n^2 [V_n^2 + i_{non-inv}^2 R_+^2 + 4kT R_+] + i_{inv}^2 R_F^2 + 4kT R_F A_n$$

where

- $V_n$  is the Input referred voltage noise
  - $i_n$  is the Input referred current noise
  - $i_{non-inv}$  is the Input referred non-inverting current noise
  - $i_{inv}$  is the Input referred inverting current noise
  - $k$  is the Boltzmann's constant,  $K = 1.38 \times 10^{-23}$
  - $T$  is the Resistor temperature in k
  - $R_+$  is the source resistance at the non-inverting input to balance offset voltage, typically very small for this inverting summing applications
- (12)

For a voltage feedback amplifier,

$$i_{inv} = i_{non-inv} = i_n \quad (13)$$

Therefore, total output noise from the differential pre-amp is:

$$e_{TotalOutput}^2 = 2 e_o^2 \quad (14)$$

The factor '2' appears here because of differential output.

### 9.3 Differential Analog-to-Digital Driver

**Figure 37. Circuit for Differential A/D Driver**

The LMH6622 is a low noise, low distortion high speed operational amplifier. The LMH6622 comes in either SOIC-8 or VSSOP-8 packages. Because two channels are available in each package the LMH6622 can be used as a high dynamic range differential amplifier for the purpose of driving a high speed analog-to-digital converter. Driving a 1 kΩ load, the differential amplifier of [Figure 37](#) provides 20 dB gain, a flat frequency response up to 6 MHz, and harmonic distortion that is lower than 80 dBc. This circuit makes use of a transformer to convert a single-ended signal to a differential signal. The input resistor  $R_{IN}$  is chosen by the following equation,

$$R_{IN} = \frac{1}{N^2} R_S \quad (15)$$

The gain of this differential amplifier can be adjusted by  $R_C$  and  $R_F$ ,

$$A_V = 2 \frac{R_F}{R_C} \quad (16)$$

See [Figure 38](#) and [Figure 39](#) below for plots related to the discussion of [Figure 37](#).

**Figure 38. Frequency Response**

**Figure 39. Total Output Referred Noise Density**

## 9.4 Typical Application

See Figure 40 for application circuit.

