THVD1454 具有集成 120Ω 可切换终端和压摆率控制功能的 3V 至 5.5V 半双工 RS-485 收发器

1 特性

- 符合或超出 TIA/EIA-485A 标准要求
- 3V 至 5.5V 电源电压
- 差分输出超过 2.1V，在 5V 电源下与 PROFIBUS 兼容
- 半双工 RS-422/RS-485
- 总线引脚之间的引脚控制片上 120Ω 端接电阻
- 最大数据速率可配置
  - SLR = 高：500kbps
  - SLR = 低电平或悬空：20Mbps
- 总线 I/O 保护
  - ±16kV HBM ESD
  - ±8kV IEC 61000-4-2 接触放电
  - ±15kV IEC 61000-4-2 空气间隙放电
  - ±4kV IEC 61000-4-4 快速瞬变脉冲
  - ±16V 总线故障保护（总线引脚上的绝对最大电压）
- 工业级工作温度范围：-40°C 至 125°C
- 低功耗
  - 关断电源电流 < 5µA
  - 运行期间静态电流 < 3mA
- 适用于热插拔功能的无干扰上电/断电
- 开路、短路和空闲总线失效防护
- 1/8 单位负载（多达 256 个总线节点）
- 节省空间的小型高效散热型 10 引脚 VSON 封装 (3mm x 3mm)

2 应用

- 工厂自动化与控制
- 楼宇自动化
- 电机驱动
- 电力输送
- 工业运输
- HVAC 系统
- 智能电表

3 说明

THVD1454 是一款适用于工业应用的灵活半双工 RS-485 收发器。该器件具有片上 120Ω 端接电阻器和驱动器输出压摆率控制等功能。这两个特性均由引脚控制。这使得该器件可以在任何网络中的任何节点位置（末端节点或中间节点）使用，无论是慢速还是快速。终端设备设计人员现在可以设计通用印刷电路板 (PCB)，并使用软件配置 PCB 来满足各种应用需求。这可以为客户节省设计和鉴定时间。

这些总线引脚可耐受高级别的 IEC 接触放电 ESD 事件，因此无需使用其他系统级保护元件。这些器件由 3V 至 5.5V 单电源供电。总线引脚具备宽共模电压范围和低输入泄漏，从而使这些器件适用于长线缆上的多点应用。

THVD1454 采用节省空间的高效散热型 10 引脚 VSON 封装 (3mm x 3mm)。该器件的额定温度范围为 -40°C 至 125°C。

封装信息

器件型号	封装(1)	封装尺寸(2)
THVD1454	VSON (10)	3mm x 3mm

(1) 如需完整的器件型号，请参阅数据表末尾的可订购产品附录。
(2) 封装尺寸（长 × 宽）为标称值，并包括引脚（如适用）。

5 Pin Configuration and Functions

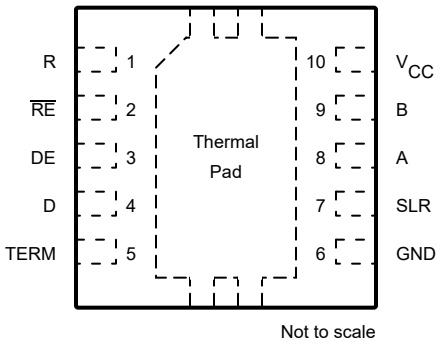

图 5-1. VSON (DRC) Package, 10-Pins (Top View)

表 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
R	1	Digital output	Logic output RS-485 data
$\overline{RE}$	2	Digital input	Receiver enable/disable. Internal pull-up. Receiver disabled by default
DE	3	Digital input	Driver enable/disable. Internal pull-down. Driver disabled by default
D	4	Digital input	Logic input RS485 data. Internal pull-up. Drives the bus high by default if driver is enabled
TERM	5	Digital input	120 Ω on-chip termination control for A/B pins. Internal pull-down. Termination across A/B is disabled by default
GND	6	GND	Ground
SLR	7	Digital input	Slew rate control. Internal pull-down, default 20 Mbps operation. Logic high SLR enables slow speed (500 kbps)
A	8	Bus input/output	RS-485 bus pin. This pin is non-inverting driver output or non-inverting receiver input
B	9	Bus input/output	RS-485 bus pin. This pin is inverting driver output or inverting receiver input
V_{CC}	10	Power	3 V to 5.5 V supply
Thermal Pad		--	Connect to GND for optimal thermal and electrical performance

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1) (2)

		MIN	MAX	UNIT
Supply voltage	V_{CC}	– 0.5	7	V
Bus voltage	Voltage at any bus pin (A or B) with respect to GND	– 16	16	V
Differential bus voltage	(A-B) or (B-A) with termination enabled	-6	6	V
Input voltage	Range at any logic pin (D, DE, SLR, TERM, or $\overline{RE}$)	– 0.3	5.7	V
Receiver output current	I_O	– 24	24	mA
Storage temperature	T_{stg}	– 65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) All voltage values, except differential I/O bus voltages, are with respect to ground terminal.

