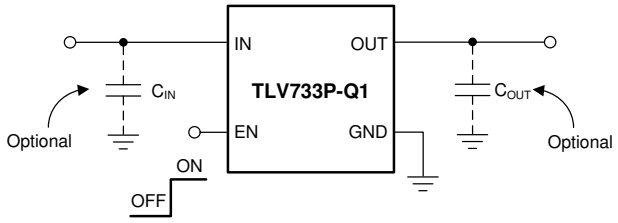
TLV733P-Q1
无电容 300mA 低压降 (LDO) 线性稳压器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准：
  - 温度等级 1：– 40 ° C 至 125 ° C 、 T_A
- 器件结温范围：
  – 40°C 至 150°C
- 输入电压范围：1.4V 至 5.5V
- 有无电容器均可实现稳定运行
- 折返过流保护
- 封装：
  - 2.0mm × 2.0mm WSON-6
  - 2.9mm × 1.6mm SOT-23
- 非常低的压降：300mA 时为 125mV ($3.3V_{OUT}$)
- 精度：典型值为 1%，最大值为 1.4%
- 低 I_Q：34µA
- 可提供固定输出电压：
  1.0V 至 3.3V
- 高 PSRR：1kHz 时为 50dB
- 有源输出放电

2 应用

- 摄像头模块
- 汽车信息娱乐系统
- 导航系统



典型应用电路

3 说明

TLV733P-Q1 系列低压降 (LDO) 线性稳压器尺寸超小且静态电流较低，可提供 300mA 拉电流，线路和负载瞬态性能优异。此类器件可提供典型值为 1% 的精度。

TLV733P-Q1 系列采用现代无电容架构设计，无需使用输入或输出电容即可确保运行稳定。移除输出电容有助于减小解决方案的尺寸，并且可以消除启动时的浪涌电流。此外，如果必须使用陶瓷电容，TLV733P-Q1 系列依然可以稳定运行。使用输出电容时，TLV733P-Q1 系列还可以在器件上电和使能期间提供折返电流控制。该功能对于电池供电类器件尤为重要。

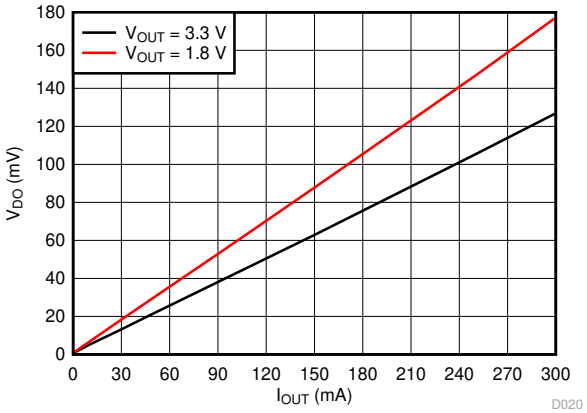
TLV733P-Q1 系列提供有源下拉电路，处于禁用状态时可使输出负载快速放电。

TLV733P-Q1 系列采用 6 引脚 DRV (WSON) 和 5 引脚 DBV (SOT-23) 封装。

器件信息 (1)

器件型号	封装	封装尺寸（标称值）
TLV733P-Q1	WSON (6)	2.00mm × 2.00mm
	SOT-23 (5)	2.90mm × 1.60mm

(1) 如需了解所有可用封装，请参阅数据表末尾的封装选项附录。



压降电压与输出电流间的关系

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision E (July 2019) to Revision F (October 2020) — **Page**

- 更新了整个文档的表和图的编号格式.....1
- 更改了特定于汽车的*特性* 项目符号.....1
- Changed storage temperature max parameter from 160°C to 150°C.....5
- Added classificaton levels to *ESD Ratings* table.....5

Changes from Revision D (December 2018) to Revision E (July 2019) — **Page**

- Changed description of EN pin in *Pin Functions* table.....4
- Deleted typical specifications from $V_{EN(HI)}$ and $V_{EN(LO)}$ parameters in *Electrical Characteristics* table.....6
- Added maximum specification to I_{LIM} parameter in *Electrical Characteristics* table.....6
- Added *and Output Enable* to title and changed first paragraph of *Shutdown and Output Enable* section.....13

