

用于无线电话听筒和便携式音频设备并装有嵌入式小型数字信号处理器 (miniDSP) 的低功耗立体声数模转换器 (ADC)

查询样品: **TLV320ADC3101-Q1**

特性

- 符合汽车应用要求
- 具有下列结果的 **AEC-Q100** 测试指南:
 - 器件温度 2 级: **-40°C** 至 **+105°C** 的环境运行温度范围
 - 器件人体模型 (HBM) 静电放电 (ESD) 分类等级 **H1C**
 - 器件充电器件模型 (CDM) ESD 分类等级 **C3B**
- 立体声音频数模转换器 (ADC)
 - **92dBA** 信噪比
 - 支持从 **8 kHz** 到 **96 kHz** 的 **ADC** 采样率
- 指令可编程嵌入式 **miniDSP**
- 具有 **RAM** 可编程系数、指令、和内置处理块的灵活数字滤波
 - 针对语音的低延迟无限脉冲响应 (**IIR**) 滤波器
 - 针对音频的线性相位有限脉冲响应 (**FIR**) 滤波器
 - 用于均衡 (**EQ**)、噪声消除或降低的附加可编程 **IIR** 滤波器
 - 高达 **128** 个可编程 **ADC** 数字滤波器系数
- 六个带有可配置自动增益控制 (**AGC**) 的音频输入
 - 在单端或者完全差分配置中可编程
 - 可配置为 **3** 态以轻松实现与其它音频集成电路 (**IC**) 的互用性
- 低功耗并具有广泛模块功率控制:
 - **6mW** 单声道录制, **8kHz**
 - **11mW** 立体声录制, **8kHz**
 - **10mW** 单声道录制, **48kHz**
 - **17mW** 立体声录制, **48kHz**
- 双可编程麦克风偏置
- 用于时钟生成的可编程锁相环路 (**PLL**)
- **I²C™** 控制总线
- 音频串行数据总线支持 **I²S**、左对齐/右对齐、**DSP**、脉冲编码调制 (**PCM**)、和时分复用 (**TDM**) 模式
- 支持数字麦克风输入
- 两个通用输入输出接口 (**GPIO**)

电源:

- 模拟: **2.6V-3.6V**
- 数字: 内核: **1.65V-1.95V**,
I/O: **1.1V-3.6V**

- **4mm x 4mm 24** 引脚 **RGE** (四方扁平无引线 (**QFN**) 封装)

应用范围

- 无线手持终端
- 便携式低功耗音频系统
- 噪声消除系统
- 针对数字音频的前端语音或者音频处理器

说明

TLV320ADC3101-Q1 是一款低功耗、立体声音频模数转换器 (ADC), 此器件支持 **8kHz** 至 **96kHz** 的采样率并有一个可提供高达 **40dB** 模拟增益或者自动增益控制 (**AGC**) 的集成可编程增益放大器。提供一个用于定制音频处理的可编程 **miniDSP**。还提供粗糙衰减为 **0dB**, **-6dB**, 或者关闭的前端输入。此输入在一个单端组合或者完全差分配置中可编程。通过 **I²C** 接口可提供广泛的基于寄存器的功率控制, 从而启用单声道或者立体声录音。低功耗使得 TLV320ADC3101-Q1 成为电池供电便携式设备的理想选择。

AGC 可在宽范围的启动

(**7ms-1.4s**) 和衰减 (**50ms-22.4s**) 时间区间内进行编程。包含一个用于避免噪声抽吸的可编程噪声栅极功能。低延迟 **IIR** 滤波器针对提供的语音和电话通讯进行了优化, 并且线性相位 **FIR** 滤波器针对音频进行了优化。还提供可用于声音均衡、或者去除噪声组件的可编程 **IIR** 滤波器。可对音频串行总线进行编程以支持 **I²S**、左对齐、右对齐、**DSP**、**PCM**、和 **TCM** 模式。音频总线可运行在主控或者受控模式下。

说明（继续）

包括一个用于灵活时钟生成的可编程集成锁相环路 (PLL) 并且为来自宽范围可用 MCLK 的所有标准音频速率（在 512kHz 至 50MHz 间变化）提供支持，包括最常用的 12MHz, 13MHz, 16MHz, 19.2MHz, 和 19.68MHz 系统时钟的情况。

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

	Dynamic range, A-weighted ^{(1) (2)}	f _S = 48 kHz, 1-kHz –60-dB full-scale input applied at IN1 inputs, 0-dB PGA gain		92		dB
THD	Total harmonic distortion	f _S = 48 kHz, 1-kHz –2-dB full-scale input applied at IN1 inputs, 0-dB PGA gain		–110	–72	dB
				0.003%	0.017%	
PSRR	Power supply rejection ratio	234 Hz, 100 mV _{PP} on AVDD, single-ended input		46		dB
		234 Hz, 100 mV _{PP} on AVDD, differential input		68		
	ADC channel separation	1 kHz, –2 dB IN1L to IN1R		–73		dB
	ADC gain error	1 kHz input, 0-dB PGA gain		0.7		dB
	ADC programmable-gain amplifier maximum gain	1-kHz input tone, R _{SOURCE} < 50 Ω		40		dB
	ADC programmable-gain amplifier step size			0.502		dB
Input resistance		IN1 inputs, routed to single ADC Input mix attenuation = 0 dB		35		kΩ
		IN2 inputs, input mix attenuation = 0 dB		35		
		IN1 inputs, input mix attenuation = –6 dB		62.5		
		IN2 inputs, input mix attenuation = –6 dB		62.5		
	Input capacitance			10		pF
	Input level control minimum attenuation setting			0		dB
	Input level control maximum attenuation setting			6		dB
	Input level control attenuation step size			6		dB

- (1) Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the inputs short-circuited, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
- (2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD and lower SNR and dynamic range readings than shown in the *Electrical Characteristics*. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.

OVERVIEW

The TLV320ADC3101-Q1 is a flexible, low-power, stereo audio ADC device with extensive feature integration, intended for applications in smartphones, PDAs, and portable computing, communication, and entertainment applications. The device integrates a host of features to reduce cost, board space, and power consumption in space-constrained, battery-powered, portable applications.

The TLV320ADC3101-Q1 consists of the following blocks:

- Stereo audio multibit delta-sigma ADC (8 kHz–96 kHz)
- Programmable digital audio effects processing (3-D, bass, treble, mid-range, EQ, de-emphasis)
- Register-configurable combinations of up to six single-ended or three differential audio inputs
- Fully programmable PLL with extensive ADC clock-source and divider options for maximum end-system design flexibility

Communication to the TLV320ADC3101-Q1 for control is via a two-wire I²C interface. The I²C interface supports both standard and fast communication modes.

HARDWARE RESET

The TLV320ADC3101-Q1 requires a hardware reset after power up for proper operation. After all power supplies are at their specified values, the RESET pin must be driven low for at least 10 ns. If this reset sequence is not performed, the TLV320ADC3101-Q1 may not respond properly to register reads/writes.

PLL START-UP

When the PLL is powered on, a start-up delay of approximately 10 ms occurs after the power-up command of the PLL and before the clocks are available to the TLV320ADC3101-Q1. This delay is to ensure stable operation of the PLL and clock-divider logic.

SOFTWARE POWER DOWN

By default, all circuit blocks are powered down following a reset condition. Hardware power up of each circuit block can be controlled by writing to the appropriate control register. This approach allows the lowest power-supply current for the functionality required. However, when a block is powered down, all of the register settings are maintained as long as power is still being applied to the device.

miniDSP

The TLV320ADC3101-Q1 features a miniDSP core which is tightly coupled to the ADC. The fully programmable algorithms for the miniDSP must be loaded into the device after power up. The miniDSP has direct access to the digital stereo audio stream, offering the possibility for advanced, very low-group-delay DSP algorithms. The ADC miniDSP has 512 programmable instructions, 256 data memory locations, and 128 programmable coefficients.

Software development for the TLV320ADC3101-Q1 is supported through TI's comprehensive PurePath™ Studio software development environment, a powerful, easy-to-use tool designed specifically to simplify software development on Texas Instruments miniDSP audio platforms. The graphical development environment consists of a library of common audio functions that can be dragged and dropped into an audio signal flow and graphically connected together. The DSP code can then be assembled from the graphical signal flow with the click of a mouse. See the TLV320ADC3101-Q1 product folder on www.ti.com to learn more about PurePath Studio software and the latest status on available, ready-to-use DSP algorithms.

DIGITAL CONTROL SERIAL INTERFACE

I²C CONTROL MODE

The TLV320ADC3101-Q1 supports the I²C control protocol and is capable of both standard and fast modes. Standard mode is up to 100 kHz and fast mode is up to 400 kHz. When in I²C control mode, the TLV320ADC3101-Q1 can be configured for one of four different addresses, using the pins I2C_ADR1 and I2C_ADR0, which control the two LSBs of the device address. The 5 MSBs of the device address are fixed as 00110 and cannot be changed, while the two LSBs are given by I2C_ADR1:I2C_ADR0. This results in four possible device addresses:

Table 2. I²C Slave Device Addresses for I2C_ADR1, I2C_ADR0 Settings

I2C_ADR1	I2C_ADR0	Device Address
0	0	0011 000
0	1	0011 001
1	0	0011 010
1	1	0011 011

I²C is a two-wire, open-drain interface supporting multiple devices and masters on a single bus. Devices on the I²C bus only drive the bus lines LOW by connecting them to ground; they never drive the bus lines HIGH. Instead, the bus wires are pulled HIGH by pullup resistors, so the bus wires are HIGH when no device is driving them LOW. This way, two devices cannot conflict; if two devices drive the bus simultaneously, there is no driver contention.

Communication on the I²C bus always takes place between two devices, one acting as the master and the other acting as the slave. Both masters and slaves can read and write, but slaves can only do so under the direction of the master. Some I²C devices can act as masters or slaves, but the TLV320ADC3101-Q1 can only act as a slave device.

An I²C bus consists of two lines, SDA and SCL. SDA carries data; SCL provides the clock. All data is transmitted across the I²C bus in groups of eight bits. To send a bit on the I²C bus, the SDA line is driven to the appropriate level while SCL is LOW (a LOW on SDA indicates the bit is 0; a HIGH indicates the bit is 1). Once the SDA line has settled, the SCL line is brought HIGH, then LOW. This pulse on SCL clocks the SDA bit into the receiver shift register.

The I²C bus is bidirectional: the SDA line is used both for transmitting and receiving data. When a master reads from a slave, the slave drives the data line; when a master sends to a slave, the master drives the data line. Under normal circumstances, the master drives the clock line.

Most of the time the bus is idle, no communication is taking place, and both lines are HIGH. When communication is taking place, the bus is active. Only master devices can start a communication. They do this by causing a START condition on the bus. Normally, the data line is only allowed to change state while the clock line is LOW. If the data line changes state while the clock line is HIGH, it is either a START condition or its counterpart, a STOP condition. A START condition is when the clock line is HIGH and the data line goes from HIGH to LOW. A STOP condition is when the clock line is HIGH and the data line goes from LOW to HIGH.

