

TLC59116-Q1 16 通道 FM+ I²C 总线恒流 LED 灌电流驱动器

1 特性

- 16 个发光二极管 (LED) 驱动器 (每个输出均可通过编程设定为关闭、开启、可编程的 LED 亮度或者可编程的组合式调光和闪烁 (各 LED 亮度混合))
- 16 条恒流输出通道
- 256 色阶 (8 位) 线性可编程亮度范围, 对应的 LED 输出从完全关闭 (默认) 到最大亮度 (采用 97kHz 的脉宽调制 (PWM) 信号)
- 256 色阶组合式亮度控制支持通用调光 [采用 190Hz PWM 信号, 从完全关闭到最大亮度 (默认)]
- 256 色阶组合式闪烁, 频率可在 24Hz 至 10.73s 范围内编程设定, 占空比范围为 0% 至 99.6%
- 四个硬件地址引脚支持 14 个 TLC59116-Q1 器件连接至同一条 I²C 总线
- 四个可通过软件编程设定的 I²C 总线地址 (一个 LED 组合式调用地址和三个 LED 子调用地址) 支持以任意组合同时寻址多组器件
- 软件复位功能 (SWRST 调用) 支持通过 I²C 总线复位器件
- 多达 14 个可通过硬件调节的独立 I²C 总线地址, 这样便可对每个器件进行编程设定
- 负载开路和过热检测模式, 用于检测各个 LED 故障
- 可通过编程在收到应答命令或停止命令时更改输出状态以逐字节更新输出或同时更新全部输出 (默认在收到停止命令时更改)
- 可通过外部电阻调节输出电流
- 恒定输出电流范围: 5mA 至 120mA
- 最大输出电压: 17V
- 25MHz 内部振荡器, 无需外部组件
- 1MHz 快速模式 Plus (FMT) 兼容 I²C 总线接口, SDA 输出具有 30mA 高驱动能力, 用于驱动高容性总线
- 内部上电复位
- SCL 和 SDA 输入端装有噪声滤波器
- 上电时无毛刺脉冲
- 低电平有效复位
- 支持热插入
- 低待机电流
- 3.3V 或 5V 电源电压

- 5.5V 耐压输入
- 28 引脚薄型紧缩小尺寸封装 (TSSOP) (PW-28)
- 运行温度范围: -40°C 至 +105°C

2 应用

- 通用 LED 照明 应用
- 中控台按钮背光
- 仪表板指示灯背光

3 说明

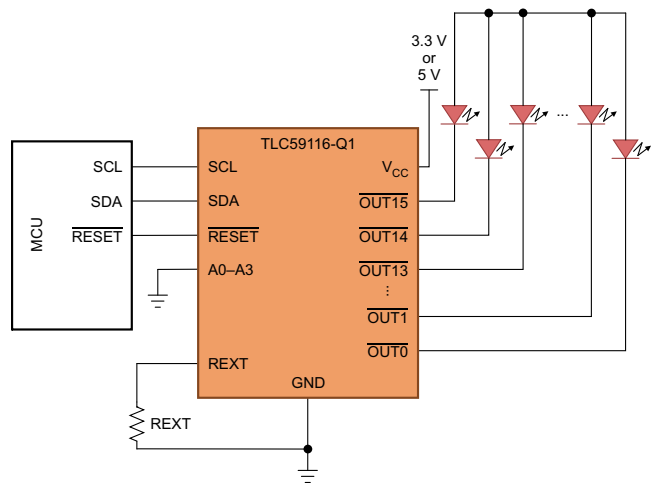

TLC59116-Q1 是一款 I²C 总线控制的 16 通道 LED 驱动器, 它针对红色/绿色/蓝色/琥珀色 (RGBA) 混合和背光应用进行了优化。每个 LED 输出都拥有自己的 8 位分辨率 (256 色阶)、固定频率、独立 PWM 控制器 (工作频率为 97kHz) 和可调节占空比 (0% 至 99.6%)。

5 说明（续）

独立 PWM 控制器允许将每个 LED 设置为特定的亮度值。附加的 8 位分辨率（256 色阶）组合式 PWM 控制器既具有 190Hz 的固定频率，又拥有可调节频率（24Hz 至每隔 10.73 秒一次）和可调节占空比（0% 至 99.6%）。组合式 PWM 控制器使用相同的值来调亮或调暗所有 LED。

每个 LED 输出均可设置为关闭、开启（无 PWM 控制）或其各自 PWM 控制器的值（独立 PWM 控制器的值和组合式 PWM 控制器的值）。

TLC59116-Q1 的工作电源电压范围为 3V 至 5.5V，输出可耐受 17V 电压。LED 可直接连接至 TLC59116-Q1 器件输出。

可通过软件编程的 LED 组合式和三个子调用 I²C 总线地址允许所有或定义的几组 TLC59116-Q1 器件响应同一 I²C 总线地址，以实现例如同时开启或关闭颜色相同的 LED 或者跑马灯效果，从而以最大限度减少 I²C 总线命令。

四个硬件地址引脚支持同一总线上连接 14 个器件。

软件复位 (SWRST) 调用允许主机通过 I²C 总线对 TLC59116-Q1 执行复位，该复位与上电复位 (POR) 一样会将寄存器初始化为默认状态，从而将输出设置为高电平（LED 关闭）。这样一来，便可以轻松快速地将所有器件寄存器重新配置为相同状态。

		FAST MODE	100		
		FAST MODE PLUS	50		
t _{LOW}	Low period of SCL clock	STANDARD MODE	4.7		μs
		FAST MODE	1.3		
		FAST MODE PLUS	0.5		
t _{HIGH}	High period of SCL clock	STANDARD MODE	4		μs
		FAST MODE	0.6		
		FAST MODE PLUS	0.26		
t _f	Fall time of both SDA and SCL signals ^{(4) (5)}	STANDARD MODE		300	ns
		FAST MODE	20+0.1C _b ⁽⁶⁾	300	
		FAST MODE PLUS		120	
t _r	Rise time of both SDA and SCL signals	STANDARD MODE		1000	ns
		FAST MODE	20+0.1C _b ⁽⁶⁾	300	
		FAST MODE PLUS		120	

(1) The TLC59116-Q1 does not have a self timeout on the I²C Bus. The Master can issue a reset if needed.

(2) t_{VD;ACK} = time for ACK signal from SCL low to SDA (out) low.

(3) t_{VD;DAT} = minimum time for SDA data out to be valid following SCL low.

(4) A master device must internally provide a hold time of at least 300 ns for the SDA signal (refer to the V_{IL} of the SCL signal) in order to bridge the undefined region of the SCL falling edge.

(5) The maximum t_f for the SDA and SCL bus lines is specified at 300 ns. The maximum fall time (t_f) for the SDA output stage is specified at 250 ns. This allows series protection resistors to be connected between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified t_f.

(6) C_b = Total capacitance of one bus line in pF

Timing Requirements (continued)

 $T_A = -40^{\circ}\text{C to } +105^{\circ}\text{C}$

		I ² C BUS	MIN	MAX	UNIT
t _{SP}	Pulse width of spikes that must be suppressed by the input filter ⁽⁷⁾	STANDARD MODE		50	ns
		FAST MODE		50	
		FAST MODE PLUS		50	
RESET					
t _W	Reset pulse width	STANDARD MODE		10	ns
		FAST MODE		10	
		FAST MODE PLUS		10	
t _{REC}	Reset recovery time	STANDARD MODE		0	ns
		FAST MODE		0	
		FAST MODE PLUS		0	
t _{RESET}	Time to reset ⁽⁸⁾ ⁽⁹⁾	STANDARD MODE		400	ns
		FAST MODE		400	
		FAST MODE PLUS		400	

(7) Input filters on the SDA and SCL inputs suppress noise spikes less than 50 ns.

