

# LP87524B/J/P-Q1 适用于 AWR 和 IWR MMIC 的四 4MHz 降压转换器

## 1 特性

- 符合汽车应用 要求
- 具有符合 AEC-Q100 标准的下列结果：
  - 器件温度 1 级：-40℃ 至 +125℃ 的环境运行温度范围
- 输入电压：2.8V 至 5.5V
- 输出电压：0.6V 至 3.36V
- 四个高效降压直流/直流转换器内核：
  - 总输出电流高达 10A
  - 输出电压转换率 3.8mV/μs
- 4MHz 开关频率
- 扩频模式和相位交错
- 可配置通用 I/O (GPIO)
- I<sup>2</sup>C 兼容接口，支持标准 (100kHz)、快速 (400kHz)、快速+ (1MHz) 和高速 (3.4MHz) 四种模式
- 具有可编程屏蔽的中断功能
- 可编程电源正常信号 (PGOOD)
- 输出短路和过载保护
- 过热警告和保护
- 过压保护 (OVP) 和欠压锁定 (UVLO)

## 2 应用

汽车信息娱乐系统、仪表组、雷达和摄像头电源 应用

## 3 说明

LP87524B/J/P-Q1 专为满足各种汽车电源应用中最新处理器和平台的电源管理要求而设计。该器件包含四个降压直流/直流转换器内核，这些内核配置为 4 个单相输出。该器件由 I<sup>2</sup>C 兼容串行接口和使能信号进行控制。

自动 PFM/PWM (AUTO 模式) 操作可在较宽输出电流范围内最大限度地提高效率。LP87524B/J/P-Q1 支持远程电压感应，可补偿稳压器输出与负载点 (POL) 之间的 IR 压降，从而提高输出电压的精度。此外，可以强制开关时钟进入 PWM 模式以及将其与外部时钟同步，从而最大限度地降低干扰。

LP87524B/J/P-Q1 器件支持在不添加外部电流感应电阻器的情况下进行负载电流测量。此外，LP87524B/J/P-Q1 还支持与使能信号同步的可编程启动和关断延迟与时序。这些序列可能还包括用于控制外部稳压器、负载开关和处理器复位的 GPIO 信号。在启动和电压变化期间，器件会对输出转换率进行控制，从而最大限度地减小输出电压过冲和浪涌电流。

器件信息<sup>(1)</sup>

| 器件型号        | 封装           | 封装尺寸 (标称值)      |
|-------------|--------------|-----------------|
| LP87524B-Q1 | VQFN-HR (26) | 4.50mm × 4.00mm |
| LP87524J-Q1 |              |                 |
| LP87524P-Q1 |              |                 |

| 1                     | FB_B2    | A     | Output voltage feedback (positive) for Buck2.                                                                                                                              |
| 2                     | EN3      | D/I/O | Programmable enable signal for buck regulators (can be also configured to select between two buck output voltage levels). Alternative function is GPIO3.                   |
| 3                     | CLKIN    | D/I   | External clock input. Connect to ground if external clock is not used.                                                                                                     |
| 4, 17,<br>Thermal Pad | AGND     | G     | Ground                                                                                                                                                                     |
| 5                     | SCL      | D/I   | Serial interface clock input for I2C access. Connect a pullup resistor.                                                                                                    |
| 6                     | SDA      | D/I/O | Serial interface data input and output for I2C access. Connect a pullup resistor.                                                                                          |
| 7                     | EN1      | D/I/O | Programmable Enable signal for buck regulators (can be also configured to select between two buck output voltage levels). Alternative function is GPIO1.                   |
| 8                     | FB_B0    | A     | Output voltage feedback (positive) for Buck0                                                                                                                               |
| 9                     | VIN_B0   | P     | Input for Buck0. The separate power pins VIN_Bx are not connected together internally - VIN_Bx pins must be connected together in the application and be locally bypassed. |
| 10                    | SW_B0    | A     | Buck0 switch node                                                                                                                                                          |
| 11                    | PGND_B01 | G     | Power ground for Buck0 and Buck1                                                                                                                                           |
| 12                    | SW_B1    | A     | Buck1 switch node                                                                                                                                                          |
| 13                    | VIN_B1   | P     | Input for Buck1. The separate power pins VIN_Bx are not connected together internally – VIN_Bx pins must be connected together in the application and be locally bypassed. |
| 14                    | FB_B1    | A     | Output voltage feedback (positive) for Buck1.                                                                                                                              |
| 15                    | EN2      | D/I/O | Programmable enable signal for Buck regulators (can be also configured to select between two buck output voltage levels). Alternative function is GPIO2.                   |
| 16                    | PGOOD    | D/O   | Power Good indication signal                                                                                                                                               |
| 18                    | VANA     | P     | Supply voltage for analog and digital blocks. Must be connected to same node as with VIN_Bx.                                                                               |
| 19                    | nINT     | D/O   | Open-drain interrupt output, active LOW                                                                                                                                    |
| 20                    | NRST     | D/I   | Reset signal for the device.                                                                                                                                               |
| 21                    | FB_B3    | A     | Output voltage feedback (positive) for Buck3.                                                                                                                              |
| 22                    | VIN_B3   | P     | Input for Buck3. The separate power pins VIN_Bx are not connected together internally – VIN_Bx pins must be connected together in the application and be locally bypassed. |
| 23                    | SW_B3    | A     | Buck3 switch node                                                                                                                                                          |
| 24                    | PGND_B23 | G     | Power Ground for Buck2 and Buck3                                                                                                                                           |
| 25                    | SW_B2    | A     | Buck2 switch node                                                                                                                                                          |
| 26                    | VIN_B2   | P     | Input for Buck2. The separate power pins VIN_Bx are not connected together internally – VIN_Bx pins must be connected together in the application and be locally bypassed. |

A: Analog Pin, D: Digital Pin, G: Ground Pin, P: Power Pin, I: Input Pin, O: Output Pin

## 6 Specifications

| Maximum lead temperature (soldering, 10 sec.) |                                              |      | 260                               | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground.

### 6.2 ESD Ratings

|                                            |                                                         | VALUE | UNIT |
|--------------------------------------------|---------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> Electrostatic discharge | Human-body model (HBM), per AEC Q100-002 <sup>(1)</sup> | ±2000 | V    |
|                                            | Charged-device model (CDM), per AEC Q100-011            | ±500  |      |
|                                            | Corner pins (1, 8, 14 and 21)                           | ±750  |      |

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

|                                                                                                             |              | MIN  | MAX                     | UNIT |
|-------------------------------------------------------------------------------------------------------------|--------------|------|-------------------------|------|
| INPUT VOLTAGE                                                                                               |              |      |                         |      |

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq +140^{\circ}\text{C}$ ,  $C_{POL} = 22 \mu\text{F}$  / phase, specified  $V_{VANA}$ ,  $V_{VIN\_Bx}$ ,  $V_{NRST}$ ,  $V_{VOUT\_Bx}$  and  $I_{OUT}$  range, unless otherwise noted. Typical values are at  $T_J = 25^{\circ}\text{C}$ ,  $V_{VANA} = V_{VIN\_Bx} = 3.7 \text{ V}$ , and  $V_{OUT} = 1 \text{ V}$ , unless otherwise noted.<sup>(1) (2)</sup>

(1) All voltage values are with respect to network ground.