After the master issues a START condition, it sends a byte that indicates the slave device with which it is to communicate. This byte is called the address byte. Each device on an I²C bus has a unique 7-bit address to which it responds. (Slaves can also have 10-bit addresses; see the I²C specification for details.) The master sends an address in the address byte, together with a bit that indicates whether it is to read from or write to the slave device.

Every byte transmitted on the I²C bus, whether it is address or data, is acknowledged with an acknowledge bit. When a master has finished sending a byte (eight data bits) to a slave, it stops driving SDA and waits for the slave to acknowledge the byte. The slave acknowledges the byte by pulling SDA LOW. The master then sends a clock pulse to clock the acknowledge bit. Similarly, when a master has finished reading a byte, it pulls SDA LOW to acknowledge this to the slave. It then sends a clock pulse to clock the bit.

A not-acknowledge is performed by leaving SDA HIGH during an acknowledge cycle. If a device is not present on the bus, and the master attempts to address it, it receives a not-acknowledge because no device is present at that address to pull the line LOW.

When a master has finished communicating with a slave, it may issue a STOP condition. When a STOP condition is issued, the bus becomes idle again. A master may also issue another START condition. When a START condition is issued while the bus is active, it is called a repeated START condition.

The TLV320ADC3101-Q1 also responds to and acknowledges a general call, which consists of the master issuing a command with a slave address byte of 00h.

TLV320ADC3101-Q1

ZHCS788B –MARCH 2012–REVISED AUGUST 2012

www.ti.com.cn

Figure 12. I²C Write

Figure 13. I²C Read

In the case of an I²C register write, if the master does not issue a STOP condition, then the device enters auto-increment mode. So in the next eight clocks, the data on SDA is treated as data for the next incremental register.

Similarly, in the case of an I²C register read, after the device has sent out the 8-bit data from the addressed register, if the master issues an ACKNOWLEDGE, the slave takes over control of SDA bus and transmits for the next eight clocks the data of the next incremental register.

DIGITAL AUDIO DATA SERIAL INTERFACE

Audio data is transferred between the host processor and the TLV320ADC3101-Q1 via the digital-audio serial-data interface, or audio bus. The audio bus on this device is flexible, including left- or right-justified data options, support for I²S or PCM protocols, programmable data-length options, a TDM mode for multichannel operation, flexible master/slave configurability for each bus clock line, and the ability to communicate with multiple devices within a system directly.

The audio serial interface on the TLV320ADC3101-Q1 has an extensive I/O control to allow for communicating with two independent processors for audio data. The processors can communicate with the device one at a time. This feature is enabled by register programming of the various pin selections.

The audio bus of the TLV320ADC3101-Q1 can be configured for left- or right-justified, I²S, DSP, or TDM modes of operation, where communication with standard telephony PCM interfaces is supported within the TDM mode. These modes are all MSB-first, with data width programmable as 16, 20, 24, or 32 bits by configuring page 0 / register 27, bits D5–D4. In addition, the word clock and bit clock can be independently configured in either master or slave mode for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame, and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC sampling frequencies.

The bit clock is used to clock in and out the digital audio data across the serial bus. When in master mode, this signal can be programmed to generate variable clock pulses by controlling the bit-clock divider in page 0 / register 30 (see Figure 31). Accommodating various word lengths as well as supporting the case when multiple TLV320ADC3101-Q1s share the same audio bus may require that the number of bit-clock pulses in a frame be adjusted.

The TLV320ADC3101-Q1 also includes a feature to offset the position of the start of data a transfer with respect to the word clock. There are two configurations that afford the user to use either a single offset for both channels or to use separate offsets. Ch_Offset_1 reference represents the value in page 0 / register 28 and Ch_Offset_2 represents the value in page 0 / register 37. When page 0 / register 38, bit D0 is set to zero (time-slot-based channel assignment is disabled), the offset of both channels is controlled, in terms of number of bit clocks, by the programming in page 0 / register 28 (Ch_Offset_1). When page 0 / register 38, bit D0 = 1 (time-slot-based

channel assignment enabled), the first channel is controlled, in terms of number of bit clocks, by the programming in page 0 / register 28 (Ch_Offset_1), and the second channel is controlled, in terms of number of bit clocks, by the programming in page 0 / register 37 (Ch_Offset_2), where register 37 programs the delay between the first word and the second word. Also, the relative order of the two channels can be swapped, depending on the programmable register bit (page 0 / register 38, bit D4) that enables swapping of the channels.

The TLV320ADC3101-Q1 also supports a feature of inverting the polarity of bit clock used for transferring the audio data as compared to the default clock polarity used. This feature can be used independently of the mode of audio interface chosen. This can be configured by writing to page 0 / register 29, bit D3.

The TLV320ADC3101-Q1 further includes programmability (page 0 / register 27, bit D0) to place DOUT in the high-impedance state at the end of data transfer (i.e., at the end of the bit cycle corresponding to the LSB of a channel). By combining this capability with the ability to program at what bit clock in a frame the audio data begins, time-division multiplexing (TDM) can be accomplished, resulting in multiple ADCs able to use a single audio serial data bus. To further enhance the 3-state capability, the TLV320ADC3101-Q1 can be put in a high-impedance state a half bit cycle earlier by setting page 0 / register 38, bit D1 to 1. When the audio serial data bus is powered down while configured in master mode, the pins associated with the interface are put into a high-impedance output state.

Figure 14. Both Channels Enabled, Early 3-Stating Enabled

Either or both of the two channels can be disabled in LJF, I²S, and DSP modes by using page 0 / register 38, bits D3–D2. [Figure 14](#) shows the interface timing when both channels are enabled and early 3-stating is enabled. [Figure 15](#) shows the effect of setting page 0 / register 38, bit D2, first channel disabled, and setting page 0 / register 27, bit D0 to 1, which enables placing DOUT in the high-impedance state. If placing DOUT in the high-impedance state is disabled, then the DOUT signal is driven to logic level 0.

Figure 15. First Channel Disabled, Second Channel Enabled, 3-Stating Enabled

The sync signal for the ADC filter is not generated based on the disabled channel. The sync signal for the filter corresponds to the beginning of the earlier of the two channels. If the first channel is disabled, the filter sync is generated at the beginning of the second channel, if it is enabled. If both the channels are disabled, there is no output to the serial bus, and the filter sync corresponds to the beginning of the frame.

By default, when the word clocks and bit clocks are generated by the TLV320ADC3101-Q1, these clocks are active only when the ADC is powered up within the device. This is done to save power. However, it also supports a feature wherein both the word clocks and bit clocks can be active even when the codec in the device is powered down. This is useful when using the TDM mode with multiple codecs on the same bus or when word clocks or bit clocks are used in the system as general-purpose clocks.

Right-Justified Mode

In right-justified mode, the LSB of the left channel is valid on the rising edge of the bit clock preceding the falling edge of word clock. Similarly, the LSB of the right channel is valid on the rising edge of the bit clock preceding the rising edge of the word clock. See [Figure 16](#) for right-justified mode timing.

Figure 16. Timing Diagram for Right-Justified Mode

For right-justified mode, the number of bit clocks per frame should be greater than twice the programmed word-length of the data. Note that the time-slot-based mode is not available in the right-justified mode.

Left-Justified Mode

In left-justified mode, the MSB of the right channel is valid on the rising edge of the bit clock following the falling edge of the word clock. Similarly, the MSB of the left channel is valid on the rising edge of the bit clock following the rising edge of the word clock. Figure 17 shows the standard timing of the left-justified mode.

Figure 17. Left-Justified Mode (Standard Timing)

Figure 18 shows the left-justified mode with Ch_Offset_1 = 1.

Figure 18. Left-Justified Mode With Ch_Offset_1 = 1

Figure 19 shows the left-justified mode with Ch_Offset_1 = 0 and bit clock inverted.

Figure 19. Left-Justified Mode With Ch_Offset_1 = 0, Bit Clock Inverted

For left-justified mode, the number of bit clocks per frame should be greater than twice the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

When the time-slot-based channel assignment is disabled (page 0 / register 38, bit D0 = 0), the left and right channels have the same offset Ch_Offset_1 (page 0 / register 28), and each edge of the word clock starts data transfer for one of the two channels, depending on whether or not channel swapping is enabled. Data bits are valid on the rising edges of the bit clock. With the time-slot-based channel assignment enabled (page 0 / register 38, bit D0 = 1), the left and right channels have independent offsets (Ch_Offset_1 and Ch_Offset_2). The rising edge of the word clock starts data transfer for the first channel after a delay of its programmed offset (Ch_Offset_1) for this channel. Data transfer for the second channel starts after a delay of its programmed offset (Ch_Offset_2) from the LSB of the first-channel data. The falling edge of the word clock is not used.

With no channel swapping, the MSB of the left channel is valid on the (Ch_Offset_1 + 1)th rising edge of the bit clock following the rising edge of the word clock. And, the MSB of the right channel is valid on the (Ch_Offset_1 + 1)th rising edge of the bit clock following the falling edge of the word clock. The operation in this case, with offset of 1, is shown in the timing diagram of Figure 18. Because channel swapping is not enabled, the left-channel data is before the right-channel data. With channel swapping enabled, the MSB of the right channel is valid on the (Ch_Offset_1 + 1)th rising edge of the bit clock following the rising edge of the word clock. And, the MSB of the left channel is valid on the (Ch_Offset_1 + 1)th rising edge of the bit clock following the falling edge of the word clock. The operation in this case, with offset of 1, is shown in the timing diagram of Figure 20. As shown in the diagram, right-channel data of a frame is before that frame's left-channel data, due to channel swapping. Otherwise, the behavior is similar to the case where channel swapping is disabled. The MSB of the right-channel data is valid on the second rising edge of the bit clock after the rising edge of the word clock, due to an offset of 1. Similarly, the MSB of the left-channel data is valid on the second rising edge of the bit clock after the falling edge of the word clock.

Figure 20. Left-Justified Mode With Ch_Offset_1 = 1, Channel Swapping Enabled

When time-based-slot mode is enabled with no channel swapping, the MSB of the left channel is valid on the (Offset1 + 1)th rising edge of the bit clock following the rising edge of the word clock. And, the MSB of the right channel is valid on the (Ch_Offset_2 + 1)th rising edge of the bit clock following the LSB of the left channel.

TLV320ADC3101-Q1

ZHCS788B – MARCH 2012 – REVISED AUGUST 2012

www.ti.com.cn

Figure 21 shows the operation with time-based-slot mode enabled and $\text{Ch_Offset_1} = 0$ and $\text{Ch_Offset_2} = 1$. The MSB of the left channel is valid on the first rising edge of the bit clock after the rising edge of the word clock. Data transfer for the right channel does not wait for the falling edge of the word clock, and the MSB of the right channel is valid on the second rising edge of the bit clock after the LSB of the left channel.