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	Bus terminals (A, B) and GND	±16,000	V
			All pins except bus terminals and GND	±4,000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)		±1,500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 ESD Ratings [IEC]

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge, on chip termination ON or OFF	Contact discharge, per IEC 61000-4-2	Bus terminals and GND	±8,000	V
		Air-gap discharge, per IEC 61000-4-2	Bus terminals and GND	±15,000	
$V_{(EFT)}$	Electrical fast transient	Per IEC 61000-4-4	Bus terminals	±4,000	V

6.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage		3		5.5	V
V_I	Input voltage at any bus terminal (separately or common mode)(1)		-7		12	V
V_{IH}	High-level input voltage (D, DE, $\overline{RE}$, TERM, SLR inputs)		2		5.5	V
V_{IL}	Low-level input voltage (D, DE, $\overline{RE}$, TERM, SLR inputs)		0		0.8	V
I_O	Output current, driver		-60		60	mA
I_{OR}	Output current, receiver		-8		8	mA
R_L	Differential load resistance		54	60		Ω
$1/t_{UI}$	Signaling rate	SLR = V_{IO}			500	kbps
		SLR = GND or floating			20	Mbps
T_A (2)	Operating ambient temperature		-40		125	°C
T_J (2)	Junction temperature		-40		150	°C

(1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.
(2) Operation is specified for internal (junction) temperatures upto 150°C. Self-heating due to internal power dissipation should be considered for each application. Maximum junction temperature is internally limited by the thermal shut-down (TSD) circuit which disables the driver outputs when the junction temperature reaches typical 170°C.

6.5 Thermal Information

THERMAL METRIC(1)		THVD1454 DRC (VSON) 10 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	48.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	54	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	21.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.1	°C/W
ψ_{JB}	Junction-to-board characterization parameter	21.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	6.7	°C/W

(1) For more information about traditional and new thermalmetrics, see the *Semiconductor and ICPackage Thermal Metrics* application report.

6.6 Power Dissipation

PARAMETER		TEST CONDITIONS			Typical	Max	UNIT
P_D	Driver and receiver enabled, V_{CC} = 5.5 V, T_A = 125 °C, D = square wave 50% duty	Unterminated, TERM = L	SLR = H	500 kbps	185	210	mW
			SLR = L	20Mbps	310	340	
		TERM = H, With 120 Ω load between A/B inputs	SLR = H	500 kbps	316	360	mW
			SLR = L	20Mbps	396	430	

6.7 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted). All typical values are at 25°C and supply voltage of V_{CC} = 5 V , unless otherwise noted.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
Driver							
$\|V_{OD}\|$	Driver differential output voltage magnitude	R_L = 60 Ω , – 7 V ≤ V_{test} ≤ 12 V (See 图 7-1)		1.5	3.3		V
		R_L = 60 Ω , – 7 V ≤ V_{test} ≤ 12 V, 4.5 V ≤ V_{CC} ≤ 5.5 V (See 图 7-1)		2.1	3.3		V
		R_L = 100 Ω (See 图 7-2)		2	4		V
		R_L = 54 Ω , 4.5 V ≤ V_{CC} ≤ 5.5 V (See 图 7-2)		2.1	3.3		V
		R_L = 54 Ω (See 图 7-2)		1.5	3.3		V
$\Delta\|V_{OD}\|$	Change in magnitude of differential output voltage	R_L = 54 Ω or 100 Ω (See 图 7-2)		– 50		50	mV
V_{OC}	Common-mode output voltage	R_L = 54 Ω or 100 Ω (See 图 7-2)			V_{CC}/2	3	V
$\Delta V_{OC(SS)}$	Change in steady-state common-mode output voltage	R_L = 54 Ω or 100 Ω (See 图 7-2)		– 50		50	mV
I_{OS}	Short-circuit output current	DE = V_{IO}, -7 V ≤ (V_A or V_B) ≤ 12 V, or A shorted to B		– 250		250	mA
Receiver							
I_I	Bus input current (termination disabled)	DE = 0 V, V_{CC} = 0 V or 5.5 V	V_I = 12 V		85	110	μA
			V_I = – 7 V	– 100	– 70		μA
I_{RXT}	Receiver bus input leakage current with termination enabled	DE = 0 V, V_{CC} = 5.5 V, TERM = V_{CC}	V_I = - 7 to 12 V	-300		300	μA
V_{TH+}	Positive-going input threshold voltage(1)	Over common-mode range of - 7 V to 12 V			- 85	- 45	mV
V_{TH-}	Negative-going input threshold voltage(1)			– 200	– 150		mV
V_{HYS}	Input hysteresis			30	50		mV
$C_{A,B}$	Input differential capacitance	Measured between A and B, f = 1 MHz			20		pF
V_{OH}	Output high voltage	I_{OH} = – 8 mA		V_{CC} – 0.4	V_{CC} – 0.2		V
V_{OL}	Output low voltage	I_{OL} = 8 mA			0.2	0.4	V
I_{OZ}	Output high-impedance current, R pin	V_O = 0 V or V_{CC}, $\overline{RE}$ = V_{CC}		– 2		2	μA
Logic							
I_{IN}	Input current (D, $\overline{RE}$, DE , SLR, TERM)	3 V ≤ V_{CC} ≤ 5.5 V, 0 V ≤ V_{IN} ≤ V_{CC}		-5		5	μA
Thermal Protection							
T_{SHDN}	Thermal shutdown threshold	Temperature rising		150	170		°C
T_{HYS}	Thermal shutdown hysteresis				15		°C
Supply							
UV_{VCC} (rising)	Rising under-voltage threshold on V_{CC}				2.5	2.7	V
UV_{VCC} (falling)	Falling under-voltage threshold on V_{CC}			2	2.1		V
$UV_{VCC(hys)}$	Hysteresis on under-voltage of V_{CC}				400		mV