Changes from Revision C (October 2018) to Revision D (December 2018) — **Page**

- 将 DBV 封装状态更改为“量产数据”.....1

Changes from Revision B (August 2018) to Revision C (October 2018) — **Page**

- 向文档添加了 DBV 封装（“预发布”状态）.....1

Changes from Revision A (August 2016) to Revision B (August 2018) — **Page**

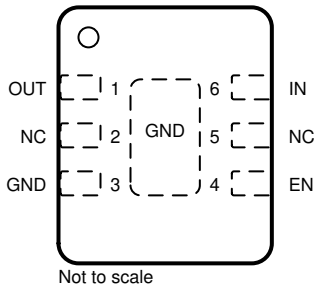
- 添加了*器件结温范围* 特性项目符号.....1
- Changed T_J maximum specification from *135°C* to *150°C*.....5
- Changed *Electrical Characteristics* conditions statement from *T_J, T_A = –40°C to +125°C* to *T_J = –40°C to +150°C, T_A = –40°C to +125°C*.....6
- Added last 6 rows to V_{DO} parameter.....6
- Added second row to I*GND* parameter, added temperature range to first row test conditions.....6
- Changed *Typical Characteristics* condition statement from *T_J = –40°C to +125°C* to *T_J = –40°C to +150°C*.....8

- Changed operating junction temperature from *–40°C to +135°C* to *–40°C to +150°C* in *Overview* section.... 12
- Changed junction temperature limit from *135°C* to *150°C* in *Thermal Shutdown* section..... 13

Changes from Revision * (August 2016) to Revision A (August 2016) **Page**

- 已投入量产.....1

5 Pin Configuration and Functions



NC – No internal connection.

图 5-1. DRV Package, 6-Pin WSON, Top View

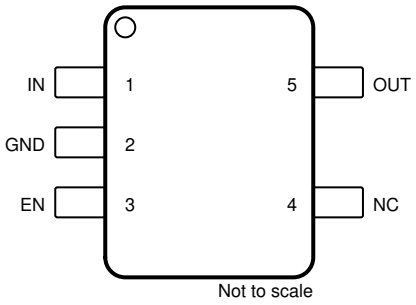


图 5-2. DBV Package, 5-Pin SOT-23, Top View

表 5-1. Pin Functions

NAME	NO.		I/O	DESCRIPTION
	DRV	DBV		
EN	4	3	I	Enable pin. Drive EN greater than $V_{EN(HI)}$ to turn on the regulator. Drive EN less than $V_{EN(LO)}$ to put the LDO into shutdown mode.
GND	3	2	—	Ground pin
IN	6	1	I	Input pin. A small capacitor is recommended from this pin to ground. See the *Input and Output Capacitor Selection* section for more details.
NC	2, 5	4	—	No internal connection
OUT	1	5	O	Regulated output voltage pin. For best transient response, use a small 1- μ F ceramic capacitor from this pin to ground. See the *Input and Output Capacitor Selection* section for more details.
Thermal pad		—	—	The thermal pad is electrically connected to the GND node. Connect to the GND plane for improved thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted); all voltages are with respect to GND(1)

		MIN	MAX	UNIT
Voltage	V_{IN}	–0.3	6.0	V
	V_{EN}	–0.3	V_{IN} + 0.3	
	V_{OUT}	–0.3	3.6	
Current	I_{OUT}		Internally limited	A
Output short-circuit duration			Indefinite	
Temperature	Operating junction, T_J	–40	150	°C
	Storage, T_{stg}	–65	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002(1), classification level 2		±2000	V
		Charged-device model (CDM), per AEC Q100-011, classification level C4B	All pins	±500	
			Corner pins (1, 3, 4, and 6)	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{IN}	Input range	1.4		5.5	V
V_{OUT}	Output range	1.0		3.3	V
I_{OUT}	Output current	0		300	mA
V_{EN}	Enable range	0		V_{IN}	V
T_J	Junction temperature	–40		150	°C
T_A	Ambient temperature	–40		125	°C

6.4 Thermal Information

THERMAL METRIC(1)		TLV733P-Q1		UNIT
		DRV (WSON)	DBV (SOT-23)	
		6 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	92.5	198.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	123.9	118.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	61.9	65.8	°C/W
ψ_{JT}	Junction-to-top characterization parameter	9.7	42.4	°C/W
ψ_{JB}	Junction-to-board characterization parameter	62.3	65.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	30.9	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

at operating temperature range (T_J = –40°C to +150°C, T_A = –40°C to +125°C), V_{IN} = $V_{OUT(nom)}$ + 0.5 V or 2.0 V (whichever is greater), I_{OUT} = 1 mA, V_{EN} = V_{IN}, and C_{IN} = C_{OUT} = 1 µF (unless otherwise noted); all typical values are at T_J = 25°C