(2) Minimum (Min) and Maximum (Max) limits are specified by design, test, or statistical analysis. Typical (Typ) numbers are not verified, but do represent the most likely norm.

(3) The maximum output current can be limited by the forward current limit  $I_{LIM\_FWD}$  and by the junction temperature. The power dissipation inside the die depends on the length of the current pulse and efficiency and the junction temperature may increase to thermal shutdown level if the board and ambient temperatures are high.

## Electrical Characteristics (continued)

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq +140^{\circ}\text{C}$ ,  $C_{POL} = 22\text{ }\mu\text{F}$  / phase, specified  $V_{VANA}$ ,  $V_{VIN\_BX}$ ,  $V_{NRST}$ ,  $V_{VOUT\_BX}$  and  $I_{OUT}$  range, unless otherwise noted. Typical values are at  $T_J = 25^{\circ}\text{C}$ ,  $V_{VANA} = V_{VIN\_BX} = 3.7\text{ V}$ , and  $V_{OUT} = 1\text{ V}$ , unless otherwise noted.<sup>(1) (2)</sup>

(4) Output capacitance, forward and negative current limits and load current may limit the maximum and minimum slew rates.

## Electrical Characteristics (continued)

Limits apply over the junction temperature range  $-40^{\circ}\text{C} \leq T_J \leq +140^{\circ}\text{C}$ ,  $C_{POL} = 22 \mu\text{F}$  / phase, specified  $V_{VANA}$ ,  $V_{VIN\_BX}$ ,  $V_{NRST}$ ,  $V_{VOUT\_BX}$  and  $I_{OUT}$  range, unless otherwise noted. Typical values are at  $T_J = 25^{\circ}\text{C}$ ,  $V_{VANA} = V_{VIN\_BX} = 3.7 \text{ V}$ , and  $V_{OUT} = 1 \text{ V}$ , unless otherwise noted.<sup>(1) (2)</sup>

## 7 Detailed Description

### 7.1 Overview

The LP87524B/J/P-Q1 is a high-efficiency, high-performance power supply device with four step-down DC-DC converter cores for automotive applications. 表 1 lists the output characteristics of the regulators.

**表 1. Supply Specification**

| SUPPLY                               | OUTPUT                                                                                       |                                                                     |                                             |

The LP87524B/J/P-Q1 also supports switching clock synchronization to an external clock. The nominal frequency of the external clock can be from 1 MHz to 24 MHz with 1-MHz steps.

Additional features include:

- Soft start
- Input voltage protection:
  - Undervoltage lockout
  - Overvoltage protection
- Output voltage monitoring and protection:
  - Overvoltage monitoring
  - Undervoltage monitoring
  - Overload protection
- Thermal warning
- Thermal shutdown

Three enable signals can be multiplexed to general purpose I/O (GPIO) signals. The direction and output type (open-drain or push-pull) are programmable for the GPIOs.

## 7.2 Functional Block Diagram

## 7.3 Feature Descriptions

### 7.3.1 DC-DC Converters

#### 7.3.1.1 Overview

The LP87524B/J/P-Q1 includes four step-down DC-DC converter cores configured for four single-phase outputs. The cores are designed for flexibility; most of the functions are programmable, thus giving a possibility to optimize the regulator operation for each application.

The LP87524B/J/P-Q1 has the following features:

- DVS support
- Automatic mode control based on the loading (PFM or PWM mode)
- Forced-PWM mode operation
- Optional external clock input to minimize crosstalk
- Optional spread spectrum technique to reduce EMI
- Phase control for optimized EMI
- Synchronous rectification
- Current mode loop with PI compensator
- Soft start
- Power Good flag with maskable interrupt
- Power Good signal (PGOOD) with selectable sources
- Average output current sensing (for PFM entry and load current measurement)

## Feature Descriptions (接下页)

The following parameters can be programmed via registers:

- Output voltage
- Forced-PWM operation
- Enable and disable delays for regulators and GPIOs controlled by ENx pins

There are two modes of operation for the converter, depending on the output current required: pulse-width modulation (PWM) and pulse-frequency modulation (PFM). The converter operates in PWM mode at high load currents of approximately 600 mA or higher. Lighter output current loads cause the converter to automatically switch into PFM mode for reduced current consumption when forced-PWM mode is disabled.

A multi-phase synchronous buck converter offers several advantages over a single power stage converter. For application processor power delivery, lower ripple on the input and output currents and faster transient response to load steps are the most significant advantages. Also, because the load current is evenly shared among multiple channels in multi-phase output configuration, the heat generated is greatly reduced for each channel due to the fact that power loss is proportional to square of current. The physical size of the output inductor shrinks significantly due to this heat reduction. A block diagram of a single core is shown in 图 5.

图 5. Detailed Block Diagram Showing One Core

### 7.3.1.2 Transition Between PWM and PFM Modes

The LP87524B/J/P-Q1 converter operates in PWM mode at load current of about 600 mA or higher. At lighter load-current levels the device automatically switches into PFM mode for reduced current consumption when forced-PWM mode is disabled (AUTO-mode operation). By combining the PFM and the PWM modes a high efficiency is achieved over a wide output-load-current range.

### 7.3.1.3 Buck Converter Load-Current Measurement

Buck load current can be monitored via I<sup>2</sup>C registers. The monitored buck converter is selected with the LOAD\_CURRENT\_BUCK\_SELECT[1:0] bits in SEL\_I\_LOAD register. A write to this selection register starts a current measurement sequence. The regulator is forced to PWM mode during the measurement. The measurement sequence is 50  $\mu$ s long, maximum. LP87524B/J/P-Q1 can be configured to give out an interrupt (I\_LOAD\_READY bit in INT\_TOP1 register) after the load current measurement sequence is finished. Load current measurement interrupt can be masked with I\_LOAD\_READY\_MASK bit (TOP\_MASK1 register). The measurement result can be read from registers I\_LOAD\_1 and I\_LOAD\_2. Register I\_LOAD\_1 bits BUCK\_LOAD\_CURRENT[7:0] give out the LSB bits and register I\_LOAD\_2 bits BUCK\_LOAD\_CURRENT[9:8] the MSB bits. The measurement result BUCK\_LOAD\_CURRENT[9:0] LSB is 20 mA, and maximum value of the measurement corresponds to 20.46 A.