Figure 21. Left-Justified Mode, Time-Based-Slot Mode Enabled, $\text{Ch_Offset_1} = 0$, $\text{Ch_Offset_2} = 1$

For the case with time-based-slot mode enabled and channel swapping enabled, the MSB of the right channel is valid on the $(\text{Ch_Offset_1} + 1)$ th rising edge of the bit clock following the rising edge of the word clock. And, the MSB of the left channel is valid on the $(\text{Ch_Offset_2} + 1)$ th rising edge of the bit clock following the LSB of the right channel. Figure 22 shows the operation in this mode with $\text{Ch_Offset_1} = 0$ and $\text{Ch_Offset_2} = 1$. The MSB of the right channel is valid on the first rising edge of the bit clock after the rising edge of the word clock. Data transfer for the left channel starts following the completion of data transfer for the right channel without waiting for the falling edge of the word clock. The MSB of the left channel is valid on the second rising edge of the bit clock after the LSB of the right channel.

Figure 22. Left-Justified Mode, Time-Based-Slot Mode Enabled, $\text{Ch_Offset_1} = 0$, $\text{Ch_Offset_2} = 1$, Channel Swapping Enabled

I²S Mode

In I²S mode, the MSB of the left channel is valid on the second rising edge of the bit clock after the falling edge of the word clock. Similarly, the MSB of the right channel is valid on the second rising edge of the bit clock after the rising edge of the word clock. Figure 23 shows the standard I²S timing.

Figure 23. I²S Mode (Standard Timing)

Figure 24 shows the I²S mode timing with Ch_Offset_1 = 2.

Figure 24. I²S Mode With Ch_Offset_1 = 2

Figure 25 shows the I²S mode timing with Ch_Offset_1 = 0 and bit clock inverted.

Figure 25. I²S Mode With Ch_Offset_1 = 0, Bit Clock Inverted

For I²S mode, the number of bit clocks per channel should be greater than or equal to the programmed word length of the data. Also the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

DSP Mode

In DSP mode, the rising edge of the word clock starts the data transfer with the left-channel data first and is immediately followed by the right-channel data. Each data bit is valid on the falling edge of the bit clock. Figure 26 shows the standard timing for the DSP mode.

Figure 26. DSP Mode (Standard Timing)

Figure 27 shows the DSP mode timing with Ch_Offset_1 = 1.

Figure 27. DSP Mode With Ch_Offset_1 = 1

Figure 28 shows the DSP mode timing with Ch_Offset_1 = 0 and bit clock inverted.

Figure 28. DSP Mode With Ch_Offset_1 = 0, Bit Clock Inverted

For DSP mode, the number of bit clocks per frame should be greater than twice the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

Figure 29 shows the DSP time-slot-based mode without channel swapping, and with Ch_Offset_1 = 0 and Ch_Offset_2 = 3. The MSB of left channel data is valid on the first falling edge of the bit clock after the rising edge of the word clock. Because the right channel has an offset of 3, the MSB of its data is valid on the third falling edge of the bit clock after the LSB of the left-channel data. As in the case of other modes, the serial output bus is put in the high-impedance state, if 3-stating of the output is enabled, during all the extra bit-clock cycles in the frame.

Figure 29. DSP Mode, Time-Slot-Based Mode Enabled, Ch_Offset_1 = 0, Ch_Offset_2 = 3

Figure 30 shows the timing diagram for the DSP mode with left and right channels swapped, Ch_Offset_1 = 0, and Ch_Offset_2 = 3. The MSB of the right channel is valid on the first falling edge of the bit clock after the rising edge of the word clock. And, the MSB of the left channel is valid three bit-clock cycles after the LSB of right channel, because the offset for the left channel is 3.

Figure 30. DSP Mode, Time-Slot-Based Mode Enabled, Ch_Offset_1 = 0, Ch_Offset_2 = 3, Channel Swap Enabled

TLV320ADC3101-Q1

ZHCS788B – MARCH 2012 – REVISED AUGUST 2012

www.ti.com.cn

AUDIO DATA CONVERTERS

The TLV320ADC3101-Q1 supports the following standard audio sampling rates: 8 kHz, 11.025 kHz, 12 kHz, 16 kHz, 22.05 kHz, 24 kHz, 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, and 96 kHz. The converters can also operate at different sampling rates in various combinations, which are described further as follows.

The TLV320ADC3101-Q1 supports a wide range of options for generating clocks for the ADC section as well as the digital interface section and the other control blocks, as shown in [Figure 31](#). The clocks for the ADC require a source reference clock. The clock can be provided on device pins MCLK and BCLK. The source reference clock for the ADC section can be chosen by programming the ADC_CLKIN value on page 0 / register 4, bits D1–D0. The ADC_CLKIN can then be routed through highly flexible clock dividers, shown in [Figure 31](#), to generate various clocks required for the ADC and programmable digital filter sections. In the event that the desired audio or programmable digital filter clocks cannot be generated from the external reference clocks on MCLK and BCLK, the TLV320ADC3101-Q1 also provides the option of using an on-chip PLL that supports a wide range of fractional multiplication values to generate the required system clocks. Starting from ADC_CLKIN, the TLV320ADC3101-Q1 provides for several programmable clock dividers to support a variety of sampling rates for the ADC and the clocks for the programmable digital filter section.

AUDIO CLOCK GENERATION

The audio converters in fully programmable filter mode in the TLV320ADC3101-Q1 require an internal audio master clock at a frequency of $\geq N \times f_s$, where $N = \text{IADC}$ (page 0 / register 21) when filter mode (page 0 / register 61) equals zero; otherwise, N equals the instruction count from the ADC processing blocks (see [Table 7](#)). The master clock is obtained from an external clock signal applied to the device.

The device can accept an MCLK input from 512 kHz to 50 MHz, which can then be passed through either a programmable divider or a PLL to get the proper internal audio master clock required by the device. The BCLK input can also be used to generate the internal audio master clock.

A primary concern is proper operation of the TLV320ADC3101-Q1 at various sample rates with the limited MCLK frequencies available in the system. This device includes a programmable PLL to accommodate such situations. The integrated PLL can generate audio clocks from a wide variety of possible MCLK inputs, with particular focus paid to the standard MCLK rates already widely used.

When the PLL is enabled,

$$f_s = (\text{PLLCLK_IN} \times K \times R) / (N_{\text{ADC}} \times M_{\text{ADC}} \times A_{\text{OSR}} \times P), \text{ where}$$

$$P = 1, 2, 3, \dots, 8$$

$$R = 1, 2, \dots, 16$$

$$K = J.D$$

$$J = 1, 2, 3, \dots, 63$$

$$D = 0000, 0001, 0002, 0003, \dots, 9998, 9999$$

$$\text{PLLCLK_IN can be MCLK or BCLK, selected by page 0 / register 4, bits D3–D2.}$$

P , R , J , and D are register programmable. J is the integer portion of K (the numbers to the left of the decimal point), whereas D is the fractional portion of K (the numbers to the right of the decimal point, assuming four digits of precision).

Examples:

If $K = 8.5$, then $J = 8$, $D = 5000$

If $K = 7.12$, then $J = 7$, $D = 1200$

If $K = 14.03$, then $J = 14$, $D = 0300$

If $K = 6.0004$, then $J = 6$, $D = 0004$

When the PLL is enabled and $D = 0000$, the following conditions must be satisfied to meet specified performance:

$$512 \text{ kHz} \leq (\text{PLLCLK_IN} / P) \leq 20 \text{ MHz}$$

$$80 \text{ MHz} \leq (\text{PLLCLK_IN} \times K \times R / P) \leq 110 \text{ MHz}$$

$$4 \leq J \leq 55$$

When the PLL is enabled and $D \neq 0000$, the following conditions must be satisfied to meet specified performance:

$$10 \text{ MHz} \leq \text{PLLCLK_IN} / P \leq 20 \text{ MHz}$$

$$80 \text{ MHz} \leq \text{PLLCLK_IN} \times K \times R / P \leq 110 \text{ MHz}$$

$$4 \leq J \leq 11$$

$$R = 1$$

Example:

For MCLK = 12 MHz, $f_s = 44.1 \text{ kHz}$, NADC = 8, MADC = 2, and AOSR = 128:
Select P = 1, R = 1, K = 7.5264, which results in J = 7, D = 5264

Example:

For MCLK = 12 MHz, $f_s = 48 \text{ kHz}$, NADC = 8, MADC = 2, and AOSR = 128:
Select P = 1, R = 1, K = 8.192, which results in J = 8, D = 1920

The following table lists several example cases of typical MCLK rates and how to program the PLL to achieve sample rates of $f_s = 44.1 \text{ kHz}$ or 48 kHz with NADC = 8, MADC = 2, and AOSR = 128.

$f_s = 44.1 \text{ kHz}$

TLV320ADC3101-Q1

ZHCS788B –MARCH 2012–REVISED AUGUST 2012

www.ti.com.cn

A detailed diagram of the audio clock section of the TLV320ADC3101-Q1 is shown in Figure 31.

Note:

MADC × AOSR ≥ IADC

Where IADC number of instructions (Instruction Count) for the ADC MAC engine, it is programmable from 2, 4, ..., 510.

Convention:

Page Number: Register Number: (Register Bit) [Register Name] (Reset Value)

Figure 31. Audio Clock Generation Processing

STEREO AUDIO ADC

The TLV320ADC3101-Q1 includes a stereo audio ADC, which uses a delta-sigma modulator with 128-times oversampling in single-rate mode, followed by a digital decimation filter. The ADC supports sampling rates from 8 kHz to 48 kHz in single-rate mode, and up to 96 kHz in dual-rate mode. Whenever the ADC is in operation, the device requires that an audio master clock be provided and appropriate audio clock generation be set up within the device.

In order to provide optimal system power dissipation, the stereo ADC can be powered one channel at a time, to support the case where only mono record capability is required. In addition, both channels can be fully or partially powered down.

The integrated digital decimation filter removes high-frequency content and downsamples the audio data from an initial sampling rate of $128 f_s$ to the final output sampling rate of f_s . The decimation filter provides a linear phase output response with a group delay of $17/f_s$. The -3 dB bandwidth of the decimation filter extends to $0.45 f_s$ and scales with the sample rate (f_s). The filter has minimum 73 dB attenuation over the stop band from $0.55 f_s$ to $64 f_s$. Independent digital high-pass filters are also included with each ADC channel, with a corner frequency that can be set independently by programmable coefficients or can be disabled entirely.

Because of the oversampling nature of the audio ADC and the integrated digital decimation filtering, requirements for analog anti-aliasing filtering are relaxed. The TLV320ADC3101-Q1 integrates a second-order analog anti-aliasing filter with 20-dB attenuation at 1 MHz. This filter, combined with the digital decimation filter, provides sufficient anti-aliasing filtering without requiring additional external components.