(8) Resetting the device while actively communicating on the bus may cause glitches or errant Stop conditions.

(9) Upon reset, the full delay will be the sum of t_{RESET} and the RC time constant of the SDA bus.

7.7 Typical Characteristics

Figure 3. Output Current vs Output Voltage across Temp

Figure 4. I_{CC} vs V_{CC} across Temp

8 Parameter Measurement Information

Figure 5. Reset Timing

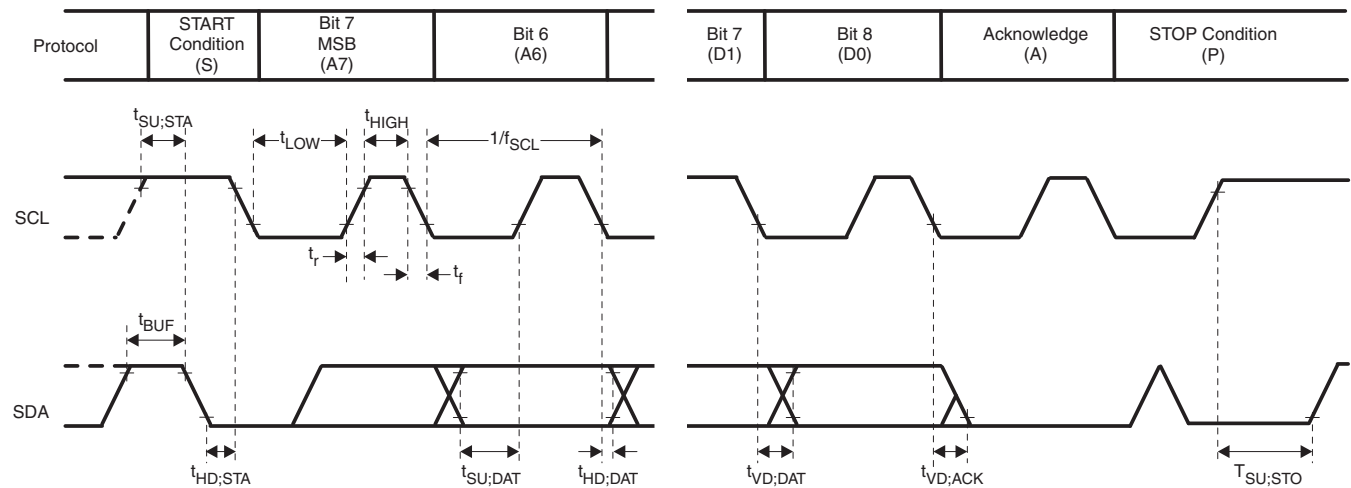

Figure 6. Definition of Timing

NOTE: Rise and fall times refer to V_{IL} and V_{IH} .

Figure 7. I²C Bus Timing

Parameter Measurement Information (continued)

NOTE:

- R_L = Load resistance for SDA and SCL; should be $>1\text{ k}\Omega$ at 3-mA or lower current
- C_L = Load capacitance; includes jig and probe capacitance
- R_T = Termination resistance; should be equal to the output impedance (Z_O) of the pulse generator

Figure 8. Test Circuit for Switching Characteristics

9 Detailed Description

9.1 Overview

The TLC59116-Q1 is an I²C Bus controlled 16-channel LED driver that is optimized for red/green/blue/amber (RGBA) color mixing and backlight application. Each LED output has its own 8-bit resolution (256 steps) fixed-frequency individual PWM controller that operates at 97-kHz, with a duty cycle that is adjustable from 0% to 99.6%. The individual PWM controller allows each LED to be set to a specific brightness value. An additional 8-bit resolution (256 steps) group PWM controller has both a fixed frequency of 190-Hz and an adjustable frequency between 24-Hz to once every 10.73 seconds, with a duty cycle that is adjustable from 0% to 99.6%. The group PWM controller dims or blinks all LEDs with the same value.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Open-Circuit Detection

The TLC59116-Q1 LED open-circuit detection compares the effective current level I_{OUT} with the open load detection threshold current $I_{OUT,Th}$. If I_{OUT} is below the threshold $I_{OUT,Th}$, the TLC59116-Q1 detects an open load condition. This error status can be read out as an error flag through the registers EFLAG1 and EFLAG2.

For open-circuit error detection, a channel must be on and the PWM must be off. See [Table 1](#).

Feature Description (continued)

Table 1. Open-Circuit Detection

STATE OF OUTPUT PORT	CONDITION OF OUTPUT CURRENT	ERROR STATUS CODE	MEANING
Off	$I_{OUT} = 0 \text{ mA}$	0	Detection not possible
On	$I_{OUT} < I_{OUT,Th}^{(1)}$	0	Open circuit
	$I_{OUT} \geq I_{OUT,Th}^{(1)}$	Channel n error status bit 1	Normal

(1) $I_{OUT,Th} = 0.5 \times I_{OUT,target}$ (typical)

9.3.2 Overtemperature Detection and Shutdown

The TLC59116-Q1 LED is equipped with a global overtemperature sensor and 16 individual channel-selective overtemperature sensors.

- When the global sensor reaches the trip temperature, all output channels are shut down, and the error status is stored in the internal Error Status register of every channel. After shutdown, the channels automatically restart after cooling down, if the control signal (output latch) remains on. The stored error status is not reset after cooling down and can be read out as the error status code in registers EFLAG1 and EFLAG2.
- When one of the channel-specific sensors reaches trip temperature, only the affected output channel is shut down, and the error status is stored only in the internal Error Status register of the affected channel. After shutdown, the channel automatically restarts after cooling down, if the control signal (output latch) remains on. The stored error status is not reset after cooling down and can be read out as error status code in registers EFLAG1 and EFLAG2.

For channel-specific overtemperature error detection, a channel must be on.

The error flags of open-circuit and overtemperature are ORed to set the EFLAG1 and EFLAG2 registers.

The error status code because of overtemperature is reset when the host writes 1 to bit 7 of the MODE2 register. The host must write 0 to bit 7 of the MODE2 register to enable the overtemperature error flag. See [Table 2](#).

Table 2. Overtemperature Detection ⁽¹⁾

STATE OF OUTPUT PORT	CONDITION	ERROR STATUS CODE	MEANING
On	$T_j < T_{j,trip} \text{ global}$	1	Normal
On → all channels Off	$T_j > T_{j,trip} \text{ global}$	All error status bits = 0	Global overtemperature
On	$T_j < T_{j,trip} \text{ channel n}$	1	Normal
On → Off	$T_j > T_{j,trip} \text{ channel n}$	Channel n error status bit = 0	Channel n overtemperature

(1) The global shutdown threshold temperature is approximately 170°C.

9.3.3 Power-On Reset (POR)

When power is applied to V_{CC} , an internal power-on reset holds the TLC59116-Q1 in a reset condition until V_{CC} reaches V_{POR} . At this point, the reset condition is released and the TLC59116-Q1 registers, and I²C Bus state machine are initialized to their default states (all zeroes), causing all the channels to be deselected. Thereafter, V_{CC} must be lowered below 0.2 V to reset the device.

9.3.4 External Reset

A reset can be accomplished by holding the $\overline{\text{RESET}}$ pin low for a minimum of t_{W} . The TLC59116-Q1 registers and I²C state machine are held in their default states until the RESET input is again high.

This input requires a pullup resistor to V_{CC} if no active connection is used.

9.3.5 Software Reset

The Software Reset Call (SWRST Call) allows all the devices in the I²C Bus to be reset to the power-up state value through a specific I²C Bus command.

The SWRST Call function is defined as the following:

- A Start command is sent by the I²C Bus master.

