

TLIN2021-Q1 具有抑制和唤醒功能的汽车类故障保护 LIN 收发器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准
- 符合 LIN 2.0、LIN 2.1、LIN 2.2、LIN 2.2A 和 ISO 17987 - 4 电气物理层 (EPL) 规格标准 (参阅 [SLLA493](#))
- 符合面向汽车应用的 SAE J2602-1 LIN 网络标准和面向汽车应用的 SAE J2602-2 LIN 网络标准一致性测试 (参阅 [SLLA493](#))
- 支持 12V 和 24V 应用
- 宽工作输入电压范围：
 - V_{SUP} 范围为 4.5V 至 45V
- LIN 传输数据速率高达 20kbps
- LIN 接收数据速率高达 100kbps
- 工作模式：
 - 正常模式
 - 低功耗待机模式
 - 低功耗睡眠模式
- 通过源识别提供低功耗模式唤醒支持：
 - 通过 LIN 总线实现远程唤醒
 - 通过 WAKE 引脚实现本地唤醒
 - 通过 EN 引脚实现本地唤醒
- 可耐受 5V 的输入电平支持
- 集成 45k Ω LIN 上拉电阻器
- 使用 INH 引脚控制系统级功耗
- 在 LIN 总线和 RXD 输出上实现上电/断电无干扰运行
- 保护特性：±60V LIN 总线容错、42V 负载突降支持、IEC ESD 保护、 V_{SUP} 输入端上的欠压保护、TXD 显性状态超时、热关断、系统级未供电节点或接地断开失效防护
- 结温范围为 -40°C 至 150°C
- 采用 SOIC (8) 和 VSON (8) 封装，提高了自动光学检测 (AOI) 能力

2 应用

- 车身电子装置和照明
- 信息娱乐系统与仪表组
- 混合动力电动汽车和动力总成系统
- 被动安全
- 电器

3 说明

TLIN2021-Q1 是一款本地互连网络 (LIN) 物理层收发器。LIN 是支持汽车车载网络的低速通用异步接收器发送器 (UART) 通信协议。

TLIN2021-Q1 发送器支持高达 20kbps 的数据速率，接收器支持高达 100kbps 的数据速率，以实现更快的下线编程。TLIN2021-Q1 通过 TXD 引脚控制 LIN 总线的状态，并通过其开漏 RXD 输出引脚报告总线的状态。该器件具有限流波形驱动器，用于降低电磁辐射 (EME)。

TLIN2021-Q1 旨在为 24V 应用提供支持，具有宽输入工作电压范围，还支持低功耗睡眠模式。该器件支持通过从 LIN、WAKE 引脚或 EN 引脚唤醒的功能从低功耗模式唤醒。该器件可以通过 TLIN2021-Q1 INH 输出引脚选择性地启用节点上可能存在的各种电源，从而在整个系统级别减少电池电流消耗。

TLIN2021-Q1 集成了一个用于 LIN 响应器应用、ESD 保护和故障保护的电阻器，可减少应用中的外部组件数量。一旦发生接地漂移或电源电压断开的情况，该器件可防止反馈电流经 LIN 流向电源输入。

封装信息

器件型号	封装 ⁽¹⁾	封装尺寸 (标称值)
TLIN2021-Q1	SOIC (D)	4.90mm x 3.91mm
	VSON (DRB)	3.00mm x 3.00mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision B (May 2020) to Revision C (June 2022) Page

- 将提到的所有旧术语实例更改为“指挥官”和“响应者”。..... **1**

Changes from Revision A (May 2020) to Revision B (May 2020) Page

- 将 (参阅 SLLA493) 添加到特性列表中..... **1**
- Added : See errata TLIN1021-Q1 and TLIN2021-Q1 Duty Cycle Over V_{SUP} **8**

Changes from Revision * (December 2019) to Revision A (May 2020) Page

- Changed note 3 to: Results given here are specific to the SAE J2962-1 Communication Transceivers Qualification Requirements - LIN. Testing performed by OEM approved independent 3rd party up to $\pm 35V$, EMC report available upon request. $\pm 85V$ verified internally during characterization..... **6**
- Changed C_{LIN} max value from 45pF to 25pF..... **8**
- Changed text in the WAKE section from: The WAKE pin is a high-voltage reverse-blocked input used for the local wake-up (LWU) function. To: The WAKE pin is a high-voltage input used for the local wake-up (LWU) function. **24**
- Changed text in the Changed text in the *Local Wake-Up (LWU) via WAKE Input Terminal* section From: The WAKE terminal is a bi-directional high-voltage reverse battery protected input To: The WAKE terminal is a bi-directional high-voltage input..... **27**

5 说明 (续)

TLIN2021-Q1 还包含欠压保护、过热关断保护和接地失效保护功能。一旦发生故障，此发送器便会立即关闭并在故障被排除之前一直保持关闭状态。

6 Pin Configuration and Functions

图 6-1. D Package, 8-Pin (SOIC)
(Top View)

图 6-2. DRB Package, 8-Pin (VSON)
(Top View)

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
RXD	1	Digital	LIN receive data output, open-drain
EN	2	Digital	Sleep mode control input, integrated pull-down
WAKE	3	High Voltage	Local wake-up input, high voltage
TXD	4	Digital	LIN transmit data input, integrated pulled down - active low after a local wake-up event
GND	5	GND	Ground connection
LIN	6	Bus IO	LIN bus input/output line
V _{SUP}	7	Supply	High-voltage supply from the battery
INH	8	High Voltage	Inhibit output to control system voltage regulators and supplies, high voltage
Thermal Pad	—		Electrically connected to GND, connect the thermal pad to the printed circuit board (PCB) ground plane for thermal relief