The ADC is preceded by a programmable gain amplifier (PGA), which allows analog gain control from 0 dB to 40 dB in steps of 0.5 dB. The PGA gain changes are implemented with an internal soft-stepping algorithm that only changes the actual volume level by one 0.5-dB step every one or two ADC output samples, depending on the register programming (see register page 0 / register 81). This soft-stepping specifies that volume control changes occur smoothly with no audible artifacts. On reset, the PGA gain defaults to a mute condition, and upon power down, the PGA soft-steps the volume to mute before shutting down. A read-only flag is set whenever the gain applied by PGA equals the desired value set by the register. The soft-stepping control can also be disabled by programming a register bit.

AUDIO ANALOG INPUTS

Digital Volume Control

The TLV320ADC3101-Q1 also has a digital volume-control block with a range from -12 dB to 20 dB in steps of 0.5 dB. It is set by programming page 0 / register 83 and page 0 / register 84 for the left and right channels, respectively.

Table 3. Digital Volume Control for ADC

Desired Gain dB	Left / Right Channel Page 0 / Register 83 and Page 0 / Register 84, Bits D6–D0
-12	110 1000
-11.5	110 1001
-11	110 1010
...	...
-0.5	111 1111

20	010 1000

TLV320ADC3101-Q1

ZHCS788B –MARCH 2012–REVISED AUGUST 2012

www.ti.com.cn

During volume control changes, the soft-stepping feature is used to avoid audible artifacts. The soft-stepping rate can be set to either 1 or 2 gain steps per sample. Soft-stepping can also be entirely disabled. This soft-stepping is configured via page 0 / register 81, bits D1–D0, and is common to soft-stepping control for the analog PGA. During power-down of an ADC channel, this volume control soft-steps down to –12 dB before powering down. Due to the soft-stepping control, soon after changing the volume control setting or powering down the ADC channel, the actual applied gain may be different from the one programmed through the control register. The TLV320ADC3101-Q1 gives feedback to the user through the read-only flags in page 0 / register 36, bit D7 for the left channel and page 0 / register 36, bit D3 for the right channel.

Fine Digital Gain Adjustment

Additionally, the gain in each of the channels is finely adjustable in steps of 0.1 dB. This is useful when trying to match the gain between channels. By programming page 0 / register 82, the gain can be adjusted from 0 dB to –0.4 dB in steps of 0.1 dB. This feature, in combination with the regular digital volume control, allows the gains through the left and right channels be matched in the range of –0.5 dB to 0.5 dB with a resolution of 0.1 dB.

AGC

The TLV320ADC3101-Q1 includes automatic gain control (AGC) for ADC recording. AGC can be used to maintain a nominally constant output level when recording speech. As opposed to manually setting the PGA gain, in the AGC mode, the circuitry automatically adjusts the PGA gain as the input signal becomes overly loud or very weak, such as when a person speaking into a microphone moves closer to or farther from the microphone. The AGC algorithm has several programmable parameters, including target gain, attack and decay time constants, noise threshold, and maximum PGA applicable, that allow the algorithm to be fine-tuned for any particular application. The algorithm uses the absolute average of the signal (which is the average of the absolute value of the signal) as a measure of the nominal amplitude of the output signal. Because the gain can be changed at the sample interval time, the AGC algorithm operates at the ADC sample rate.

- **Target level** represents the nominal output level at which the AGC attempts to hold the ADC output signal level. The TLV320ADC3101-Q1 allows programming of eight different target levels, which can be programmed from –5.5 dB to –24 dB relative to a full-scale signal. Because the TLV320ADC3101-Q1 reacts to the signal absolute average and not to peak levels, it is recommended that the target level be set with enough margin to avoid clipping at the occurrence of loud sounds.
- **Attack time** determines how quickly the AGC circuitry reduces the PGA gain when the output signal level exceeds the target level due to an increase in input signal level. A wide range of attack-time programmability is supported in terms of number of samples (i.e., number of ADC sample-frequency clock cycles).
- **Decay time** determines how quickly the PGA gain is increased when the output signal level falls below the target level due to a reduction in input signal level. A wide range of decay-time programmability is supported in terms of number of samples (i.e., number of ADC sample-frequency clock cycles).
- **Noise threshold.** If the input signal level falls below the noise threshold, the AGC considers it as silence, and thus brings down the gain to 0 dB in steps of 0.5 dB every sample period and sets the noise-threshold flag. The gain stays at 0 dB unless the input signal average rises above the noise threshold setting. This keeps noise from being amplified in the absence of signal. Noise threshold level in the AGC algorithm is programmable from –30 dB to –90 dB of full scale. When the AGC noise threshold is set to –70 dB, –80 dB, or –90 dB, the microphone input maximum PGA applicable setting must be greater than or equal to 11.5 dB, 21.5 dB, or 31.5 dB, respectively. This operation includes hysteresis and debounce to prevent the AGC gain from cycling between high gain and 0 dB when signals are near the noise threshold level. The noise (or silence) detection feature can be entirely disabled by the user.
- **Maximum PGA applicable** allows the designer to restrict the maximum gain applied by the AGC. This can be used for limiting PGA gain in situations where environmental noise is greater than the programmed noise threshold. Microphone input maximum PGA can be programmed from 0 dB to 40 dB in steps of 0.5 dB.
- **Hysteresis**, as the name suggests, determines a window around the noise threshold which must be exceeded to detect that the recorded signal is indeed either noise or signal. If initially the energy of the recorded signal is greater than the noise threshold, then the AGC recognizes it as noise only when the energy of the recorded signal falls below the noise threshold by a value given by hysteresis. Similarly, after the recorded signal is recognized as noise, for the AGC to recognize it as a signal, its energy must exceed the noise threshold by a value given by the hysteresis setting. In order to prevent the AGC from jumping between noise and signal states, (which can happen when the energy of recorded signal is very close to the noise threshold) a non-zero hysteresis value should be chosen. The hysteresis feature can also be disabled.
- **Debounce time (noise and signal)** determines the hysteresis in time domain for noise detection. The AGC

continuously calculates the energy of the recorded signal. If the calculated energy is less than the set noise threshold, then the AGC does not increase the input gain to achieve the target level. However, to handle audible artifacts which can occur when the energy of the input signal is very close to the noise threshold, the AGC checks if the energy of the recorded signal is less than the noise threshold for a time greater than the noise debounce time. Similarly, the AGC starts increasing the input-signal gain to reach the target level when the calculated energy of the input signal is greater than the noise threshold. Again, to avoid audible artifacts when the input-signal energy is very close to noise threshold, the energy of the input signal must continuously exceed the noise threshold value for the signal debounce time. If the debounce times are kept very small, then audible artifacts can result by rapidly enabling and disabling the AGC function. At the same time, if the debounce time is kept too large, then the AGC may take time to respond to changes in levels of input signals with respect to noise threshold. Both noise and signal debounce time can be disabled.

- The **AGC noise threshold flag** is a read-only flag indicating that the input signal has levels lower than the noise threshold, and thus is detected as noise (or silence). In such a condition, the AGC applies a gain of 0 dB.
- **Gain applied by AGC** is a read-only register setting which gives a real-time feedback to the system on the gain applied by the AGC to the recorded signal. This, along with the target setting, can be used to determine the input signal level. In a steady state situation

$$\text{Target level (dB)} = \text{gain applied by AGC (dB)} + \text{input signal level (dB)}$$

When the AGC noise threshold flag is set, then the status of gain applied by AGC is not valid.

- The **AGC saturation flag** is a read-only flag indicating that the ADC output signal has not reached its target level. However, the AGC is unable to increase the gain further because the required gain is higher than the maximum allowed PGA gain. Such a situation can happen when the input signal has very low energy and the noise threshold is also set very low. When the AGC noise threshold flag is set, the status of the AGC saturation flag should be ignored.
- The **ADC saturation flag** is a read-only flag indicating an overflow condition in the ADC channel. On overflow, the signal is clipped and distortion results. This typically happens when the AGC target level is kept very high and the energy in the input signal increases faster than the attack time.
- An **AGC low-pass filter** is used to help determine the average level of the input signal. This average level is compared to the programmed detection levels in the AGC to provide the correct functionality. This low-pass filter is in the form of a first-order IIR filter. Two 8-bit registers are used to form the 16-bit digital coefficient, as shown on the register map. In this way, a total of 6 registers are programmed to form the three IIR coefficients. The transfer function of the filter implemented for signal-level detection is given by

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (1)$$

where:

Coefficient N0 can be programmed by writing into page 4 / register 2 and page 4 / register 3.

Coefficient N1 can be programmed by writing into page 4 / register 4 and page 4 / register 5.

Coefficient D1 can be programmed by writing into page 4 / register 6 and page 4 / register 7.

N0, N1, and D1 are 16-bit 2s-complement numbers, and their default values implement a low-pass filter with cutoff at $0.002735 \times \text{ADC}_{f_s}$.

See [Table 4](#) for various AGC programming options. AGC can be used only if the analog microphone input is routed to the ADC channel.

Figure 32. AGC Characteristics

The TLV320ADC3101-Q1 includes three analog audio input pins, which can be configured as three fully differential inputs, three single-ended audio inputs, or any variation thereof. These pins connect through series resistors and switches to the virtual ground terminals of two fully differential operational amplifiers (one per ADC/PGA channel). By selecting to turn on only one set of switches per operational amplifier at a time, the inputs can be effectively multiplexed to each ADC PGA channel.

By selecting to turn on multiple sets of switches per operational amplifier at a time, mixing can also be achieved. Mixing of multiple inputs can easily lead to PGA outputs that exceed the range of the internal operational amplifiers, resulting in saturation and clipping of the mixed output signal. Whenever mixing is being implemented, the user should take adequate precautions to avoid such a saturation case from occurring. In general, the mixed signal should not exceed $2 V_{pp}$ (single-ended) or $4 V_{pp}$ (differential).

In most mixing applications, there is also a general need to adjust the levels of the individual signals being mixed. For example, if a soft signal and a large signal are to be mixed and played together, the soft signal generally should be amplified to a level comparable to the large signal before mixing. In order to accommodate this need, the TLV320ADC3101-Q1 includes input level control on each of the individual inputs before they are mixed or multiplexed into the ADC PGAs, with programmable attenuation at 0 dB, –6 dB, or off. Note that this input-level control is not intended to be a volume control, but instead used for coarse level setting. Finer soft-stepping of the input level is implemented in this device by the ADC PGA.