6.7 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted). All typical values are at 25°C and supply voltage of V_{CC} = 5 V , unless otherwise noted.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I_{CC}	Supply current (quiescent), V_{CC} = 4.5 V to 5.5 V, TERM = Floating or low, SLR = X	Driver and receiver enabled	$\overline{RE}$ = 0 V, DE = V_{CC}, No load		1.5	3	mA
		Driver enabled, receiver disabled	$\overline{RE}$ = V_{CC}, DE = V_{CC}, No load		1.3	2.5	mA
		Driver disabled, receiver enabled	$\overline{RE}$ = 0 V, DE = 0 V, No load		0.8	1.2	mA
		Driver and receiver disabled	$\overline{RE}$ = V_{CC}, DE = 0 V, D = open, No load		0.2	8	µA
I_{CC}	Supply current (quiescent), V_{CC} = 3 V to 3.6 V, TERM = Floating or low, SLR = X	Driver and receiver enabled	$\overline{RE}$ = 0 V, DE = V_{CC}, No load		1.4	2	mA

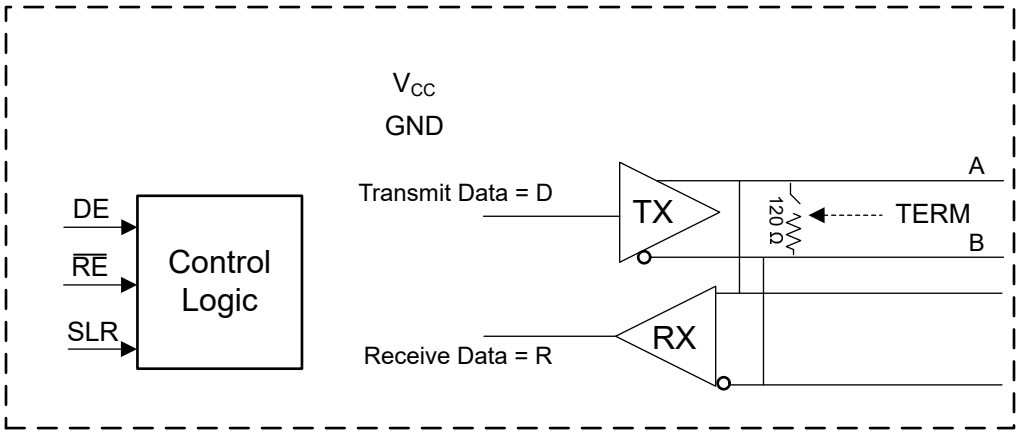
8 Detailed Description

8.1 Overview

The THVD1454 is a flexible half duplex RS-485 transceiver. The device has slew rate control pin SLR which can be used to set the device in maximum 20 Mbps mode or slew rate limited 500 kbps mode. THVD1454 also has on-chip 120 Ω termination resistor across bus terminals A/B which is controlled using TERM pin.

8.2 Functional Block Diagrams



8.3 Feature Description

The THVD1454 operates from 3 V to 5.5 V bus supply. Internal ESD protection circuits on bus pins protect the transceiver against Electrostatic Discharges (ESD) according to IEC 61000-4-2 of up to ±8 kV (Contact Discharge), ±15 kV (Air Gap Discharge) and against electrical fast transients (EFT) according to IEC 61000-4-4 of up to ±4 kV.

8.4 Device Functional Modes

When the driver enable pin, DE, is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this condition, the differential output voltage defined as $V_{OD} = V_A - V_B$ is positive. When D is low, the output states reverse, B turns high, A becomes low, and V_{OD} is negative.

