

LP5912-EP 500mA、低噪声、低 I_Q 增强型 LDO 产品

1 特性

- 输入电压范围：1.6V 至 6.5V
- 输出电压范围：0.8V 至 5.5V
- 输出电流：高达 500 mA
- 低输出电压噪声：12 μV_{RMS} (典型值)
- 1kHz 下的 PSRR：75 dB (typ)
- 输出电压容差 ($V_{OUT} \geq 3.3V$)： $\pm 2\%$
- 低 I_Q (使能时，无负载)：30 μA (典型值)
- 低压降 ($V_{OUT} \geq 3.3V$)：500mA 负载下为 95mV (典型值)
- 与 1 μF 陶瓷输入和输出电容搭配使用，性能稳定
- 具备热过载和短路保护功能
- 反向电流保护
- 无需噪声旁路电容
- 输出自动放电以实现快速关断
- 电源正常状态输出，具有 140 μs (典型值) 延迟
- 内部软启动，可限制浪涌电流
- 工作结温：-55°C 至 +125°C
- 支持国防、航空航天和医疗应用：
 - 受控基线
 - 一个组装和测试基地
 - 一个制造基地
 - 延长了产品生命周期
 - 延长了产品变更通知
 - 产品可追溯性

2 应用

- 监控系统
- 惯性导航
- 陆地移动无线电
- 全球定位系统接收器
- 数据集中器单元

3 说明

LP5912-EP 是一款能提供高达 500mA 输出电流的低噪声低压降稳压器 (LDO)。LP5912-EP 符合射频和模拟电路要求，可提供低噪声、高 PSRR、低静态电流以及低线路和负载瞬态响应。LP5912-EP 无需噪声旁路电容器便可提供出色的噪声性能，并且支持远距离安置输出电容。

该器件可与 1 μF 输入和 1 μF 输出陶瓷电容搭配使用 (无需独立的噪声旁路电容)。

其固定输出电压介于 0.8V 和 5.5V 之间 (以 25mV 为单位增量)。有关特定的电压选项要求，请联系德州仪器 (TI) 销售办事处。

封装信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
LP5912-EP	WSON (6)	2.00mm × 2.00mm

5 Pin Configuration and Functions

图 5-1. DRV Package, 6-Pin WSON With Thermal Pad (Top View)

表 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	OUT	O	Regulated output voltage.
2	NC	—	No internal connection. Leave open, or connect to ground.
3	PG	O	Power-good indicator. Requires an external pullup resistor.
4	EN	I	Enable input. Logic high = device is on, logic low = device is off, with an internal 3-M Ω pulldown resistor.
5	GND	G	Ground.
6	IN	I	Unregulated input voltage.
Thermal pad		—	Connect this pad to the copper area under the package to improve thermal performance. Use thermal vias to transfer heat to inner layers of the printed circuit board (PCB). Connect the thermal pad to ground, or leave floating. Do not connect the thermal pad to any potential other than ground.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
V_{IN}	IN pin voltage	- 0.3	7	V
V_{OUT}	OUT pin voltage	-0.3	7	V
V_{EN}	EN pin voltage	- 0.3	7	V
V_{PG}	PG pin voltage	- 0.3	7	V
T_J	Junction temperature	- 55	150	°C
P_{DISS}	Continuous power dissipation ⁽³⁾	Internally Limited		W
T_{stg}	Storage temperature	- 65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltages are with respect to the potential at the GND pin.
- (3) Internal thermal shutdown circuitry protects the device from permanent damage.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Input voltage	1.6		6.5	V
V_{OUT}	Output voltage	0.8		5.5	V
V_{EN}	EN input voltage	0		V_{IN}	V
V_{PG}	PG pin off voltage	0		6.5	V
I_{OUT}	Output current	0		500	mA
$T_{J-MAX-OP}$	Operating junction temperature	- 55		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LP5912-EP	UNIT
		DRV (WSON)	
		6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	75.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	92.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	40.0	°C/W
ψ_{JT}	Junction-to-top characterization parameter	3.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	40.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	15.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC package thermal metrics application report](#).