TLC59116-Q1

ZHCSEQ9A – MARCH 2016 – REVISED MARCH 2016

www.ti.com.cn

2. The reserved SWRST I²C Bus address 1101 011 with the $\overline{R/\overline{W}}$ bit set to 0 (write) is sent by the I²C Bus master.
3. The TLC59116-Q1 device(s) acknowledge(s) after seeing the SWRST Call address 1101 0110 (D6h) only. If the $\overline{R/\overline{W}}$ bit is set to 1 (read), no acknowledge is returned to the I²C Bus master.
4. Once the SWRST Call address has been sent and acknowledged, the master sends two bytes with two specific values (SWRST data byte 1 and byte 2):
 - (a) Byte1 = A5h: the TLC59116-Q1 acknowledges this value only. If byte 1 is not equal to A5h, the TLC59116-Q1 does not acknowledge it.
 - (b) Byte 2 = 5Ah: the TLC59116-Q1 acknowledges this value only. If byte 2 is not equal to 5Ah, the TLC59116-Q1 does not acknowledge it.

If more than two bytes of data are sent, the TLC59116-Q1 does not acknowledge any more.

5. Once the correct two bytes (SWRST data byte 1 and byte 2 only) have been sent and correctly acknowledged, the master sends a Stop command to end the SWRST Call. The TLC59116-Q1 then resets to the default value (power-up value) and is ready to be addressed again within the specified bus free time (t_{BUF}).

The I²C Bus master may interpret a non-acknowledge from the TLC59116-Q1 (at any time) as a SWRST Call Abort. The TLC59116-Q1 does not initiate a reset of its registers. This happens only when the format of the Start Call sequence is not correct.

9.3.6 Individual Brightness Control With Group Dimming/Blinking

A 97-kHz fixed-frequency signal with programmable duty cycle (8 bits, 256 steps) is used to control the individual brightness for each LED.

On top of this signal, one of the following signals can be superimposed (this signal can be applied to the four LED outputs):

- A lower 190-Hz fixed-frequency signal with programmable duty cycle (8 bits, 256 steps) provides a global brightness control.
- A programmable frequency signal from 24-Hz to 1/10.73 s (8 bits, 256 steps) provides a global blinking control. See [Figure 9](#).

NOTE:

- Minimum pulse width for LEDn brightness control is 40 ns.
- Minimum pulse width for group dimming is 20.48 μs .
- When $M = 1$ (GRPPWM register value), the resulting LEDn Brightness Control + Group Dimming signal has two pulses of the LED Brightness Control signal (pulse width = $n \times 40 \text{ ns}$, with n defined in the PWMx register).
- This resulting Brightness + Group Dimming signal shows a resulting control signal with $M = 4$ (8 pulses).

Figure 9. Brightness and Group Dimming Signals

9.4 Device Functional Modes

9.4.1 Active

Active mode occurs when one or more of the output channels is enabled.

9.4.2 Standby

Standby mode occurs when all output channels are disabled. Standby mode may be entered via I²C command or by pulling the $\overline{\text{RESET}}$ pin low.

9.5 Programming

9.5.1 Characteristics of the I²C Bus

The I²C Bus is for two-way two-line communication between different devices or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pullup resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

9.5.1.1 Bit Transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see Figure 10).

Programming (continued)

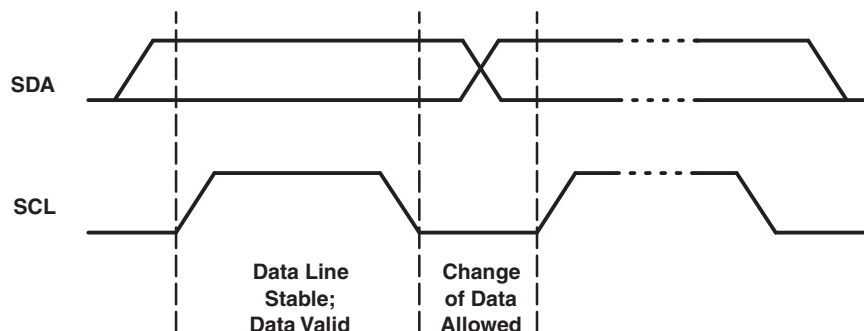

Figure 10. Bit Transfer

9.5.1.2 Start and Stop Conditions

Both data and clock lines remain high when the bus is not busy. A high-to-low transition of the data line while the clock is high is defined as the Start condition (S). A low-to-high transition of the data line while the clock is high is defined as the Stop condition (P) (see [Figure 11](#)).

Figure 11. Start and Stop Conditions

9.5.1.3 Acknowledge

The number of data bytes transferred between the Start and the Stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a high level put on the bus by the transmitter, whereas the master generates an extra acknowledge related clock pulse. See [Figure 12](#).

A slave receiver that is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable low during the high period of the acknowledge related clock pulse; set-up time and hold time must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line high to enable the master to generate a Stop condition. See [Figure 13](#).

Programming (continued)

Figure 12. Acknowledge/Not Acknowledge on I²C Bus

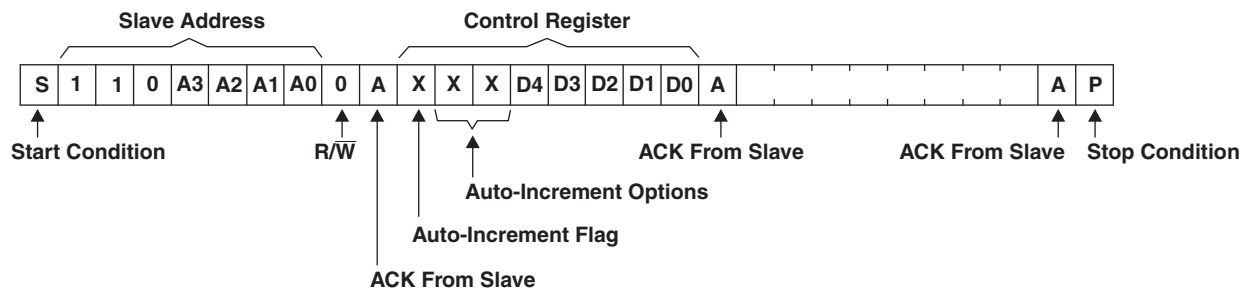

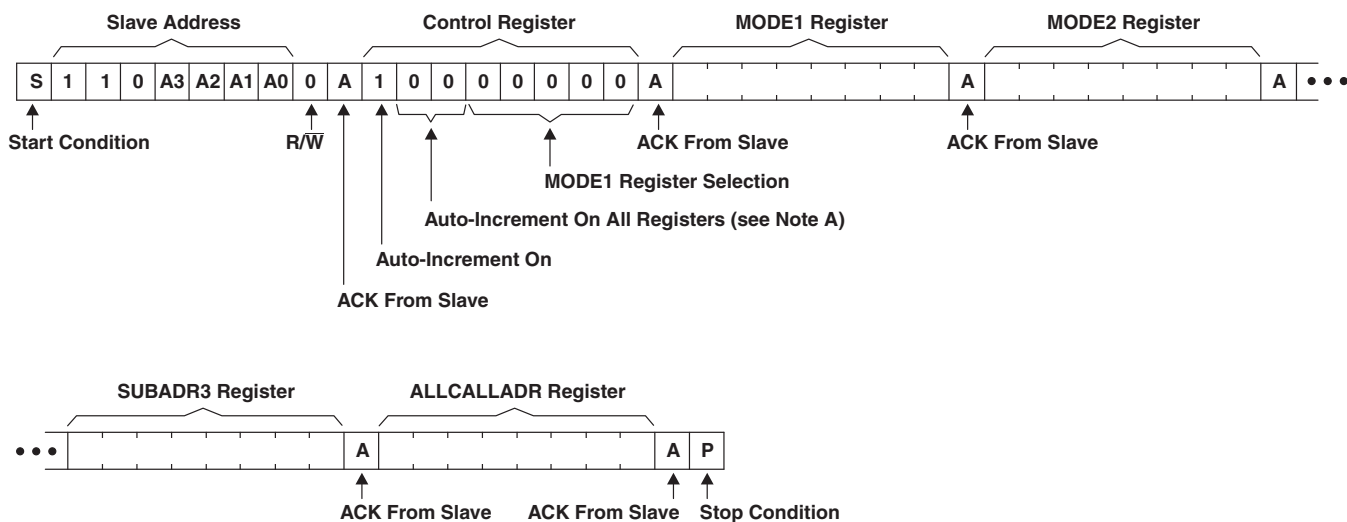

Figure 13. Write to a Specific Register

See [Table 4](#) for register definitions.