When DE is low, both outputs turn high-impedance. In this condition, the logic state at D is irrelevant. The DE pin has an internal pull-down resistor to ground; thus, when left open, the driver is disabled (high-impedance) by default. The D pin has an internal pull-up resistor to V_{CC}, thus, when left open while the driver is enabled, output A turns high and B turns low.

表 8-1. Driver Function Table

INPUT	ENABLE	OUTPUTS		FUNCTION
D	DE	A	B	
H	H	H	L	Actively drive bus high
L	H	L	H	Actively drive bus low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drive bus high by default

When the receiver enable pin, $\overline{RE}$, is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_A - V_B$ is positive and higher than the positive input threshold, V_{TH+}, the receiver output, R, turns high. When V_{ID} is negative and lower than the negative input threshold, V_{TH-}, the receiver output, R, turns low. If V_{ID} is between V_{TH+} and V_{TH-} the output is indeterminate.

When $\overline{RE}$ is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go fail safe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

表 8-2. Receiver Function Table

DIFFERENTIAL INPUT	ENABLE	OUTPUT	FUNCTION
$V_{ID} = V_A - V_B$	$\overline{RE}$	R	
$V_{TH+} < V_{ID}$	L	H	Receive valid bus high
$V_{TH-} < V_{ID} < V_{TH+}$	L	?	Indeterminate bus state
$V_{ID} < V_{TH-}$	L	L	Receive valid bus low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Fail-safe high output
Short-circuit bus	L	H	Fail-safe high output
Idle (terminated) bus	L	H	Fail-safe high output

8.4.1 On-Chip Switchable Termination

THVD1454 has integrated termination resistor of nominal 120 Ω across A/B bus terminals. Termination resistor is enabled or disabled using the TERM pin described in 表 8-3.

表 8-3. On-chip termination function table

Signal state	Function	Comments
TERM = V_{CC}	120 Ω enabled between A and B	
TERM = GND or floating	120 Ω disabled between A and B	Termination is disabled by default

On-chip 120 Ω termination resistor variation with temperature and across common mode voltage is shown in 图 8-1 and 图 8-2.

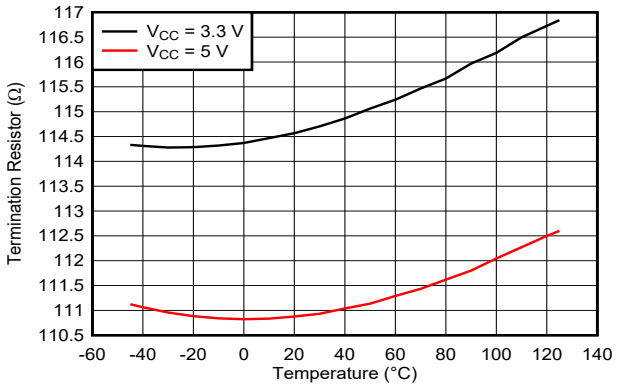


图 8-1. Termination Resistor vs Temperature

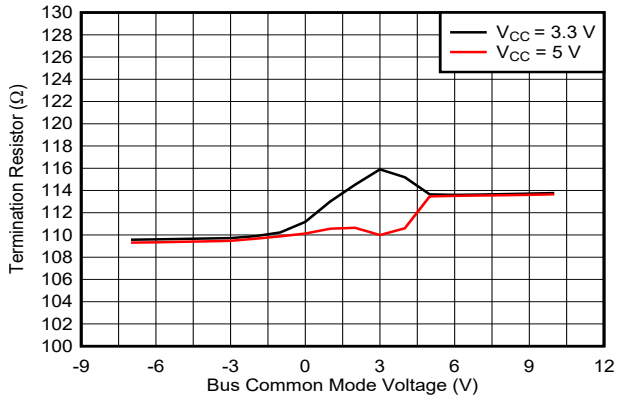

图 8-2. Termination Resistor vs Bus Common Mode voltage

THVD1454 on-chip termination resistor has been designed so the termination block offers a resistive load to the bus, and does not alter the magnitude or phase of the bus signals from DC to 20Mbps signaling. See 图 8-3 and 图 8-4 with the bus voltage swept from -6 V to +6 V. Current into the bus changes linearly in both conditions of termination ON or OFF.