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
V_{IN}	Input voltage			1.4		5.5	V
	DC output accuracy	T_J = 25°C		–1%		1%	
		–40°C ≤ T_J ≤ 150°C		–1.4%		1.4%	
UVLO	Undervoltage lockout	V_{IN} rising			1.3	1.4	V
		V_{IN} falling			1.25		
$\Delta V_{O(\Delta VI)}$	Line regulation	ΔVI = $V_{OUT(nom)}$ + 0.5 V or 2.0 V (whichever is greater) to 5.5 V			1		mV
$\Delta V_{O(\Delta IO)}$	Load regulation	ΔIO = 1 mA to 300 mA			25		mV
V_{DO}	Dropout voltage(1)	V_{OUT} = 0.98 × $V_{OUT(nom)}$, I_{OUT} = 300 mA	V_{OUT} = 1.1 V, –40°C ≤ T_J ≤ +125°C			510	mV
			1.2 V ≤ V_{OUT} < 1.5 V, –40°C ≤ T_J ≤ 125°C			450	
			1.5 V ≤ V_{OUT} < 1.8 V, –40°C ≤ T_J ≤ 125°C			400	
			1.8 V ≤ V_{OUT} < 2.5 V, –40°C ≤ T_J ≤ 125°C			300	
			2.5 V ≤ V_{OUT} < 3.3 V, –40°C ≤ T_J ≤ 125°C			290	
			V_{OUT} = 3.3 V, –40°C ≤ T_J ≤ 125°C		125	270	
			V_{OUT} = 1.1 V, –40°C ≤ T_J ≤ 150°C			560	
			1.2 V ≤ V_{OUT} < 1.5 V, –40°C ≤ T_J ≤ 150°C			490	
			1.5 V ≤ V_{OUT} < 1.8 V, –40°C ≤ T_J ≤ 150°C			440	
			1.8 V ≤ V_{OUT} < 2.5 V, –40°C ≤ T_J ≤ 150°C			340	
			2.5 V ≤ V_{OUT} < 3.3 V, –40°C ≤ T_J ≤ 150°C			330	
			V_{OUT} = 3.3 V, –40°C ≤ T_J ≤ 150°C			320	
I_{GND}	Ground pin current	I_{OUT} = 0 mA, –40°C ≤ T_J ≤ 125°C			34	62	µA
		I_{OUT} = 0 mA, –40°C ≤ T_J ≤ 150°C				78	
I_{SHDN}	Shutdown current	V_{EN} ≤ 0.35 V, 2.0 V ≤ V_{IN} ≤ 5.5 V, T_J = 25°C			0.1	1	µA
PSRR	Power-supply rejection ratio	V_{OUT} = 1.8 V, I_{OUT} = 300 mA	f = 100 Hz		68		dB
			f = 10 kHz		35		
			f = 100 kHz		28		
V_n	Output noise voltage	BW = 10 Hz to 100 kHz, V_{OUT} = 1.8 V, I_{OUT} = 10 mA			120		μV_{RMS}
$V_{EN(HI)}$	EN pin high voltage (enabled)			0.9			V
$V_{EN(LO)}$	EN pin low voltage (disabled)					0.35	V
I_{EN}	EN pin current	V_{EN} = 5.5 V			0.01		µA
	Pulldown resistor	V_{IN} = 2.3 V			120		Ω
I_{LIM}	Output current limit			360		700	mA
I_{OS}	Short-circuit current limit	V_{OUT} shorted to GND, V_{OUT} = 1.0 V			150		mA
		V_{OUT} shorted to GND, V_{OUT} = 3.3 V			170		

at operating temperature range (T_J = –40°C to +150°C, T_A = –40°C to +125°C), V_{IN} = $V_{OUT(nom)}$ + 0.5 V or 2.0 V (whichever is greater), I_{OUT} = 1 mA, V_{EN} = V_{IN}, and C_{IN} = C_{OUT} = 1 µF (unless otherwise noted); all typical values are at T_J = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
T_{sd}	Thermal shutdown	Shutdown, temperature increasing		160		°C
		Reset, temperature decreasing		140		

(1) Dropout voltage for the TLV73310P is not valid at room temperature. The device engages undervoltage lockout (V_{IN} < $UVLO_{FALL}$) before the dropout condition is met.

6.6 Timing Requirements

			MIN	NOM	MAX	UNIT
t_{STR}	Startup time	Time from EN assertion to 98% × $V_{OUT(nom)}$, V_{OUT} = 1.0 V, I_{OUT} = 0 mA		250		µs
		Time from EN assertion to 98% × $V_{OUT(nom)}$, V_{OUT} = 3.3 V, I_{OUT} = 0 mA		800		

6.7 Typical Characteristics

at operating temperature range (T_J = –40°C to +150°C), V_{IN} = $V_{OUT(nom)}$ + 0.5 V or 2.0 V (whichever is greater), I_{OUT} = 1 mA, V_{EN} = V_{IN}, and C_{IN} = C_{OUT} = 1 µF (unless otherwise noted)