6.5 Electrical Characteristics

$V_{IN} = V_{OUT(NOM)} + 0.5\text{ V}$ or 1.6 V , whichever is greater; $V_{EN} = 1.35\text{ V}$, $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 1\text{ }\mu\text{F}$, $I_{OUT} = 1\text{ mA}$ (unless otherwise stated).^{(1) (2) (3)}

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT VOLTAGE AND REGULATION						
ΔV_{OUT}	Output voltage tolerance	For $V_{OUT(NOM)} \geq 3.3\text{ V}$, $V_{OUT(NOM)} + 0.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$, $I_{OUT} = 1\text{ mA to }500\text{ mA}$	-2		2	%
		For $1.1\text{ V} \leq V_{OUT(NOM)} < 3.3\text{ V}$, $V_{OUT(NOM)} + 0.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$, $I_{OUT} = 1\text{ mA to }500\text{ mA}$	-3	3		
		For $V_{OUT(NOM)} < 1.1\text{ V}$, $1.6\text{ V} \leq V_{IN} \leq 6.5\text{ V}$, $I_{OUT} = 1\text{ mA to }500\text{ mA}$				
	Line regulation	For $V_{OUT(NOM)} \geq 1.1\text{ V}$, $V_{OUT(NOM)} + 0.5\text{ V} \leq V_{IN} \leq 6.5\text{ V}$		0.8	% / V	
		For $V_{OUT(NOM)} < 1.1\text{ V}$, $1.6\text{ V} \leq V_{IN} \leq 6.5\text{ V}$				
	Load regulation	For $I_{OUT} = 1\text{ mA to }500\text{ mA}$		0.0022		% / mA
CURRENT LEVELS						
I_{SC}	Short-circuit current limit	$T_J = 25^{\circ}\text{C}$, ⁽⁴⁾	700	900	1100	mA
I_{RO}	Reverse leakage current ⁽⁵⁾	$V_{IN} < V_{OUT}$		10	150	μA
I_Q	Quiescent current ⁽⁶⁾	$V_{EN} = 1.35\text{ V}$, $I_{OUT} = 0\text{ mA}$		30	55	μA
		$V_{EN} = 1.35\text{ V}$, $I_{OUT} = 500\text{ mA}$		400	600	
$I_{Q(SD)}$	Quiescent current shutdown mode ⁽⁶⁾	$V_{EN} = 0\text{ V}$, $-55^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$		0.2	1.5	μA
		$V_{EN} = 0\text{ V}$		0.2	5	
I_G	Ground-current ⁽⁷⁾	$V_{EN} = 1.35\text{ V}$, $I_{OUT} = 0\text{ mA}$		35		μA
VDO DROPOUT VOLTAGE						
V_{DO}	Dropout voltage ⁽⁸⁾	$I_{OUT} = 500\text{ mA}$, $1.6\text{ V} \leq V_{OUT(NOM)} < 3.3\text{ V}$		170	250	mV
		$I_{OUT} = 500\text{ mA}$, $3.3\text{ V} \leq V_{OUT(NOM)} \leq 5.5\text{ V}$		95	180	mV
V_{IN} to V_{OUT} RIPPLE REJECTION						
PSRR	Power-supply rejection ratio ⁽⁹⁾	$f = 100\text{ Hz}$, $V_{OUT} \geq 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		80		dB
		$f = 1\text{ kHz}$, $V_{OUT} \geq 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		75		
		$f = 10\text{ kHz}$, $V_{OUT} \geq 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		65		
		$f = 100\text{ kHz}$, $V_{OUT} \geq 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		40		
		$f = 100\text{ Hz}$, $0.8\text{ V} \leq V_{OUT} < 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		65		
		$f = 1\text{ kHz}$, $0.8\text{ V} \leq V_{OUT} < 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		65		
		$f = 10\text{ kHz}$, $0.8\text{ V} \leq V_{OUT} < 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		65		
		$f = 100\text{ kHz}$, $0.8\text{ V} \leq V_{OUT} < 1.1\text{ V}$, $I_{OUT} = 20\text{ mA}$		40		
OUTPUT NOISE VOLTAGE						
e_N	Noise voltage	$I_{OUT} = 1\text{ mA}$, BW = 10 Hz to 100 kHz		12		$\mu\text{ V}_{RMS}$
		$I_{OUT} = 500\text{ mA}$, BW = 10 Hz to 100 kHz		12		
THERMAL SHUTDOWN						
T_{SD}	Thermal shutdown temperature			160		$^{\circ}\text{C}$
T_{HYS}	Thermal shutdown hysteresis			15		$^{\circ}\text{C}$
LOGIC INPUT THRESHOLDS						
$V_{EN(OFF)}$	Off threshold				0.25	V
$V_{EN(ON)}$	On threshold		1.35			V
I_{EN}	Input current at EN terminal ⁽¹⁰⁾	$V_{IN} = 6\text{ V}$, $V_{EN} = 6\text{ V}$		3		μA
		$V_{IN} = 3.3\text{ V}$, $V_{EN} = 0\text{ V}$		0.001		μA
PG_{HYS}	PG threshold hysteresis (% of nominal V_{OUT})			4		%