## Feature Descriptions (接下页)

### 7.3.1.4 Spread-Spectrum Mode

Systems with periodic switching signals may generate a large amount of switching noise in a set of narrowband frequencies (the switching frequency and its harmonics). The usual solution to reduce noise coupling is to add EMI filters and shields to the boards. The LP87524B/J/P-Q1 device has register selectable spread-spectrum mode which minimizes the need for output filters, ferrite beads, or chokes. In spread-spectrum mode, the switching frequency varies around the center frequency, reducing the EMI emissions radiated by the converter and associated passive components and PCB traces (see 图 6). This feature is available only when internal RC oscillator is used (PLL\_MODE[1:0] = 00 in PLL\_CTRL register), and it is enabled with the EN\_SPREAD\_SPEC bit (PIN\_FUNCTION register), and it affects all the buck cores.

Where a fixed-frequency converter exhibits large amounts of spectral energy at the switching frequency, the spread-spectrum architecture of the LP87524B/J/P-Q1 spreads that energy over a large bandwidth.

图 6. Spread-Spectrum Modulation

### 7.3.2 Sync Clock Functionality

The LP87524B/J/P-Q1 device contains a CLKIN input to synchronize switching clock of the buck regulator with the external clock. The block diagram of the clocking and PLL module is shown in 图 7. Depending on the PLL\_MODE[1:0] bits (in PLL\_CTRL register) and the external clock availability, the external clock is selected and interrupt is generated as shown in 表 2. The interrupt can be masked with SYNC\_CLK\_MASK bit in TOP\_MASK1 register. The nominal frequency of the external input clock is set by EXT\_CLK\_FREQ[4:0] bits (in PLL\_CTRL register) and it can be from 1 MHz to 24 MHz with 1-MHz steps. The external clock must be inside accuracy limits (–30%/+10%) for valid clock detection.

The NO\_SYNC\_CLK interrupt (in INT\_TOP1 register) is also generated in cases the external clock is expected but it is not available. These cases are start-up (read OTP-to-STANDBY transition) when PLL\_MODE[1:0] = 01 and regulator enable (STANDBY-to-ACTIVE transition) when PLL\_MODE[1:0] = 10.

### 7.3.3 Power-Up

The power-up sequence for the LP87524B/J/P-Q1 is as follows:

- VANA (and VIN\_Bx) reach minimum recommended level ( $V_{VANA} > V_{VANA_{UVLO}}$ ).
- NRST is set to high level (or shorted to VANA). This initiates power-on-reset (POR), OTP reading and enables the system I/O interface. The I<sup>2</sup>C host must allow at least 1.2 ms before writing or reading data to the LP87524B/J/P-Q1.
- Device enters STANDBY-mode.
- The host can change the default register setting by I<sup>2</sup>C if needed.
- The regulator(s) can be enabled/disabled by ENx pin(s) and by I<sup>2</sup>C interface.

### 7.3.4 Regulator Control

#### 7.3.4.1 Enabling and Disabling Regulators

The regulator(s) can be enabled when the device is in STANDBY or ACTIVE state. There are two ways for enable and disable the regulators:

- Using EN\_BUCKx bit in BUCKx\_CTRL1 register (EN\_PIN\_CTRLx register bit is 0)
- Using EN1/2/3 control pins (EN\_BUCKx bit is 1 **AND** EN\_PIN\_CTRLx register bit is 1 in BUCKx\_CTRL1 register)

If the EN1/2/3 control pins are used for enable and disable then the control pin is selected with BUCKx\_EN\_PIN\_SELECT[1:0] bits (in BUCKx\_CTRL1 register). The delay from the control signal rising edge to enabling of the regulator is set by BUCKx\_STARTUP\_DELAY[3:0] bits and the delay from control signal falling edge to disabling of the regulator is set by BUCKx\_SHUTDOWN\_DELAY[3:0] bits in BUCKx\_DELAY register. The delays are valid only for EN1/2/3 signal control. The control with EN\_BUCKx bit is immediate without the delays.

The control of the regulator (with 0-ms delays) is shown in 表 3.

#### 注

The control of the regulator cannot be changed from one ENx pin to a different ENx pin because the control is ENx signal edge sensitive. The control from ENx pin to register bit and back to the original ENx pin can be done during operation.

The regulator is enabled by the ENx pin or by I<sup>2</sup>C writing as shown in 图 8. The soft-start circuit limits the in-rush current during start-up. When the output voltage rises to 0.35-V level, the output voltage becomes slew-rate controlled. If there is a short circuit at the output and the output voltage does not increase above 0.35-V level in 1 ms, the regulator is disabled, and interrupt is set. When the output voltage reaches the Power-Good threshold level the BUCKx\_PG\_INT interrupt flag (in INT\_BUCK\_x register) is set. The Power-Good interrupt flag can be masked using BUCKx\_PG\_MASK bit (in BUCKx\_MASK register).

The ENx input pins have integrated pulldown resistors. The pulldown resistors are enabled by default, and the host can disable those with ENx\_PD bits (in CONFIG register).

**图 8. Regulator Enable and Disable**

### 7.3.4.2 Changing Output Voltage

The output voltage of the regulator can be changed by the ENx pin (voltage levels defined by the BUCKx\_VOUT and BUCKx\_FLOOR\_VOUT registers) or by writing to the BUCKx\_VOUT and BUCKx\_FLOOR\_VOUT registers. The voltage change is always slew-rate controlled,  $3.8\text{ mV}/\mu\text{s}$ . During voltage change the forced-PWM mode is used automatically. When the programmed output voltage is achieved, the mode becomes the one defined by the load current and the BUCKx\_FPWM bit in BUCKx\_CTRL1 register.

The Power-Good interrupt is generated when the output voltage reaches the programmed voltage level, as shown in 图 9.

**图 9. Regulator Output Voltage Change With ENx pin**

### 7.3.5 Enable and Disable Sequences

The LP87524B/J/P-Q1 device supports start-up and shutdown sequencing with programmable delays for different regulator outputs using single EN1/2/3 control signal. The regulator is selected for delayed control with:

- EN\_BUCKx = 1 (in BUCKx\_CTRL1 register)
- EN\_PIN\_CTRLx = 1 (in BUCKx\_CTRL1 register)
- EN\_ROOF\_FLOORx = 0 (in BUCKx\_CTRL1 register)
- BUCKx\_VSET[7:0] = Required voltage when ENx is high (in BUCKx\_VOUT register)
- The ENABLE pin for control is selected with BUCKx\_EN\_PIN\_SELECT[1:0] (in BUCKx\_CTRL1 register)
- The delay from rising edge of ENx signal to the regulator enable is set by BUCKx\_STARTUP\_DELAY[3:0] bits (in BUCKx\_DELAY register) and
- The delay from falling edge of ENx signal to the regulator disable is set by BUCKx\_SHUTDOWN\_DELAY[3:0] bits (in BUCKx\_DELAY register)

There are four time steps available for start-up and shutdown sequences. The delay times are selected with DOUBLE\_DELAY bit in CONFIG register and HALF\_DELAY bit in PGOOD\_CTRL2 register as shown in 表 4.