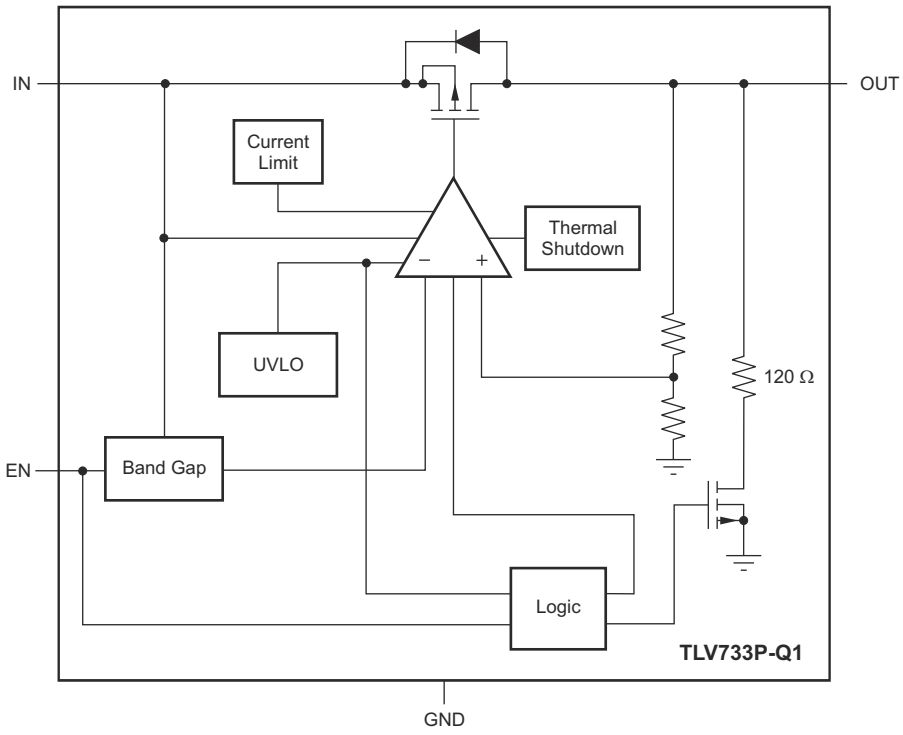
7 Detailed Description

7.1 Overview

The TLV733P-Q1 belongs to a family of low dropout (LDO) linear regulators. These devices consume low quiescent current and deliver excellent line and load transient performance. These characteristics, combined with low noise and good PSRR with low dropout voltage, make this family of devices ideal for portable consumer applications.

This family of regulators offers foldback current limit, shutdown, and thermal protection. The operating junction temperature for this family of devices is –40°C to +150°C.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Undervoltage Lockout (UVLO)

The TLV733P-Q1 family uses an undervoltage lockout (UVLO) circuit that disables the output until the input voltage is greater than the rising UVLO voltage. This circuit ensures that the device does not exhibit any unpredictable behavior when the supply voltage is lower than the operational range of the internal circuitry. During UVLO disable, the output is connected to ground with a 120-Ω pulldown resistor.

7.3.2 Shutdown and Output Enable

The enable pin (EN) is active high. Enable the device by forcing the EN pin to exceed $V_{EN(HI)}$. Turn off the device by forcing the EN pin to drop below $V_{EN(LO)}$. If shutdown capability is not required, connect EN to IN. There is no internal pulldown resistor connected to the EN pin.

The TLV733P-Q1 has an internal pulldown MOSFET that connects a 120-Ω resistor to ground when the device is disabled. The discharge time after disabling depends on the output capacitance (C_{OUT}) and the load resistance (R_L) in parallel with the 120-Ω pulldown resistor. The time constant is calculated in 方程式 1:

$$\tau = \frac{120 \cdot R_L}{120 + R_L} \cdot C_{OUT} \quad (1)$$

7.3.3 Internal Foldback Current Limit

The TLV733P-Q1 has an internal foldback current limit that protects the regulator during fault conditions. The current allowed through the device is reduced when the output voltage falls. When the output is shorted, the LDO supplies a typical current of 150 mA. The output voltage is not regulated when the device is in current limit. In this condition, the output voltage is the product of the regulated current and the load resistance. When the device output is shorted, the PMOS pass transistor dissipates power [(V_{IN} – V_{OUT}) × I_{OS}] until thermal shutdown is triggered and the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the fault condition continues, the device cycles between current limit and thermal shutdown; see the *Thermal Information* table for more details.

The foldback current-limit circuit limits the current allowed through the device to current levels lower than the minimum current limit at a nominal V_{OUT} current limit (I_{LIM}) during startup. See 图 6-6 to 图 6-8 for typical foldback current limit values. If the output is loaded by a constant-current load during startup, or if the output voltage is negative when the device is enabled, then the load current demanded by the load can exceed the foldback current limit and the device may not rise to the full output voltage. For constant-current loads, disable the output load until the TLV733P-Q1 has fully risen to the nominal output voltage.