Figure 33. TLV320ADC3101-Q1 Available Audio Input Path Configurations

Table 5. TLV320ADC3101-Q1 Audio Signals

Audio Signals Available to Left ADC		Audio Signals Available to Right ADC	
Single-Ended Inputs	Differential Inputs	Single-Ended Inputs	Differential Inputs
IN1L(P)	IN1L(P), IN1R(M)	IN1R(M)	IN1L(P), IN1R(M)
IN2L(P)	IN2L(P), IN3L(M)	IN2R(P)	IN2R(P), IN3R(M)
IN3L(M)	IN2R(P), IN3R(M)	IN3R(M)	IN2L(P), IN3L(M)
IN1R(M)		IN1L(P)	

Inputs can be selected as single-ended instead of fully differential, and mixing or multiplexing into the ADC PGAs is also possible in this mode. It is not possible, however, for an input pair to be selected as fully-differential for connection to one ADC PGA and simultaneously selected as single-ended for connection to the other ADC PGA channel. However, it is possible for an input to be selected or mixed into both left and right channel PGAs, as long as it has the same configuration for both channels (either both single-ended or both fully differential).

INPUT IMPEDANCE AND VCM CONTROL

The TLV320ADC3101-Q1 includes several programmable settings to control analog input pins, particularly when they are not selected for connection to an ADC PGA. The default option allows unselected inputs to be put into a high-impedance state, such that the input impedance seen looking into the device is extremely high. Note, however, that the pins on the device do include protection diode circuits connected to AVDD and AVSS. Thus, if any voltage is driven onto a pin approximately one diode drop (~ 0.6 V) above AVDD or one diode drop below AVSS, these protection diodes will begin conducting current, resulting in an effective impedance that no longer appears as a high-impedance state.

Another programmable option for unselected analog inputs is to weakly hold them at the common-mode input voltage of the ADC PGA (which is determined by an internal band-gap voltage reference). This is useful to keep the ac-coupling capacitors connected to analog inputs biased up at a normal dc level, thus avoiding the need for them to charge up suddenly when the input is changed from being unselected to selected for connection to an ADC PGA. This option is controlled in page 1 / register 52 through page 1 / register 57. The user should make sure this option is disabled when an input is selected for connection to an ADC PGA or selected for the analog input bypass path, because it can corrupt the recorded input signal if left operational when an input is selected.

In most cases, the analog input pins on the TLV320ADC3101-Q1 should be ac-coupled to analog input sources, the only exception to this generally being if an ADC is being used for dc voltage measurement. The ac-coupling capacitor causes a high-pass filter pole to be inserted into the analog signal path, so the size of the capacitor must be chosen to move that filter pole sufficiently low in frequency to cause minimal effect on the processed analog signal. The input impedance of the analog inputs, when selected for connection to an ADC PGA, varies with the setting of the input-level control, starting at approximately 35 k Ω with an input-level control setting of 0 dB, and 62.5-k Ω when the input-level control is set at -6 dB. For example, using a 0.1- μ F ac-coupling capacitor at an analog input results in a high-pass filter pole of 45.5 Hz when the 0-dB input-level control setting is selected. To set a high-pass corner for the application, the following input-impedance table has been provided with various mixer gains and microphone PGA ranges.

Table 6. Single-Ended Input Impedance vs PGA Ranges ⁽¹⁾

Mixer Gain (dB)	Microphone PGA Range (dB)	Input Impedance (Ohms)
0	0–5.5	35,000
0	6–11.5	38,889
0	12–17.5	42,000
0	18–23.5	44,074
0	24–29.5	45,294
0	30–35.5	45,960
0	36–40	46,308
-6	0–5.5	62,222
-6	6–11.5	70,000
-6	12–17.5	77,778
-6	18–23.5	84,000
-6	24–29.5	88,148
-6	30–35.5	90,588
-6	36–40	91,919

(1) Valid when only one input is enabled

MICBIAS GENERATION

The TLV320ADC3101-Q1 includes two programmable microphone bias outputs (MICBIAS1, MICBIAS2), each capable of providing output voltages of 2 V or 2.5 V (both derived from the on-chip band-gap voltage) with 4-mA output-current drive capability. In addition, the MICBIAS outputs may be programmed to be switched to AVDD directly through an on-chip switch, or it can be powered down completely when not needed, for power savings. This function is controlled by register programming in page 1 / register 51.

ADC Decimation Filtering and Signal Processing

The TLV320ADC3101-Q1 ADC channel includes a built-in digital decimation filter to process the oversampled data from the delta-sigma modulator to generate digital data at the Nyquist sampling rate with high dynamic range. The decimation filter can be chosen from three different types, depending on the required frequency response, group delay and sampling rate.

Processing Blocks

The TLV320ADC3101-Q1 offers a range of processing blocks which implement various signal processing capabilities along with decimation filtering. These processing blocks give users the choice of how much and what type of signal processing they may use and which decimation filter is applied.

The signal processing blocks available are:

- First-order IIR
- Scalable number of biquad filters
- Variable-tap FIR filter
- AGC

The processing blocks are tuned for common cases and can achieve high anti-alias filtering or low group delay in combination with various signal processing effects such as audio effects and frequency shaping. The available first-order IIR, biquad, and FIR filters have fully user-programmable coefficients. ADC processing blocks can be selected by writing to page 0 / register 61. The default (reset) processing block is PRB_R1.

Table 7. ADC Processing Blocks

Processing Blocks	Channel	Decimation Filter	First-Order IIR Available	Number of Biquads	FIR	Required AOSR Value	Instruction Count
PRB_R1	Stereo	A	Yes	0	No	128, 64	188

User-Programmable Filters

Depending on the selected processing block, different types and orders of digital filtering are available. A first-order IIR filter is always available, and is useful to filter out possible dc components of the signal efficiently. Up to five biquad sections, or alternatively up to 25-tap FIR filters, are available for specific processing blocks. The coefficients of the available filters are arranged as sequentially indexed coefficients in two banks. If adaptive filtering is chosen, the coefficient banks can be switched while the processor is running.

The coefficients of these filters are each 16 bits wide, in 2s-complement format, and occupy two consecutive 8-bit registers in the register space, as shown in [Table 8](#). Specifically, the filter coefficients are in 1.15 (one dot 15) format with a range from –1.0 (0x8000) to 0.999969482421875 (0x7FFF), as shown in [Figure 43](#).

Figure 43. 2s-Complement Coefficient Format

First-Order IIR Section

The transfer function for the first-order IIR filter is given by [Equation 2](#).

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (2)$$

The frequency response for the first-order IIR section with default coefficients is flat at a gain of 0 dB.

Table 8. ADC First-Order IIR Filter Coefficients

Filter	Filter Coefficient	ADC Coefficient, Left Channel	ADC Coefficient, Right Channel
First-order IIR	N0	C4 (page 4 / register 8, 9)	C36 (page 4 / register 72, 73)
	N1	C5 (page 4 / register 10, 11)	C37 (page 4 / register 74, 75)
	D1	C6 (page 4 / register 12, 13)	C38 (page 4 / register 76, 77)

Biquad Section

The transfer function of each of the biquad filters is given by [Equation 3](#).

$$H(z) = \frac{N_0 + 2 \times N_1 z^{-1} + N_2 z^{-2}}{2^{15} - 2 \times D_1 z^{-1} - D_2 z^{-2}} \quad (3)$$

The frequency response for each of the biquad sections with default coefficients is flat at a gain of 0 dB.

Table 9. ADC Biquad Filter Coefficients

FIR Section

Six of the available ADC processing blocks offer FIR filters for signal processing. PRB_R9 and PRB_R12 feature a 20-tap FIR filter, whereas the processing blocks PRB_R3, PRB_R6, PRB_R15, and PRB_R18 feature a 25-tap FIR filter.

$$H(z) = \sum_{n=0}^M \text{FIR}_n z^{-n}$$

M = 24 for PRB_R3, PRB_R6, PRB_R15, and PRB_R18

M = 19 for PRB_R9 and PRB_R12

(4)

The coefficients of the FIR filters are 16-bit 2s-complement format and correspond to the ADC coefficient space as listed in [Table 10](#). There is no default transfer function for the FIR filter. When the FIR filter is used, all applicable coefficients must be programmed.

Table 10. ADC FIR Filter Coefficients

Filter Coefficient	ADC Coefficient, Left Channel	ADC Coefficient, Right Channel
FIR0	C7 (page 4 / register 14, page 4 / register 15)	C39 (page 4 / register 78, page 4 / register 79)
FIR1	C8 (page 4 / register 16, page 4 / register 17)	C40 (page 4 / register 80, page 4 / register 81)

Decimation Filter

The TLV320ADC3101-Q1 offers three different types of decimation filters. The integrated digital decimation filter removes high-frequency content and downsamples the audio data from an initial sampling rate of $\text{AOSR} \times f_s$ to the final output sampling rate of f_s . The decimation filtering is achieved using a higher-order CIC filter followed by linear-phase FIR filters. The decimation filter cannot be chosen by itself; it is implicitly set through the chosen processing block.

The following subsections describe the properties of the available filters A, B, and C.

TLV320ADC3101-Q1

ZHCS788B – MARCH 2012 – REVISED AUGUST 2012

www.ti.com.cn

Decimation Filter A

This filter is intended for use at sampling rates up to 48 kHz. When configuring this filter, the oversampling ratio of the ADC can either be 128 or 64. For highest performance, the oversampling ratio must be set to 128. Filter A can also be used for 96 kHz at an AOSR of 64.

Table 11. Specification for ADC Decimation Filter A

Parameter	Condition	Value (Typical)	Unit
AOSR = 128			
Filter gain pass band	0–0.39 f_S	0.062	dB
Filter gain stop band	0.55–64 f_S	–73	dB
Filter group delay		$17/f_S$	s
Pass-band ripple, 8 ksps	0–0.39 f_S	0.062	dB
Pass-band ripple, 44.18 ksps	0–0.39 f_S	0.05	dB
Pass-band ripple, 48 ksps	0–0.39 f_S	0.05	dB
AOSR = 64			
Filter gain pass band	0–0.39 f_S	0.062	dB
Filter gain stop band	0.55–32 f_S	–73	dB
Filter group delay		$17/f_S$	s
Pass-band ripple, 8 ksps	0–0.39 f_S	0.062	dB
Pass-band ripple, 44.18 ksps	0–0.39 f_S	0.05	dB
Pass-band ripple, 48 ksps	0–0.39 f_S	0.05	dB
Pass-band ripple, 96 ksps	0–20 kHz	0.1	dB

Figure 44. ADC Decimation Filter A, Frequency Response

Decimation Filter B

Filter B is intended to support sampling rates up to 96 kHz at an oversampling ratio of 64.

Table 12. Specification for ADC Decimation Filter B

Parameter	Condition	Value (Typical)	Unit
AOSR = 64			
Filter gain pass band	0–0.39 f_S	± 0.077	dB
Filter gain stop band	0.6 f_S –32 f_S	–46	dB
Filter group delay		11/ f_S	s
Pass-band ripple, 8 ksps	0–0.39 f_S	0.076	dB
Pass-band ripple, 44.18 ksps	0–0.39 f_S	0.06	dB
Pass-band ripple, 48 ksps	0–0.39 f_S	0.06	dB
Pass-band ripple, 96 ksps	0–20 kHz	0.11	dB

Figure 45. ADC Decimation Filter B, Frequency Response

TLV320ADC3101-Q1

ZHCS788B – MARCH 2012 – REVISED AUGUST 2012

www.ti.com.cn

Decimation Filter C

Filter type C along with an AOSR of 32 is specially designed for 192-ksps operation of the ADC. The pass band, which extends up to $0.11 \times f_s$ (corresponds to 21 kHz), is suited for audio applications.