**表 4. Start-up and Shutdown Delays**

| X_STARTUP_DELAY /<br>X_SHUTDOWN_DELAY | DOUBLE_DELAY = 0<br>HALF_DELAY = 1 | DOUBLE_DELAY = 1<br>HALF_DELAY = 1 | DOUBLE_DELAY = 0<br>HALF_DELAY = 0 | DOUBLE_DELAY = 1<br>HALF_DELAY = 0 |
|---------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|

| 1111                                  | 4.8 ms                             | 9.6 ms                             | 15 ms                              | 30 ms                              |

An example of start-up and shutdown sequences is shown in 图 10 and 图 11. The start-up and shutdown delays for the Buck0/1 regulators are 1 ms and 4 ms and for the Buck2/3 regulators 3 ms and 1 ms. The delay settings are used only for enable/disable control with EN1/2/3 signals, not for Roof/Floor control.

**图 10. Typical Start-Up and Shutdown Sequencing**

**图 11. Start-Up and Shutdown Sequencing With Short ENx Low and High Periods**

### 7.3.6 Device Reset Scenarios

There are three reset methods implemented on the LP87524B/J/P-Q1:

- Software reset with SW\_RESET register bit (in RESET register)
- POR from rising edge of NRST signal
- Undervoltage lockout (UVLO) reset from VANA supply

A SW-reset occurs when SW\_RESET bit is written 1. The bit is automatically cleared after writing. This event disables all the regulators immediately, resets all the register bits to the default values and OTP bits are loaded (see 图 15). I<sup>2</sup>C interface is not reset during software reset. The host must wait at least 1.2 ms after writing SW reset until making a new I<sup>2</sup>C read or write to the device.

If VANA supply voltage falls below UVLO threshold level or NRST signal is set low then all the regulators are disabled immediately, and all the register bits are reset to the default values. When the VANA supply voltage rises above UVLO threshold level **AND** NRST signal rises above threshold level an internal power-on reset (POR) occurs. OTP bits are loaded to the registers and a start-up is initiated according to the register settings. The host must wait at least 1.2 ms after POR until reading or writing to I<sup>2</sup>C interface.

### 7.3.7 Diagnosis and Protection Features

The LP87524B/J/P-Q1 is capable of providing four levels of protection features:

- Information of valid regulator output voltage which sets interrupt or PGOOD signal;
- Warnings for diagnosis which sets interrupt;
- Protection events which are disabling the regulators affected; and
- Faults which are causing the device to shutdown.

The LP87524B/J/P-Q1 sets the flag bits indicating what protection or warning conditions have occurred, and the nINT pin is pulled low. nINT is released again after a clear of flags is complete. The nINT signal stays low until all the pending interrupts are cleared.

When a fault is detected, it is indicated by a RESET\_REG interrupt flag (in INT2\_TOP register) after next start-up.

**表 5. Summary of Interrupt Signals**

| EVENT                                                                                                                                                 | RESULT                                                            | INTERRUPT REGISTER AND BIT          | INTERRUPT MASK    | STATUS BIT       | RECOVERY/INTERRUPT CLEAR                                                                           |

| Software requested reset                                              | Immediate shutdown followed by power up, registers reset to default values and interrupt | RESET_REG = 1              | RESET_REG_MASK | N/A        | Write 1 to RESET_REG bit |

### 7.3.7.1 Power-Good Information (PGOOD pin)

In addition to the interrupt based indication of current limit and Power-Good level the LP87524B/J/P-Q1 device supports the indication with PGOOD signal. Either voltage and current monitoring or a voltage monitoring only can be selected for PGOOD indication. This selection is individual for all buck regulators and is set by PGx\_SEL[1:0] bits (in PGOOD\_CTRL1 register). When both voltage and current are monitored, PGOOD signal active indicates that regulator output is inside the Power-Good voltage window and that load current is below  $I_{LIM\_FWD}$ . If only voltage is monitored, then the current monitoring is ignored for the PGOOD signal. When a regulator is disabled, the monitoring is automatically masked to prevent it forcing PGOOD inactive. This allows connecting PGOOD signals from various devices together when open-drain outputs are used. When regulator voltage is transitioning from one target voltage to another, the voltage monitoring PGOOD signal is set inactive. The monitoring from all the output rails are combined, and PGOOD is active only if all the sources shows active status. The status from all the voltage rails are summarized in 表 6.

If the PGOOD signal is inactive or it changes the state to inactive, the source for the state can be read from PGOOD\_FLT register. During reading all the PGx\_FLT bit are cleared that are not driving the PGOOD inactive. When PGOOD signal goes active, the host must read the PGOOD\_FLT register to clear all the bits. The PGOOD signal follows the status of all the monitored outputs.

The PGOOD signal can be also configured so that it maintains inactive state even when the monitored outputs are valid but there are PGx\_FLT bits pending clearance in PGOOD\_FLT register. This mode of operation is selected by setting EN\_PGFLT\_STAT bit to 1 (in PGOOD\_CTRL2 register).

The type of output voltage monitoring for PGOOD signal is selected by PGOOD\_WINDOW bit (in PGOOD\_CTRL2 register). If the bit is 0, only undervoltage is monitored; if the bit is 1, both undervoltage and overvoltage are monitored.

The polarity and the output type (push-pull or open-drain) are selected by PGOOD\_POL and PGOOD\_OD bits in PGOOD\_CTRL2 register.

The filtering time for invalid output voltage is always typically 7  $\mu$ s and for valid output voltage the filtering time is selected with PGOOD\_SET\_DELAY bit (in PGOOD\_CTRL2 register). The Power-Good waveforms are shown in 图 13.

### 7.3.7.2 Warnings for Diagnosis (Interrupt)

#### 7.3.7.2.1 Output Power Limit

The regulators have output peak current limits. The peak current limits are described in [Specifications](#). If the load current is increased so that the current limit is triggered, the regulator continues to regulate to the limit current level (current peak regulation, peak on every switching cycle). The voltage may decrease if the load current is higher than the average output current. If the current regulation continues for 20  $\mu$ s, the LP87524B/J/P-Q1 device sets the BUCKx\_ILIM\_INT bit (in INT\_BUCKx register) and pulls the nINT pin low. The host processor can read BUCKx\_ILIM\_STAT bits (in BUCKx\_STAT register) to see if the regulator is still in peak current regulation mode.

If the load is so high that the output voltage decreases below a 350-mV level, the LP87524B/J/P-Q1 device disables the regulator and sets the BUCKx\_SC\_INT bit (in INT\_BUCKx register). In addition the BUCKx\_STAT bit (in BUCKx\_STAT register) is set to 0. The interrupt is cleared when the host processor writes 1 to BUCKx\_SC\_INT bit. The overload situation is shown in [图 14](#).

图 14. Overload Situation

#### 7.3.7.2.2 Thermal Warning

The LP87524B/J/P-Q1 device includes a monitoring feature against overtemperature by setting an interrupt for host processor. The threshold level of the thermal warning is selected with TDIE\_WARN\_LEVEL bit (in CONFIG register).