Figure 14. Write to All Registers Using Auto-Increment

Programming (continued)

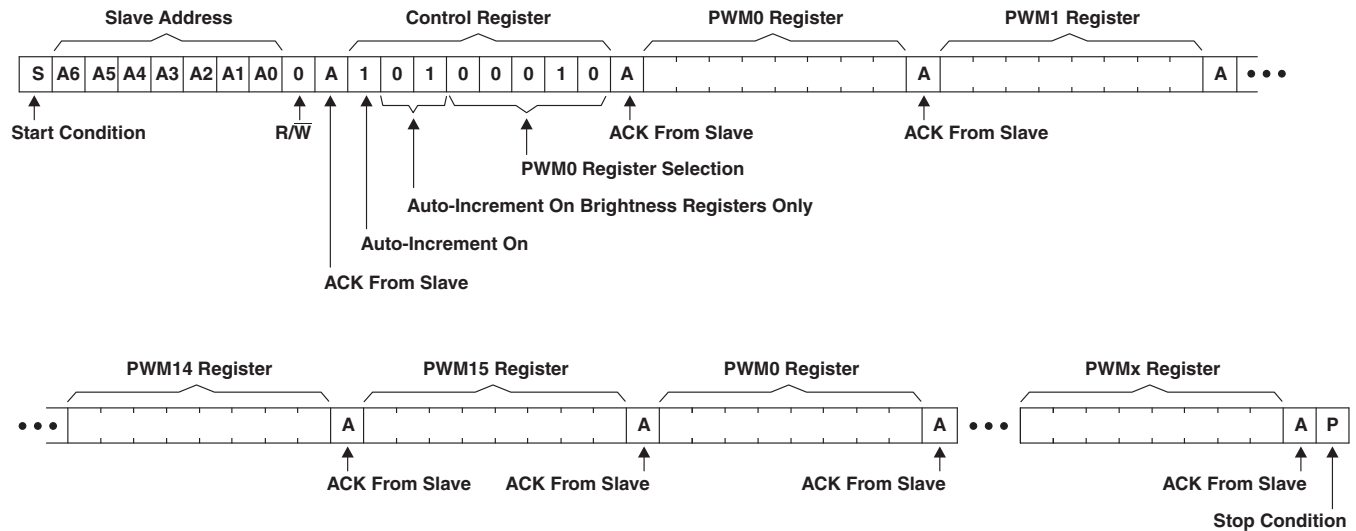

Figure 15. Multiple Writes to Individual Brightness Registers Using Auto-Increment

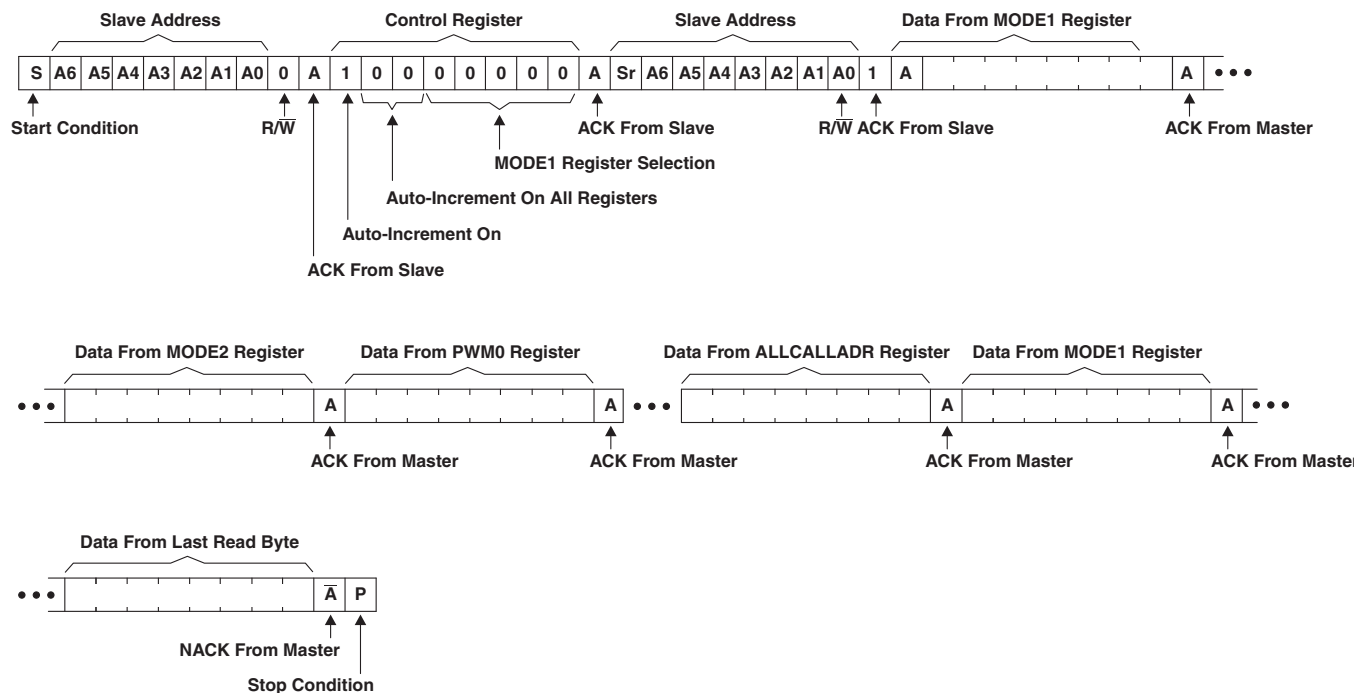

Figure 16. Read All Registers Auto-Increment

Programming (continued)

- A. In this example, several TLC59116-Q1 devices are used, and the same Sequence A is sent to each of them.
- B. The ALLCALL bit in the MODE1 register is equal to 1 for this example.
- C. The OCH bit in the MODE2 register is equal to 1 for this example.

Figure 17. LED All Call I²C Bus Address Programming and LED All Call Sequence

9.5.2 System Configuration

A device generating a message is a transmitter; a device receiving is the receiver. The device that controls the message is the master and the devices that are controlled by the master are the slaves (see [Figure 18](#)).