Table 13. Specifications for ADC Decimation Filter C

Parameter	Condition	Value (Typical)	Unit
Filter gain from 0 to $0.11 f_s$	$0-0.11 f_s$	± 0.033	dB
Filter gain from $0.28 f_s$ to $16 f_s$	$0.28 f-16 f_s$	-60	dB
Filter group delay		$11/f_s$	s
Pass-band ripple, 8 ksps	$0-0.11 f_s$	0.033	dB
Pass-band ripple, 44.18 ksps	$0-0.11 f_s$	0.033	dB
Pass-band ripple, 48 ksps	$0-0.11 f_s$	0.032	dB
Pass-band ripple, 96 ksps	$0-0.11 f_s$	0.032	dB
Pass-band ripple, 192 ksps	0–20 kHz	0.086	dB

Figure 46. ADC Decimation Filter C, Frequency Response

ADC Data Interface

The decimation filter and signal processing block in the ADC channel passes 32-bit data words to the audio serial interface once every frame (WCLK). During each frame (WCLK), a pair of data words (for left and right channels) is passed. The audio serial interface rounds the data to the required word length of the interface before converting to serial data per the different modes for audio serial interface.

Digital Microphone Function

In addition to supporting analog microphones, the TLV320ADC3101-Q1 also interfaces to digital microphones.

Figure 47. Digital Microphone in TLV320ADC3101-Q1

The TLV320ADC3101-Q1 outputs internal clock ADC_MOD_CLK on the DMCLK pin (page 0 / register 51, bits D5–D2) or DMDIN pin (page 0 / register 52, bits D5–D2). This clock can be connected to the external digital microphone device. The single-bit output of the external digital microphone device can be connected to DMDIN or DMCLK pins. Internally, the TLV320ADC3101-Q1 latches the steady value of data on a selectable edge (page 0 / register 80, bit D1) of ADC_MOD_CLK for the left ADC channel, and the steady value of data on a selectable edge (page 0 / register 80, bit D0) for the right ADC channel.

Figure 48. Timing Diagram for Digital Microphone Interface

The digital-microphone mode can be selectively enabled for only-left, only-right, or stereo channels. When the digital microphone mode is enabled, the analog section of the ADC can be powered down and bypassed for power efficiency. The AOSR value for the ADC channel must be configured to select the desired decimation ratio to be achieved based on the external digital microphone properties. Following the CIC filter is a stereo digital volume control, where left and right volume are adjusted by writing to page 0 / register 83 and page 0 / register 84, respectively. Next is the miniDSP, where the processing blocks can be selected or custom processing can be used. The processed digital microphone signal is then output at the DOUT pin.

CONTROL REGISTERS

The control registers for the TLV320ADC3101-Q1 are described in detail as follows. All registers are 8 bits in width, with D7 referring to the most-significant bit of each register and D0 referring to the least-significant bit.

Pages 0, 1, 4, 5, and 32–47 are available. All other pages are reserved. Do not read from or write to reserved pages.

The procedure for register access is:

- Select page N (Write data N to register 0 regardless of the current page number).
- Read or write data from/to valid registers in page N.
- Select new page M (Write data M to register 0 regardless of the current page number).
- Read or write data from/to valid registers in page M.

Table 61. Page 0 / Register 59: ADC CIC Filter Gain Control

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D4	R/W	0100	Left CIC filter gain ⁽¹⁾
D3–D0	R/W	0100	Right CIC filter gain ⁽¹⁾

- (1) For proper operation, CIC gain must be ≤ 1 .
If AOSR {page 0 / register 20} = 64 and $(1 \leq \text{Filter Mode \{page 0 / register 61\}} \leq 6)$, then the reset value of 4 results in CIC gain = 1.
Otherwise, the CIC gain = $(\text{AOSR}/(64 \times \text{miniDSP Engine Decimation}))^4 \times 2^{(\text{CIC Filter Gain Control})}$ for $0 \leq \text{CIC Filter Gain Control} \leq 12$,
and if CIC Filter Gain Control = 15, CIC gain is automatically set such that for $7 \leq (\text{AOSR}/\text{miniDSP Engine Decimation}) \leq 64$,
 $0.5 < \text{CIC gain} \leq 1$.

ZHCS788B –MARCH 2012–REVISED AUGUST 2012

www.ti.com.cn

The remaining page 4 registers are either reserved registers or are used for setting coefficients for the various filters in the processing blocks. Reserved registers should not be written to.

The filter coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient are interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. [Table 106](#) is a list of the page 4 registers, excepting the previously described register 0.

Table 106. Page 4 Registers

REGISTER NUMBER	RESET VALUE	REGISTER NAME
1	XXXX XXXX	Reserved. Do not write to this register.

21	0000 0000	Coefficient D1(7:0) for Left ADC Biquad A or Coefficient FIR3(7:0) for ADC FIR Filter or Coefficient C10(7:0) of ADC miniDSP
22	0000 0000	Coefficient D2(15:8) for Left ADC Biquad A or Coefficient FIR4(15:8) for ADC FIR Filter or Coefficient C11(15:8) of ADC miniDSP
23	0000 0000	Coefficient D2(7:0) for Left ADC Biquad A or Coefficient FIR4(7:0) for ADC FIR Filter or Coefficient C11(7:0) of ADC miniDSP

Table 106. Page 4 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
24	0111 1111	Coefficient N0(15:8) for Left ADC Biquad B or Coefficient FIR5(15:8) for ADC FIR Filter or Coefficient C12(15:8) of ADC miniDSP
25	1111 1111	Coefficient N0(7:0) for Left ADC Biquad B or Coefficient FIR5(7:0) for ADC FIR Filter or Coefficient C12(7:0) of ADC miniDSP
26	0000 0000	Coefficient N1(15:8) for Left ADC Biquad B or Coefficient FIR6(15:8) for ADC FIR Filter or Coefficient C13(15:8) of ADC miniDSP
27	0000 0000	Coefficient N1(7:0) for Left ADC Biquad B or Coefficient FIR6(7:0) for ADC FIR Filter or Coefficient C13(7:0) of ADC miniDSP
28	0000 0000	Coefficient N2(15:8) for Left ADC Biquad B or Coefficient FIR7(15:8) for ADC FIR Filter or Coefficient C14(15:8) of ADC miniDSP
29	0000 0000	Coefficient N2(7:0) for Left ADC Biquad B or Coefficient FIR7(7:0) for ADC FIR Filter or Coefficient C14(7:0) of ADC miniDSP
30	0000 0000	Coefficient D1(15:8) for Left ADC Biquad B or Coefficient FIR8(15:8) for ADC FIR Filter or Coefficient C15(15:8) of ADC miniDSP
31	0000 0000	Coefficient D1(7:0) for Left ADC Biquad B or Coefficient FIR8(7:0) for ADC FIR Filter or Coefficient C15(7:0) of ADC miniDSP
32	0000 0000	Coefficient D2(15:8) for Left ADC Biquad B or Coefficient FIR9(15:8) for ADC FIR Filter or Coefficient C16(15:8) of ADC miniDSP
33	0000 0000	Coefficient D2(7:0) for Left ADC Biquad B or Coefficient FIR9(7:0) for ADC FIR Filter or Coefficient C16(7:0) of ADC miniDSP
34	0111 1111	Coefficient N0(15:8) for Left ADC Biquad C or Coefficient FIR10(15:8) for ADC FIR Filter or Coefficient C17(15:8) of ADC miniDSP
35	1111 1111	Coefficient N0(7:0) for Left ADC Biquad C or Coefficient FIR10(7:0) for ADC FIR Filter or Coefficient C17(7:0) of ADC miniDSP
36	0000 0000	Coefficient N1(15:8) for Left ADC Biquad C or Coefficient FIR11(15:8) for ADC FIR Filter or Coefficient C18(15:8) of ADC miniDSP
37	0000 0000	Coefficient N1(7:0) for Left ADC Biquad C or Coefficient FIR11(7:0) for ADC FIR Filter or Coefficient C18(7:0) of ADC miniDSP
38	0000 0000	Coefficient N2(15:8) for Left ADC Biquad C or Coefficient FIR12(15:8) for ADC FIR Filter or Coefficient C19(15:8) of ADC miniDSP
39	0000 0000	Coefficient N2(7:0) for Left ADC Biquad C or Coefficient FIR12(7:0) for ADC FIR Filter or Coefficient C19(7:0) of ADC miniDSP
40	0000 0000	Coefficient D1(15:8) for Left ADC Biquad C or Coefficient FIR13(15:8) for ADC FIR Filter or Coefficient C20(15:8) of ADC miniDSP
41	0000 0000	Coefficient D1(7:0) for Left ADC Biquad C or Coefficient FIR13(7:0) for ADC FIR Filter or Coefficient C20(7:0) of ADC miniDSP
42	0000 0000	Coefficient D2(15:8) for Left ADC Biquad C or Coefficient FIR14(15:8) for ADC FIR Filter or Coefficient C21(15:8) of ADC miniDSP
43	0000 0000	Coefficient D2(7:0) for Left ADC Biquad C or Coefficient FIR14(7:0) for ADC FIR Filter or Coefficient C21(7:0) of ADC miniDSP
44	0111 1111	Coefficient N0(15:8) for Left ADC Biquad D or Coefficient FIR15(15:8) for ADC FIR Filter or Coefficient C22(15:8) of ADC miniDSP
45	1111 1111	Coefficient N0(7:0) for Left ADC Biquad D or Coefficient FIR15(7:0) for ADC FIR Filter or Coefficient C22(7:0) of ADC miniDSP
46	0000 0000	Coefficient N1(15:8) for Left ADC Biquad D or Coefficient FIR16(15:8) for ADC FIR Filter or Coefficient C23(15:8) of ADC miniDSP
47	0000 0000	Coefficient N1(7:0) for Left ADC Biquad D or Coefficient FIR16(7:0) for ADC FIR Filter or Coefficient C23(7:0) of ADC miniDSP
48	0000 0000	Coefficient N2(15:8) for Left ADC Biquad D or Coefficient FIR17(15:8) for ADC FIR Filter or Coefficient C24(15:8) of ADC miniDSP
49	0000 0000	Coefficient N2(7:0) for Left ADC Biquad D or Coefficient FIR17(7:0) for ADC FIR Filter or Coefficient C24(7:0) of ADC miniDSP
50	0000 0000	Coefficient D1(15:8) for Left ADC Biquad D or Coefficient FIR18(15:8) for ADC FIR Filter or Coefficient C25(15:8) of ADC miniDSP