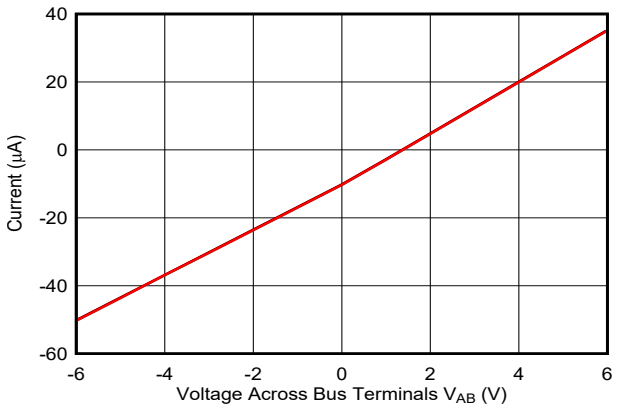

图 8-3. Voltage vs Current Across AB Bus Pins with Termination OFF

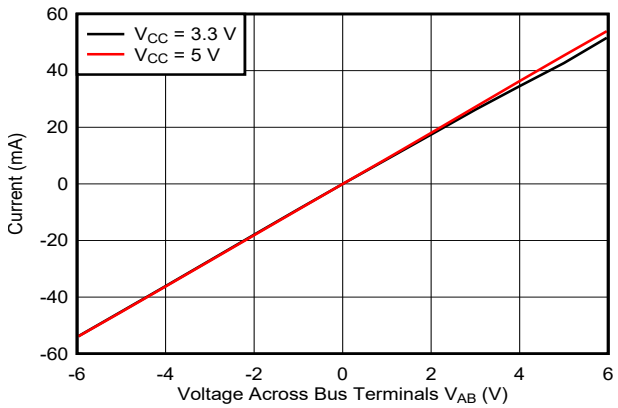

图 8-4. Voltage vs Current Across AB Bus Pins with Termination ON

8.4.2 Operational Data rate

THVD1454 can be used in slow speed or fast speed RS-485 networks by configuring Slew rate control (SLR) pin. 表 8-4 describes slew rate control function.

表 8-4. Slew rate control function table

Signal state	Driver	Receiver	Comment
SLR = V_{CC}	Maximum speed of operation = 500kbps	Maximum speed of operation = 500kbps	Active high slew rate limiting applied on driver output and glitch filter in receiver path enabled
SLR = GND or floating	Maximum speed of operation = 20Mbps	Maximum speed of operation = 20Mbps	Slew rate limiting on driver output disabled and glitch filter in receiver path disabled

Receiver path in the slow speed mode (500kbps) provides additional noise filtering. To attenuate noise frequency noise pulses from the bus which can be wrongly interpreted as valid data, SLR = V_{CC} enables a low pass filter to filter out pulses with frequency higher than typical 800 kHz.

8.4.3 Protection Features

THVD1454 has in-built protection features such as supply undervoltage, bus short circuit and thermal shutdown.

Supply undervoltage protection is present on V_{CC} supply. This maintains the bus output and receiver logic output in known driven state when the supply is above the rising undervoltage threshold. 表 8-5 describes the device behavior in various scenarios of supply levels.

表 8-5. Supply Function Table

V_{CC}	Driver Output	Receiver Output	Termination across bus pins AB
> $UV_{VCC(rising)}$	Determined by DE and D inputs	Determined by $\overline{RE}$ and A-B	Determined by TERM pin
< $UV_{VCC(falling)}$	High impedance	Undetermined	OFF

Bus terminals are protected against high voltage short circuit events up to ± 16 V. Additionally, bus short circuit current is limited to 250 mA. In events like bus contention when multiple drivers are driving the bus simultaneously, the current through the bus terminals is internally limited. If the power dissipation makes the junction temperature cross 150°C, thermal shutdown is activated which disables the driver and receiver and reduces the on-chip power dissipation. The device is enabled once the junction temperature falls by the thermal shutdown hysteresis as specified in electrical parameter section of the data sheet.

9 Application Information Disclaimer

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The THVD1454 is a flexible RS-485 transceiver used for asynchronous data transmissions. The driver and receiver enable pins, slew rate control, and termination control pins allow the device to be applicable for various point-to-point, multipoint or multidrop network configurations.

9.2 Typical Application

An RS-485 bus consists of multiple transceivers connecting in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor, R_T, whose value matches the characteristic impedance, Z_0, of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length. 图 9-1 shows two end nodes terminated, while remaining nodes unterminated. THVD1454 can be designed in all node designs. TERM pin allows configuring the nodes for end nodes and middle nodes in the network.