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{SUP}	Supply voltage range (ISO 17987)	- 0.3	60	V
V _{LIN}	LIN Bus input voltage (ISO 17987)	- 60	60	V
V _{WAKE}	WAKE pin input voltage	- 0.3	60	V
V _{INH}	INH pin output voltage range	- 0.3	60 and V _O ≤ V _{SUP} +0.3	V
V _{LOGIC_INPUT}	Logic input voltage	- 0.3	6	V
V _{LOGIC_OUTPUT}	Logic output voltage	- 0.3	6	V
I _O	Digital pin output current		8	mA
I _{O(INH)}	Inhibit output current		4	mA
I _{O(WAKE)}	WAKE output current due to ground shift (V _{WAKE} ≤ V _{GND}) - 0.3 V thus current out of the WAKE pin must be limited		3	mA
T _J	Junction Temp	- 55	165	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

				VALUE	UNIT
V _{ESD}	Electrostatic discharge	Human body model (HBM) classification level 3B: V _{SUP} , INH, and WAKE with respect to ground		±8000	
		Human body model (HBM) classification level 3B: LIN with respect to ground		±10000	
		Human body model (HBM) classification level 3A: all other pins, per AEC Q100-002 ⁽¹⁾		±4000	
		Charged device model (CDM) classification level C5, per AEC Q100-011	All pins	±750	
		LIN, V _{SUP} , WAKE terminal to GND ⁽²⁾	IEC 62228-3 per ISO 10605 Contact discharge R = 330 Ω, C = 150 pF (IEC 61000-4-2)	±8000	
		LIN terminal to GND ⁽²⁾	IEC 62228-3 per ISO 10605 Indirect contact discharge R = 330 Ω, C = 150 pF (IEC 61000-4-2)	±8000	
		LIN terminal to GND ⁽³⁾	SAE J2962-1 per ISO 10605 Contact discharge	±8000	
		LIN terminal to GND ⁽³⁾	SAE J2962-1 per ISO 10605 Air discharge	±25000	
V _{TRAN}	Non-synchronous transient injection	LIN, V _{SUP} , WAKE terminal to GND ⁽²⁾	IEC 62228-3 per IEC 62215-3 12 V electrical systems Pulse 1	-100	V
			IEC 62215-3 24 V electrical systems ⁽⁴⁾ Pulse 1	-450	
			IEC 62228-3 per IEC 62215-3 12 V electrical systems 24 V electrical systems ⁽⁴⁾ Pulse 2	75	
			IEC 62228-3 per IEC 62215-3 12 V electrical systems Pulse 3a	-150	
			IEC 62215-3 24 V electrical systems ⁽⁴⁾ Pulse 3a	-225	
			IEC 62228-3 per IEC 62215-3 12 V electrical systems Pulse 3b	150	
			IEC 62215-3 24 V electrical systems ⁽⁴⁾ Pulse 3b	225	
	Direct capacitor coupling	LIN terminal to GND ⁽³⁾	SAE J2962-1 per ISO 7637-3 DCC - Slow transient pulse	±85	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

(2) Results given here are specific to the IEC 62228-2 Integrated circuits - EMC evaluation of transceivers - Part 2: LIN transceivers. Testing performed by OEM approved independent 3rd party, EMC report available upon request.

(3) Results given here are specific to the SAE J2962-1 Communication Transceivers Qualification Requirements - LIN. Testing performed by OEM approved independent 3rd party up to ±35V, EMC report available upon request. ±85V verified internally during characterization.

(4) Verified during characterization

7.3 Thermal Information

THERMAL METRIC ⁽¹⁾		TLIN2021		UNIT
		D (SOIC)	DRB (VSON)	
		PINS	PINS	
R _{θJA}	Junction-to-ambient thermal resistance	125.3	53.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	65.4	60	°C/W
R _{θJB}	Junction-to-board thermal resistance	68.7	25.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	17.6	1.8	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	68.0	25.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	–	9.8	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.4 Recommended Operating Conditions

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{SUP}	Supply Voltage	4.5		45	V
V_{LIN}	LIN Bus input voltage	0		45	V
V_{LOGIC}	Logic Pin Voltage	0		5.25	V
T_J	Operating virtual junction temperature range	-40		150	$^{\circ}\text{C}$
T_{SDR}	Thermal shutdown rising	160			$^{\circ}\text{C}$
T_{SDF}	Thermal shutdown falling			150	$^{\circ}\text{C}$
$T_{\text{SD(HYS)}}$	Thermal shutdown hysteresis		10		$^{\circ}\text{C}$