If the LP87524B/J/P-Q1 device temperature increases above thermal warning level the device sets TDIE\_WARN bit (in INT\_TOP1 register) and pulls nINT pin low. The status of the thermal warning can be read from TDIE\_WARN\_STAT bit (in TOP\_STAT register), and the interrupt is cleared by writing 1 to TDIE\_WARN bit.

#### 7.3.7.3 Protection (Regulator Disable)

If the regulator is disabled because of protection or fault (short-circuit protection, overload protection, thermal shutdown, overvoltage protection, or UVLO), the output power FETs are set to high-impedance mode, and the output pulldown resistor is enabled (if enabled with EN\_RDISx bits in BUCKx\_CTRL1 register). The turnoff time of the output voltage is defined by the output capacitance, load current, and the resistance of the integrated pulldown resistor. The pulldown resistors are active as long as VANA voltage is above approximately a 1.2-V level.

#### **7.3.7.3.1 Short-Circuit and Overload Protection**

A short-circuit protection feature allows the LP87524B/J/P-Q1 to protect itself and external components against short circuit at the output or against overload during start-up. The fault threshold is 350 mV, the protection is triggered, and the regulator is disabled if the output voltage is below the threshold level 1 ms after the regulator is enabled.

In a similar way the overload situation is protected during normal operation. If the voltage on the feedback pin of the regulator falls below 0.35 V and remains below the threshold level for 1 ms, the regulator is disabled.

In the short-circuit and overload situations the BUCKx\_SC\_INT (in INT\_BUCKx register) and the INT\_BUCKx bits (in INT\_TOP1 register) are set to 1, the BUCKx\_STAT bit (in BUCKx\_STAT register) is set to 0, and the nINT signal is pulled low. The host processor clears the interrupt by writing 1 to the BUCKx\_SC\_INT bit. Upon clearing the interrupt the regulator makes a new start-up attempt if the regulator is in enabled state.

#### **7.3.7.3.2 Overvoltage Protection**

The LP87524B/J/P-Q1 device monitors the input voltage from the VANA pin in standby and active operation modes. If the input voltage rises above  $VANA_{OVP}$  voltage level, all the regulators are disabled, pulldown resistors discharge the output voltages (if EN\_RDISx = 1 in BUCKx\_CTRL1 register), GPIOs that are configured to outputs are set to logic low level, nINT signal is pulled low, INT\_OVP bit (in INT\_TOP1 register) is set to 1, and BUCKx\_STAT bits (in BUCK\_x\_STAT register) are set to 0. The host processor clears the interrupt by writing 1 to the INT\_OVP bit. If the input voltage is above the overvoltage detection level the interrupt is not cleared. The host can read the status of the overvoltage from the OVP\_STAT bit (in TOP\_STAT register). Regulators cannot be enabled as long as the input voltage is above overvoltage detection level or the overvoltage interrupt is pending.

#### **7.3.7.3.3 Thermal Shutdown**

The LP87524B/J/P-Q1 has an overtemperature protection function that operates to protect the device from short-term misuse and overload conditions. When the junction temperature exceeds around 150°C, the regulators are disabled, the TDIE\_SD bit (in INT\_TOP1 register) is set to 1, the nINT signal is pulled low, and the device enters STANDBY. nINT is cleared by writing 1 to the TDIE\_SD bit. If the temperature is above thermal shutdown level the interrupt is not cleared. The host can read the status of the thermal shutdown from the TDIE\_SD\_STAT bit (in TOP\_STAT register). Regulators cannot be enabled as long as the junction temperature is above thermal shutdown level or the thermal shutdown interrupt is pending.

#### **7.3.7.4 Fault (Power Down)**

##### **7.3.7.4.1 Undervoltage Lockout**

When the input voltage falls below  $VANA_{UVLO}$  at the VANA pin, the buck converters are disabled immediately, and the output capacitors are discharged using the pulldown resistor, and the LP87524B/J/P-Q1 device enters SHUTDOWN. When VANA voltage is above UVLO threshold level and NRST signal is high, the device powers up to STANDBY state.

If the reset interrupt is unmasked by default (RESET\_REG\_MASK = 0 in TOP\_MASK2 register) the RESET\_REG interrupt (in INT\_TOP2 register) indicates that the device has been in SHUTDOWN. The host processor must clear the interrupt by writing 1 to the RESET\_REG bit. If the host processor reads the RESET\_REG flag after detecting an nINT low signal, it knows that the input supply voltage has been below UVLO level (or the host has requested reset), and the registers are reset to default values.

### 7.3.8 GPIO Signal Operation

The LP87524B/J/P-Q1 device supports up to 3 GPIO signals. The GPIO signals are multiplexed with enable signals. The selection between enable and GPIO function is set with GPIOx\_SEL bits in PIN\_FUNCTION register. The GPIOs are mapped to EN signals so that:

- EN1 is multiplexed with GPIO1
- EN2 is multiplexed with GPIO2
- EN3 is multiplexed with GPIO3

When the pin is selected for GPIO function, additional bits defines how the GPIO operates:

- GPIOx\_DIR defines the direction of the GPIO, input or output (GPIO\_CONFIG register)
- GPIOx\_OD defines the type of the output when the GPIO is set to output, either push-pull with VANA level or open-drain (GPIO\_CONFIG register)

When the GPIOx is defined as output, the logic level of the pin is set by GPIOx\_OUT bit (in GPIO\_OUT register).

When the GPIOx is defined as input, the logic level of the pin can be read from GPIOx\_IN bit (in GPIO\_IN register).

The control of the GPIOs configured to outputs can be included to start-up and shutdown sequences. The GPIO control for a sequence with ENx signal is selected by EN\_PIN\_CTRL\_GPIOx and EN\_PIN\_SELECT\_GPIOx bits (in PIN\_FUNCTION register). The delays during start-up and shutdown are set by GPIOx\_STARTUP\_DELAY[3:0] and GPIOx\_SHUTDOWN\_DELAY[3:0] bits (in GPIOx\_DELAY register) in the same way as control of the regulators.

The GPIOx signals have a selectable pulldown resistor. The pulldown resistors are selected by ENx\_PD bits (in CONFIG register).

---

#### 注

The control of the GPIOx pin cannot be changed from one ENx pin to a different ENx pin because the control is ENx signal edge sensitive. The control from ENx pin to register bit and back to the original ENx pin can be done during operation.

---

### 7.3.9 Digital Signal Filtering

The digital signals have a debounce filtering. The signal/supply is sampled with a clock signal and a counter. This results as an accuracy of one clock period for the debounce window.

**表 7. Digital Signal Filtering**

| EVENT                                   | SIGNAL/SUPPLY                      | RISING EDGE DEBOUNCE TIME                            | FALLING EDGE DEBOUNCE TIME        |

(1) No glitch filtering, only synchronization.

