SN65MLVD047A 多点 LVDS 四路差分线路驱动器

1 特性

- 差分线路驱动器支持 30Ω 至 55Ω 负载和高达 200Mbps 的数据速率，[1] 时钟频率高达 100MHz
- 支持多点总线架构
- 由 3.3V 单电源供电运行
- 额定运行温度范围为 –40°C 至 85°C
- 16 引脚 SOIC (JEDEC MS-012) 和 16 引脚 TSSOP (JEDEC MS-153) 封装

2 应用

- AdvancedTCA™ (ATCA™) 时钟总线驱动器
- 时钟分配
- 电信、汽车、工业以及其他计算机系统中的背板或有线多点数据传输
- 蜂窝基站
- 中心局交换和 PBX 交换
- 桥接器和路由器
- 符合 TIA/EIA-485 标准的低功耗、高速短距离替代方案

3 说明

SN65MLVD047A 是一款四路线路驱动器，符合 TIA/EIA-899 标准中的多点低电压差分信号 (M–LVDS) 电气特性。与符合 LVDS 标准的器件相比，此 M–LVDS 器件的输出电流有所增加，以便支持双端接传输线和重负载的背板总线应用。背板应用通常需要在总线两端使用阻抗匹配的端接电阻器。由于总线端接以及总线接口器件的容性负载，双端接总线的有效阻抗可低至 30Ω。SN65MLVD047A 驱动器支持在低至 30Ω 的负载下运行。SN65MLVD047A 器件允许在一条总线上存在多个驱动器。SN65MLVD047A 驱动器在禁用或未上电时保持高阻抗。驱动器融合了边沿速率控制功能以支持运行。当从主传输线到接口器件预期有多个总线存根时，M–LVDS 标准允许多达 32 个节点（驱动器和/或接收器）连接到背板中的同一介质。SN65MLVD047A 在所有总线引脚上提供 9kV ESD 保护。

8 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Synchroization Clock in AdvancedTCA

Advanced Telecommunications Computing Architecture, also known as AdvancedTCA, is an open architecture to meet the needs of the rapidly changing communications network infrastructure. M−LVDS bused clocking is recommended by the ATCA.

The ATCA specification includes requirements for three redundant clock signals. An 8KHz and a 19.44MHz clock signal as well as an user-defined clock signal are included in the specification. The SN65MLVD047A quad driver supports distribution of these three ATCA clock signals, supporting operation beyond 100MHz, which is the highest clock frequency included in the ATCA specification. A pair of SN65MLVD047A devices can be used to support the ATCA redundancy requirements.

8.1.2 Multipoint Configuration

The SN65MLVD047A is designed to meet or exceed the requirement of the TIA/EIA−899 (M−LVDS) standard, which allows multipoint communication on a shared bus.

Multipoint is a bus configuration with multiple drivers and receivers present. An example is shown in 图 8-1. The figure shows transceivers interfacing to the bus, but a combination of drivers, receivers, and transceivers is also possible. Termination resistors need to be placed on each end of the bus, with the termination resistor value matched to the loaded bus impedance.

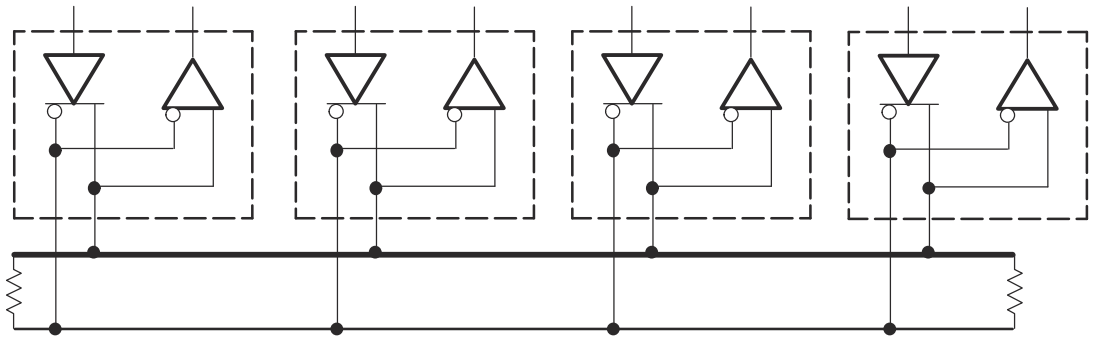

图 8-1. Multipoint Architecture

8.1.3 Multidrop Configuration

Multidrop configuration is similar to multipoint configuration, but only one driver is present on the bus. A multidrop system can be configured with the driver at one end of the bus, or in the middle of the bus. When a driver is located at one end, a single termination resistor is located at the far end, close to the last receiver on the bus. Alternatively, the driver can be located in the middle of the bus, to reduce the maximum flight time. With a centrally located driver, termination resistors are located at each end of the bus. In both cases, the termination resistor value should be matched to the loaded bus impedance. 图 8-2 shows examples of both cases.

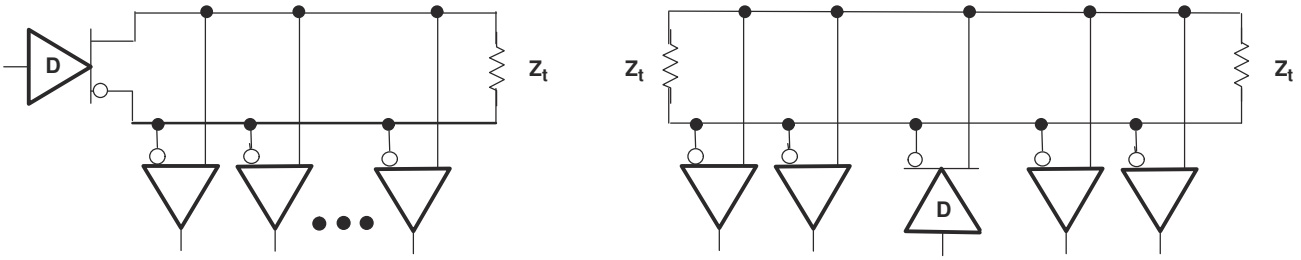

图 8-2. Multidrop Architectures With Different Driver Locations

8.1.4 Unused Channel

A 360kΩ pull-down resistor is built in every LVTTL input. The unused driver inputs should be left floating or connected to ground. The low-level output of an unused enabled driver can oscillate if left floating, and should be connected to ground. If the input is floating or connected to ground, the unused Y (non-inverting) output of an enabled driver should be connected to ground. The unused Z (inverting) should be left floating

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

9.4 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