6.5 Electrical Characteristics (continued)

$V_{IN} = V_{OUT(NOM)} + 0.5\text{ V}$ or 1.6 V , whichever is greater; $V_{EN} = 1.35\text{ V}$, $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 1\text{ }\mu\text{F}$, $I_{OUT} = 1\text{ mA}$ (unless otherwise stated).^{(1) (2) (3)}

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
PG_{LTH}	PG low threshold (% of nominal V_{OUT})		86	90	93	%
$V_{OL(PG)}$	PG pin low-level output voltage	$V_{OUT} < PG_{LTH}$, sink current = 1 mA			400	mV
$I_{LKG(PG)}$	PG pin leakage current	$V_{OUT} < PG_{LTH}$, $V_{PG} = 6\text{ V}$			1	μA
TRANSITION CHARACTERISTICS						
ΔV_{OUT}	Line transients ⁽⁹⁾	For $V_{IN} \uparrow$ and $V_{OUT(NOM)} \geq 1.1\text{ V}$, $V_{IN} = (V_{OUT(NOM)} + 0.5\text{ V})$ to $(V_{OUT(NOM)} + 1.1\text{ V})$, V_{IN} trise = 30 μs			1	mV
		For $V_{IN} \uparrow$ and $V_{OUT(NOM)} < 1.1\text{ V}$, $V_{IN} = 1.6\text{ V}$ to 2.2 V , V_{IN} trise = 30 μs				
		For $V_{IN} \downarrow$ and $V_{OUT(NOM)} \geq 1.1\text{ V}$, $V_{IN} = (V_{OUT(NOM)} + 0.5\text{ V})$ to $(V_{OUT(NOM)} + 1.1\text{ V})$, V_{IN} trise = 30 μs				
		For $V_{IN} \downarrow$ and $V_{OUT(NOM)} < 1.1\text{ V}$, $V_{IN} = 1.6\text{ V}$ to 2.2 V , V_{IN} trise = 30 μs		-1		
	Load transients ⁽⁹⁾	$I_{OUT} = 5\text{ mA}$ to 500 mA , I_{OUT} trise = 10 μs		-45		mV
		$I_{OUT} = 500\text{ mA}$ to 5 mA , I_{OUT} tfall = 10 μs			45	
	Overshoot on start-up ⁽⁹⁾				5	%
t_{ON}	Turnon time	From $V_{EN} > V_{EN(ON)}$ to $V_{OUT} = 95\%$ of $V_{OUT(NOM)}$		200		μs
OUTPUT AUTO DISCHARGE RATE						
R_{AD}	Output discharge pulldown resistance	$V_{EN} = 0\text{ V}$, $V_{IN} = 3.6\text{ V}$		100		Ω

