

SN65HVD233-HT 3.3-V CAN Transceiver

1 Features

- Bus-Pin Fault Protection Exceeds ± 36 V
- Bus-Pin ESD Protection Exceeds 16-kV Human Body Model (HBM)
- Compatible With ISO 11898
- Signaling Rates⁽¹⁾ up to 1 Mbps
- Extended -7 -V to 12 -V Common-Mode Range
- High-Input Impedance Allows for 120 Nodes
- LVTTTL I/Os Are 5-V Tolerant
- Adjustable Driver Transition Times for Improved Signal Quality
- Unpowered Node Does Not Disturb the Bus
- Low-Current Standby Mode: 200 μ A Typical
- Power-Up and Power-Down Glitch-Free Bus Inputs and Outputs
 - High-Input Impedance With Low V_{CC}
 - Monolithic Output During Power Cycling
- Loopback for Diagnostic Functions Available
- DeviceNet™ Vendor ID #806

(1) The signaling rate of a line is the number of voltage transitions that are made per second expressed in the units bps (bits per second).

2 Applications

- Down-Hole Drilling
- High-Temperature Environments
- Industrial Automation
 - DeviceNet Data Buses
 - Smart Distributed Systems (SDS™)
- SAE J1939 Data Bus Interfaces
- NMEA 2000 Data Bus Interfaces
- ISO 11783 Data Bus Interfaces
- CAN Data Bus Interfaces
- Controlled Baseline
- One Assembly or Test Site
- One Fabrication Site
- Available in Extreme (-55°C to 210°C) Temperature Range⁽¹⁾
- Extended Product Life Cycle
- Extended Product-Change Notification
- Product Traceability
- Texas Instruments high-temperature products use highly optimized silicon (die) solutions with design and process enhancements to maximize performance over extended temperatures.

(1) Custom temperature ranges available

3 Description

The SN65HVD233 is used in applications employing the controller area network (CAN) serial communication physical layer in accordance with the ISO 11898 standard, with the exception that the thermal shutdown is removed. As a CAN transceiver, the device provides transmit and receive capability between the differential CAN bus and a CAN controller, with signaling rates up to 1 Mbps.

Designed for operation in especially harsh environments, the device features cross wire, overvoltage, and loss-of-ground protection to ± 36 V, with common-mode transient protection of ± 100 V. This device operates over a -7 -V to 12 -V common-mode range with a maximum of 60 nodes on a bus.

If the common-mode range is restricted to the ISO 11898 standard range of -2 V to 7 V, up to 120 nodes may be connected on a bus. This transceiver interfaces the single-ended CAN controller with the differential CAN bus found in industrial, building automation, and automotive applications.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
SN65HVD233-HT	SOIC (8)	4.90 mm x 3.91 mm
	CFP-HKJ (8)	6.90 mm x 5.65 mm
	CFP-HKQ (8)	6.90 mm x 5.65 mm
	CDIP SB (8)	40.64 mm x 10.04 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

5 Description (Continued)

R_S (pin 8) provides for three modes of operation: high-speed, slope control, or low-power standby mode. The high-speed mode of operation is selected by connecting R_S directly to ground, thus allowing the driver output transistors to switch on and off as fast as possible with no limitation on the rise and fall slope. The rise and fall slope can be adjusted by connecting a resistor to ground at R_S , because the slope is proportional to the output current of the pin. Slope control is implemented with a resistor value of 10 k Ω to achieve a slew rate of ≈ 15 V/ μ s, and a value of 100 k Ω to achieve ≈ 2 V/ μ s slew rate. For more information about slope control, refer to the [Application and Implementation](#) section.

The SN65HVD233 enters a low-current standby mode, during which the driver is switched off and the receiver remains active if a high logic level is applied to R_S . The local protocol controller reverses this low-current standby mode when it needs to transmit to the bus.

A logic high on the loopback (LBK, pin 5) of the SN65HVD233 places the bus output and bus input in a high-impedance state. The remaining circuit remains active and available for the driver to receiver loopback, self-diagnostic node functions without disturbing the bus.

Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	D	I	CAN Transmit Data input (Low for dominant and HIGH for recessive bus states)
2	GND	Power	Ground connection
3	VCC	Power	VCC
4	R	O	CAN Receive data output
5	LBK	I	LoopBack (Active high to enable controller loopback mode)
6	CANL	I/O	Low level CAN bus line
7	CANH	I/O	High level CAN bus line
8	Rs	I	High Speed, Slope control, and standby enable mode input.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage range	–0.3	7	V
	Voltage range at any bus terminal (CANH or CANL)	–36	36	V
	Voltage input range, transient pulse (CANH and CANL) through 100 Ω (see Figure 19)	–100	100	V
V _I	Input voltage range (D, R, R _S , LBK)	–0.5	7	V
I _O	Receiver output current	–10	10	mA
T _{stg}	Storage temperature	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.