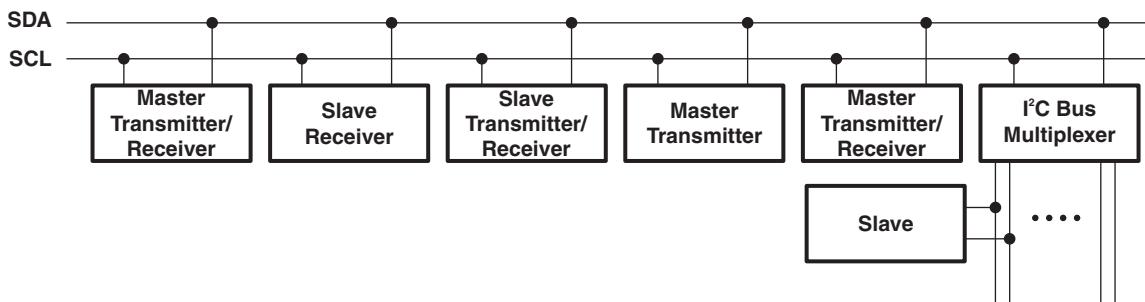

Figure 18. System Configuration

9.5.3 Device Address

Following a Start condition, the bus master must output the address of the slave it is accessing.

9.5.4 Regular I²C Bus Slave Address

The I²C Bus slave address of the TLC59116-Q1 is shown in [Figure 19](#). To conserve power, no internal pullup resistors are incorporated on the hardware-selectable address pins, and they must be pulled high or low. For buffer management purposes, a set of sector information data should be stored.

Programming (continued)

Figure 19. Slave Address

The last bit of the address byte defines the operation to be performed. When set to logic 1, a read operation is selected. When set to logic 0, a write operation is selected.

9.5.5 LED All Call I²C Bus Address

- Default power-up value (ALLCALLADR register): D0h or 1101 000
- Programmable through I²C Bus (volatile programming)
- At power-up, LED All Call I²C Bus address is enabled. TLC59116-Q1 sends an ACK when D0h ($R/\overline{W} = 0$) or D1h ($R/\overline{W} = 1$) is sent by the master.

See [LED All Call I²C Bus Address Register \(ALLCALLADR\)](#) for more detail.

NOTE

The default LED All Call I²C Bus address (D0h or 1101 000) must not be used as a regular I²C Bus slave address, since this address is enabled at power-up. All the TLC59116-Q1 devices on the I²C Bus will acknowledge the address if it is sent by the I²C Bus master.

Programming (continued)

9.5.6 LED Sub Call I²C Bus Address

- Three different I²C Bus addresses can be used
- Default power-up values:
 - SUBADR1 register: D2h or 1101 001
 - SUBADR2 register: D4h or 1101 010
 - SUBADR3 register: D8h or 1101 100
- Programmable through I²C Bus (volatile programming)
- At power-up, Sub Call I²C Bus address is disabled. TLC59116-Q1 does not send an ACK when D2h ($R/\overline{W} = 0$) or D3h ($R/\overline{W} = 1$) or D4h ($R/\overline{W} = 0$) or D5h ($R/\overline{W} = 1$) or D8h ($R/\overline{W} = 0$) or D9h ($R/\overline{W} = 1$) is sent by the master.

See [I²C Bus Subaddress Registers 1 to 3 \(SUBADR1 to SUBADR3\)](#) for more detail.

NOTE

The LED Sub Call I²C Bus addresses may be used as regular I²C Bus slave addresses if their corresponding enable bits are set to 0 in the [MODE1 Register](#).

9.5.7 Software Reset I²C Bus Address

The address shown in [Figure 20](#) is used when a reset of the TLC59116-Q1 is performed by the master. The software reset address (SWRST Call) must be used with $R/\overline{W} = 0$. If $R/\overline{W} = 1$, the TLC59116-Q1 does not acknowledge the SWRST. See [Software Reset](#) for more detail.

Figure 20. Software Reset Address

NOTE

The Software Reset I²C Bus address is reserved address and cannot be use as regular I²C Bus slave address or as an LED All Call or LED Sub Call address.

9.5.8 Control Register

Following the successful acknowledgment of the slave address, LED All Call address or LED Sub Call address, the bus master sends a byte to the TLC59116-Q1, which is stored in the Control register. The lowest five bits are used as a pointer to determine which register is accessed (D[4:0]). The highest three bits are used as auto-increment flag and auto-increment options (AI[2:0]). See [Figure 21](#).

Figure 21. Control Register

When the auto-increment flag is set (AI2 = logic 1), the five low order bits of the Control register are automatically incremented after a read or write. This allows the user to program the registers sequentially. Four different types of auto-increment are possible, depending on AI1 and AI0 values as shown in [Table 3](#).

Programming (continued)

Table 3. Auto-Increment Options

AI2	AI1	AI0	DESCRIPTION
0	0	0	No auto-increment
1	0	0	Auto-increment for all registers. D[4:0] roll over to 0 0000 after the last register (1 1011) is accessed.
1	0	1	Auto-increment for individual brightness registers only. D[4:0] roll over to 0 0010 after the last register (1 0001) is accessed.
1	1	0	Auto-increment for global control registers only. D[4:0] roll over to 1 0010 after the last register (1 0011) is accessed.
1	1	1	Auto-increment for individual and global control registers only. D[4:0] roll over to 0 0010 after the last register (1 0011) is accessed.

NOTE

Other combinations are not shown in [Table 3](#). (AI[2:0] = 001, 010, and 011) are reserved and must not be used for proper device operation.

AI[2:0] = 000 is used when the same register must be accessed several times during a single I²C Bus communication, for example, changing the brightness of a single LED. Data is overwritten each time the register is accessed during a write operation.

AI[2:0] = 100 is used when all the registers must be sequentially accessed, for example, power-up programming.

AI[2:0] = 101 is used when the four LED drivers must be individually programmed with different values during the same I²C Bus communication, for example, changing a color setting to another color setting.

AI[2:0] = 110 is used when the LED drivers must be globally programmed with different settings during the same I²C Bus communication, for example, global brightness or blinking change.

AI[2:0] = 111 is used when individually and global changes must be performed during the same I²C Bus communication, for example, changing color and global brightness at the same time.

Only the five least significant bits D[4:0] are affected by the AI[2:0] bits.

When the Control register is written, the register entry point determined by D[4:0] is the first register that will be addressed (read or write operation), and can be anywhere between 0 0000 and 1 1011 (as defined in [Table 4](#)). When AI[2] = 1, the Auto-Increment flag is set and the rollover value at which the point where the register increment stops and goes to the next one is determined by AI[2:0]. See [Table 3](#) for rollover values. For example, if the Control register = 1111 0100 (F4h), then the register addressing sequence will be (in hex):

14 → ... → 1B → 00 → ... → 13 → 02 → ... → 13 → 02 → ... as long as the master keeps sending or reading data.

9.6 Register Maps

[Table 4](#) describes the registers in the TLC59116-Q1.

Table 4. Register Descriptions

REGISTER NUMBER (HEX)	NAME	ACCESS ⁽¹⁾	DESCRIPTION
00	MODE1	R/W	Mode 1
01	MODE2	R/W	Mode 2

9.6.1 Mode Register 1 (MODE1)

Table 5 describes Mode Register 1.

Table 5. MODE1 – Mode Register 1 (Address 00h) Bit Description

BITS	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
7	AI2	R	0 ⁽²⁾	Register auto-increment disabled
			1	Register auto-increment enabled
6	AI1	R	0 ⁽²⁾	Auto-increment bit 1 = 0
			1	Auto-increment bit 1 = 1
5	AI0	R	0 ⁽²⁾	Auto-increment bit 0 = 0
			1	Auto-increment bit 0 = 1
4	OSC	R/W	0	Normal mode ⁽³⁾
			1 ⁽²⁾	Oscillator off.
3	SUB1	R/W	0 ⁽²⁾	Device does not respond to I ² C Bus subaddress 1.
			1	Device responds to I ² C Bus subaddress 1.
2	SUB2	R/W	0 ⁽²⁾	Device does not respond to I ² C Bus subaddress 2.
			1	Device responds to I ² C Bus subaddress 2.
1	SUB3	R/W	0 ⁽²⁾	Device does not respond to I ² C Bus subaddress 3.
			1	Device responds to I ² C Bus subaddress 3.
0	ALLCALL	R/W	0	Device does not respond to LED All Call I ² C Bus address.
			1 ⁽²⁾	Device responds to LED All Call I ² C Bus address.