7.5 Power Supply Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Supply Voltage and Current						
V_{SUP}	Operational supply voltage ISO 17987 Param 10,53	Device is operational beyond the LIN defined nominal supply voltage range. See Fig 8-1 and Fig 8-2	4.5		45	V
	Nominal supply voltage ISO 17987 Param 10, 53	Normal and standby modes ⁽¹⁾ See Fig 8-1 and Fig 8-2	4.5		45	V
		Sleep mode	4.5		45	V
I_{SUP}	Supply current Bus dominant	Normal mode $\text{EN} = V_{\text{CC}}, R_{\text{LIN}} \geq 500 \Omega, C_{\text{LIN}} \leq 10 \text{ nF}, \text{INH} = \text{WAKE} = V_{\text{SUP}}$		1.8	7.5	mA
		Standby mode $\text{EN} = 0 \text{ V}, R_{\text{LIN}} \geq 500 \Omega, C_{\text{LIN}} \leq 10 \text{ nF}, \text{INH} = \text{WAKE} = V_{\text{SUP}}$		1	2.1	mA
	Supply current Bus recessive	Normal mode $\text{EN} = V_{\text{CC}}, \text{INH} = \text{WAKE} = V_{\text{SUP}}$		400	850	μA
		Standby mode $\text{EN} = 0 \text{ V}, \text{INH} = \text{WAKE} = V_{\text{SUP}}$		20	55	μA
	Supply current Sleep mode	$4.5 \text{ V} < V_{\text{SUP}} \leq 27 \text{ V}, T_J = 125^{\circ}\text{C}$ $\text{EN} = 0 \text{ V}, \text{LIN} = \text{WAKE} = V_{\text{SUP}}, \text{TXD}$ and RXD floating		12	20	μA
		$27 \text{ V} < V_{\text{SUP}} \leq 45 \text{ V}, T_J = 125^{\circ}\text{C}$ $\text{EN} = 0 \text{ V}, \text{LIN} = \text{WAKE} = V_{\text{SUP}}, \text{TXD}$ and RXD floating			26	μA
UV_{SUPR}	Under voltage V_{SUP} threshold	Ramp up		4.15	4.45	V
UV_{SUPF}	Under voltage V_{SUP} threshold	Ramp down	3.5	4		V
U_{VHYS}	Delta hysteresis voltage for V_{SUP} under voltage threshold			0.13		V

(1) Normal mode ramp V_{SUP} while LIN signal is a 10 kHz square wave with 50% duty cycle and 18 V swing.

7.6 Electrical Characteristics

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
RXD Output Terminal						
V_{OL}	Low-level voltage	Based upon external pull-up to V_{CC} ⁽³⁾			0.6	V
I_{OL}	Low-level output current, open drain	LIN = 0 V, RXD = 0.4 V	1.5			mA
I_{LKG}	Leakage current, high-level	LIN = V_{SUP} , RXD = V_{CC}	- 5		5	μA
TXD Input Terminal						
V_{IL}	Low-level input voltage				0.8	V
V_{IH}	High-level input voltage		2			V
I_{LKG}	Low-level input leakage current	TXD = 0 V	- 5		5	μA
$I_{TXD(WAKE)}$	Local wake-up source recognition TXD ⁽⁴⁾	Standby mode after a local wake-up event $V_{LIN} = V_{SUP}$, WAKE = 0 V or V_{SUP} , TXD = 1 V	1.3		8	mA
R_{TXD}	Internal pull-down resistor value		125	350	800	k Ω
EN Input Terminal						
V_{IL}	Low-level input voltage		- 0.3		0.8	V
V_{IH}	High-level input voltage		2		5.25	V
V_{HYS}	Hysteresis voltage	By design and characterization	30		500	mV
I_{IL}	Low-level input current	EN = 0 V	- 5		5	μA
R_{EN}	Internal pull-down resistor		125	350	800	k Ω
LIN Terminal (Referenced to V_{SUP})						
V_{OH}	LIN recessive high-level output voltage	TXD = V_{CC} , $I_O = 0$ mA, $V_{SUP} = 7$ V to 45 V	0.85			V_{SUP}
V_{OH}	LIN recessive high-level output voltage	TXD = V_{CC} , $I_O = 0$ mA, 4.5 V $\leq V_{SUP} \leq 7$ V	3			V
V_{OL}	LIN dominant low-level output voltage	TXD = 0 V, $V_{SUP} = 7$ V to 45 V			0.2	V_{SUP}
V_{OL}	LIN dominant low-level output voltage	TXD = 0 V, 4.5 V $\leq V_{SUP} \leq 7$ V			1.2	V
$V_{SUP_NON_OP}$	V_{SUP} where impact of recessive LIN bus < 5% ISO 17987 Param 54/56	TXD & RXD open LIN = 4.5 V to 60 V	- 0.3		60	V
$I_{BUS(LIM)}$	Limiting current ISO 17987 Param 57	TXD = 0 V, $V_{LIN} = 36$ V, $R_{MEAS} = 480$ Ω , $V_{SUP} = 36$ V, $V_{BUSdom} < 10.224$ V See Figure 8-6	75	120	300	mA
$I_{BUS_PAS_dom}$	Receiver leakage current, dominant ISO 17987 Param 58	Driver off/recessive, LIN = 0 V, $V_{SUP} = 24$ V See Figure 8-7	- 1			mA
$I_{BUS_PAS_rec1}$	Receiver leakage current, recessive ISO 17987 Param 59	Driver off/recessive, LIN $\geq V_{SUP}$, 4.5 V $\leq V_{SUP} \leq 45$ V See Figure 8-8			20	μA
$I_{BUS_PAS_rec2}$	Receiver leakage current, recessive ISO 17987 Param 59	Driver off/recessive, LIN = V_{SUP} See Figure 8-8	- 5		5	μA
$I_{BUS_NO_GND}$	Leakage current, loss of ground ISO 17987 Param 60	GND = $V_{SUP} = 27$ V, 0 V $\leq V_{LIN} \leq 36$ V See Figure 8-9	- 1.5		1.5	mA
$I_{BUS_NO_BAT}$	Leakage current, loss of supply ISO 17987 Param 61	$V_{SUP} = \text{GND}$, 0 V $\leq V_{LIN} \leq 36$ V See Figure 8-9			5	μA
V_{BUSdom}	Low-level input voltage ISO 17987 Param 62	LIN dominant (including LIN dominant for wake up) See Figure 8-3 and Figure 8-4			0.4	V_{SUP}
V_{BUSrec}	High-level input voltage ISO 17987 Param 63	Lin recessive See Figure 8-3 and Figure 8-4	0.6			V_{SUP}
V_{BUS_CNT}	Receiver center threshold ISO 17987 Param 64	$V_{BUS_CNT} = (V_{BUSrec} + V_{BUSdom})/2$ See Figure 8-3 and Figure 8-4	0.475	0.5	0.525	V_{SUP}
V_{HYS}	Hysteresis voltage ISO 17987 Param 65	$V_{HYS} = V_{BUSrec} - V_{BUSdom}$ See Figure 8-3 and Figure 8-4			0.175	V_{SUP}
V_{SERIAL_DIODE}	Serial diode LIN termination pull-up path	$I_{SERIAL_DIODE} = 10$ μA	0.4	0.7	1.0	V
$R_{Responder}$	Pull-up resistor to V_{SUP}	Normal and standby modes	20	45	60	k Ω
I_{RSLEEP}	Pull-up current source to V_{SUP} sleep mode	$V_{SUP} = 27$ V, LIN = GND	- 20		- 1.5	μA
C_{LIN}	Capacitance of the LIN pin				25	pF