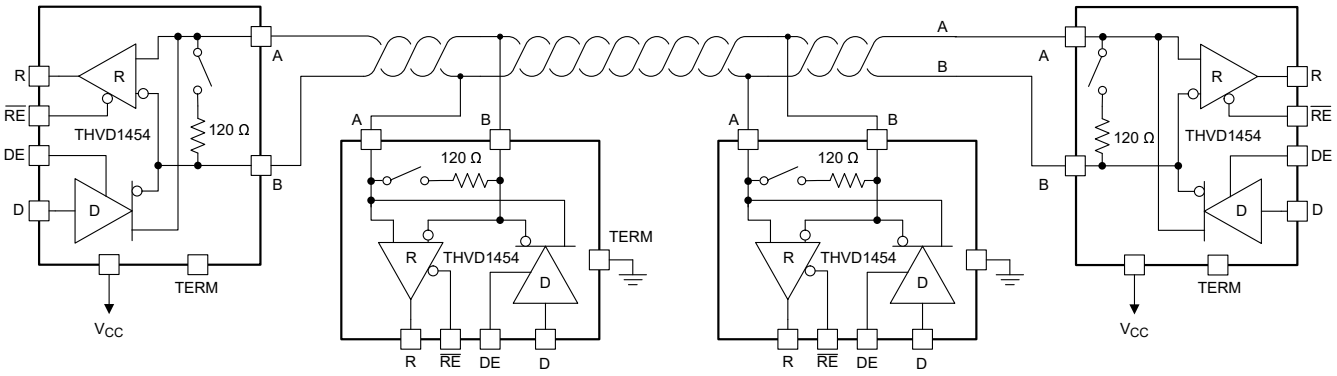

图 9-1. Typical Half Duplex RS-485 Network With all Nodes Using THVD1454

9.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

9.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and cable length, which means the higher the data rate, the shorter the cable length; and conversely, the lower the data rate, the longer the cable length. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 300 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5% or 10%.

9.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a non-terminated piece of bus line which can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in 方程式 1.

$$L_{(STUB)} \leqslant 0.1 \times t_r \times v \times c \quad (1)$$

where:

- t_r is the 10/90 rise time of the driver
- c is the speed of light (3×10^8 m/s)
- v is the signal velocity of the cable or trace as a factor of c

THVD1454 can be used in both slow speed and high speed networks with SLR pin configurability. Slew rate limiting makes the driver output rise or fall time slower so that stub lengths can be increased.

9.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to driver 32 unit loads (UL), where 1 unit load represents a load impedance of approximately 12 kΩ. Because the THVD1454 consists of 1/8 UL transceivers, connecting up to 256 transceivers to the bus is possible.

9.2.1.4 Receiver Failsafe

The differential receiver of the THVD1454 is *failsafe* to invalid bus states caused by the following:

- Open bus conditions, such as a disconnected connector
- Shorted bus conditions, such as cable damage shorting the twisted-pair together
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver outputs a failsafe logic high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the *input indeterminate* range does not include zero volts differential. To comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input V_{ID} is more positive than 200 mV, and must output a low when V_{ID} is more negative than –200 mV. The receiver parameters which determine the failsafe performance are V_{TH+}, V_{TH-}, and V_{HYS} (the separation between V_{TH+} and V_{TH-}). As shown in the 表 8-2, differential signals more negative than –200 mV always causes a low receiver output, and differential signals more positive than 200 mV always causes a high receiver output.

When the differential input signal is close to zero, it is still above the V_{TH+} threshold, and the receiver output is high. Only when the differential input is more than V_{HYS} below V_{TH+} does the receiver output transition to a low state. Therefore, the noise immunity of the receiver inputs during a bus fault conditions includes the receiver hysteresis value, V_{HYS}, as well as the value of V_{TH+}.

9.2.1.5 Transient Protection

The bus pins of the THVD1454 transceiver family include on-chip ESD protection against ±16-kV HBM and ±8-kV IEC 61000-4-2 contact discharge. The International Electrotechnical Commission (IEC) ESD test is far more severe than the HBM ESD test. The 50% higher charge capacitance, $C_{(S)}$, and 78% lower discharge resistance, $R_{(D)}$, of the IEC model produce significantly higher discharge currents than the HBM model.

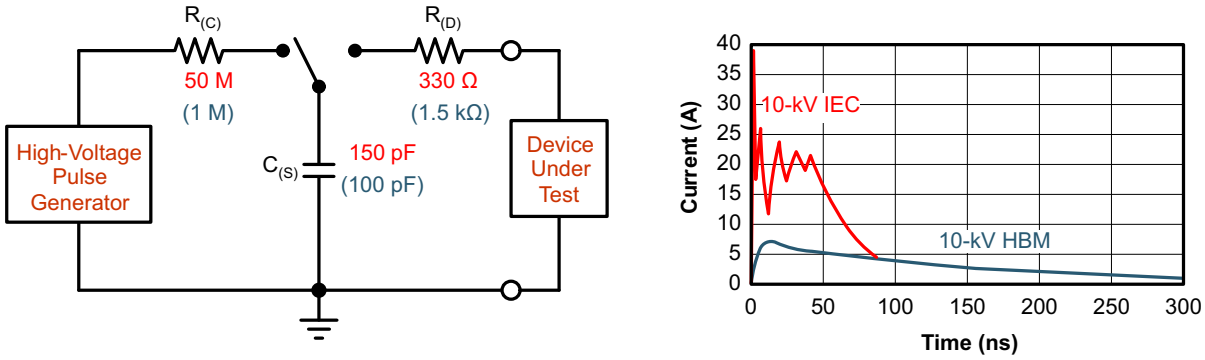

图 9-2. HBM and IEC ESD Models and Currents in Comparison (HBM Values in Parenthesis)

The on-chip implementation of IEC ESD protection significantly increases the robustness of equipment. Common discharge events occur because of human contact with connectors and cables. Designers may choose to implement protection against longer duration transients, typically referred to as surge transients.