The TLV733P-Q1 PMOS pass element has an intrinsic body diode that conducts current when the voltage at the OUT pin exceeds the voltage at the IN pin. Do not force the output voltage to exceed the input voltage because excessively high current can flow through the body diode.

7.3.4 Thermal Shutdown

Thermal shutdown protection disables the output when the junction temperature rises to approximately 160°C. Disabling the device eliminates the power dissipated by the device, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit can cycle on and off. This cycling limits regulator dissipation, protecting the device from damage as a result of overheating.

Activating the thermal shutdown feature usually indicates excessive power dissipation as a result of the product of the (V_{IN} – V_{OUT}) voltage and the load current. For reliable operation, limit junction temperature to 150°C (maximum). To estimate the margin of safety in a complete design, increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

The TLV733P-Q1 internal protection circuitry protects against overload conditions but is not intended to be activated in normal operation. Continuously running the TLV733P-Q1 into thermal shutdown degrades device reliability.

7.4 Device Functional Modes

7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage has previously exceeded the UVLO rising voltage and has not decreased below the UVLO falling threshold.
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the thermal shutdown temperature.

7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

7.4.3 Disabled

The device is disabled under the following conditions:

- The input voltage is less than the UVLO falling voltage, or has not yet exceeded the UVLO rising threshold.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

When the device is disabled, the active pulldown resistor discharges the output.

表 7-1 shows the conditions that lead to the different modes of operation.

表 7-1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > UVLO_{RISE}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{LIM}$	$T_J < 160°C$
Dropout mode	$UVLO_{RISE} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{LIM}$	$T_J < 160°C$
Disabled mode (any true condition disables the device)	$V_{IN} < UVLO_{FALL}$	$V_{EN} < V_{EN(LO)}$	—	$T_J > 160°C$

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

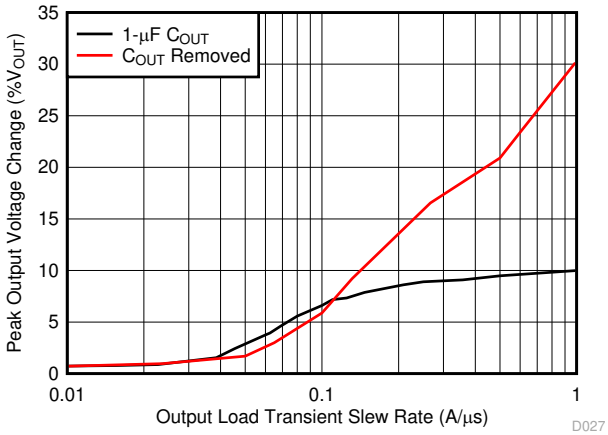
8.1 Application Information

8.1.1 Input and Output Capacitor Selection

The TLV733P-Q1 uses an advanced internal control loop to obtain stable operation both with and without the use of input or output capacitors. Dynamic performance is improved with the use of an output capacitor, and can be improved with an input capacitor. An output capacitance of 0.1 μF or larger generally provides good dynamic response. Use X5R- and X7R-type ceramic capacitors because these capacitors have minimal variation in value and equivalent series resistance (ESR) over temperature.

Although an input capacitor is not required for stability, increased output impedance from the input supply can compromise the performance of the TLV733P-Q1. Good analog design practice is to connect a 0.1-μF to 1-μF capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. Use an input capacitor if the source impedance is greater than 0.5 Ω. Use a higher-value capacitor if large, fast rise-time load transients are anticipated, or if the device is located several inches from the input power source.

图 8-1 shows the transient performance improvements with an external 1-μF capacitor on the output versus no output capacitor. The data in this figure are taken with an increasing load step from 50 mA to 300 mA, and the peak output voltage deviation (load transient response) is measured. For low output current slew rates, (< 0.1 A/μs), the transient performance of the device is similar with or without an output capacitor. When the current slew rate is increased, the peak voltage deviation is significantly increased. For loads that exhibit fast current slew rates above 0.1 A/μs, use an output capacitor. For best performance, the maximum recommended output capacitance is 100 μF.



Output current stepped from 50 mA to 300 mA, output voltage change measured at positive dI/dt

图 8-1. Output Voltage Deviation vs Load Step Slew Rate

Some applications benefit from the removal of the output capacitor. In addition to space and cost savings, the removal of the output capacitor lowers inrush current as a result of eliminating the required current flow into the output capacitor at startup. In these cases, take care to ensure that the load is tolerant of the additional output voltage deviations.

8.1.2 Dropout Voltage

The TLV733P-Q1 uses a PMOS pass transistor to achieve low dropout. When (V_{IN} – V_{OUT}) is less than the dropout voltage (V_{DO}), the PMOS pass device is in the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass element. V_{DO} scales approximately with output current because the PMOS device behaves like a resistor in dropout mode. As with any linear regulator, PSRR and transient response degrade when (V_{IN} – V_{OUT}) approaches dropout operation.