## 7.4 Device Functional Modes

### 7.4.1 Modes of Operation

**SHUTDOWN:** The NRST voltage is below threshold level. All switch, reference, control, and bias circuitry of the LP87524B/J/P-Q1 device are turned off.

**READ OTP:** The main supply voltage VANA is above  $VANA_{UVLO}$  level and NRST voltage is above threshold level. The regulators are disabled and the reference and bias circuitry of the LP87524B/J/P-Q1 are enabled. The OTP bits are loaded to registers.

**STANDBY:** The main supply voltage VANA is above  $VANA_{UVLO}$  level and NRST voltage is above threshold level. The regulators are disabled and the reference, control and bias circuitry of the LP87524B/J/P-Q1 are enabled. All registers can be read or written by the host processor via the system serial interface. The regulators can be enabled if needed.

**ACTIVE:** The main supply voltage VANA is above  $VANA_{UVLO}$  level and NRST voltage is above threshold level. At least one regulated DC-DC converter is enabled. All registers can be read or written by the host processor via the system serial interface.

The operating modes and transitions between the modes are shown in 图 15.

## Device Functional Modes (接下页)

**图 15. Device Operation Modes**

## 7.5 Programming

### 7.5.1 I<sup>2</sup>C-Compatible Interface

The I<sup>2</sup>C-compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the devices connected to the bus. The two interface lines are the serial data line (SDA), and the serial clock line (SCL). Every device on the bus is assigned a unique address and acts as either a master or a slave depending on whether it generates or receives the serial clock SCL. The SCL and SDA lines must each have a pullup resistor placed somewhere on the line and remain HIGH even when the bus is idle. Note: CLK pin is not used for serial bus data transfer. The LP87524B/J/P-Q1 supports standard mode (100 kHz), fast mode (400 kHz), fast mode+ (1 MHz), and high-speed mode (3.4 MHz).

#### 7.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, the state of the data line can only be changed when clock signal is LOW.

图 16. Data Validity Diagram

#### 7.5.1.2 Start and Stop Conditions

The LP87524B/J/P-Q1 is controlled via an I<sup>2</sup>C-compatible interface. START and STOP conditions classify the beginning and end of the I<sup>2</sup>C session. A START condition is defined as SDA transitions from HIGH to LOW while SCL is HIGH. A STOP condition is defined as SDA transition from LOW to HIGH while SCL is HIGH. The I<sup>2</sup>C master always generates the START and STOP conditions.

图 17. Start and Stop Sequences

The I<sup>2</sup>C bus is considered busy after a START condition and free after a STOP condition. During data transmission the I<sup>2</sup>C master can generate repeated START conditions. A START and a repeated START condition are equivalent function-wise. The data on SDA must be stable during the HIGH period of the clock signal (SCL). In other words, the state of SDA can only be changed when SCL is LOW. 图 18 shows the SDA and SCL signal timing for the I<sup>2</sup>C-compatible bus. See the 图 1 for timing values.

## Programming (接下页)

图 18. I²C-Compatible Timing

### 7.5.1.3 Transferring Data

Every byte put on the SDA line must be eight bits long, with the most significant bit (MSB) being transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge related clock pulse is generated by the master. The master releases the SDA line (HIGH) during the acknowledge clock pulse. The LP87524B/J/P-Q1 pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The LP87524B/J/P-Q1 generates an acknowledge after each byte has been received.

There is one exception to the *acknowledge after every byte* rule. When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (*negative acknowledge*) the last byte clocked out of the slave. This *negative acknowledge* still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

#### 注

If the NRST signal is low during I²C communication the LP87524B/J/P-Q1 device does not drive SDA line. The ACK signal and data transfer to the master is disabled at that time.

After the START condition, the bus master sends a chip address. This address is seven bits long followed by an eighth bit which is a data direction bit (READ or WRITE). For the eighth bit, a 0 indicates a WRITE and a 1 indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

图 19. Write Cycle (w = write; SDA = 0), id = Device Address = 0x60 for LP87524B/J/P-Q1

## Programming (接下页)

When READ function is to be accomplished, a WRITE function must precede the READ function as shown above.

**图 20. Read Cycle ( r = read; SDA = 1), id = Device Address = 0x60 for LP87524B/J/P-Q1**

### 7.5.1.4 I<sup>2</sup>C-Compatible Chip Address

注

The device address for the LP87524B/J/P-Q1 is 0x60

After the START condition, the I<sup>2</sup>C master sends the 7-bit address followed by an eighth bit, read or write (R/W). R/W = 0 indicates a WRITE and R/W = 1 indicates a READ. The second byte following the device address selects the register address to which the data will be written. The third byte contains the data for the selected register.

A. Here device address is 1100000Bin = 60Hex.

**图 21. Example Device Address**

### 7.5.1.5 Auto-Increment Feature

The auto-increment feature allows writing several consecutive registers within one transmission. Every time an 8-bit word is sent to the device, the internal address index counter is incremented by one and the next register is written. 表 8 below shows writing sequence to two consecutive registers. Note that auto increment feature does not work for read.

**表 8. Auto-Increment Example**

| MASTER ACTION   | START | DEVICE ADDRESS = 0x60 | WRITE |     | REGISTER ADDRESS |     | DATA |     | DATA |     | STOP |
|-----------------|-------|-----------------------|-------|-----|------------------|-----|------|-----|------|-----|------|
| LP87524B/J/P-Q1 |       |                       |       | ACK |                  | ACK |      | ACK |      | ACK |      |

## 7.6 Register Maps

### 7.6.1 Register Descriptions

The LP87524B/J/P-Q1 is controlled by a set of registers through the I<sup>2</sup>C-compatible interface. The device registers, their addresses, and their abbreviations are listed in 表 9. A more detailed description is given in the [OTP\\_REV](#) to [GPIO\\_OUT](#) sections.

The asterisk (\*) marking indicates register bits which are updated from OTP memory during READ OTP state.

#### 注

This register map describes the default values read from OTP memory for a device with orderable code of LP87524BRNFRQ1, LP87524JRNFRQ1 and LP87524PRNFRQ1. For other LP8752x versions the default values read from OTP memory can be different.

**表 9. Summary of LP87524B/J/P-Q1 Control Registers**

| Addr | Register         | Read / Write | D7                        | D6           | D5                       | D4 | D3                       | D2       | D1         | D0       |          |

## 8 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LP87524B/J/P-Q1 is a multi-phase step-down converter with four switcher cores, which are configured to four one-phase regulators configuration.

### 8.2 Typical Application

#### 8.2.1 Design Requirements

##### 8.2.1.1 Inductor Selection

The inductors  $L_0$ ,  $L_1$ ,  $L_2$ , and  $L_3$  are shown in the [Typical Application](#). The inductance and DCR of the inductor affects the control loop of the buck regulator. TI recommends using inductors similar to those listed in [Table 10](#). Pay attention to the saturation current and temperature rise current of the inductor. Check that the saturation current is higher than the peak current limit and the temperature rise current is higher than the maximum expected rms output current. Minimum effective inductance to ensure good performance is 0.22  $\mu\text{H}$  at maximum peak output current over the operating temperature range. DC resistance of the inductor must be less than 0.05  $\Omega$  for good efficiency at high-current condition. The inductor AC loss (resistance) also affects conversion efficiency. Higher Q factor at switching frequency usually gives better efficiency at light load to middle load. Shielded inductors are preferred as they radiate less noise.