7.2 ESD Ratings

				VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	CANH, CANL, and GND	±16000	V
			All pins	±3000	
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾		±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

T_A = –55°C to 210°C

			MIN	MAX	UNIT
V _{CC}	Supply voltage		3	3.6	V
	Voltage at any bus terminal (separately or common mode)		–7	12	V
V _{IH}	High-level input voltage	D, LBK	2	5.5	V
V _{IL}	Low-level input voltage	D, LBK	0	0.8	V
V _{ID}	Differential input voltage		–6	6	V
	Resistance from R _S to ground		0	100	kΩ
V _{I(RS)}	Input voltage at R _S for standby		0.75 V _{CC}	5.5	V
I _{OH}	High-level output current	Driver	–50		mA
		Receiver	–10		
I _{OL}	Low-level output current	Driver		50	mA
		Receiver		10	
T _J	Operating junction temperature			212	°C
T _A	Operating free-air temperature ⁽¹⁾		–55	210	°C

- (1) Maximum free-air temperature operation is allowed as long as the device maximum junction temperature is not exceeded.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		SN65HVD233-HT			UNIT
		D	HJK/HKQ	JDJ	
		8 PINS	8 PINS	8 PINS

9 Detailed Description

9.1 Overview

Controller Area Network (CAN) is a robust multi master-master, differential signaling, serial communications bus specified by the ISO 11898 family of standards. TI's SSN65HVD23x family of transceivers solve specialized networking requirements for various applications.

Table 2. Available Options

ORDERABLE PART NUMBER	LOW-POWER MODE	SLOPE CONTROL	DIAGNOSTIC LOOPBACK	AUTOBAUD LOOPBACK
SN65HVD233HD	200- μ A standby mode	Adjustable	Yes	No

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 ISO 11898 Compliance of SN65HVD23x Family of 3.3-V CAN Transceivers

Many users value the low power consumption of operating CAN transceivers from a 3.3-V supply. However, some are concerned about the interoperability with 5-V supplied transceivers on the same bus. This section analyzes this situation to address those concerns.

9.3.1.1 Differential Signal

CAN is a differential bus where complementary signals are sent over two wires, and the voltage difference between the two wires defines the logical state of the bus. The differential CAN receiver monitors this voltage difference and outputs the bus state with a single-ended output signal.

Feature Description (continued)

Figure 26. Typical SN65HVD23x Differential Output Voltage Waveform

The CAN driver creates the difference voltage between CANH and CANL in the dominant state. The dominant differential output of the SN65HVD23x is greater than 1.5 V and less than 3 V across a 60-Ω load. The minimum required by ISO 11898 is 1.5 V and the maximum is 3 V. These are the same limiting values for 5-V supplied CAN transceivers. The bus termination resistors drive the recessive bus state and not the CAN driver.

A CAN receiver is required to output a recessive state with less than 500 mV and a dominant state with more than 900-mV difference voltage on its bus inputs. The CAN receiver must do this with common-mode input voltages from –2 V to 7 V. The SN65HVD23x family receivers meet these same input specifications as 5-V supplied receivers.

9.3.1.1.1 Common-Mode Signal

A common-mode signal is an average voltage of the two signal wires that the differential receiver rejects. The common-mode signal comes from the CAN driver, ground noise, and coupled bus noise. Obviously, the supply voltage of the CAN transceiver has nothing to do with noise. The SN65HVD23x family driver lowers the common-mode output in a dominant bit by a couple hundred millivolts from that of most 5-V drivers. While this does not fully comply with ISO 11898, this small variation in the driver common-mode output is rejected by differential receivers and does not affect data, signal noise margins, or error rates.

9.3.1.2 Interoperability Of 3.3-V CAN in 5-V CAN Systems

The 3.3-V-supplied SN65HVD23x family of CAN transceivers are electrically interchangeable with 5-V CAN transceivers. The differential output is the same. The recessive common-mode output is the same. The dominant common-mode output voltage is a couple hundred millivolts lower than 5-V-supplied drivers, while the receivers exhibit identical specifications as 5-V devices.

Electrical interoperability does not assure interchangeability however. Most implementers of CAN buses recognize that ISO 11898 does not sufficiently specify the electrical layer and that strict standard compliance alone does not ensure interchangeability. This comes only with thorough equipment testing.