(1) R = read, W = write

(2) Default value

(3) Requires 500 μ s maximum for the oscillator to be up and running once OSC bit has been set to logic 1. Timings on LED outputs are not ensured if PWMx, GRPPWM, or GRPFREQ registers are accessed within the 500- μ s window.

NOTE

The OSC bit (Bit 4) must be set to 0 before any outputs will turn on. Proper operation requires this bit to be 0. Setting the bit to a 1 will turn all channels off.

9.6.2 Mode Register 2 (MODE2)

Table 6 describes Mode Register 2.

Table 6. MODE2 – Mode Register 2 (Address 01h) Bit Description

BITS	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
7	EFCLR	R/W	0 ⁽²⁾	Enable error status flag
			1	Clear error status flag
6		R	0 ⁽²⁾	Reserved
5	DMBLNK	R/W	0 ⁽²⁾	Group control = dimming
			1	Group control = blinking
4		R	0 ⁽²⁾	Reserved
3	OCH	R/W	0 ⁽²⁾	Outputs change on Stop command ⁽³⁾
			1	Outputs change on ACK
2:0		R	000 ⁽²⁾	Reserved

(1) R = read, W = write

(2) Default value

(3) Change of the outputs at the Stop command allows synchronizing outputs of more than one TLC59116-Q1. Applicable to registers from 02h (PWM0) to 17h (LEDOUT3) only.

9.6.3 Brightness Control Registers 0 to 15 (PWM0 to PWM15)

Table 7 describes Brightness Control Registers 0 to 15.

Table 7. PWM0 to PWM15 – Brightness Control Registers 0 to 15 (Address 02h to 11h) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
02h	PWM0	7:0	IDC0[7:0]	R/W	0000 0000 ⁽²⁾	PWM0 individual duty cycle
03h	PWM1	7:0	IDC1[7:0]	R/W	0000 0000 ⁽²⁾	PWM1 individual duty cycle
04h	PWM2	7:0	IDC2[7:0]	R/W	0000 0000 ⁽²⁾	PWM2 individual duty cycle
05h	PWM3	7:0	IDC3[7:0]	R/W	0000 0000 ⁽²⁾	PWM3 individual duty cycle
06h	PWM4	7:0	IDC4[7:0]	R/W	0000 0000 ⁽²⁾	PWM4 individual duty cycle
07h	PWM5	7:0	IDC5[7:0]	R/W	0000 0000 ⁽²⁾	PWM5 individual duty cycle
08h	PWM6	7:0	IDC6[7:0]	R/W	0000 0000 ⁽²⁾	PWM6 individual duty cycle
09h	PWM7	7:0	IDC7[7:0]	R/W	0000 0000 ⁽²⁾	PWM7 individual duty cycle
0Ah	PWM8	7:0	IDC8[7:0]	R/W	0000 0000 ⁽²⁾	PWM8 individual duty cycle
0Bh	PWM9	7:0	IDC9[7:0]	R/W	0000 0000 ⁽²⁾	PWM9 individual duty cycle
0Ch	PWM10	7:0	IDC10[7:0]	R/W	0000 0000 ⁽²⁾	PWM10 individual duty cycle
0Dh	PWM11	7:0	IDC11[7:0]	R/W	0000 0000 ⁽²⁾	PWM11 individual duty cycle
0Eh	PWM12	7:0	IDC12[7:0]	R/W	0000 0000 ⁽²⁾	PWM12 individual duty cycle
0Fh	PWM13	7:0	IDC13[7:0]	R/W	0000 0000 ⁽²⁾	PWM13 individual duty cycle
10h	PWM14	7:0	IDC14[7:0]	R/W	0000 0000 ⁽²⁾	PWM14 individual duty cycle
11h	PWM15	7:0	IDC15[7:0]	R/W	0000 0000 ⁽²⁾	PWM15 individual duty cycle

(1) R = read, W = write

(2) Default value

A 97-kHz fixed frequency signal is used for each output. Duty cycle is controlled through 256 linear steps from 00h (0% duty cycle = LED output off) to FFh (99.6% duty cycle = LED output at maximum brightness). Applicable to LED outputs programmed with LDRx = 10 or 11 (LEDOUT0, LEDOUT1, LEDOUT2 and LEDOUT3 registers).

$$\text{Duty cycle} = \text{IDCn}[7:0] / 256$$

(1)

9.6.4 Group Duty Cycle Control Register (GRPPWM)

Table 8 describes the Group Duty Cycle Control Register.

Table 8. GRPPWM – Group Brightness Control Register (Address 12h) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
12h	GRPPWM	7:0	GDC0[7:0]	R/W	1111 1111 ⁽²⁾	GRPPWM register

(1) R = read, W = write

(2) Default value

When the DMBLNK bit (MODE2 register) is programmed with logic 0, a 190-Hz fixed-frequency signal is superimposed with the 97-kHz individual brightness control signal. GRPPWM is then used as a global brightness control, allowing the LED outputs to be dimmed with the same value. The value in GRPFREQ is then a Don't care.

General brightness for the 16 outputs is controlled through 256 linear steps from 00h (0% duty cycle = LED output off) to FFh (99.6% duty cycle = maximum brightness). This is applicable to LED outputs programmed with LDRx = 11 (LEDOUT0, LEDOUT1, LEDOUT2 and LEDOUT3 registers).

When DMBLNK bit is programmed with logic 1, the GRPPWM and GRPFREQ registers define a global blinking pattern, where GRPFREQ defines the blinking period (from 24-Hz to 10.73 s) and GRPPWM defines the duty cycle (ON/OFF ratio in %).

$$\text{Duty cycle} = \text{GDC0}[7:0] / 256$$

(2)

9.6.5 Group Frequency Register (GRPFREQ)

Table 9 describes the Group Frequency Register.

Table 9. GRPFREQ – Group Frequency Register (Address 13h) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
13h	GRPFREQ	7:0	GFRQ[7:0]	R/W	0000 0000 ⁽²⁾	GRPFREQ register

(1) R = read, W = write

(2) Default value

GRPFREQ is used to program the global blinking period when the DMBLNK bit (MODE2 register) is equal to 1. Value in this register is a Don't care when DMBLNK = 0. This is applicable to LED output programmed with LDRx = 11 (LEDOUT0, LEDOUT1, LEDOUT2 and LEDOUT3 registers).

The blinking period is controlled through 256 linear steps from 00h (41 ms, frequency 24 Hz) to FFh (10.73 s).

$$\text{Global blinking period (seconds)} = (\text{GFRQ}[7:0] + 1) / 24$$

9.6.6 LED Driver Output State Registers 0 to 3 (LEDOUT0 to LEDOUT3)

Table 10 describes LED Driver Output State Registers 0 to 3.