## Typical Application (接下页)

**表 10. Recommended Inductors**

| MANUFACTURER | PART NUMBER      | VALUE         | DIMENSIONS<br>L × W × H (mm) | RATED DC CURRENT,<br>I <sub>SAT</sub> maximum (typical) / I <sub>TEMP</sub><br>maximum (typical) (A) | DCR typical /<br>maximum<br>(mΩ) |
|--------------|------------------|---------------|------------------------------|------------------------------------------------------------------------------------------------------|----------------------------------|
| TOKO         | DFE252012PD-R47M | 0.47 μH (20%) | 2.5 × 2 × 1.2                | 5.2 (–) / 4 (–) <sup>(1)</sup>                                                                       | – / 27                           |

(1) Operating temperature range is up to 125°C including self temperature rise.

### 8.2.1.2 Input Capacitor Selection

The input capacitors C<sub>IN0</sub>, C<sub>IN1</sub>, C<sub>IN2</sub>, and C<sub>IN3</sub> are shown in the [Typical Application](#). A ceramic input bypass capacitor of 10 μF is required for each phase of the regulator. Place the input capacitor as close as possible to the VIN\_Bx pin and PGND\_Bx pin of the device. A larger value or higher voltage rating improves the input voltage filtering. Use X7R type of capacitors, not Y5V or F. DC bias characteristics capacitors must be considered, minimum effective input capacitance to ensure good performance is 1.9 μF per buck input at maximum input voltage including tolerances and ambient temperature range, assuming that there are at least 22 μF of additional capacitance common for all the power input pins on the system power rail. See [表 11](#).

The input filter capacitor supplies current to the high-side FET switch in the first half of each cycle and reduces voltage ripple imposed on the input power source. A ceramic capacitor's low ESR provides the best noise filtering of the input voltage spikes due to this rapidly changing current. Select an input filter capacitor with sufficient ripple current rating. In addition ferrite can be used in front of the input capacitor to reduce the EMI.

**表 11. Recommended Input Capacitors (X7R Dielectric)**

| MANUFACTURER | PART NUMBER       | VALUE       | CASE SIZE | DIMENSIONS L × W × H<br>(mm) | VOLTAGE<br>RATING (V) |
|--------------|-------------------|-------------|-----------|------------------------------|-----------------------|
| Murata       | GCM21BR71A106KE22 | 10 μF (10%) | 0805      | 2 × 1.25 × 1.25              | 10 V                  |

### 8.2.1.3 Output Capacitor Selection

The output capacitors C<sub>OUT0</sub>, C<sub>OUT1</sub>, C<sub>OUT2</sub>, and C<sub>OUT3</sub> are shown in [Typical Application](#). A ceramic local output capacitor of 22 μF is required per phase. Use ceramic capacitors, X7R or X7T types; do not use Y5V or F. DC bias voltage characteristics of ceramic capacitors must be considered. The output filter capacitor smooths out current flow from the inductor to the load, helps maintain a steady output voltage during transient load changes and reduces output voltage ripple. These capacitors must be selected with sufficient capacitance and sufficiently low ESR and ESL to perform these functions. Minimum effective output capacitance to ensure good performance is 10 μF per phase including the DC voltage roll-off, tolerances, aging and temperature effects.

The output voltage ripple is caused by the charging and discharging of the output capacitor and also due to its R<sub>ESR</sub>. The R<sub>ESR</sub> is frequency dependent (as well as temperature dependent); make sure the value used for selection process is at the switching frequency of the part. See [表 12](#).

POL capacitors (C<sub>POL0</sub>, C<sub>POL1</sub>, C<sub>POL2</sub>, C<sub>POL3</sub>) can be used to improve load transient performance and to decrease the ripple voltage. A higher output capacitance improves the load step behavior and reduces the output voltage ripple as well as decreases the PFM switching frequency. However, output capacitance higher than 100 μF per phase is not necessarily of any benefit. Note that the output capacitor may be the limiting factor in the output voltage ramp and the maximum total output capacitance listed in electrical characteristics must not be exceeded. At shutdown the output voltage is discharged to 0.6 V level using forced-PWM operation. This can increase the input voltage if the load current is small and the output capacitor is large. Below 0.6 V level the output capacitor is discharged by the internal discharge resistor and with large capacitor more time is required to settle V<sub>OUT</sub> down as a consequence of the increased time constant.

**表 12. Recommended Output Capacitors (X7R or X7T Dielectric)**

| MANUFACTURER | PART NUMBER       | VALUE            | CASE SIZE | DIMENSIONS L × W × H (mm) | VOLTAGE RATING (V) |
|--------------|-------------------|------------------|-----------|---------------------------|--------------------|
| Murata       | GCM31CR71A226KE02 | 22 $\mu$ F (10%) | 1206      | 3.2 × 1.6 × 1.6           | 10                 |

#### 8.2.1.4 Snubber Components

If the input voltage for the regulators is above 4 V, snubber components are needed at the switching nodes to decrease voltage spiking in the switching node and to improve EMI. The snubber capacitors  $C_0$ ,  $C_1$ ,  $C_2$ , and  $C_3$  and the snubber resistors  $R_0$ ,  $R_1$ ,  $R_2$ , and  $R_3$  are shown in 图 22. The recommended components are shown in 表 13 and these component values give good performance on LP87524B/J/P-Q1 EVM. The optimal resistance and capacitance values finally depend on the PCB layout.

**表 13. Recommended Snubber Components**

| MANUFACTURER | PART NUMBER       | VALUE             | CASE SIZE | DIMENSIONS L × W × H (mm) | VOLTAGE / POWER RATING |
|--------------|-------------------|-------------------|-----------|---------------------------|------------------------|
| Vishay-Dale  | CRCW04023R90JNED  | 3.9 $\Omega$ (5%) | 0402      | 1 × 0.5 × 0.4             | 62 mW                  |
| Murata       | GCM1555C1H391JA16 | 390 pF (5%)       | 0402      | 1 × 0.5 × 0.5             | 50 V                   |

#### 8.2.1.5 Supply Filtering Components

The VANA input is used to supply analog and digital circuits in the device. See 表 14 for recommended components for VANA input supply filtering.