- (1) All voltages are with respect to the device GND pin, unless otherwise stated.
- (2) Minimum and maximum limits are specified through test, design, or statistical correlation over the junction temperature (T_J) range of -55°C to $+125^\circ\text{C}$, unless otherwise stated. Typical values represent the most likely parametric norm at $T_A = 25^\circ\text{C}$, and are provided for reference purposes only.
- (3) In applications where high power dissipation and poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A-MAX}) is dependent on the maximum operating junction temperature ($T_{J-MAX-OP} = 125^\circ\text{C}$), the maximum power dissipation of the device in the application (P_{D-MAX}), and the junction-to-ambient thermal resistance of the part/package in the application ($R_{\theta JA}$), as given by the following equation: $T_{A-MAX} = T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})$.
- (4) Short-circuit current (I_{SC}) is equivalent to current limit. To minimize thermal effects during testing, I_{SC} is measured with V_{OUT} pulled to 100 mV below its nominal voltage.
- (5) Reverse current (I_{RO}) is measured at the IN pin.
- (6) Quiescent current is defined here as the difference in current between the input voltage source and the load at V_{OUT} .
- (7) Ground current is defined here as the total current flowing to ground as a result of all input voltages applied to the device ($I_Q + I_{EN}$).
- (8) Dropout voltage (V_{DO}) is the voltage difference between the input and the output at which the output voltage drops to 150 mV below its nominal value when $V_{IN} = V_{OUT} + 0.5\text{ V}$. Dropout voltage is not a valid condition for output voltages less than 1.6 V as compliance with the minimum operating voltage requirement cannot be assured.
- (9) This specification is specified by design.
- (10) There is a 3-M Ω pulldown resistor between the EN pin and GND pin on the device.

6.6 Output and Input Capacitors

over operating free-air temperature range (unless otherwise noted)

	PARAMETERS	TEST CONDITIONS	MIN	NOM	MAX	UNIT
C_{IN}	Input capacitance ⁽¹⁾	Capacitance for stability	0.7	1		μF
C_{OUT}	Output capacitance ⁽¹⁾	Capacitance for stability	0.7	1	10	μF
ESR	Output voltage ⁽¹⁾		5		500	m Ω

- (1) This specification is verified by design.

6.7 Typical Characteristics

$V_{IN} = V_{OUT} + 0.5\text{ V}$, $V_{EN} = V_{IN}$, $I_{OUT} = 1\text{ mA}$, $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 1\text{ }\mu\text{F}$, and $T_J = 25^\circ\text{C}$ (unless otherwise noted)

7 Detailed Description

7.1 Overview

The LP5912-EP is a low-noise, high PSRR, low-dropout regulator (LDO) capable of sourcing a 500-mA load. The LP5912-EP can operate down to a 1.6-V input voltage and a 0.8-V output voltage. With this combination of low noise, high PSRR, and low output voltage, the device is designed to power a multitude of loads from noise-sensitive communication components to battery-powered systems.

The LP5912-EP contains several features, as shown in the *Functional Block Diagram*:

- Internal output resistor divider feedback
- Small size and low-noise internal protection circuit current limit
- Reverse current protection
- Current limit and inrush current protection
- Thermal shutdown
- Output auto discharge for fast turnoff
- Power-good output, with a fixed 140- μ s typical delay

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Enable (EN)

The LP5912-EP enable (EN) pin is internally held low by a 3-M Ω resistor to GND. The EN pin voltage must be higher than the $V_{EN(ON)}$ threshold to ensure that the device is fully enabled under all operating conditions. The EN pin voltage must be lower than the $V_{EN(OFF)}$ threshold to ensure that the device is fully disabled and the automatic output discharge is activated.

When the device is disabled the output stage is disabled, the PG output pin is low, and the output automatic discharge is on.

7.3.2 Output Automatic Discharge (R_{AD})

The LP5912-EP output employs an internal 100- Ω (typical) pulldown resistance to discharge the output when the EN pin is low. If the LP5912-EP EN pin is low (the device is off) and the OUT pin is held high by a secondary supply, current flows from the secondary supply through the automatic discharge pulldown resistor to ground.

7.3.3 Reverse Current Protection (I_{RO})

The LP5912-EP input is protected against reverse current when the output voltage is higher than the input voltage. In the event that extra output capacitance is used at the output, a power-down transient at the input normally causes a large reverse current through a conventional regulator. The LP5912-EP includes a reverse voltage detector that trips when V_{IN} drops below V_{OUT} , shutting off the regulator and opening the p-channel metal-oxide-semiconductor field effect transistor (PMOS) body diode connection, preventing any reverse current from the OUT pin from flowing to the IN pin.

If the LP5912-EP EN pin is low (the LP5912-EP is off) and the OUT pin is held high by a secondary supply, current flows from the secondary supply through the automatic discharge pulldown resistor to ground. This scenario is not reverse current, but is instead automatic discharge pulldown current.