9.4 Device Functional Modes

9.4.1 Function Tables

Table 3. Function Table (Driver)⁽¹⁾

DRIVER					
INPUTS			OUTPUTS		
D	LBK	R _s	CANH	CANL	BUS STATE
X	X	$>0.75 V_{CC}$	Z	Z	Recessive
L	L or open	$\leq 0.33 V_{CC}$	H	L	Dominant
H or open	X		Z	Z	Recessive
X	H	$\leq 0.33 V_{CC}$	Z	Z	Recessive

(1) H = high level, L = low level, Z = high impedance, X = irrelevant, ? = indeterminate

Table 4. Function Table (Receiver)

RECEIVER				
INPUTS				OUTPUT
BUS STATE	$V_{ID} = V_{(CANH)} - V_{(CANL)}$	LBK	D	R
Dominant	$V_{ID} \geq 0.9 V$	L or open	X	L
Recessive	$V_{ID} \leq 0.5 V$ or open	L or open	H or open	H
?	$0.5 V < V_{ID} < 0.9 V$	L or open	H or open	
X	X	H	L	L
X	X		H	H

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

10.1.1 Diagnostic Loopback

The loopback (LBK) function of the SN65HVD233 is enabled with a high-level input to pin 5. This forces the driver into a recessive state and redirects the data (D) input at pin 1 to the received-data (R) output at pin 4. This allows the host controller to input and read back a bit sequence to perform diagnostic routines without disturbing the CAN bus. A typical CAN bus application is displayed in [Figure 34](#).

If the LBK pin is not used, it may be tied to ground (GND). However, it is pulled low internally (defaults to a low-level input) and may be left open if not in use.

10.2 Typical Application

Figure 34. Typical SN65HVD233 Application

10.2.1 Design Requirements

The High-Speed ISO 11898 Standard specifications are given for a maximum signaling rate of 1 Mbps with a bus length of 40 m and a maximum of 30 nodes. It also recommends a maximum un-terminated stub length of 0.3 m. The cable is specified to be a shielded or unshielded twisted-pair with a 120-Ω characteristic impedance (Z₀). The Standard defines a single line of twisted-pair cable with the network topology as shown in [Figure 34](#). It is terminated at both ends with 120-Ω resistors, which match the characteristic impedance of the line to prevent signal reflections. According to ISO 11898, placing RL on a node should be avoided because the bus lines lose termination if the node is disconnected from the bus.

Typical Application (continued)

10.2.2 Detailed Design Procedure

Table 5. Suggested Cable Length vs Signaling Rate

BUS LENGTH (m)	SIGNALING RATE (Mbps)
40	1
100	0.5
200	0.25
500	0.10
1000	0.05

Basically, the maximum bus length is determined by, or rather is a trade-off with the selected signaling rate as listed in [Table 5](#).

A signaling rate decreases as transmission distance increases. While steady-state losses may become a factor at the longest transmission distances, the major factors limiting signaling rate as distance is increased are time varying. Cable bandwidth limitations, which degrade the signal transition time and introduce inter-symbol interference (ISI), are primary factors reducing the achievable signaling rate when transmission distance is increased.

For a CAN bus, the signaling rate is also determined from the total system delay – down and back between the two most distant nodes of a system and the sum of the delays into and out of the nodes on a bus with the typical 5ns/m prop delay of a twisted-pair cable. Also, consideration must be given the signal amplitude loss due to resistance of the cable and the input resistance of the transceivers. Under strict analysis, skin effects, proximity to other circuitry, dielectric loss, and radiation loss effects all act to influence the primary line parameters and degrade the signal.

A conservative rule of thumb for bus lengths over 100 m is derived from the product of the signaling rate in Mbps and the bus length in meters, which should be less than or equal to 50.

Signaling Rate (Mbps) × Bus Length (m) ≤ 50. Operation at extreme temperatures should employ additional conservatism.

10.2.2.1 Slope Control

The rise and fall slope of the SN65HVD233 driver output can be adjusted by connecting a resistor from R_s (pin 8) to ground (GND), or to a low-level input voltage (see [Figure 35](#)).

The slope of the driver output signal is proportional to the output current of the pin. This slope control is implemented with an external resistor value of 10 kΩ to achieve a ± 15 -V/μs slew rate, and up to 100 kΩ to achieve a ± 2.0 -V/μs slew rate (see [Figure 36](#)). Typical driver output waveforms with slope control are displayed in [Figure 37](#).

Figure 35. Slope Control/Standby Connection to DSP

10.2.2.2 Standby

If a high-level input ($>0.75 V_{CC}$) is applied to R_s , the circuit enters a low-current, *listen-only* standby mode, during which the driver is switched off and the receiver remains active. The local controller can reverse this low-power standby mode when the rising edge of a dominant state (bus differential voltage >900 mV typical) occurs on the bus.

10.2.3 Application Curves

Figure 36. SN65HVD233 Driver Output Signal Slope vs Slope Control Resistance Value

Figure 37. Typical SN65HVD233 250-kbps Output Pulse Waveforms With Slope Control

11 Power Supply Recommendations

TI recommend to have localized capacitive decoupling near device VCC pin to GND. Values of 4.7 μ F at VCC pin and 10 μ F, 1 μ F, and 0.1 μ F at supply have tested well on evaluation modules.

12 Layout

12.1 Layout Guidelines

Minimize stub length from node insertion to bus.

12.2 Layout Example

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