8.2 Typical Applications

8.2.1 DC-DC Converter Post Regulation

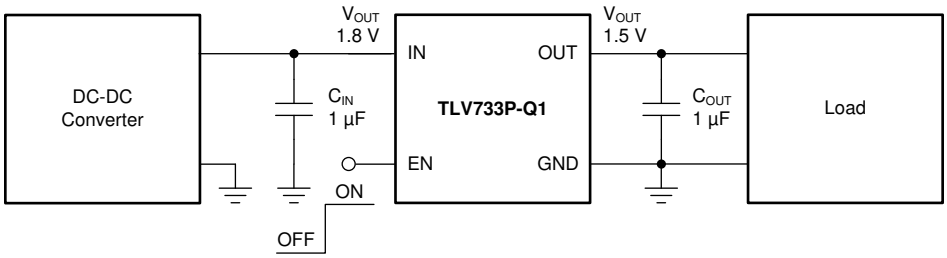


图 8-2. DC-DC Converter Post Regulation

8.2.1.1 Design Requirements

表 8-1. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	1.8 V, ±5%
Output voltage	1.5 V, ±1%
Output current	200-mA dc, 300-mA peak
Output voltage transient deviation	< 10%, 1-A/µs load step from 50 mA to 200 mA
Maximum ambient temperature	85°C

8.2.1.2 Design Considerations

The TLV733P-Q1 can provide post regulation after a dc-dc converter, as shown in 图 8-2. For this application, input and output capacitors are required to achieve the output voltage transient requirements. Capacitance values of 1 µF are selected to give the maximum output capacitance in a small, low-cost package.

8.2.1.3 Application Curve

图 8-3 shows the TLV733P-Q1 startup, regulation, and shutdown as specified in 图 8-2.

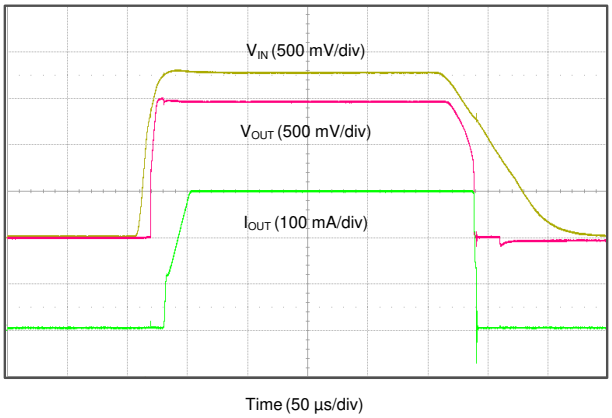

图 8-3. 1.8-V to 1.5-V Regulation at 300 mA

8.2.2 Capacitor-Free Operation from a Battery Input Supply

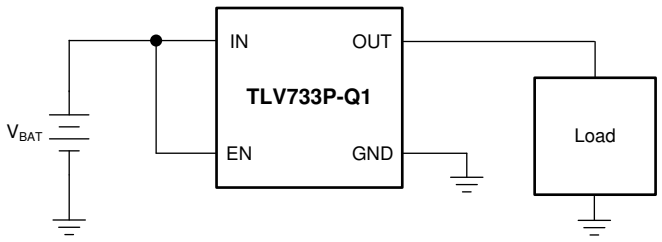

图 8-4. Capacitor-Free Operation from a Battery Input Supply

8.2.2.1 Design Requirements

表 8-2. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	3.0 V to 1.8 V (two 1.5-V batteries)
Output voltage	1.0 V, ±1%
Input current	200 mA, maximum
Output load	100-mA dc
Maximum ambient temperature	70°C

8.2.2.2 Design Considerations

The TLV733P-Q1 can be directly powered off of a battery, as shown in 图 8-4. An input capacitor is not required for this design because of the direct low impedance connection to the battery.

Eliminating the output capacitor allows for the minimal possible inrush current during startup, ensuring that the 200-mA maximum input current is not exceeded.

8.2.2.3 Application Curve

图 8-5 shows no inrush with the capacitor-free startup.

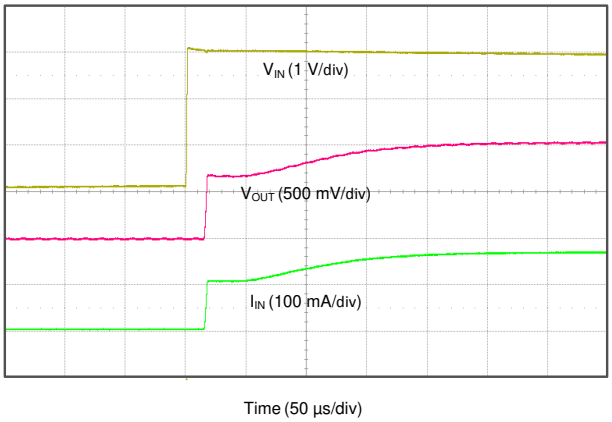

图 8-5. No Inrush Startup, 3.0-V to 1.0-V Regulation

Power Supply Recommendations

Connect a low output impedance power supply directly to the IN pin of the TLV733P-Q1. Inductive impedances between the input supply and the IN pin can create significant voltage excursions at the IN pin during startup or load transient events. If inductive impedances are unavoidable, use an input capacitor.