Reverse current (I_{RO}) is measured at the IN pin.

7.3.4 Internal Current Limit (I_{SC})

The internal current limit circuit protects the LDO against high-load current faults or shorting events. The LDO is not designed to operate continuously at the I_{SC} current limit. During a current-limit event, the LDO sources constant current. Therefore, the output voltage falls when load impedance decreases. If a current limit occurs and the resulting output voltage is low, excessive power may be dissipated across the LDO, resulting in a thermal shutdown of the output.

7.3.5 Thermal Overload Protection (T_{SD})

Thermal shutdown disables the output when the junction temperature rises to approximately 160°C, which allows the device to cool. When the junction temperature cools to approximately 145°C, the output circuitry enables. Based on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This thermal cycling limits the dissipation of the regulator, thus protecting the regulator from damage as a result of overheating.

7.3.6 Power-Good Output (PG)

The LP5912-EP has a power-good function that works by toggling the state of the PG output pin. When the output voltage falls below the PG threshold voltage (PG_{LTH}), the PG pin open-drain output engages (low impedance to GND). When the output voltage rises above the PG threshold voltage (PGV_{HTH}), the PG pin becomes high impedance. By connecting a pullup resistor to an external supply, any downstream device can receive PG as a logic signal. Make sure that the external pullup supply voltage results in a valid logic signal for the receiving device or devices. Use a pullup resistor from 10 k Ω to 100 k Ω for best results.

The input supply, V_{IN} , must be no less than the minimum operating voltage of 1.6 V to ensure that the PG pin output status is valid. The PG pin output status is undefined when V_{IN} is less than 1.6 V.

In the power-good function, the PG output pin being pulled high is typically delayed 140 μ s after the output voltage rises above the PG_{HTH} threshold voltage. If the output voltage rises above the PG_{HTH} threshold and then falls below the PG_{LTH} threshold voltage, the PG pin falls immediately with no delay time.

If the PG function is not needed, the pullup resistor can be eliminated, and the PG pin can be either connected to ground or left floating.

7.4 Device Functional Modes

7.4.1 Enable (EN)

The LP5912-EP EN pin is internally held low by a 3-M Ω resistor to GND. The EN pin voltage must be higher than the $V_{EN(ON)}$ threshold to ensure that the device is fully enabled under all operating conditions. When the EN pin voltage is lower than the $V_{EN(OFF)}$ threshold, the output stage is disabled, the PG pin goes low, and the output automatic discharge circuit is activated. Any charge on the OUT pin is discharged to ground through the internal 100- Ω (typical) output auto discharge pulldown resistance.

7.4.2 Minimum Operating Input Voltage (V_{IN})

The LP5912-EP does not include a dedicated undervoltage lockout (UVLO) circuit. The device internal circuit is not fully functional until V_{IN} is at least 1.6 V. The output voltage is not regulated until V_{IN} has reached at least the greater of 1.6 V or ($V_{OUT} + V_{DO}$).

8 Applications and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The LP5912-EP is designed to meet the requirements of RF and analog circuits by providing low noise, high PSRR, low quiescent current, and low line or load transient response. The device offers excellent noise performance without the need for a noise bypass capacitor and is stable with input and output capacitors with a value of 1 μ F. The device delivers this performance in an industry standard WSON package, which for this device is specified with an operating junction temperature (T_J) of -55°C to $+125^{\circ}\text{C}$.

8.2 Typical Application

图 8-1 shows a typical application circuit for the LP5912-EP. Input and output capacitances may need to be increased above the 1- μ F minimum for some applications.

图 8-1. LP5912-EP Typical Application

8.2.1 Design Requirements

Use the parameters listed in 表 8-1 for typical RF linear regulator applications.

表 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	1.6 V to 6.5 V
Output voltage	0.8 V to 5.5 V
Output current	500 mA
Output capacitor	1 μ F to 10 μ F
Input and output capacitor ESR range	5 m Ω to 500 m Ω

8.2.2 Detailed Design Procedure

8.2.2.1 External Capacitors

As with most low-dropout regulators, the LP5912-EP requires external capacitors for regulator stability. The device is specifically designed for portable applications requiring minimum board space and the smallest possible components. These capacitors must be correctly selected for good performance.