**表 14. Recommended Supply Filtering Components**

| MANUFACTURER | PART NUMBER       | VALUE        | CASE SIZE | DIMENSIONS L × W × H (mm) | VOLTAGE RATING (V) |
|--------------|-------------------|--------------|-----------|---------------------------|--------------------|
| Murata       | GCM155R71C104KA55 | 100 nF (10%) | 0402      | 1.0 × 0.5 × 0.5           | 16                 |
| Murata       | GCM188R71C104KA37 | 100 nF (10%) | 0603      | 1.6 × 0.8 × 0.8           | 16                 |

### 8.2.2 Detailed Design Procedure

The performance of the LP87524B/J/P-Q1 device depends greatly on the care taken in designing the printed circuit board (PCB). The use of low-inductance and low serial-resistance ceramic capacitors is strongly recommended, while proper grounding is crucial. Attention must be given to decoupling the power supplies. Decoupling capacitors must be connected close to the device and between the power and ground pins to support high peak currents being drawn from system power rail during turnon of the switching MOSFETs. Keep input and output traces as short as possible, because trace inductance, resistance, and capacitance can easily become the performance limiting items. The separate power pins VIN\_Bx are not connected together internally. Connect the VIN\_Bx power connections together outside the package using power plane construction.

### 8.2.3 Application Curves

Measurements are done using typical application set up with connections shown in 图 22 (snubber components included when  $V_{IN} > 4$  V). Graphs may not reflect the OTP default settings. Unless otherwise specified:  $V_{IN} = 3.7$  V,  $V_{OUT} = 1$  V,  $V_{(NRST)} = 1.8$  V,  $T_A = 25^\circ\text{C}$ ,  $f_{SW} = 4$  MHz,  $L = 0.47$   $\mu\text{H}$  (TOKO DFE252012PD-R47M),  $C_{OUT} = 22$   $\mu\text{F}$  / phase, and  $C_{POL} = 22$   $\mu\text{F}$  / phase. Measurements are done using connections in the [Typical Application](#).

## 9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 2.8 V and 5.5 V. This input supply must be well regulated and able to withstand maximum input current and maintain stable voltage without voltage drop even at load transition condition. The resistance of the input supply rail must be low enough that the input current transient does not cause too high drop in the LP87524B/J/P-Q1 supply voltage that can cause false UVLO fault triggering. If the input supply is located more than a few inches from the LP87524B/J/P-Q1 additional bulk capacitance may be required in addition to the ceramic bypass capacitors.

## 10 Layout

### 10.1 Layout Guidelines

The high frequency and large switching currents of the LP87524B/J/P-Q1 make the choice of layout important. Good power supply results only occur when care is given to proper design and layout. Layout affects noise pickup and generation and can cause a good design to perform with less-than-expected results. With a range of output currents from milliamps to 10 A, good power supply layout is much more difficult than most general PCB design. Use the following steps as a reference to ensure the device is stable and maintains proper voltage and current regulation across its intended operating voltage and current range.

1. Place  $C_{IN}$  as close as possible to the VIN\_Bx pin and the PGND\_Bxx pin. Route the  $V_{IN}$  trace wide and thick to avoid IR drops. The trace between the positive node of the input capacitor and the VIN\_Bx pin(s) of LP87524B/J/P-Q1, as well as the trace between the negative node of the input capacitor and power PGND\_Bxx pin(s), must be kept as short as possible. The input capacitance provides a low-impedance voltage source for the switching converter. The inductance of the connection is the most important parameter of a local decoupling capacitor — parasitic inductance on these traces must be kept as small as possible for proper device operation. The parasitic inductance can be reduced by using a ground plane as close as possible to top layer by using thin dielectric layer between top layer and ground plane.
2. The output filter, consisting of COUT and L, converts the switching signal at SW\_Bx to the noiseless output voltage. It must be placed as close as possible to the device keeping the switch node small, for best EMI behavior. Route the traces between the LP87524B/J/P-Q1 output capacitors and the load direct and wide to avoid losses due to the IR drop.
3. Input for analog blocks (VANA and AGND) must be isolated from noisy signals. Connect VANA directly to a quiet system voltage node and AGND to a quiet ground point where no IR drop occurs. Place the decoupling capacitor as close as possible to the VANA pin.
4. If the processor load supports remote voltage sensing, connect the feedback pins FB\_Bx of the LP87524B/J/P-Q1 device to the respective sense pins on the processor. The sense lines are susceptible to noise. They must be kept away from noisy signals such as PGND\_Bxx, VIN\_Bx, and SW\_Bx, as well as high bandwidth signals such as the I<sup>2</sup>C. Avoid both capacitive and inductive coupling by keeping the sense lines short, direct, and close to each other. Run the lines in a quiet layer. Isolate them from noisy signals by a voltage or ground plane if possible. If series resistors are used for load current measurement, place them after connection of the voltage feedback.
5. PGND\_Bxx, VIN\_Bx and SW\_Bx must be routed on thick layers. They must not surround inner signal layers, which are not able to withstand interference from noisy PGND\_Bxx, VIN\_Bx and SW\_Bx.
6. If the input voltage is above 4 V, place snubber components (capacitor and resistor) between SW\_Bx and ground on all four phases. The components can be also placed to the other side of the board if there are area limitations and the routing traces can be kept short.

Due to the small package of this converter and the overall small solution size, the thermal performance of the PCB layout is important. Many system-dependent parameters such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component. Proper PCB layout, focusing on thermal performance, results in lower die temperatures. Wide and thick power traces come with the ability to sink dissipated heat. This can be improved further on multi-layer PCB designs with vias to different planes. This results in reduced junction-to-ambient ( $R_{\theta JA}$ ) and junction-to-board ( $R_{\theta JB}$ ) thermal resistances and thereby reduces the device junction temperature,  $T_J$ . TI strongly recommends to perform of a careful system-level 2D or full 3D dynamic thermal analysis at the beginning product design process, by using a thermal modeling analysis software.

## 10.2 Layout Example

图 43. LP87524B/J/P-Q1 Board Layout

The output voltage rails are shorted together based on the configuration as shown in [Typical Application](#).

## 11 器件和文档支持

### 11.1 器件支持

#### 11.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

### 11.2 接收文档更新通知

要接收文档更新通知，请导航至 [TI.com.cn](http://TI.com.cn) 上的器件产品文件夹。单击右上角的 [通知我](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 11.3 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的 [《使用条款》](#)。

**TI E2E™ 在线社区** [TI 的工程师对工程师 \(E2E\) 社区](#)。此社区的创建目的在于促进工程师之间的协作。在 [e2e.ti.com](http://e2e.ti.com) 中，您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

**设计支持** [TI 参考设计支持](#) 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

### 11.4 商标

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

### 11.5 静电放电警告

这些装置包含有限的内置 ESD 保护。存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

### 11.6 术语表

**SLYZ022** — [TI 术语表](#)。

这份术语表列出并解释术语、缩写和定义。

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

# RNF0026C

## PACKAGE OUTLINE

### VQFN-HR - 0.9 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

## EXAMPLE BOARD LAYOUT

**RNF0026C**

### VQFN-HR - 0.9 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

4223207/B 04/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

## EXAMPLE STENCIL DESIGN

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