9 Layout

9.1 Layout Guidelines

- Place input and output capacitors as close to the device as possible.
- Use copper planes for device connections, in order to optimize thermal performance.
- Place thermal vias around the device to distribute the heat.

图 9-1 and 图 9-2 show examples of how the TLV733P-Q1 is laid out on a printed circuit board (PCB).

9.2 Layout Examples

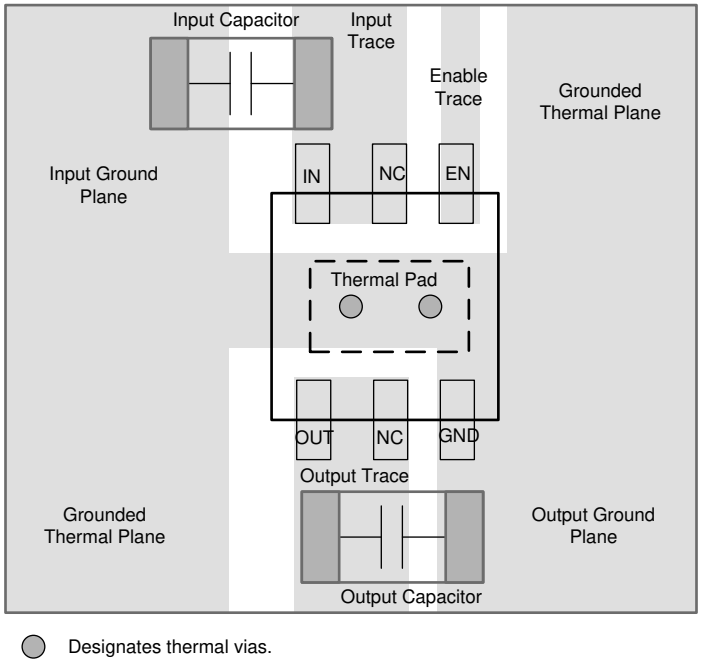

图 9-1. WSON Layout Example

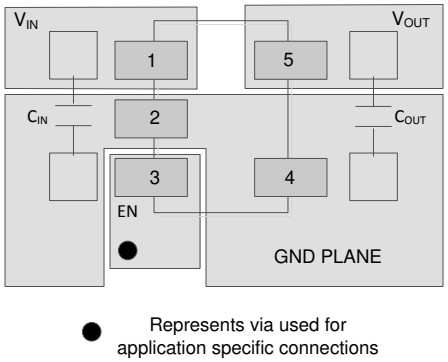

图 9-2. SOT-23 Layout Example

10 Device and Documentation Support

10.1 Device Support

10.1.1 Development Support

10.1.1.1 Evaluation Module

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TLV733P-Q1. The TLV73312PEVM-643 evaluation module (and related user guide) can be requested at the Texas Instruments website through the product folders or purchased directly from the TI eStore.

10.1.2 Device Nomenclature

表 10-1. Device Nomenclature (1) (2)

PRODUCT	V_{OUT}
TLV733P-Q1**xx(x)Pyyyz**Q1	**xx(x)** is the nominal output voltage. For output voltages with a resolution of 100 mV, two digits are used in the ordering number; otherwise, three digits are used (for example, 28 = 2.8 V; 125 = 1.25 V). **P** indicates an active output discharge feature. All members of the TLV733P-Q1 family will actively discharge the output when the device is disabled. **yyy** is the package designator. **z** is the package quantity. R is for reel (3000 pieces), T is for tape (250 pieces).

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder on www.ti.com.

(2) Output voltages from 1.0 V to 3.3 V in 50-mV increments are available. Contact the factory for details and availability.

