

TLV7081 纳瓦级功率 4 凸点 WCSP 小尺寸比较器

1 特性

- 宽电源电压范围：1.7V 至 5.5V
- 370nA 静态电源电流
- 4μs 低传播延迟
- 漏极开路输出
- 独立输入电压范围最高可达 5.6V
- 内部磁滞：10mV
- 温度范围：-40°C 至 +125°C
- 封装：
 - 0.7mm × 0.7mm WCSP (4)

2 应用

- 智能手机
- 笔记本电脑和平板电脑
- 光学模块
- 数码相机
- 中继器和断路器
- 便携式医疗设备
- 门窗传感器
- 视频游戏控制器

3 说明

TLV7081 是一款单通道纳瓦级功率比较器，工作电压低至 1.7V。该比较器采用 0.7mm × 0.7mm 超小型 WCSP 封装，使 TLV7081 适用于空间关键型设计，例如智能手机和其他便携式或电池供电应用。

TLV7081 具有不依赖电源电压的广泛输入电压范围。拥有不依赖电源电压的输入范围使 TLV7081 即使在无通电的情况下也可直接连接电源。

TLV7081 具有可上拉到 V+ 之上的漏极开路输出级，因此适用于电平转换器和双极至单端转换器。

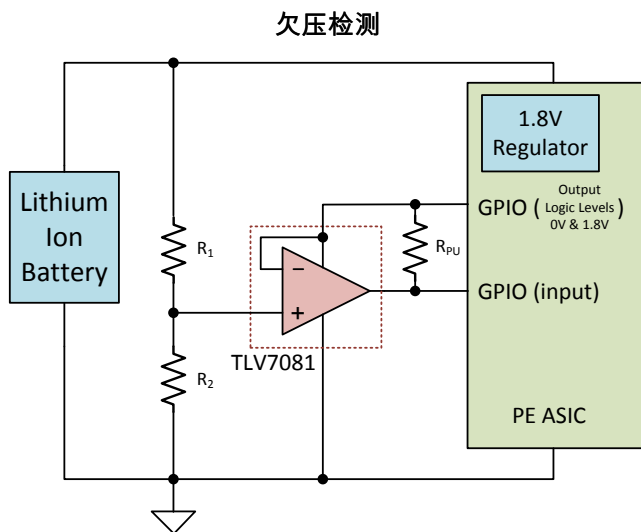

器件信息 (1)

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	Number		
OUT	A1	O	Comparator output: OUT is open-drain.
V+	B1	P	Positive (highest) power supply; functions as an external reference voltage
V–	B2	P	Negative (lowest) power supply
IN	A2	I	Comparator input: IN is the noninverting input

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Supply voltage $V_S = (V+) - (V-)$	– 0.3	6	V
Input (IN) to $(V-)$ ⁽²⁾	– 0.3	6	V
Current into input (IN)		±10	mA
Output (OUT) to $(V-)$	– 0.3	6	V
Output short-circuit duration ⁽³⁾		10	s
Junction temperature, T_J		150	°C
Storage temperature, T_{stg}	– 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input signals that can swing more than 0.3 V below $(V-)$ must be current-limited to 10 mA or less.
- (3) Short-circuit to ground, one comparator per package.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage $V_S = (V+) - (V-)$	1.7	5.5	V
Open-Drain PULL-UP voltage $V_{PULL-UP}$		5.5	V
Ambient temperature, T_A	–40	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLV7081	UNIT
		YKA (DSBGA)	
		4 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	207	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	1.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	73.2	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	73.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

Over the operating temperature range of $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_S = 3.3\text{ V}$, and $V_{\text{PULL-UP}} = V_+$ (unless otherwise noted). Typical values are at $T_A = 25^{\circ}\text{C}$. Voltage at input pin (IN) is referenced to (V-).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IO} Input Offset Voltage	$V_S = 1.8\text{ V}$ and 3.3 V , $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	-10	± 1	10	mV
dV_{IO}/dT Input Offset Voltage Drift	$T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$		± 3		$\mu\text{V}/^{\circ}\text{C}$
V_{HYS} Input Hysteresis Voltage			10		mV
V_{IN} Input Voltage Range ⁽¹⁾		0		5.6	V
I_{BIAS} Input bias current	IN = 5.6 V, positive value means current entering pin (IN)		3		pA
I_{LEAK} Input leakage current	IN = 5.6 V, $V_S = 0\text{ V}$, positive value means current entering pin (IN)		4		pA
C_{I} Input Capacitance			1.9		pF
V_{OL} Low-Level Output Voltage	Sinking 200 μA , measured relative to (V-)			0.1	V
	Sinking 2 mA, measured relative to (V-)			0.4	V
$I_{\text{O-SC}}$ Short-circuit sink current	$V_S = 5\text{ V}$		45		mA
$I_{\text{O-LKG}}$ Output Leakage Current	IN = (V+) + 0.1V (output high), $V_{\text{PULL-UP}} = (V_+)$		130		pA
PSRR Power Supply Rejection Ratio	$V_S = 1.8\text{ V}$ to 5 V		75		dB
I_{S} Supply Current	no load, IN = (V+) – 0.1V (output low), $T_A = 25^{\circ}\text{C}$		370	470	nA
	no load, IN = (V+) – 0.1V (output low), $T_A = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$			630	