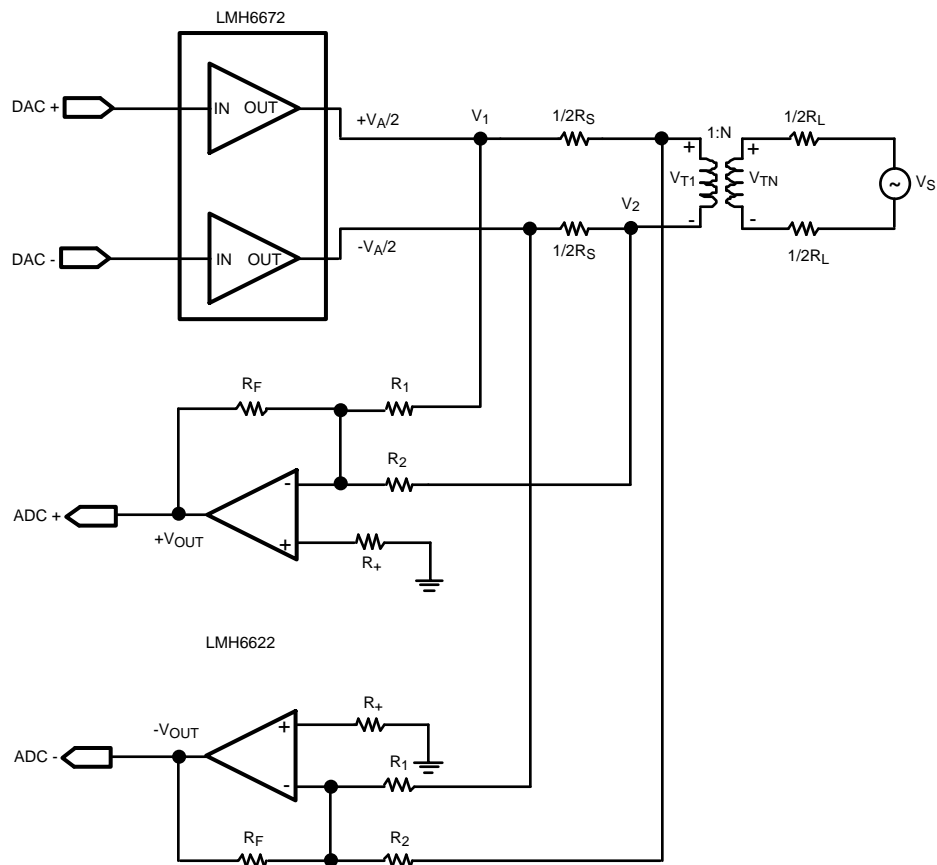

Figure 40. ADSL Receive Applications Circuit

### 9.4.1 Design Requirements

All normal precautions / considerations with Op Amps apply

### 9.4.2 Detailed Design Procedure

- Use power supply decoupling capacitors close to supply pins
- Beware of junction temperature rise at elevated ambient temperature and / or heavy output(s) load current especially at higher supply voltages
- Ground plane near sensitive input pins can be removed to minimize parasitic capacitance

### 9.4.3 Application Curves

See Figure 38 and Figure 39.

## 10 Power Supply Recommendations

### 10.1 Driving Capacitive Load

Capacitive Loads decrease the phase margin of all op amps. The output impedance of a feedback amplifier becomes inductive at high frequencies, creating a resonant circuit when the load is capacitive. This can lead to overshoot, ringing and oscillation. To eliminate oscillation or reduce ringing, an isolation resistor can be placed between the load and the output. In general, the bigger the isolation resistor, the more damped the pulse response becomes. For initial evaluation, a 50  $\Omega$  isolation resistor is recommended.

## 11 Layout

### 11.1 Layout Guidelines

#### 11.1.1 Circuit Layout Considerations

Texas Instruments suggests the copper patterns on the evaluation boards listed below as a guide for high frequency layout. These boards are also useful as an aid in device testing and characterization. As is the case with all high-speed amplifiers, accepted-practice  $R_F$  design technique on the PCB layout is mandatory. Generally, a good high frequency layout exhibits a separation of power supply and ground traces from the inverting input and output pins. Parasitic capacitances between these nodes and ground will cause frequency response peaking and possible circuit oscillations (see [SNOA367](#), Application Note OA-15, for more information). High quality chip capacitors with values in the range of 1000 pF to 0.1  $\mu$ F should be used for power supply bypassing. One terminal of each chip capacitor is connected to the ground plane and the other terminal is connected to a point that is as close as possible to each supply pin as allowed by the manufacturer's design rules. In addition, a tantalum capacitor with a value between 4.7  $\mu$ F and 10  $\mu$ F should be connected in parallel with the chip capacitor. Signal lines connecting the feedback and gain resistors should be as short as possible to minimize inductance and microstrip line effect. Input and output termination resistors should be placed as close as possible to the input/output pins. Traces greater than 1 inch in length should be impedance matched to the corresponding load termination.

Symmetry between the positive and negative paths in the layout of differential circuitry should be maintained so as to minimize the imbalance of amplitude and phase of the differential signal.

DEVICE	PACKAGE	EVALUATION BOARD P/N
LMH6622MA	SOIC-8	LMH730036
LMH6622MM	VSSOP-8	LMH730123

Component value selection is another important parameter in working with high speed/high performance amplifiers. Choosing external resistors that are large in value compared to the value of other critical components will affect the closed loop behavior of the stage because of the interaction of these resistors with parasitic capacitances. These parasitic capacitors could either be inherent to the device or be a by-product of the board layout and component placement. Moreover, a large resistor will also add more thermal noise to the signal path. Either way, keeping the resistor values low will diminish this interaction. On the other hand, choosing very low value resistors could load down nodes and will contribute to higher overall power dissipation and worse distortion.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