Table 106. Page 4 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
51	0000 0000	Coefficient D1(7:0) for Left ADC Biquad D or Coefficient FIR18(7:0) for ADC FIR Filter or Coefficient C25(7:0) of ADC miniDSP
52	0000 0000	Coefficient D2(15:8) for Left ADC Biquad D or Coefficient FIR19(15:8) for ADC FIR Filter or Coefficient C26(15:8) of ADC miniDSP
53	0000 0000	Coefficient D2(7:0) for Left ADC Biquad D or Coefficient FIR19(7:0) for ADC FIR Filter or Coefficient C26(7:0) of ADC miniDSP
54	0111 1111	Coefficient N0(15:8) for Left ADC Biquad E or Coefficient FIR20(15:8) for ADC FIR Filter or Coefficient C27(15:8) of ADC miniDSP
55	1111 1111	Coefficient N0(7:0) for Left ADC Biquad E or Coefficient FIR20(7:0) for ADC FIR Filter or Coefficient C27(7:0) of ADC miniDSP
56	0000 0000	Coefficient N1(15:8) for Left ADC Biquad E or Coefficient FIR21(15:8) for ADC FIR Filter or Coefficient C28(15:8) of ADC miniDSP
57	0000 0000	Coefficient N1(7:0) for Left ADC Biquad E or Coefficient FIR21(7:0) for ADC FIR Filter or Coefficient C28(7:0) of ADC miniDSP
58	0000 0000	Coefficient N2(15:8) for Left ADC Biquad E or Coefficient FIR22(15:8) for ADC FIR Filter or Coefficient C29(15:8) of ADC miniDSP
59	0000 0000	Coefficient N2(7:0) for Left ADC Biquad E or Coefficient FIR22(7:0) for ADC FIR Filter or Coefficient C29(7:0) of ADC miniDSP
60	0000 0000	Coefficient D1(15:8) for Left ADC Biquad E or Coefficient FIR23(15:8) for ADC FIR Filter or Coefficient C30(15:8) of ADC miniDSP
61	0000 0000	Coefficient D1(7:0) for Left ADC Biquad E or Coefficient FIR23(7:0) for ADC FIR Filter or Coefficient C30(7:0) of ADC miniDSP
62	0000 0000	Coefficient D2(15:8) for Left ADC Biquad E or Coefficient FIR24(15:8) for ADC FIR Filter or Coefficient C31(15:8) of ADC miniDSP
63	0000 0000	Coefficient D2(7:0) for Left ADC Biquad E or Coefficient FIR24(7:0) for ADC FIR Filter or Coefficient C31(7:0) of ADC miniDSP
64	0000 0000	Coefficient C32(15:8) of ADC miniDSP
65	0000 0000	Coefficient C32(7:0) of ADC miniDSP
66	0000 0000	Coefficient C33(15:8) of ADC miniDSP
67	0000 0000	Coefficient C33(7:0) of ADC miniDSP
68	0000 0000	Coefficient C34(15:8) of ADC miniDSP
69	0000 0000	Coefficient C34(7:0) of ADC miniDSP
70	0000 0000	Coefficient C35(15:8) of ADC miniDSP
71	0000 0000	Coefficient C35(7:0) of ADC miniDSP
72	0000 0000	Coefficient N0(15:8) for Right ADC programmable first-order IIR or Coefficient C36(15:8) of ADC miniDSP
73	0000 0000	Coefficient N0(7:0) for Right ADC programmable first-order IIR or Coefficient C36(7:0) of ADC miniDSP
74	0000 0000	Coefficient N1(15:8) for Right ADC programmable first-order IIR or Coefficient C37(15:8) of ADC miniDSP
75	0000 0000	Coefficient N1(7:0) for Right ADC programmable first-order IIR or Coefficient C37(7:0) of ADC miniDSP
76	0000 0000	Coefficient D1(15:8) for Right ADC programmable first-order IIR or Coefficient C38(15:8) of ADC miniDSP
77	0000 0000	Coefficient D1(7:0) for Right ADC programmable first-order IIR or Coefficient C38(7:0) of ADC miniDSP
78	0000 0000	Coefficient N0(15:8) for Right ADC Biquad A or Coefficient FIR0(15:8) for ADC FIR Filter or Coefficient C39(15:8) of ADC miniDSP
79	0000 0000	Coefficient N0(7:0) for Right ADC Biquad A or Coefficient FIR0(7:0) for ADC FIR Filter or Coefficient C39(7:0) of ADC miniDSP
80	0000 0000	Coefficient N1(15:8) for Right ADC Biquad A or Coefficient FIR1(15:8) for ADC FIR Filter or Coefficient C40(15:8) of ADC miniDSP
81	0000 0000	Coefficient N1(7:0) for Right ADC Biquad A or Coefficient FIR1(7:0) for ADC FIR Filter or Coefficient C40(7:0) of ADC miniDSP

Table 106. Page 4 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
82	0000 0000	Coefficient N2(15:8) for Right ADC Biquad A or Coefficient FIR2(15:8) for ADC FIR Filter or Coefficient C41(15:8) of ADC miniDSP
83	0000 0000	Coefficient N2(7:0) for Right ADC Biquad A or Coefficient FIR2(7:0) for ADC FIR Filter or Coefficient C41(7:0) of ADC miniDSP
84	0000 0000	Coefficient D1(15:8) for Right ADC Biquad A or Coefficient FIR3(15:8) for ADC FIR Filter or Coefficient C42(15:8) of ADC miniDSP
85	0000 0000	Coefficient D1(7:0) for Right ADC Biquad A or Coefficient FIR3(7:0) for ADC FIR Filter or Coefficient C42(7:0) of ADC miniDSP
86	0000 0000	Coefficient D2(15:8) for Right ADC Biquad A or Coefficient FIR4(15:8) for ADC FIR Filter or Coefficient C43(15:8) of ADC miniDSP
87	0000 0000	Coefficient D2(7:0) for Right ADC Biquad A or Coefficient FIR4(7:0) for ADC FIR Filter or Coefficient C43(7:0) of ADC miniDSP
88	0000 0000	Coefficient N0(15:8) for Right ADC Biquad B or Coefficient FIR5(15:8) for ADC FIR Filter or Coefficient C44(15:8) of ADC miniDSP
89	0000 0000	Coefficient N0(7:0) for Right ADC Biquad B or Coefficient FIR5(7:0) for ADC FIR Filter or Coefficient C44(7:0) of ADC miniDSP
90	0000 0000	Coefficient N1(15:8) for Right ADC Biquad B or Coefficient FIR6(15:8) for ADC FIR Filter or Coefficient C45(15:8) of ADC miniDSP
91	0000 0000	Coefficient N1(7:0) for Right ADC Biquad B or Coefficient FIR6(7:0) for ADC FIR Filter or Coefficient C45(7:0) of ADC miniDSP
92	0000 0000	Coefficient N2(15:8) for Right ADC Biquad B or Coefficient FIR7(15:8) for ADC FIR Filter or Coefficient C46(15:8) of ADC miniDSP
93	0000 0000	Coefficient N2(7:0) for Right ADC Biquad B or Coefficient FIR7(7:0) for ADC FIR Filter or Coefficient C46(7:0) of ADC miniDSP
94	0000 0000	Coefficient D1(15:8) for Right ADC Biquad B or Coefficient FIR8(15:8) for ADC FIR Filter or Coefficient C47(15:8) of ADC miniDSP
95	0000 0000	Coefficient D1(7:0) for Right ADC Biquad B or Coefficient FIR8(7:0) for ADC FIR Filter or Coefficient C47(7:0) of ADC miniDSP
96	0000 0000	Coefficient D2(15:8) for Right ADC Biquad B or Coefficient FIR9(15:8) for ADC FIR Filter or Coefficient C48(15:8) of ADC miniDSP
97	0000 0000	Coefficient D2(7:0) for Right ADC Biquad B or Coefficient FIR9(7:0) for ADC FIR Filter or Coefficient C48(7:0) of ADC miniDSP
98	0000 0000	Coefficient N0(15:8) for Right ADC Biquad C or Coefficient FIR10(15:8) for ADC FIR Filter or Coefficient C49(15:8) of ADC miniDSP
99	0000 0000	Coefficient N0(7:0) for Right ADC Biquad C or Coefficient FIR10(7:0) for ADC FIR Filter or Coefficient C49(7:0) of ADC miniDSP
100	0000 0000	Coefficient N1(15:8) for Right ADC Biquad C or Coefficient FIR11(15:8) for ADC FIR Filter or Coefficient C50(15:8) of ADC miniDSP
101	0000 0000	Coefficient N1(7:0) for Right ADC Biquad C or Coefficient FIR11(7:0) for ADC FIR Filter or Coefficient C50(7:0) of ADC miniDSP
102	0000 0000	Coefficient N2(15:8) for Right ADC Biquad C or Coefficient FIR12(15:8) for ADC FIR Filter or Coefficient C51(15:8) of ADC miniDSP
103	0000 0000	Coefficient N2(7:0) for Right ADC Biquad C or Coefficient FIR12(7:0) for ADC FIR Filter or Coefficient C51(7:0) of ADC miniDSP
104	0000 0000	Coefficient D1(15:8) for Right ADC Biquad C or Coefficient FIR13(15:8) for ADC FIR Filter or Coefficient C52(15:8) of ADC miniDSP
105	0000 0000	Coefficient D1(7:0) for Right ADC Biquad C or Coefficient FIR13(7:0) for ADC FIR Filter or Coefficient C52(7:0) of ADC miniDSP
106	0000 0000	Coefficient D2(15:8) for Right ADC Biquad C or Coefficient FIR14(15:8) for ADC FIR Filter or Coefficient C53(15:8) of ADC miniDSP
107	0000 0000	Coefficient D2(7:0) for Right ADC Biquad C or Coefficient FIR14(7:0) for ADC FIR Filter or Coefficient C53(7:0) of ADC miniDSP
108	0000 0000	Coefficient N0(15:8) for Right ADC Biquad D or Coefficient FIR15(15:8) for ADC FIR Filter or Coefficient C54(15:8) of ADC miniDSP