Table 10. LEDOUT0 to LEDOUT3 – LED Driver Output State Registers 0 to 3 (Address 14h to 17h) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
14h	LEDOUT0	7:6	LDR3[1:0]	R/W	00 ⁽²⁾	LED3 output state control
		5:4	LDR2[1:0]	R/W	00 ⁽²⁾	LED2 output state control
		3:2	LDR1[1:0]	R/W	00 ⁽²⁾	LED1 output state control
		1:0	LDR0[1:0]	R/W	00 ⁽²⁾	LED0 output state control
15h	LEDOUT1	7:6	LDR7[1:0]	R/W	00 ⁽²⁾	LED7 output state control
		5:4	LDR6[1:0]	R/W	00 ⁽²⁾	LED6 output state control
		3:2	LDR5[1:0]	R/W	00 ⁽²⁾	LED5 output state control
		1:0	LDR4[1:0]	R/W	00 ⁽²⁾	LED4 output state control
16h	LEDOUT2	7:6	LDR11[1:0]	R/W	00 ⁽²⁾	LED11 output state control
		5:4	LDR10[1:0]	R/W	00 ⁽²⁾	LED10 output state control
		3:2	LDR9[1:0]	R/W	00 ⁽²⁾	LED9 output state control
		1:0	LDR8[1:0]	R/W	00 ⁽²⁾	LED8 output state control
17h	LEDOUT3	7:6	LDR15[1:0]	R/W	00 ⁽²⁾	LED15 output state control
		5:4	LDR14[1:0]	R/W	00 ⁽²⁾	LED14 output state control
		3:2	LDR13[1:0]	R/W	00 ⁽²⁾	LED13 output state control
		1:0	LDR12[1:0]	R/W	00 ⁽²⁾	LED12 output state control

(1) R = read, W = write

(2) Default value

LDRx = 00: LED driver x is off (default power-up state).

LDRx = 01: LED driver x is fully on (individual brightness and group dimming/blinking not controlled).

LDRx = 10: LED driver x is individual brightness can be controlled through its PWMx register.

LDRx = 11: LED driver x is individual brightness and group dimming/blinking can be controlled through its PWMx register and the GRPPWM registers.

9.6.7 I²C Bus Subaddress Registers 1 to 3 (SUBADR1 to SUBADR3)

Table 11 describes I²C Bus Subaddress Registers 1 to 3.

**Table 11. SUBADR1 to SUBADR3 – I²C Bus Subaddress Registers 1 to 3 (Address 18h to 1Ah)
Bit Description**

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
18h	SUBADR1	7:1	A1[7:1]	R/W	1101 001 ⁽²⁾	I ² C Bus subaddress 1
		0	A1[0]	R	0 ⁽²⁾	Reserved
19h	SUBADR2	7:1	A2[7:1]	R/W	1101 010 ⁽²⁾	I ² C Bus subaddress 2
		0	A2[0]	R	0 ⁽²⁾	Reserved
1Ah	SUBADR3	7:1	A3[7:1]	R/W	1101 100 ⁽²⁾	I ² C Bus subaddress 3
		0	A3[0]	R	0 ⁽²⁾	Reserved

(1) R = read, W = write

(2) Default value

Subaddresses are programmable through the I²C Bus. Default power-up values are D2h, D4h, D8h. The TLC59116-Q1 does not acknowledge these addresses immediately after power-up (the corresponding SUBx bit in MODE1 register is equal to 0).

Once subaddresses have been programmed to valid values, the SUBx bits (MODE1 register) must be set to 1 to allows the device to acknowledge these addresses.

Only the 7 MSBs representing the I²C Bus subaddress are valid. The LSB in SUBADR_x register is a read-only bit (0).

When SUB_x is set to 1, the corresponding I²C Bus subaddress can be used during either an I²C Bus read or write sequence.

9.6.8 LED All Call I²C Bus Address Register (ALLCALLADR)

Table 12 describes the LED All Call I²C Bus Address Register.

Table 12. ALLCALLADR – LED All Call I²C Bus Address Register (Address 1Bh) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
1Bh	ALLCALLADR	7:1	AC[7:1]	R/W	1101 000 ⁽²⁾	All Call I ² C Bus address
		0	AC[0]	R	0 ⁽²⁾	Reserved

(1) R = read, W = write

(2) Default value

The LED All Call I²C Bus address allows all the TLC59116-Q1 devices in the bus to be programmed at the same time (ALLCALL bit in register MODE1 must be equal to 1, which is the power-up default state). This address is programmable through the I²C Bus and can be used during either an I²C Bus read or write sequence. The register address can also be programmed as a Sub Call.

Only the seven MSBs representing the All Call I²C bus address are valid. The LSB in ALLCALLADR register is a read-only bit (0).

If ALLCALL bit = 0, the device does not acknowledge the address programmed in register ALLCALLADR.

9.6.9 Output Gain Control Register (IREF)

Table 13 describes the Output Gain Control Register.

Table 13. IREF – Output Gain Control Register (Address 1Ch) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE	DESCRIPTION
1Ch	IREF	7	CM	R/W	1 ⁽²⁾	High/low current multiplier
		6	HC	R/W	1 ⁽²⁾	Subcurrent
		5:0	CC[5:0]	R/W	11 1111 ⁽²⁾	Current multiplier

(1) R = read, W = write

(2) Default value

IREF determines the voltage gain (VG), which affects the voltage at the REXT terminal and indirectly the reference current (I_{ref}) flowing through the external resistor at terminal REXT. Bit 0 is the Current Multiplier (CM) bit, which determines the ratio $I_{OUT,target}/I_{ref}$. Each combination of VG and CM sets a Current Gain (CG).

- VG: the relationship between {HC,CC[0:5]} and the voltage gain is calculated as shown:

$$VG = (1 + HC) \times (1 + D/64) / 4$$

$$D = CC0 \times 2^5 + CC1 \times 2^4 + CC2 \times 2^3 + CC3 \times 2^2 + CC4 \times 2^1 + CC5 \times 2^0$$

Where HC is 1 or 0, and D is the binary value of CC[0:5]. So, the VG could be regarded as a floating-point number with 1-bit exponent HC and 6-bit mantissa CC[0:5]. {HC,CC[0:5]} divides the programmable voltage gain (VG) into 128 steps and two sub-bands:

Low-voltage subband (HC = 0): VG = 1/4 to 127/256, linearly divided into 64 steps

High-voltage subband (HC = 1): VG = 1/2 to 127/128, linearly divided into 64 steps

- CM: In addition to determining the ratio $I_{OUT,target}/I_{ref}$, CM limits the output current range.
High Current Multiplier (CM = 1): $I_{OUT,target}/I_{ref} = 15$, suitable for output current range $I_{OUT} = 10$ mA to 120 mA.
Low Current Multiplier (CM = 0): $I_{OUT,target}/I_{ref} = 5$, suitable for output current range $I_{OUT} = 5$ mA to 40 mA
- CG: The total Current Gain is defined as:

$$V_{REXT} = 1.26 \text{ V} \times VG$$

$$I_{ref} = V_{REXT}/R_{ext}, \text{ if the external resistor (R}_{ext}\text{) is connected to ground.}$$

$$I_{OUT,target} = I_{ref} \times 15 \times 3^{CM-1} = 1.26 \text{ V}/R_{ext} \times VG \times 15 \times 3^{CM-1} = (1.26 \text{ V}/R_{ext} \times 15) \times CG$$

$$CG = VG \times 3^{CM-1}$$

Therefore, CG = (1/12) to (127/128), divided into 256 steps.

Examples

- IREF Code {CM, HC, CC[0:5]} = {1,1,111111}
VG = 127/128 = 0.992 and CG = VG \times 3⁰ = VG = 0.992
- IREF Code {CM, HC, CC[0:5]} = {1,1,000000}
VG = (1 + 1) \times (1 + 0/64)/4 = 1/2 = 0.5, and CG = 0.5
- IREF Code {CM, HC, CC[0:5]} = {0,0,000000}
VG = (1 + 0) \times (1 + 0/64)/4 = 1/4, and CG = (1/4) \times 3⁻¹ = 1/12

After power-on, the default value of the Configuration Code {CM, HC, CC[0:5]} is {1,1,111111}. Therefore, VG = CG = 0.992. The relationship between the Configuration Code and the Current Gain is shown in Figure 22.