EFTs are generally caused by relay-contact bounce or the interruption of inductive loads. Surge transients often result from lightning strikes (direct strike or an indirect strike which induce voltages and currents), or the switching of power systems, including load changes and short circuit switching. These transients are often encountered in industrial environments, such as factory automation and power-grid systems.

图 9-3 compares the pulse-power of the EFT and surge transients with the power caused by an IEC ESD transient. The left side of the diagram shows the relative pulse-power for a 0.5-kV surge transient and 4-kV EFT transient, both of which exceed the 10-kV ESD transient visible in the lower-left corner. 500-V surge transients are representative of events that may occur in factory environments in industrial and process automation.

The right side of the diagram shows the pulse-power of a 6-kV surge transient, relative to the same 0.5-kV surge transient. 6-kV surge transients may occur in power generation and power-grid systems.

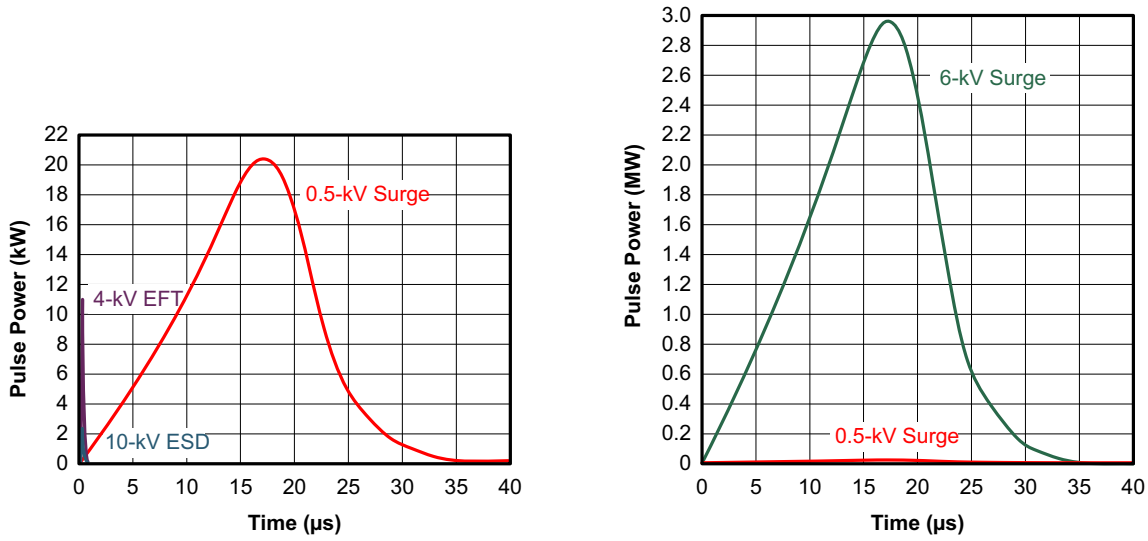

图 9-3. Power Comparison of ESD, EFT, and Surge Transients

For surge transients, high-energy content is characterized by long pulse duration and slow decaying pulse power. The electrical energy of a transient that is dumped into the internal protection cells of a transceiver is converted into thermal energy, which heats and destroys the protection cells, thus destroying the transceiver. 图 9-4 shows the large differences in transient energies for single ESD, EFT, surge transients, and an EFT pulse train that is commonly applied during compliance testing.