Table 106. Page 4 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
109	0000 0000	Coefficient N0(7:0) for Right ADC Biquad D or Coefficient FIR15(7:0) for ADC FIR Filter or Coefficient C54(7:0) of ADC miniDSP
110	0000 0000	Coefficient N1(15:8) for Right ADC Biquad D or Coefficient FIR16(15:8) for ADC FIR Filter or Coefficient C55(15:8) of ADC miniDSP
111	0000 0000	Coefficient N1(7:0) for Right ADC Biquad D or Coefficient FIR16(7:0) for ADC FIR Filter or Coefficient C55(7:0) of ADC miniDSP
112	0000 0000	Coefficient N2(15:8) for Right ADC Biquad D or Coefficient FIR17(15:8) for ADC FIR Filter or Coefficient C56(15:8) of ADC miniDSP
113	0000 0000	Coefficient N2(7:0) for Right ADC Biquad D or Coefficient FIR17(7:0) for ADC FIR Filter or Coefficient C56(7:0) of ADC miniDSP
114	0000 0000	Coefficient D1(15:8) for Right ADC Biquad D or Coefficient FIR18(15:8) for ADC FIR Filter or Coefficient C57(15:8) of ADC miniDSP
115	0000 0000	Coefficient D1(7:0) for Right ADC Biquad D or Coefficient FIR18(7:0) for ADC FIR Filter or Coefficient C57(7:0) of ADC miniDSP
116	0000 0000	Coefficient D2(15:8) for Right ADC Biquad D or Coefficient FIR19(15:8) for ADC FIR Filter or Coefficient C58(15:8) of ADC miniDSP
117	0000 0000	Coefficient D2(7:0) for Right ADC Biquad D or Coefficient FIR19(7:0) for ADC FIR Filter or Coefficient C58(7:0) of ADC miniDSP
118	0000 0000	Coefficient N0(15:8) for Right ADC Biquad E or Coefficient FIR20(15:8) for ADC FIR Filter or Coefficient C59(15:8) of ADC miniDSP
119	0000 0000	Coefficient N0(7:0) for Right ADC Biquad E or Coefficient FIR20(7:0) for ADC FIR Filter or Coefficient C59(7:0) of ADC miniDSP
120	0000 0000	Coefficient N1(15:8) for Right ADC Biquad E or Coefficient FIR21(15:8) for ADC FIR Filter or Coefficient C60(15:8) of ADC miniDSP
121	0000 0000	Coefficient N1(7:0) for Right ADC Biquad E or Coefficient FIR21(7:0) for ADC FIR Filter or Coefficient C60(7:0) of ADC miniDSP
122	0000 0000	Coefficient N2(15:8) for Right ADC Biquad E or Coefficient FIR22(15:8) for ADC FIR Filter or Coefficient C61(15:8) of ADC miniDSP
123	0000 0000	Coefficient N2(7:0) for Right ADC Biquad E or Coefficient FIR22(7:0) for ADC FIR Filter or Coefficient C61(7:0) of ADC miniDSP
124	0000 0000	Coefficient D1(15:8) for Right ADC Biquad E or Coefficient FIR23(15:8) for ADC FIR Filter or Coefficient C62(15:8) of ADC miniDSP
125	0000 0000	Coefficient D1(7:0) for Right ADC Biquad E or Coefficient FIR23(7:0) for ADC FIR Filter or Coefficient C62(7:0) of ADC miniDSP
126	0000 0000	Coefficient D2(15:8) for Right ADC Biquad E or Coefficient FIR24(15:8) for ADC FIR Filter or Coefficient C63(15:8) of ADC miniDSP
127	0000 0000	Coefficient D2(7:0) for Right ADC Biquad E or Coefficient FIR24(7:0) for ADC FIR Filter or Coefficient C63(7:0) of ADC miniDSP

Control Registers, Page 5: ADC Programmable Coefficients RAM (65:127)

Page 5 / Register 0 is the page control register as described below.

Page 5 / Register 0: Page Control Register⁽¹⁾

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	0000 0000	0000 0000: Page 0 selected 0000 0001: Page 1 selected ... 1111 1110: Page 254 selected (reserved) 1111 1111: Page 255 selected (reserved)

(1) Valid pages are 0, 1, 4, 5, 32-47. All other pages are reserved (do not access).

Table 107 is a list of the page 5 registers, excepting the previously described register 0.

Table 107. Page 5 Registers

REGISTER NUMBER	RESET VALUE	REGISTER NAME
1	XXXX XXXX	Reserved. Do not write to this register.
2	0000 0000	Coefficient C65(15:8) of ADC miniDSP
3	0000 0000	Coefficient C65(7:0) of ADC miniDSP
4	0000 0000	Coefficient C66(15:8) of ADC miniDSP
5	0000 0000	Coefficient C66(7:0) of ADC miniDSP
6	0000 0000	Coefficient C67(15:8) of ADC miniDSP
7	0000 0000	Coefficient C67(7:0) of ADC miniDSP
8	0000 0000	Coefficient C68(15:8) of ADC miniDSP
9	0000 0000	Coefficient C68(7:0) of ADC miniDSP
10	0000 0000	Coefficient C69(15:8) of ADC miniDSP
11	0000 0000	Coefficient C69(7:0) of ADC miniDSP
12	0000 0000	Coefficient C70(15:8) of ADC miniDSP
13	0000 0000	Coefficient C70(7:0) of ADC miniDSP
14	0000 0000	Coefficient C71(15:8) of ADC miniDSP
15	0000 0000	Coefficient C71(7:0) of ADC miniDSP
16	0000 0000	Coefficient C72(15:8) of ADC miniDSP
17	0000 0000	Coefficient C72(7:0) of ADC miniDSP
18	0000 0000	Coefficient C73(15:8) of ADC miniDSP
19	0000 0000	Coefficient C73(7:0) of ADC miniDSP
20	0000 0000	Coefficient C74(15:8) of ADC miniDSP
21	0000 0000	Coefficient C74(7:0) of ADC miniDSP
22	0000 0000	Coefficient C75(15:8) of ADC miniDSP
23	0000 0000	Coefficient C75(7:0) of ADC miniDSP
24	0000 0000	Coefficient C76(15:8) of ADC miniDSP
25	0000 0000	Coefficient C76(7:0) of ADC miniDSP
26	0000 0000	Coefficient C77(15:8) of ADC miniDSP
27	0000 0000	Coefficient C77(7:0) of ADC miniDSP
28	0000 0000	Coefficient C78(15:8) of ADC miniDSP
29	0000 0000	Coefficient C78(7:0) of ADC miniDSP
30	0000 0000	Coefficient C79(15:8) of ADC miniDSP
31	0000 0000	Coefficient C79(7:0) of ADC miniDSP
32	0000 0000	Coefficient C80(15:8) of ADC miniDSP
33	0000 0000	Coefficient C80(7:0) of ADC miniDSP
34	0000 0000	Coefficient C81(15:8) of ADC miniDSP
35	0000 0000	Coefficient C81(7:0) of ADC miniDSP
36	0000 0000	Coefficient C82(15:8) of ADC miniDSP
37	0000 0000	Coefficient C82(7:0) of ADC miniDSP
38	0000 0000	Coefficient C83(15:8) of ADC miniDSP
39	0000 0000	Coefficient C83(7:0) of ADC miniDSP
40	0000 0000	Coefficient C84(15:8) of ADC miniDSP
41	0000 0000	Coefficient C84(7:0) of ADC miniDSP
42	0000 0000	Coefficient C85(15:8) of ADC miniDSP
43	0000 0000	Coefficient C85(7:0) of ADC miniDSP
44	0000 0000	Coefficient C86(15:8) of ADC miniDSP
45	0000 0000	Coefficient C86(7:0) of ADC miniDSP

Table 107. Page 5 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
46	0000 0000	Coefficient C87(15:8) of ADC miniDSP
47	0000 0000	Coefficient C87(7:0) of ADC miniDSP
48	0000 0000	Coefficient C88(15:8) of ADC miniDSP
49	0000 0000	Coefficient C88(7:0) of ADC miniDSP
50	0000 0000	Coefficient C89(15:8) of ADC miniDSP
51	0000 0000	Coefficient C89(7:0) of ADC miniDSP
52	0000 0000	Coefficient C90(15:8) of ADC miniDSP
53	0000 0000	Coefficient C90(7:0) of ADC miniDSP
54	0000 0000	Coefficient C91(15:8) of ADC miniDSP
55	0000 0000	Coefficient C91(7:0) of ADC miniDSP
56	0000 0000	Coefficient C92(15:8) of ADC miniDSP
57	0000 0000	Coefficient C92(7:0) of ADC miniDSP
58	0000 0000	Coefficient C93(15:8) of ADC miniDSP

118	0000 0000	Coefficient C123(15:8) of ADC miniDSP
119	0000 0000	Coefficient C123(7:0) of ADC miniDSP
120	0000 0000	Coefficient C124(15:8) of ADC miniDSP
121	0000 0000	Coefficient C124(7:0) of ADC miniDSP
122	0000 0000	Coefficient C125(15:8) of ADC miniDSP
123	0000 0000	Coefficient C125(7:0) of ADC miniDSP
124	0000 0000	Coefficient C126(15:8) of ADC miniDSP
125	0000 0000	Coefficient C126(7:0) of ADC miniDSP
126	0000 0000	Coefficient C127(15:8) of ADC miniDSP
127	0000 0000	Coefficient C127(7:0) of ADC miniDSP

Control Registers, Page 32: ADC DSP Engine Instruction RAM (0:31)

Control registers from Page 32 – Page 47 contain instruction RAM for the ADC miniDSP. There are 32 instructions / page and 16 pages so the TLV320ADC3101-Q1 miniDSP supports 512 instructions.

TLV320ADC3101-Q1

ZHCS788B – MARCH 2012 – REVISED AUGUST 2012

Page 32 / Register 5 Through Page 32 / Register 97

The remaining unreserved registers on page 32 are arranged in groups of three, with each group containing the bits of one instruction. The arrangement is the same as that of registers 2–4 for Instruction 0. Registers 5–7, 8–10, 11–13, ..., 95–97 contain instructions 1, 2, 3, ..., 31, respectively.

Page 32 / Register 98 Through Page 32 / Register 127: Reserved

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	XXXX XXXX	Reserved. Write only the default value to this register

Control Registers, Pages 33–47: ADC DSP Engine Instruction RAM (32:63) Through (480:511)

The structuring of the registers within pages 33–43 is identical to that of page 32. Only the instruction numbers differ. The range of instructions within each page is listed in the following table.

Page	Instructions
33	32 to 63
34	64 to 95
35	96 to 127
36	128 to 159
37	160 to 191
38	192 to 223
39	224 to 255
40	256 to 287

Page	Instructions
41	288 to 319
42	320 to 351
43	352 to 383
44	384 to 415
45	416 to 447
46	448 to 479
47	480 to 511

REVISION HISTORY

Changes from Revision A (March, 2012) to Revision B	Page
Changed the first sentence in the first paragraph after Fig. 32 from: "The TLV320ADC3101-Q1 includes three analog audio input pins, which can be configured as one fully-differential pair and one single-ended input, or as three single-ended audio inputs." to: "The TLV320ADC3101-Q1 includes three analog audio input pins, which can be configured as three fully differential inputs, three single-ended audio inputs, or any variation thereof."	30

6PADC3101TRGERQ1	Active	Production	VQFN (RGE) 24	3000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	ADC 3101Q
6PADC3101TRGERQ1.A	Active	Production	VQFN (RGE) 24	3000 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	ADC 3101Q

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information.