Figure 22. Current Gain vs Configuration Code

9.6.10 Error Flags Registers (EFLAG1, EFLAG2)

Table 14 describes Error Flags Registers 1 and 2.

Table 14. EFLAG1, EFLAG2 – Error Flags Registers (Address 1Dh and 1Eh) Bit Description

ADDRESS	REGISTER	BIT	SYMBOL	ACCESS ⁽¹⁾	VALUE ⁽²⁾	DESCRIPTION ⁽³⁾
1Dh	EFLAG1	0	EFLAG1[0]	R	0	Channel 0
		1	EFLAG1[1]		0	Channel 1
		2	EFLAG1[2]		0	Channel 2
		3	EFLAG1[3]		0	Channel 3
		4	EFLAG1[4]		0	Channel 4
		5	EFLAG1[5]		0	Channel 5
		6	EFLAG1[6]		0	Channel 6
		7	EFLAG1[7]		0	Channel 7
1Eh	EFLAG2	0	EFLAG1[0]	R	0	Channel 8
		1	EFLAG1[1]		0	Channel 9
		2	EFLAG1[2]		0	Channel 10
		3	EFLAG1[3]		0	Channel 11
		4	EFLAG1[4]		0	Channel 12
		5	EFLAG1[5]		0	Channel 13
		6	EFLAG1[6]		0	Channel 14
		7	EFLAG1[7]		0	Channel 15

(1) R = read, W = write

(2) Default value

(3) At power-up, in order to initialize the Error Flags registers, the host must write 1 to bit 7 of the MODE2 register and then write 0 to bit 7 of the MODE2 register.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

10.1.1 Constant Current Output

In LED display applications, TLC59116-Q1 provides nearly no current variations from channel to channel and from device to device. While $I_{OUT} \leq 52$ mA, the maximum current skew between channels is less than $\pm 6\%$ and less than $\pm 10\%$ between devices.

10.1.2 Adjusting Output Current

TLC59116-Q1 scales up the reference current (I_{ref}) set by the external resistor (R_{ext}) to sink the output current (I_{out}) at each output port. [Table 13](#) shows the Configuration Code and discusses bits CM, HC, and CC[5:0]. The following formulas can be used to calculate the target output current $I_{OUT,target}$ in the saturation region:

$$V_{REXT} = 1.26 \text{ V} \times VG \quad (3)$$

$$I_{ref} = V_{REXT}/R_{ext}, \text{ if another end of the external resistor } R_{ext} \text{ is connected to ground} \quad (4)$$

$$I_{OUT,target} = I_{ref} \times 15 \times 3^{CM-1} \quad (5)$$

Where R_{ext} is the resistance of the external resistor connected to the REXT terminal, and V_{REXT} is the voltage of REXT, which is controlled by the programmable voltage gain (VG), which is defined by the Configuration Code.

The Current Multiplier bit (CM) sets the ratio $I_{OUT,target}/I_{ref}$ to 15 or 5 (sets the exponent $CM - 1$ to either 0 or -1). After power-on, the default value of VG is $127/128 = 0.992$, and the default value of CM is 1, so that the ratio $I_{OUT,target}/I_{ref} = 15$. Based on the default VG and CM:

$$V_{REXT} = 1.26 \text{ V} \times 127/128 = 1.25 \text{ V} \quad (6)$$

$$I_{OUT,target} = (1.25 \text{ V}/R_{ext}) \times 15 \quad (7)$$

Therefore, the default current is approximately 20 mA at 931 Ω . The default relationship after power-on between $I_{OUT,target}$ and R_{ext} is shown in [Figure 24](#).

shows the output voltage versus the output current with several different resistor values on REXT. This shows the minimum voltage required at the device to have full VF across the LED. The VLED voltage must be higher than the VF plus the VOL of the driver. If the VLED is too high, more power will be dissipated in the driver. If this is the case, a resistor can be inserted in series with the LED to dissipate the excess power and reduce the thermal conditions on the driver.

If a single driver is used with LEDs that have different VF values, resistors can also be used in series with the LED to remove the excess power from the driver. In cases where not all outputs are being used, the unused outputs can be left floating without issue.

10.2 Typical Application

The TLC59116-Q1 outputs can be wired in parallel to increase the current per LED string.

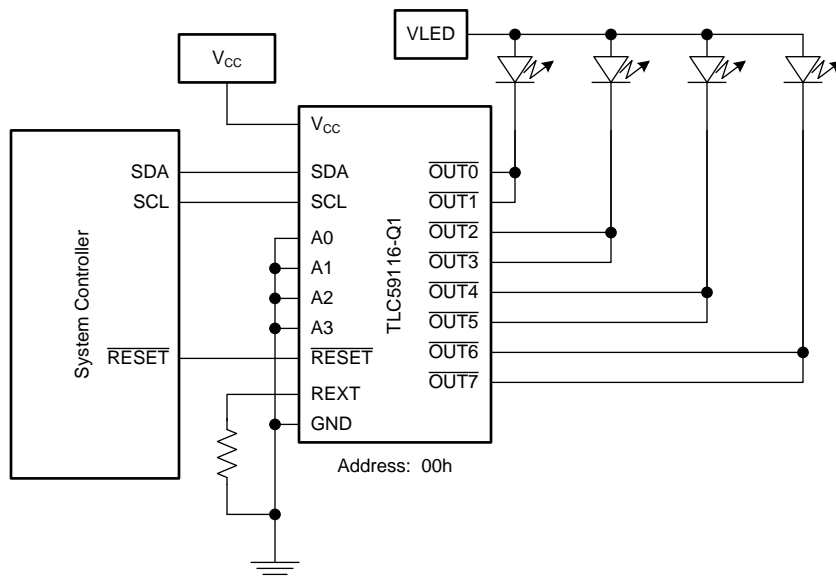

Figure 23. Parallel Channels

10.2.1 Design Requirements

Set the LED current to 50 mA while the IREF register is at the default value (CG = 0.992).

10.2.2 Detailed Design Procedure

The goal of this design is to set the LED current to 50 mA. Because two outputs are in parallel, the LED current should actually be set to 25 mA. With the IREF register at the default value:

$$I_{OUT,target} = (1.25 \text{ V} / R_{EXT}) \times 15 \quad (8)$$

Using this equation, the appropriate R_{EXT} is calculated to be 750 Ω .

Typical Application (continued)

10.2.3 Application Curve

Figure 24. $I_{OUT,target}$ vs R_{ext}

11 Power Supply Recommendations

TLC59116-Q1 is designed to operate from a V_{CC} range of 3 V to 5.5 V.

12 Layout

12.1 Layout Guidelines

The I²C signals (SDA / SCL) should be kept away from potential noise sources.

The traces carrying power through the LEDs should be wide enough to handle necessary current.

All LED current passes through the device and into the ground node. The connection between the device ground and the circuit board ground must be a strong connection.

12.2 Layout Example

Figure 25. PW-28 Layout Example

12.3 Thermal Considerations

The maximum IC junction temperature should be restricted to 150°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given ambient temperature, use [Equation 9](#) as a guideline:

$$P_{D(max)} = \frac{T_{J(max)} - T_A}{\theta_{JA}}$$

where

- $P_{D(max)}$ = maximum allowable power dissipation
- $T_{J(max)}$ = maximum allowable junction temperature (150°C for the TLC59116-Q1)
- T_A = ambient temperature of the device
- θ_{JA} = junction to air thermal impedance. (9)

See [Thermal Information](#) section. This parameter is highly dependent upon board layout.

Power dissipation in the device is determined by the LED current and the voltage at the \overline{OUTx} pins. For example, if the LED current is 50 mA continuous through each channel and the output voltage is 1 V on each channel, then the total power dissipation is 50 mA × 1 V × 16 ch = 0.8 W.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