(1) Over Operating Supply Voltage Range (V_S): 1.7 V to 5.5 V

6.6 Switching Characteristics

Typical values are at $T_A = 25^{\circ}\text{C}$, $V_S = 3.3\text{ V}$; $C_L = 15\text{ pF}$, (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PHL} High-to-low propagation delay ⁽¹⁾	Input overdrive = -100 mV		4		μs
t_{PLH} Low-to-high propagation delay ⁽¹⁾	Input overdrive = +100 mV, $R_{\text{PULL-UP}} = 4.99\text{ k}\Omega$		4		μs
t_{F} Output fall time	Measured from 20% to 80%		7		ns
t_{ON} Start-up delay ⁽²⁾			1		ms

(1) High-to-low and low-to-high refers to the transition at the input pin (IN).

(2) During power on, V_S must exceed 1.7 V for 1 ms before the output is in a correct state.

6.7 Timing Diagrams

7 Detailed Description

7.1 Overview

The TLV7081 is a single-channel, nano-power comparator that does not need a dedicated power supply connection, and can operate down to 1.7 V. The comparator is available in an ultra-small, WCSP package measuring 0.7 mm × 0.7 mm, making the TLV7081 applicable for space-critical designs like smartphones and other portable or battery-powered applications.

The TLV7081 features a wide input-voltage range that is independent of supply voltage. Having an input range that is independent of supply voltage allows the TLV7081 to be directly connected to sources that are active even if the TLV7081 is not powered.

The TLV7081 has an open-drain output stage that can be pulled beyond $V+$, making it appropriate for level translators and bipolar to single-ended converters.

7.2 Functional Block Diagram

7.3 Feature Description

The TLV7081 is a single-channel, nano-power comparator that operates down to 1.7 V. The inverting input is internally tied to $V+$ which helps to streamline applications which use supply as the reference. The non-inverting input IN extends to 5.6 V which is independent of the power supply $V+$ (1.7 V - 5.5 V) and it's available in an ultra-small, WCSP package measuring 0.7 mm × 0.7 mm.

7.4 Device Functional Modes

The TLV7081 has a power-on-reset (POR) circuit. While the power supply (V_S) is greater than V_{POR} (typically 1V) and less than the minimum operating supply voltage, either upon ramp-up or ramp-down, the POR circuitry is activated.

The POR circuit keeps the output high impedance (logical high) while activated.

When the supply voltage is greater than, or equal to, the minimum supply voltage, the comparator output reflects the state of the input IN .

Device Functional Modes (continued)

7.4.1 Inputs

The TLV7081 input extends from V_- to 5.6 V which is independent of supply. The input IN can be any voltage within these limits and no phase inversion of the comparator output occurs.

The input of TLV7081 is fault tolerant. It maintains the same high input impedance when V_+ is unpowered or ramping up. The input can be safely driven up to the specified maximum voltage (5.6 V) with $V_+ = 0$ V or any value up to the maximum specified.

The input bias current is typically 3 pA for input IN voltages between 0 and 5.6 V. The comparator inputs are protected from undervoltage by internal diodes connected to V_- . As the input voltage goes under V_- , the protection diodes become forward biased and begin to conduct causing the input bias current to increase exponentially. Input bias current typically doubles for every 10°C temperature increase.

7.4.2 Internal Hysteresis

The device hysteresis transfer curve is shown in Figure 20. This curve is a function of three components: V_{TH} , V_{OS} , and V_{HYST} :

- V_{TH} is the actual set voltage or threshold trip voltage.
- V_{OS} is the internal offset voltage between IN and V_+ . This voltage is added to V_{TH} to form the actual trip point at which the comparator must respond to change output states.
- V_{HYST} is the internal hysteresis (or trip window) that is designed to reduce comparator sensitivity to noise (10 mV typical).

Figure 20. Hysteresis Transfer Curve

7.4.3 Output

The TLV7081 features an open-drain output stage enabling the output logic levels to be pulled up to an external source up to 5.5 V independently of the supply voltage.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