8.2.2.2 Input Capacitor

An input capacitor is required for stability. The input capacitor must be at least equal to, or greater than, the output capacitor for good load-transient performance. A capacitor of at least 1 μF must be connected between the LP5912-EP IN pin and ground for stable operation over full load-current range. Having more output than input capacitance is acceptable, as long as the input is at least 1 μF .

The input capacitor must be located no more than 1 cm from the input pin and returned to a clean analog ground. Any good-quality ceramic, tantalum, or film capacitor can be used at the input.

备注

To ensure stable operation, good PCB practices must be employed to minimize ground impedance and keep input inductance low. If these conditions cannot be met, or if long leads connect the battery or other power source to the LP5912-EP, increase the value of the input capacitor to at least 10 μF . Also, tantalum capacitors can suffer catastrophic failures resulting from surge current when connected to a low-impedance source of power (such as a battery or a very large capacitor). If a tantalum capacitor is used at the input, the capacitor must be verified by the manufacturer to have a surge current rating sufficient for the application. There are no requirements for the equivalent series resistance (ESR) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance remains at 1 $\mu\text{F} \pm 30\%$ over the entire operating temperature range.

8.2.2.3 Output Capacitor

The LP5912-EP is designed specifically to work with a very small ceramic output capacitor, typically 1 μF . Use a ceramic capacitor (dielectric types of X5R or X7R) in the 1- μF to 10- μF range, and with an ESR from 5 m Ω to 500 m Ω , in the LP5912-EP application circuit. For this device, the output capacitor must be connected between the OUT pin with a good connection back to the GND pin.

Tantalum or film capacitors can also be used at the device output, V_{OUT} , but these components are not as attractive for reasons of size and cost (see the [Capacitor Characteristics](#) section).

The output capacitor must meet the requirement for the minimum value of capacitance and have an ESR value that is within the range of 5 m Ω to 500 m Ω for stability.

8.2.2.4 Capacitor Characteristics

The LP5912-EP is designed to work with ceramic capacitors on the input and output to take advantage of the benefits they offer. For capacitance values in the range of 1 μF to 10 μF , ceramic capacitors are the smallest, least expensive, and have the lowest ESR values, thus making them best for eliminating high-frequency noise. The ESR of a typical 1- μF ceramic capacitor is in the range of 20 m Ω to 40 m Ω , which easily meets the ESR stability requirement for the LP5912-EP.

The preferred choice for temperature coefficient in a ceramic capacitor is X7R. This type of capacitor is the most stable and holds the capacitance within $\pm 15\%$ over the temperature range. Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more expensive when comparing equivalent capacitance and voltage ratings in the 1- μF to 10- μF range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. Although a tantalum capacitor can possibly be found with an ESR value within the stable range, low ESR tantalum capacitors are offered with larger capacitance (which means bigger and more costly) than a

ceramic capacitor with the same ESR value. Also, the ESR of a typical tantalum increases at approximately 2:1 as the temperature goes from 25°C down to -40°C, so some guard band must be allowed.

8.2.2.5 Remote Capacitor Operation

To ensure stability, the LP5912-EP requires at least a 1-μF capacitor at the OUT pin. There is no strict requirement for the location of the output capacitor in regards to the LDO OUT pin; the output capacitor can be located 5 cm to 10 cm away from the LDO. This flexibility means that there is no need to have a special capacitor close to the OUT pin if there are already respective capacitors in the system. This placement flexibility requires that the output capacitor be connected directly between the LP5912-EP OUT pin and GND pin with no vias. This remote capacitor feature can help designers minimize the number of capacitors in the system.

As a good design practice, keep the wiring parasitic inductance at a minimum. Thus, use traces that are as wide as possible from the LDO output to the capacitors, keeping the LDO output trace layer as close to ground layer as possible and avoiding vias on the path. If there is a need to use vias, implement as many vias as possible between the connection layers. Keep parasitic wiring inductance less than 35 nH. For applications with fast load transients, use an input capacitor equal to (or larger than) the sum of the capacitance at the output node for the best load-transient performance.