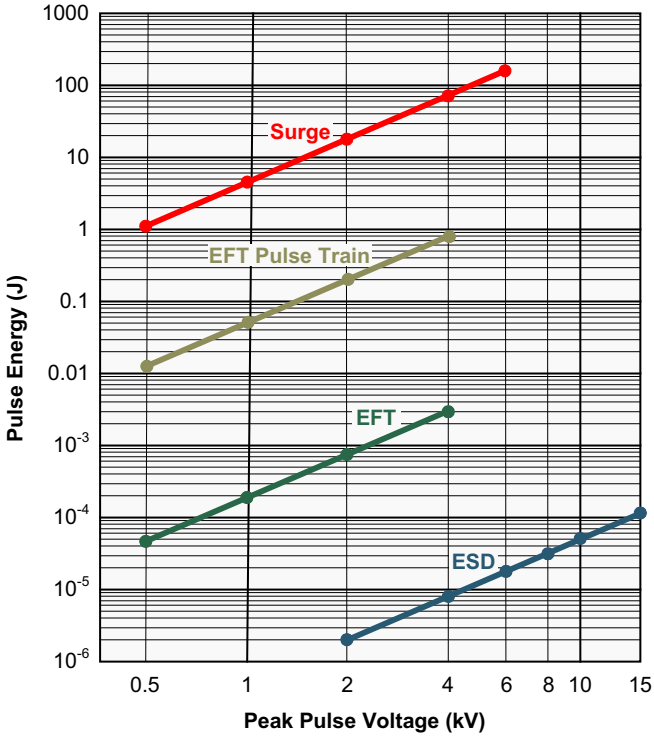

图 9-4. Comparison of Transient Energies

9.2.2 Detailed Design Procedure

To protect bus nodes against high-energy transients, the implementation of external transient protection devices is necessary. 图 9-5 suggests a protection circuit against 1 kV surge (IEC 61000-4-5) transients. 表 9-1 shows the associated bill of materials.

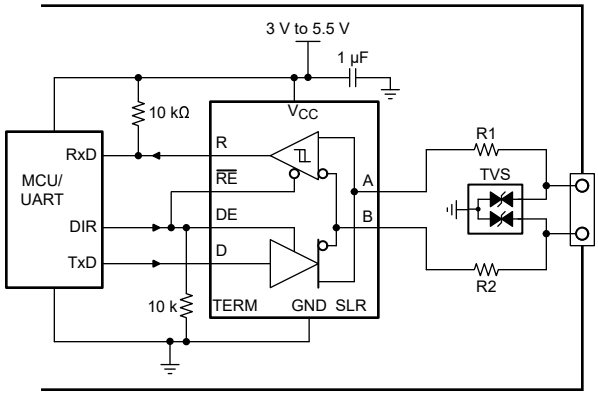

图 9-5. Transient Protection Against Surge Transients for THVD1454

表 9-1. Bill of Materials

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER(1)
XCVR	RS-485 transceiver	THVD1454	TI
R1	10-Ω, pulse-proof thick-film resistor	CRCW0603010RJNEAHP	Vishay
R2			
TVS	Bidirectional 400-W transient suppressor	CDSOT23-SM712	Bourns

图 9-7. Driver Waveforms at 20 Mbps with Termination Enabled

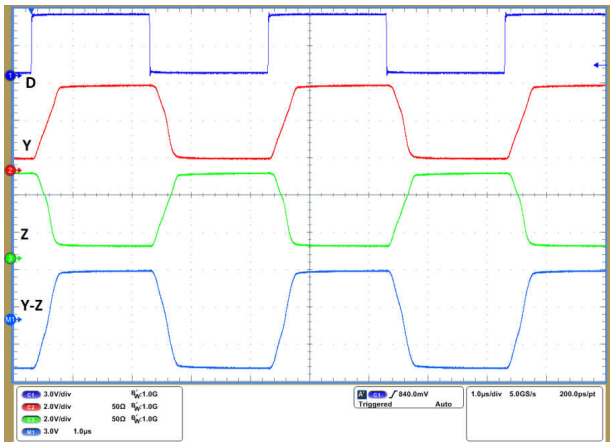

图 9-8. Driver Waveforms at 500 kbps with Termination Enabled

9.3 Power Supply Recommendations

For reliable operation at all data rates and supply voltages, V_{CC} supply should be decoupled with a 1 μF ceramic capacitor located as close to the supply pin as possible. This helps to reduce supply voltage ripple present on the outputs of switched-mode power supplies and also helps to compensate for the resistance and inductance of the PCB power planes.

9.4 Layout

9.4.1 Layout Guidelines

Robust and reliable bus node design often requires the use of external transient protection devices in order to protect against surge transients that may occur in industrial environments. Since these transients have a wide frequency bandwidth (from approximately 3 MHz to 300 MHz), high-frequency layout techniques should be applied during PCB design.

1. Place the protection circuitry close to the bus connector to prevent noise transients from propagating across the board.
2. Use V_{CC} and ground planes to provide low inductance. Note that high-frequency currents tend to follow the path of least impedance and not the path of least resistance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply atleast 1 μF decoupling capacitors as close as possible to the V_{CC} pin of the transceiver, UART and/or controller ICs on the board.
5. Use at least two vias for V_{CC} and ground connections of decoupling capacitors and protection devices to minimize effective via inductance.
6. Use 1-kΩ to 10-kΩ pull-up and pull-down resistors for logic lines to limit noise currents in these lines during transient events.
7. Insert pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to less than 1 mA.

10 Device and Documentation Support

10.1 Device Support

10.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

10.2 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 *订阅更新* 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

10.3 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

10.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

10.6 术语表

TI 术语表　　本术语表列出并解释了术语、首字母缩略词和定义。

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
THVD1454DRCR	Active	Production	VSON (DRC) | 10	5000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	1454
THVD1454DRCR.A	Active	Production	VSON (DRC) | 10	5000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	1454

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION