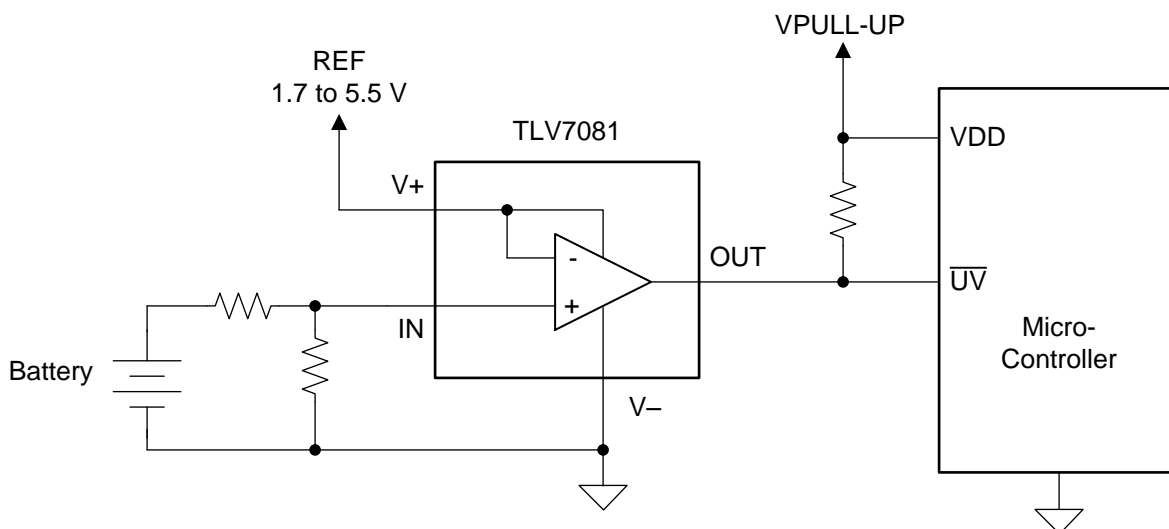

8.1 Application Information

The TLV7081 is a 4-pin, nano-power comparator with open-drain output that is well suited for monitoring battery voltages. The TLV7081's benefits include a small package footprint and a unique input stage that allows the comparator input to be driven by a voltage source even when the operating voltage for the comparator is turned-off (zero volts).

8.2 Typical Applications

8.2.1 Nano-Power Battery Monitor

The application of the TLV7081 for an under-voltage detection circuit is shown in [Figure 21](#).

Copyright © 2017, Texas Instruments Incorporated

Figure 21. Under-Voltage Detection

8.2.1.1 Design Requirements

For this design, follow these design requirements:

- The supply voltage connected to pin (V+) serves as the reference voltage for the comparator and can be any voltage between 1.7 V and 5.5 V.
- The voltage applied to the input pin (IN) can be any voltage in the range of 0 V to 5.6 V. This voltage range is uniquely independent of the supply voltage applied to pin (V+).
- The comparator output pin (OUT) requires a pull-up resistor that sets the output-high logic level (V_{OH}) for the comparator. $V_{PULL-UP}$ should be connected to the supply voltage of the microcontroller which is monitoring the comparator output and serves as the level-shifting block for the logic levels in the application.

Typical Applications (continued)

8.2.1.2 Detailed Design Procedure

Instead of being powered directly from the battery, the TLV7081 is powered directly from a voltage reference that exists in the system. The input to the comparator (IN) is allowed to operate above and below the reference voltage due to the unique analog front end of the TLV7081. When the battery voltage is above the reference threshold, the output of the comparator is high and when the battery drops below the threshold of the reference, the output of the comparator goes low (see Figure 22 for details). For simplicity, the integrated hysteresis of the comparator is not shown in the timing diagram. Integrated hysteresis is helpful in avoiding glitches at the comparator output when operating in noisy environments or when the input voltage changes thresholds very slowly. An open-drain output configuration allows the output logic level of the comparator to be level-shifted to match the logic level of the receiving device.

8.2.1.3 Application Curve

When the voltage applied to the input pin (IN) falls below the reference threshold (REF), the output pin (OUT) is pulled low to ground (V-). Moreover, when the input voltage rises above REF, the output of the comparator goes into a high impedance state and the OUT pin is pulled high by the pull-up resistor and $V_{PULL-UP}$ supply voltage.

Figure 22. Under-Voltage Timing Results

8.2.2 Battery Monitoring in Portable Electronics

A recommended circuit diagram for monitoring a battery voltage in a personal electronic device is shown in Figure 23. In this diagram, the GPIO pin of an application specific integrated circuit (ASIC) serves as the supply voltage and the voltage reference for the TLV7081. Using a GPIO pin to power the TLV7081 is possible because of the low quiescent current of the TLV7081. In systems where power consumption needs to be further reduced, the GPIO pin can be used to power-cycle the TLV7081.

Figure 23. Battery Monitor

9 Layout

9.1 Layout Guidelines

A power supply bypass capacitor of 100 nF is recommended when supply output impedance is high, supply traces are long, or when excessive noise is expected on the supply lines. Bypass capacitors are also recommended when the comparator output drives a long trace or is required to drive a capacitive load. Due to the fast rising and falling edge rates and high-output sink and source capability of the TLV7081 output stages, higher than normal quiescent current can be drawn from the power supply. Under this circumstance, the system would benefit from a bypass capacitor across the supply pins.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此产品说明书的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TLV7081YKAR	Active	Production	DSBGA (YKA) 4	3000 LARGE T&R	Yes	SAC396 SNAGCU	Level-1-260C-UNLIM	-40 to 125	W
TLV7081YKAR.A	Active	Production	DSBGA (YKA) 4	3000 LARGE T&R	Yes	SAC396	Level-1-260C-UNLIM	-40 to 125	W

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