7.6 Electrical Characteristics (continued)

parameters valid across $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INH Output Terminal						
ΔV_H	High level voltage drop INH with respect to V_{SUP}	$I_{INH} = -0.5\text{ mA}$		0.5	1	V
$I_{LKG(INH)}$	Leakage current sleep mode	$INH = 0\text{ V}$	-0.5		0.5	μA
WAKE Input Terminal						
V_{IH}	High-level input voltage	Standby and sleep mode		$V_{SUP} - 1.8$		V
V_{IL}	Low-level input voltage	Standby and sleep mode		$V_{SUP} - 3.85$		V
I_{IH}	High-level input leakage current	$WAKE = V_{SUP} - 1\text{ V}$	-25	-12.5		μA
I_{IL}	High-level input leakage current	$WAKE = 1\text{ V}$		15	25	μA
t_{WAKE}	WAKE hold time	Wake up time from sleep mode	5		50	μs
Duty Cycle Characteristics⁽⁵⁾						
D1 _{12V}	Duty Cycle 1 ISO 17987 Param 27 ⁽¹⁾	$TH_{REC(MAX)} = 0.744 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.581 \times V_{SUP}$, $V_{SUP} = 7\text{ V to }18\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D1 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11	0.396			
D1 _{12V}	Duty Cycle 1	$TH_{REC(MAX)} = 0.625 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.581 \times V_{SUP}$, $V_{SUP} = 4.5\text{ V to }7\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D1 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11	0.396			
D2 _{12V}	Duty Cycle 2 ISO 17987 Param 28	$TH_{REC(MIN)} = 0.422 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.284 \times V_{SUP}$, $V_{SUP} = 4.5\text{ V to }18\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$ (20 kbps), $D2 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11			0.581	
D3 _{12V}	Duty Cycle 3 ISO 17987 Param 29 ⁽²⁾	$TH_{REC(MAX)} = 0.778 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.616 \times V_{SUP}$, $V_{SUP} = 7\text{ V to }18\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D3 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11	0.417			
D3 _{12V}	Duty Cycle 3	$TH_{REC(MAX)} = 0.645 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.616 \times V_{SUP}$, $V_{SUP} = 4.5\text{ V to }7\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D3 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11	0.417			
D4 _{12V}	Duty Cycle 4 ISO 17987 Param 30	$TH_{REC(MIN)} = 0.389 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.251 \times V_{SUP}$, $V_{SUP} = 7\text{ V to }18\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D4 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11			0.59	
D4 _{12V}	Duty Cycle 4	$TH_{REC(MIN)} = 0.422 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.284 \times V_{SUP}$, $V_{SUP} = 4.5\text{ V to }7\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$ (10.4 kbps), $D4 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ See Fig 8-10 and Fig 8-11			0.59	
D1 _{24V}	Duty Cycle 1 ISO 17987 Param 72	$TH_{REC(MAX)} = 0.710 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.554 \times V_{SUP}$, $V_{SUP} = 15\text{ V to }36\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$, $D1 = t_{BUS_rec(MIN)}/(2 \times t_{BIT})$ See Fig 8-12 and Fig 8-13	0.330			
D2 _{24V}	Duty Cycle 2 ISO 17987 Param 73	$TH_{REC(MIN)} = 0.446 \times V_{SUP}$, $TH_{DOM(MIN)} = 0.302 \times V_{SUP}$, $V_{SUP} = 15.6\text{ V to }36\text{ V}$, $t_{BIT} = 50\text{ }\mu\text{s}$, $D2 = t_{BUS_rec(MAX)}/(2 \times t_{BIT})$ See Fig 8-12 and Fig 8-13			0.642	
D3 _{24V}	Duty Cycle 3 ISO 17987 Param 74	$TH_{REC(MAX)} = 0.744 \times V_{SUP}$, $TH_{DOM(MAX)} = 0.581 \times V_{SUP}$, $V_{SUP} = 7\text{ V to }36\text{ V}$, $t_{BIT} = 96\text{ }\mu\text{s}$, $D3 = t_{BUS_rec(min)}/(2 \times t_{BIT})$ See Fig 8-12 and Fig 8-13	0.386			

7.6 Electrical Characteristics (continued)

9 Detailed Description

9.1 Overview

The TLIN2021-Q1 is a local interconnect network (LIN) physical layer transceiver, compliant to LIN 2.0, LIN 2.1, LIN 2.2, LIN 2.2A, SAE J2602-1, SAE J2602-2, ISO 17987 - 4, and ISO 17987 - 7 standards. LIN is a low-speed universal asynchronous receiver transmitter (UART) communication protocol focused on automotive in-vehicle networking.

The TLIN2021-Q1 transmitter supports data rates from 2.4 kbps to 20 kbps and the receiver supports data rates up to 100 kbps for end-of-line programming. The TLIN2021-Q1 controls the state of the LIN bus via the TXD pin and reports the state of the bus via its open-drain RXD output pin. The LIN protocol data stream on the TXD input is converted by the TLIN2021-Q1 into a LIN bus signal using an optimized electromagnetic emissions current-limited wave-shaping driver as outlined by the LIN physical layer specification. The receiver converts the data stream to logic-level signals that are sent to the microcontroller through the open-drain RXD pin. The LIN bus has two states: dominant state (voltage near ground) and recessive state (voltage near battery). In the recessive state, the LIN bus is pulled high by the transceivers internal pull-up resistor (45 k Ω) and a series diode. No external pull-up components are required for responder applications. Commander applications require an external pull-up resistor (1 k Ω) plus a series diode per the LIN specification.

The TLIN2021-Q1 is designed to support 24 V applications with a wide input voltage operating range and also supports low-power sleep mode. The device supports wake-up from low-power mode via wake over LIN, the WAKE pin, or the EN pin. The device allows for system-level reductions in battery current consumption by selectively enabling the various power supplies that may be present on a node through the TLIN2021-Q1 INH output pin.

The TLIN2021-Q1 integrates ESD protection and fault protection which allow for a reduction in the required external components in the applications. The device prevents back-feed current through LIN to the supply input in case of a ground shift or supply voltage disconnection.

The TLIN2021-Q1 also include undervoltage detection, temperature shutdown protection, and loss-of-ground protection. In the event of a fault condition, the transmitter is immediately switched off and remains off until the fault condition is removed.

9.2 Functional Block Diagram

Copyright © 2019, Texas Instruments Incorporated

9.3 Feature Description

9.3.1 LIN

This high voltage input/output pin is the single-wire LIN bus transmitter and receiver. The LIN pin can survive transient voltages up to 60 V. Reverse currents from the LIN to supply (V_{SUP}) are minimized with blocking diodes, even in the event of a ground shift or loss of supply (V_{SUP}).

9.3.1.1 LIN Transmitter Characteristics

The LIN transmitter has thresholds and AC switching parameters according to the LIN specification. The transmitter is a low side transistor with internal current limitation and thermal shutdown. During a thermal shutdown condition, the transmitter is disabled to protect the device. There is an internal pull-up resistor with a serial diode structure to V_{SUP}, so no external pull-up components are required for LIN responder applications. An external pull-up resistor and series diode to V_{SUP} must be added when the device is used for in a commander application per the LIN specification.

9.3.1.2 LIN Receiver Characteristics

The receiver characteristic thresholds are proportional to the device supply pin in accordance to the LIN specification.

The receiver is capable of receiving higher data rates, > 100 kbps, than supported by LIN or SAEJ2602 specifications. This allows the TLIN2021-Q1 to be used for high-speed downloads at the end-of-line production or other applications. The actual data rate achievable depends on system time constants (bus capacitance and pull-up resistance) and driver characteristics used in the system.

9.3.1.2.1 Termination

There is an internal pull-up resistor with a serial diode structure to V_{SUP} , so no external pull-up components are required for the LIN responder applications. An external pull-up resistor (1 k Ω) and a series diode to V_{SUP} must be added when the device is used for commander node applications as per the LIN specification.

图 9-1 shows a Commander Node configuration and how the voltage levels are defined

图 9-1. Commander Node Configuration with Voltage Levels

9.3.2 TXD

TXD is the interface to the MCU LIN protocol controller or SCI and UART that is used to control the state of the LIN output. When TXD is low the LIN output is dominant (near ground) and when TXD is high the LIN output is recessive (near V_{SUP}), see 图 9-1.

The TXD input structure is compatible with 3.3 V and 5 V microcontrollers and integrates a weak pull-down resistor. The LIN bus is protected from being stuck dominant through a system failure driving TXD low through the dominant state timer-out timer. When a change of state on the WAKE pin initiates a local wake-up event, the TXD pin is pulled hard to ground indicating a local wake-up event. The hard pull to ground is released upon the rising edge on the EN pin. If an external pull-up resistor is added to the TXD pin to the microcontrollers IO voltage then TXD is pulled high to indicate a remote wake-up event.

9.3.3 RXD

RXD is the interface to the MCU's LIN protocol controller or SCI and UART, which reports the state of the LIN bus voltage. LIN recessive (near V_{SUP}) is represented by a high level on the RXD and LIN dominant (near ground) is represented by a low level on the RXD pin. The RXD output structure is an open-drain output stage. This allows the device to be used with 3.3 V and 5 V microcontrollers. If the microcontrollers RXD pin does not have an integrated pull-up, an external pull-up resistor to the microcontrollers IO supply voltage is required. In standby mode, the RXD pin is driven low to indicate a wake-up request.

9.3.4 V_{SUP}

V_{SUP} is the power supply pin. V_{SUP} is connected to the battery through an external reverse-blocking diode, see 图 9-1. If there is a loss of power at the ECU level, the device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

9.3.5 GND

GND is the device ground connection. The device can operate with a ground shift as long as the ground shift does not reduce the V_{SUP} below the minimum operating voltage. If there is a loss of ground at the ECU level, the

device has extremely low leakage from the LIN pin, which does not load the bus down. This is optimal for LIN systems in which some of the nodes are unpowered (ignition supplied) while the rest of the network remains powered (battery supplied).

9.3.6 EN

EN controls the operational modes of the device. When EN is high the device is in normal operating mode allowing a transmission path from TXD to LIN and from LIN to RXD. When EN is low, the device is put into sleep mode and there are no transmission paths available. The device can enter normal mode only after wake-up. EN has an internal pull-down resistor to ensure the device remains in low power mode even if EN floats.

9.3.7 WAKE

The WAKE pin is a high-voltage input used for the local wake-up (LWU) function. This function is explained further in [节 9.4.4.1](#) section. The pin is defaulted to bidirectional edge trigger, meaning it recognizes a local wake-up (LWU) on a rising or falling edge of WAKE pin transition.

9.3.8 INH

The TLIN2021-Q1 inhibit, INH, output pin can be used to control the enable of system power-management devices allowing for a significant reduction in battery quiescent current consumption while the application is in sleep mode. The INH pin has two states: driven high and high impedance. When the INH pin is driven high, the terminal shows V_{SUP} minus a diode voltage drop. In the high impedance state the output is left floating. The INH pin is high in the normal and standby modes and is low when in sleep mode. A 100 k Ω load can be added to the INH output to ensure a fast transition time from the driven high state to the low state and to also force the pin low when left floating.

The INH terminal should be considered a high-voltage logic terminal and not a power output. Thus should be used to drive the EN terminal of the systems power-management device and not used as a switch for the power-management supply itself. This terminal is not reverse battery protected and thus should not be connected outside the system module.

9.3.9 Local Faults

The TLIN2021-Q1 has several protection features that are described as follows.

9.3.10 TXD Dominant Time-Out (DTO)

While the LIN driver is in active mode a TXD DTO circuit prevents the local node from blocking network communication in event of a hardware or software failure where TXD is held dominant longer than the time-out period t_{TXD_DTO} . The TXD DTO circuit is triggered by a falling edge on TXD. If no rising edge is seen before the time-out constant of the circuit, t_{TXD_DTO} , expires the LIN driver is disabled releasing the bus line to the recessive level. This keeps the bus free for communication between other nodes on the network. The LIN driver is re-activated on the next dominant to recessive transition on the TXD terminal, thus clearing the dominant time-out. During this fault, the transceiver remains in normal mode, the integrated LIN bus pull-up termination remains on, and the LIN receiver and RXD terminal remain active reflecting the LIN bus data.

The TXD pin has an internal pull-down to ensure the device fails to a known state if TXD is disconnected. If EN pin is high at power-up, the TLIN2021-Q1 enters normal mode. With the internal TXD connected low, the DTO timer starts. To avoid a t_{TXD_DTO} fault, a recessive signal should be put onto the TXD pin before the t_{TXD_DTO} timer expires, or the device should be into sleep mode by connecting EN pin low.

9.3.11 Bus Stuck Dominant System Fault: False Wake-Up Lockout

The TLIN2021-Q1 contains logic to detect bus stuck dominant system faults and prevents the device from waking up falsely during the system fault. Upon entering sleep mode, the device detects the state of the LIN bus. If the bus is dominant, the wake-up logic is locked out until a valid recessive on the bus clears the bus stuck dominant fault, preventing excessive current use, see [图 9-2](#) and [图 9-3](#).

Copyright © 2019, Texas Instruments Incorporated

图 9-2. No Bus Fault: Entering Sleep Mode with Bus Recessive Condition and Wake-up

Copyright © 2019, Texas Instruments Incorporated

图 9-3. Bus Fault: Entering Sleep Mode With Bus Stuck Dominant Fault, Clearing, and Wake-up

9.3.12 Thermal Shutdown

The TLIN2021-Q1 transmitter is protected by limiting the current. If the junction temperature, T_J , of the device exceeds the thermal shutdown threshold, $T_J > T_{SDR}$, the device puts the LIN transmitter into the recessive state. Once the over temperature fault condition has been removed and the junction temperature has cooled beyond the hysteresis temperature, the transmitter is re-enabled. During this fault, the transceiver remains in normal mode, the integrated LIN bus pull-up termination remains on, the LIN receiver and RXD terminal remain active reflecting the LIN bus data.

9.3.13 Under Voltage on V_{SUP}

The TLIN2021-Q1 contains a power on reset circuit to avoid false bus messages during under voltage conditions when V_{SUP} is less than UV_{SUP} .

9.3.14 Unpowered Device

In automotive applications, some LIN nodes in a system can be unpowered, ignition supplied, while others in the network remains powered by the battery. The TLIN2021-Q1 has extremely low unpowered leakage current from the bus so an unpowered node does not affect the network or load it down.

9.4 Device Functional Modes

The TLIN2021-Q1 has three functional modes of operation: normal, sleep, and standby. The next sections describe these modes and how the device transitions between the different modes. 图 9-4 graphically shows the relationship while 表 9-1 shows the state of pins.

