

## LMK1C110x 1.8V、2.5V 和 3.3V LVCMOS 时钟缓冲器系列

### 1 特性

- 高性能 1:6 和 1:8 LVCMOS 时钟缓冲器
- 输出偏斜极低, < 55ps
- 附加抖动极低, 标称值 < 25fs
  - $V_{DD} = 3.3\text{ V}$  时, 典型值为 12fs
  - $V_{DD} = 2.5\text{ V}$  时, 典型值为 15fs
  - $V_{DD} = 1.8\text{ V}$  时, 典型值为 28fs
- 传播延迟极低, < 3ns
- 同步输出使能
- 电源电压: 3.3V、2.5V 或 1.8V
  - 在电源电压范围内输入端耐受 3.3V 电压
  - 失效防护输入
- 9000V HBM 的工业高 ESD 等级
- $f_{\max} = 250\text{ MHz}$  (3.3V)
- $f_{\max} = 200\text{ MHz}$  (2.5V 和 1.8V)
- 工作温度范围:  $-40^{\circ}\text{C}$  至  $125^{\circ}\text{C}$
- 采用 14 引脚和 16 引脚 TSSOP 封装

### 2 应用

- 工厂自动化与控制
- 电信设备
- 数据中心和企业计算
- 电网基础设施
- 电机驱动器
- 医疗成像

### 3 说明

LMK1C110x 是德州仪器 (TI) 的一款模块化、高性能、低偏斜、通用时钟缓冲器系列器件。整个系列采用模块化方法设计。提供五个不同的扇出选项: 1:2、1:3、1:4、1:6 和 1:8。

该系列所有器件均互相引脚兼容, 并与 CDCLVC110x 系列向后兼容, 从而易于处理。

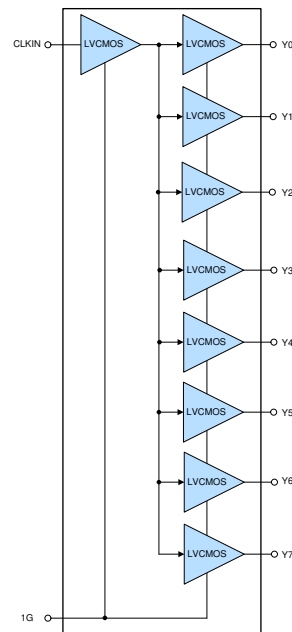

该系列所有器件均具有相同的高性能特性, 如低附加抖动、低偏斜和宽工作温度范围。

LMK1C110x 具有同步输出使能控制端 (1G), 可在 1G 处于低电平时将输出切换为低电平状态。这些器件具有失效防护输入, 可防止在没有输入信号的情况下输出发生振荡并允许在提供 VDD 之前提供输入信号。

LMK1C110x 系列可在 1.8V、2.5V 和 3.3V 电压下工作, 额定工作温度范围为  $-40^{\circ}\text{C}$  至  $125^{\circ}\text{C}$ 。

## 8 Detailed Description

### 8.1 Overview

The LMK1C110x family of devices is part of a low-jitter and low-skew LVCMOS fan-out buffer solution. For best signal integrity, it is important to match the characteristic impedance of the LMK1C110x's output driver with that of the transmission line.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

The outputs of the LMK1C110x can be disabled by driving the synchronous output enable pin (1G) low. Unused output can be left floating to reduce overall system component cost. Supply and ground pins must be connected to  $V_{DD}$  and GND, respectively.

#### 8.3.1 Fail-Safe Inputs

The LMK1C110x family of devices is designed to support fail-safe input operation. This feature allows the user to drive the device inputs before VDD is applied without damaging the device. Refer to [Absolute Maximum Ratings](#) for more information on the maximum input supported by the device. The device also incorporates an input hysteresis that prevents random oscillation in absence of an input signal, allowing the input pins to be left open.

### 8.4 Device Functional Modes

The LMK1C110x operates from 1.8-V, 2.5-V, or 3.3-V supplies. 表 8-1 shows the output logics of the LMK1C110x.

## 9 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 9.1 Application Information

The LMK1C110x family is a low additive jitter LVCMOS buffer solution that can operate up to 250-MHz at  $V_{DD} = 3.3\text{ V}$  and 200 MHz at  $V_{DD} = 2.5\text{ V}$  to 1.8 V. Low output skew as well as the ability for synchronous output enable is featured to simultaneously enable or disable buffered clock outputs as necessary in the application.

