OCTAL TRANSCEIVER WITH PARITY GENERATOR/CHECKER AND 3-STATE OUTPUTS

SDFS027A – D3217, JANUARY 1989 – REVISED OCTOBER 1993

- Combines 'F245 and 'F280B Functions in One Package
- High-Impedance N-P-N Inputs for Reduced Loading (70 μ A in Low and High States)
- High Output Drive and Light Bus Loading
- 3-State B Outputs Sink 64 mA and Source 15 mA
- Input Diodes for Termination Effects
- Package Options Include Plastic Small-Outline Packages and Standard Plastic 300-mil DIPs

description

The SN74F657 contains eight noninverting buffers with 3-state outputs and an 8-bit parity generator/checker. It is intended for bus-oriented applications. The buffers have a specified current sinking capability of 24 mA at the A port and 64 mA at the B port.

The transmit/receive ($\overline{T/R}$) input determines the direction of the data flow through the bidirectional transceivers. When $\overline{T/R}$ is high, data is transmitted from the A port to the B port. When $\overline{T/R}$ is low, data is received at the A port from the B port.

When the output enable ($\overline{OE}$) input is high, both the A and B ports are placed in a high-impedance state (disabled). The $\overline{ODD/EVEN}$ input allows the user to select between odd or even parity systems. When transmitting from A port to B port ($\overline{T/R}$ high), PARITY is an output from the generator/checker. When receiving from B port to A port ($\overline{T/R}$ low), PARITY is an input.

When transmitting ($\overline{T/R}$ high), the parity select ($\overline{ODD/EVEN}$) input is made high or low as appropriate. The A port is then polled to determine the number of high bits. The PARITY output goes to the logic state determined by $\overline{ODD/EVEN}$ and the number of high bits on A port. When $\overline{ODD/EVEN}$ is low (for even parity) and the number of high bits on A port is odd, the PARITY will be high, transmitting even parity. If the number of high bits on A port is even, the PARITY will be low, keeping even parity.

When in the receive mode ($\overline{T/R}$ low), the B port is polled to determine the number of high bits. If $\overline{ODD/EVEN}$ is low (for even parity) and the number of highs on B port is:

1. Odd and the PARITY input is high, then $\overline{ERR}$ will be high signifying no error.
2. Even and the PARITY input is high, then $\overline{ERR}$ will be low indicating an error.

The SN74F657 is characterized for operation from 0°C to 70°C.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage range, V_{CC}	–0.5 V to 7 V
Input voltage range, V_I (excluding I/O ports) (see Note 1)	–1.2 V to 7 V
Input current range	–30 mA to 5 mA
Voltage range applied to any output in the disabled or power-off state	–0.5 V to 5.5 V
Voltage range applied to any output in the high state	–0.5 V to V_{CC}
Current into any output in the low state: A1–A8	48 mA
B1–B8	128 mA
Operating free-air temperature range	0°C to 70°C
Storage temperature range	–65°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: The input-voltage ratings may be exceeded provided the input-current ratings are observed.

[†] For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

[‡] These delay times reflect the 3-state recovery time only and not the signal through the buffers or parity check circuitry. To assure valid information at the $\overline{\text{ERR}}$ output pin, time must be allowed for the signal to propagate through the drivers (B to A), and to the $\overline{\text{ERR}}$ output. Valid data at the $\overline{\text{ERR}}$ output is greater than or equal to (B to A) + (A to PARITY).

NOTE 2: Load circuits and waveforms are shown in Section 1.

- (1) **Status:** For more details on status, see our [product life cycle](#).
- (2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- (3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.
- (4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