表 9-1. Operating Modes

MODE	EN	TXD	RXD	INH	LIN BUS TERMINATION	TRANSMITTER	COMMENT
Sleep	Low	Weak pull-down	Floating	Floating	Weak current pull-up	Off	

表 9-1. Operating Modes (continued)

MODE	EN	TXD	RXD	INH	LIN BUS TERMINATION	TRANSMITTER	COMMENT
Standby	Low	weak pull-down if LIN bus wake-up; Strong pull-down if a local wake-up event (WAKE pin)	Low	High	45 kΩ	Off	Wake-up event detected, waiting on MCU to set EN
Normal	High	High: recessive state Low: dominant state	LIN Bus Data	High	45 kΩ	On	LIN transmission up to 20 kbps

Copyright © 2019, Texas Instruments Incorporated

图 9-4. Operating State Diagram

9.4.1 Normal Mode

The EN pin controls the mode of the device. If the EN pin is high at power-up the device powers-up in normal mode, if the EN is low at power-up the device powers-up in standby mode. In normal mode the receiver and transmitter fully operational. The LIN transmitter transmits data from the LIN controller to the LIN bus up to the LIN specified maximum data rate of 20 kbps. The LIN receiver detects the data stream on the LIN bus up to data rates of 100 kbps and outputs the data on RXD output for the LIN controller. Upon an EN pin transition from low to high the TLIN2021-Q1 transitions from sleep mode to normal mode in $t \geq t_{NOMINT}$.

9.4.2 Sleep Mode

Sleep mode is the lowest power mode of the TLIN2021-Q1 and is only entered from normal mode when the EN pin transitions from high to low for $t > t_{MODE_CHANGE}$. In sleep mode, the LIN driver and receiver are switched off, the LIN bus is weakly pulled up, and the transceiver cannot send or receive data. The INH pin is switched to a floating output in sleep mode causing any system power elements controlled by the INH pin to be switched off thus reducing the system power consumption. While the device is in sleep mode, the following conditions exist:

- The LIN bus driver is disabled and the internal LIN bus termination is switched off to minimize power loss if LIN is short circuited to ground.
- A weak current pull-up is active to prevent false wake-up events in case an external connection to the LIN bus is lost.
- The normal receiver is disabled.
- EN input, WAKE pin and LIN wake-up receiver are active.

The TLIN2021-Q1 supports three methods for wake-up from sleep mode:

- Wake-up over the LIN bus via the LIN wake-up receiver.
- Local wake-up via the WAKE pin.
- Local wake-up via the EN pin. The EN pin must be set high for $t > t_{\text{NOMINT}}$ in order for the device to wake-up.

9.4.3 Standby Mode

Standby mode is entered whenever a wake-up event occurs through LIN bus or the WAKE pin while the device is in sleep mode. In standby mode, the LIN bus responder termination circuit, $45\text{ k}\Omega$, is on. When a wake-up event occurs and the TLIN2021-Q1 enters standby mode the RXD pin is driven low signaling the wake-up event to the LIN controller.

The TLIN2021-Q1 exits standby mode and transitions to normal mode when the EN pin is set high for longer than $t_{\text{MODE_CHANGE}}$ where the normal LIN transmitter and receiver are fully operational and bi-directional communication is possible.

9.4.4 Wake-Up Events

There are three ways to wake-up the TLIN2021-Q1 from sleep mode:

- Remote wake-up initiated by the falling edge of a recessive-to-dominant state transition on the LIN bus where the dominant state is held than t_{LINBUS} filter time. After the t_{LINBUS} filter time has been met a rising edge on the LIN bus going from dominant-to-recessive initiates a remote wake-up event. The pattern and t_{LINBUS} filter time used for the LIN wake-up prevents noise and bus stuck dominant faults from causing false wake requests.
- A local wake-up event due to the EN pin being set high for $t > t_{\text{MODE_CHANGE}}$.
- A local wake-up event due to a change in voltage level on the WAKE pin for $t > t_{\text{WAKE}}$

9.4.4.1 Local Wake-Up (LWU) via WAKE Input Terminal

The WAKE terminal is a bi-directional high-voltage input which can be used for local wake-up (LWU) requests via a voltage transition. A LWU event is triggered on either a low-to-high or high-to-low transition since it has bi-directional input thresholds. The WAKE pin could be used with a switch to V_{SUP} or to ground. If the terminal is unused it should be pulled to V_{SUP} or ground to avoid unwanted parasitic wake-up events. When a LWU event takes place the TXD pin is pulled hard to GND letting the LIN controller know that the wake-up event was due to the WAKE pin and not a wake over LIN event.

The LWU circuitry is active in standby mode and sleep mode. If a valid LWU event occurs in standby mode, the device remains in standby mode and drive the RXD output low. If a valid LWU event occurs in sleep mode, the device transitions to standby mode and drive the RXD output low. The LWU circuitry is not active in normal mode. To minimize system level current consumption, the internal bias voltages of the terminal follows the state on the terminal with a delay of $t_{\text{WAKE(MIN)}}$. A constant high level on WAKE has an internal pull-up to V_{SUP} , and a constant low level on WAKE has an internal pull-down to GND.

图 9-5. Local Wake-Up - Rising Edge

Copyright © 2019, Texas Instruments Incorporated

图 9-6. Local Wake-Up - Falling Edge

9.4.4.2 Wake-Up Request (RXD)

When the TLIN2021-Q1 encounters a wake-up event from the WAKE pin, or the LIN bus the RXD output is driven low until EN is asserted high, the device enters normal mode. Once the device enters normal mode, the wake-up event is cleared, and the RXD output is released. The RXD output is fully operation and reflects the receiver output from the LIN bus.

10 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围, TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计, 以确保系统功能。

10.1 Application Information

The TLIN2021-Q1 can be used in both a responder application and a commander application in a LIN network.