### 9.2 Typical Application

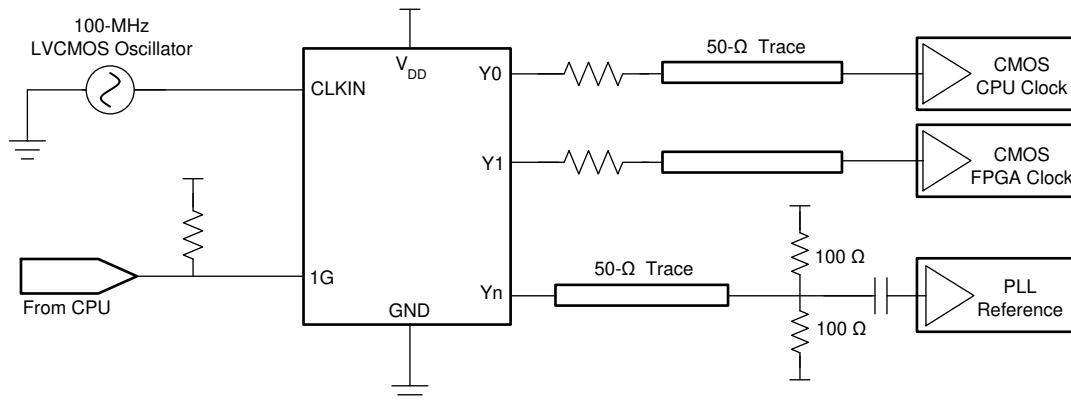

图 9-1. System Configuration Example

#### 9.2.1 Design Requirements

The LMK1C110x shown in 图 9-1 is configured to fan out a 100-MHz signal from a local LVCMOS oscillator. The CPU is configured to control the output state through 1G.

The configuration example is driving three LVCMOS receivers in a backplane application with the following properties:

- The CPU clock can accept a full swing DC-coupled LVCMOS signal. A series resistor is placed near the LMK1C110x to closely match the characteristic impedance of the trace to minimize reflections.
- The FPGA clock is similarly DC-coupled with an appropriate series resistor placed near the LMK1C110x.
- The PLL in this example can accept a lower amplitude signal, so a Thevenin's equivalent termination is used. The PLL receiver features internal biasing, so AC coupling can be used when common-mode voltage is mismatched.

#### 9.2.2 Detailed Design Procedure

Unused outputs can be left floating. See [Power Supply Recommendations](#) for recommended filtering techniques.

#### 9.2.3 Application Curves

The low additive jitter of the LMK1C110x is shown in 图 9-2.

图 9-3 shows the low-noise 156.25-MHz reference source with 24.8-fs RMS jitter driving the LMK1C110x, resulting in 27.3-fs RMS jitter when integrated from 12 kHz to 20 MHz at 3.3-V supply. The resultant additive jitter measured is a low 11.4-fs RMS for this configuration.

图 9-4 shows the low-noise 156.25-MHz reference source with 24.8-fs RMS jitter driving the LMK1C110x, resulting in 29-fs RMS jitter when integrated from 12 kHz to 20 MHz at 2.5-V supply. The resultant additive jitter measured is a low 15-fs RMS for this configuration.

图 9-5 shows the low-noise 156.25-MHz reference source with 24.8-fs RMS jitter driving the LMK1C110x, resulting in 34-fs RMS jitter when integrated from 12 kHz to 20 MHz at 1.8-V supply. The resultant additive jitter measured is a low 23.25-fs RMS for this configuration.

图 9-3. LMK1C110x 3.3-V Output Phase Noise 27.3-fs (12 kHz to 20 MHz)

## 10 Power Supply Recommendations

High-performance clock buffers can be sensitive to noise on the power supply, which may dramatically increase the additive jitter of the buffer. Thus, it is essential to manage any excessive noise from the system power supply, especially for applications where the jitter and phase noise performance is critical.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the very low impedance path for high-frequency noise and guard the power supply system against induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and should have low equivalent series resistance (ESR). To properly bypass the supply, the decoupling capacitors must be placed very close to the power-supply terminals, be connected directly to the ground plane, and laid out with short loops to minimize inductance. TI recommends adding as many high-frequency (for example, 0.1  $\mu\text{F}$ ) bypass capacitors, as there are supply terminals in the package. TI recommends, but does not require, inserting a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock buffer; these beads prevent the switching noise from leaking into the board supply. It is imperative to choose an appropriate ferrite bead with very low DC resistance to provide adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply terminals that is greater than the minimum voltage required for proper operation.

Figure 10-1 shows this recommended power supply decoupling method.

**Figure 10-1. Power Supply Decoupling**

## 11 Layout

### 11.1 Layout Guidelines

图 11-1 shows a conceptual layout detailing recommended placement of power supply bypass capacitors. For component side mounting, use 0402 body size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low-impedance connection to the ground plane.

### 12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.