8.2.2.6 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane connected to the tab or pad is critical to ensuring reliable operation. Device power dissipation can be calculated with [方程式 1](#), and depends on input voltage, output voltage, and load conditions of the design.

$$P_{D(MAX)} = (V_{IN(MAX)} - V_{OUT}) \times I_{OUT} \quad (1)$$

Power dissipation can be minimized, and greater efficiency can be achieved, by using the lowest available voltage drop option that is greater than the dropout voltage (V_{DO}). However, keep in mind that higher voltage drops result in better dynamic (that is, PSRR and transient) performance.

On the WSON (DRV) package, the primary conduction path for heat is through the exposed power pad into the PCB. To ensure the device does not overheat, connect the exposed pad (through thermal vias) to an internal ground plane with an appropriate amount of copper PCB area.

According to [方程式 2](#) or [方程式 3](#), power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A):

$$T_{J(MAX)} = T_{A(MAX)} + (R_{\theta JA} \times P_{D(MAX)}) \quad (2)$$

$$P_D = (T_{J(MAX)} - T_{A(MAX)}) / R_{\theta JA} \quad (3)$$

Unfortunately, this $R_{\theta JA}$ is highly dependent on the heat-spreading capability of the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The $R_{\theta JA}$ recorded in the [Thermal Information](#) table is determined by the specific EIA/JEDEC JESD51-7 standard for PCB and copper-spreading area, and is to be used only as a relative measure of package thermal performance. For a well-designed thermal layout, $R_{\theta JA}$ is actually the sum of the package junction-to-case (bottom) thermal resistance ($R_{\theta JCbot}$) plus the thermal resistance contribution by the PCB copper area acting as a heat sink.

8.2.2.7 Estimating Junction Temperature

The EIA/JEDEC standard recommends the use of psi (Ψ) thermal characteristics to estimate the junction temperatures of surface-mount devices on a typical PCB board application. These characteristics are not true thermal resistance values, but rather package-specific thermal characteristics that offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of copper-spreading area. The key thermal characteristics (Ψ_{JT} and Ψ_{JB}) are used in accordance with 方程式 4 or 方程式 5 and are given in the [Thermal Information](#) table.

$$T_{J(MAX)} = T_{TOP} + (\Psi_{JT} \times P_{D(MAX)}) \quad (4)$$

where:

- $P_{D(MAX)}$ is explained in 方程式 3
- T_{TOP} is the temperature measured at the center-top of the device package

$$T_{J(MAX)} = T_{BOARD} + (\Psi_{JB} \times P_{D(MAX)}) \quad (5)$$

where:

- $P_{D(MAX)}$ is explained in the [Power Dissipation](#) section
- T_{BOARD} is the PCB surface temperature measured 1 mm from the device package and centered on the package edge

For more information about the thermal characteristics Ψ_{JT} and Ψ_{JB} , see the [Semiconductor and IC Package Thermal Metrics](#) application note; for more information about measuring T_{TOP} and T_{BOARD} , see the [Using New Thermal Metrics](#) application note; and for more information about the EIA/JEDEC JESD51 PCB used for validating $R_{\theta JA}$, see the [Thermal Characteristics of Linear and Logic Packages Using JEDEC PCB Designs](#) application note. These application notes are available at www.ti.com.

8.2.3 Application Curves

8.3 Power Supply Recommendations

This device is designed to operate from an input supply voltage range of 1.6 V to 6.5 V. The input supply must be well regulated and free of spurious noise. To ensure that the LP5912-EP output voltage is well regulated and dynamic performance is optimum, the input supply must be at least $V_{OUT} + 0.5$ V. A minimum capacitor value of 1 μ F is required to be within 1 cm of the IN pin.

8.4 Layout

8.4.1 Layout Guidelines

The dynamic performance of the LP5912-EP is dependent on the layout of the PCB. PCB layout practices that are adequate for typical LDOs can degrade the PSRR, noise, or transient performance of the LP5912-EP.

Best performance is achieved by placing C_{IN} and C_{OUT} on the same side of the PCB as the LP5912-EP, and as close to the package as practical. The ground connections for C_{IN} and C_{OUT} must route back to the LP5912-EP ground pin using as wide and as short of a copper trace as practical.

Connections using long trace lengths, narrow trace widths, or connections through vias must be avoided. Such connections add parasitic inductances and resistance that result in inferior performance, especially during transient conditions.

10 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