10.2 Typical Application

The device integrates a 45 k Ω pull-up resistor and series diode for responder applications. For commander applications, an external 1 k Ω pull-up resistor with series blocking diode can be used. 图 10-1 shows the device being used in both commander and responder applications.

图 10-1. Typical LIN Bus

10.2.1 Design Requirements

The RXD output structure is an open-drain output stage which allows the TLIN2021-Q1 to be used with 3.3-V and 5-V controllers. If the RXD pin of the controller does not have an integrated pull-up, an external pull-up resistor to the controllers IO voltage is required. The external pull-up resistor value should be between 1 k Ω to 10 k Ω . The V_{SUP} pin of the device should be decoupled with a 100-nF capacitor by placing it close to the V_{SUP}

supply pin. The system should include additional decoupling on the V_{SUP} line as needed per the application requirements.

10.2.2 Detailed Design Procedures

10.2.2.1 Normal Mode Application Note

When using the TLIN2021-Q1 in systems which are monitoring the RXD pin for a wake-up request, special care should be taken during the mode transitions. The output of the RXD pin is indeterminate for the transition period between states as the receivers are switched. The application software should not look for an edge on the RXD pin indicating a wake-up request until t_{MODE_CHANGE} has been met. This is shown in 图 8-14

10.2.2.2 TXD Dominant State Time-Out Application Note

The maximum dominant TXD time allowed by the TXD dominant state time-out limits the minimum possible data rate of the device. The LIN protocol has different constraints for commander and responder applications thus there are different maximum consecutive dominant bits for each application case thus different minimum data rates.

10.2.3 Application Curves

图 10-2 and 图 10-3 show the propagation delay from the TXD pin to the LIN pin for the dominant to recessive and recessive to dominant edges.

10.3 Power Supply Recommendations

The TLIN2021-Q1 was designed to operate directly from a car battery, or any other DC supply ranging from 4.5 V to 45 V. The V_{SUP} pin of the device should be decoupled with a 100-nF capacitor by placing it close to the V_{SUP} supply pin. The system should include additional decoupling on the V_{SUP} line as needed per the application requirements.

Layout

For the PCB design to be successful, start with design of the protection and filtering circuitry. Because ESD transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high frequency layout techniques must be applied during PCB design. Placement at the connector also prevents these noisy events from propagating further into the PCB and system.

10.4.1 Layout Guidelines

- Pin 1(RXD):** The RXD pin is an open-drain output and requires an external pull-up resistor in the range of 1 kΩ and 10 kΩ to function properly. If the controller paired with the transceiver does not have an integrated pull-up, an external resistor should be placed between RXD and the supply voltage for the controller.

- **Pin 2 (EN):** EN is an input pin that is used to place the device in low-power sleep mode. If this feature is not used the pin should be connected to the supply voltage for the controller through a series resistor using a pull-up value between 1 k Ω and 10 k Ω . Additionally, a series resistor may be placed on the pin to limit current on the digital lines in the case of an over voltage fault.
- **Pin 3 (WAKE):** SW1 is oriented in a low-side configuration which is used to implement a local WAKE event. The series resistor R5 is needed for protection against over current conditions as it limits the current into the WAKE pin when the ECU has lost its ground connection. The pull-up resistor R4 is required to provide sufficient current during stimulation of a WAKE event. In this layout example R4 is set to 3 k Ω and R5 is set to 33 k Ω .
- **Pin 4 (TXD):** The TXD pin is the transmit input signal to the device from the controller. A series resistor can be placed to limit the input current to the device in the case of an over-voltage on this pin. A capacitor to ground can be placed close to the input pin of the device to help filter noise.
- **Pin 5 (GND):** This is the ground connection for the device. This pin should be tied to the ground plane through a short trace with the use of two vias to limit total return inductance.
- **Pin 6 (LIN):** The LIN pin connects to the TLIN2021-Q1 to the LIN bus. For responder applications a 220 pF capacitor to ground is implemented. For commander applications an additional series resistor and blocking diode should be placed between the LIN pin and the V_{SUP} pin, see 图 10-1.
- **Pin 7 (V_{SUP}):** This is the supply pin for the device. A 100-nF capacitor should be placed close to the V_{SUP} supply pin for local power supply decoupling.
- **Pin 8 (INH):** The INH pin is used for system power-management. A 100 k Ω load can be added to the INH output to ensure a fast transition time from the driven high state to the low state and to also force the pin low when left floating.

备注

All ground and power connections should be made as short as possible and use at least two vias to minimize the total loop inductance.

11.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 术语表

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TLIN2021DRBRQ1	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	TL021
TLIN2021DRBRQ1.A	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	TL021
TLIN2021DRQ1	Active	Production	SOIC (D) 8	2500 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	TL021
TLIN2021DRQ1.A	Active	Production	SOIC (D) 8	2500 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	TL021

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TLIN2021DRBRQ1	SON	DRB	8	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q1
TLIN2021DRQ1	SOIC	D	8	2500	330.0	12.4	6.4	5.2	2.1	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TLIN2021DRBRQ1	SON	DRB	8	3000	367.0	367.0	35.0
TLIN2021DRQ1	SOIC	D	8	2500	353.0	353.0	32.0

PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DRB 8

GENERIC PACKAGE VIEW

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4203482/L

4225036/A 06/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

LAND PATTERN EXAMPLE

EXPOSED METAL SHOWN

SCALE: 20X

SOLDER MASK DETAILS

4225036/A 06/2019

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slue271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD
81% PRINTED COVERAGE BY AREA
SCALE: 20X

4225036/A 06/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