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

OTHER QUALIFIED VERSIONS OF TLV733P-Q1 :

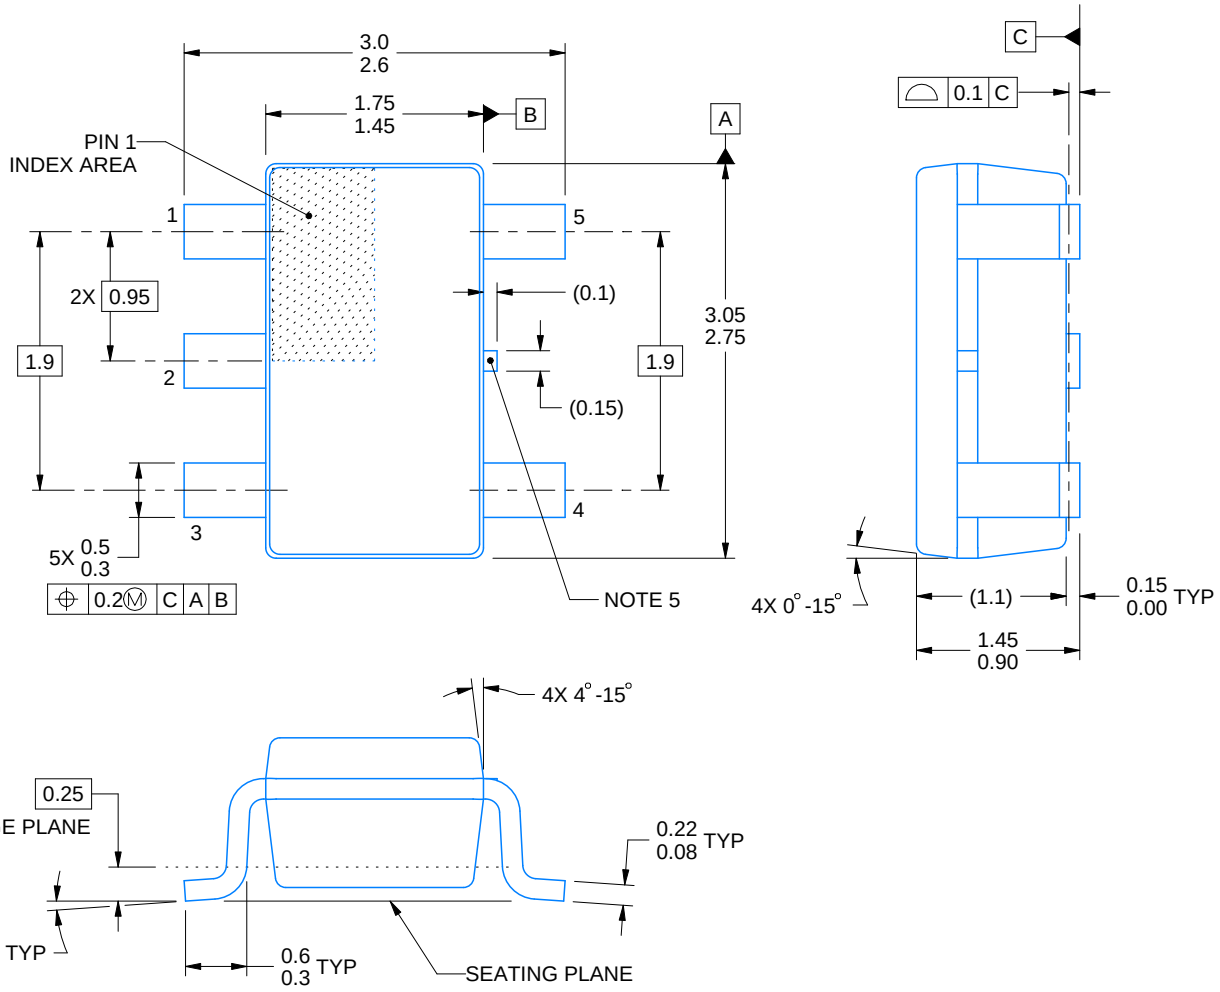
PACKAGE OUTLINE

DBV0005A

SOT-23 - 1.45 mm max height

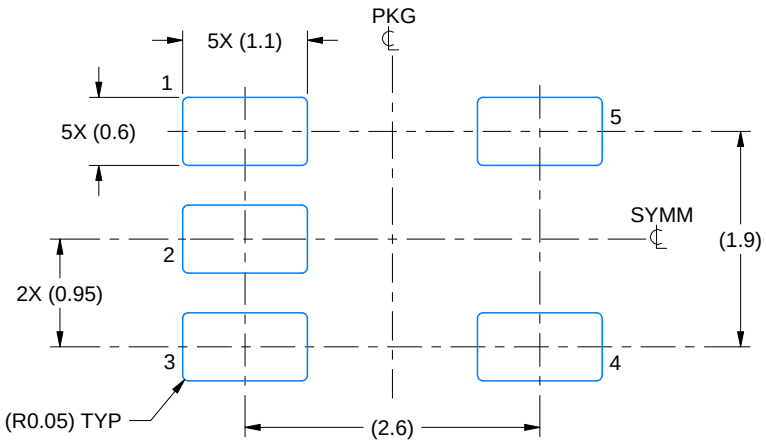
SMALL OUTLINE TRANSISTOR



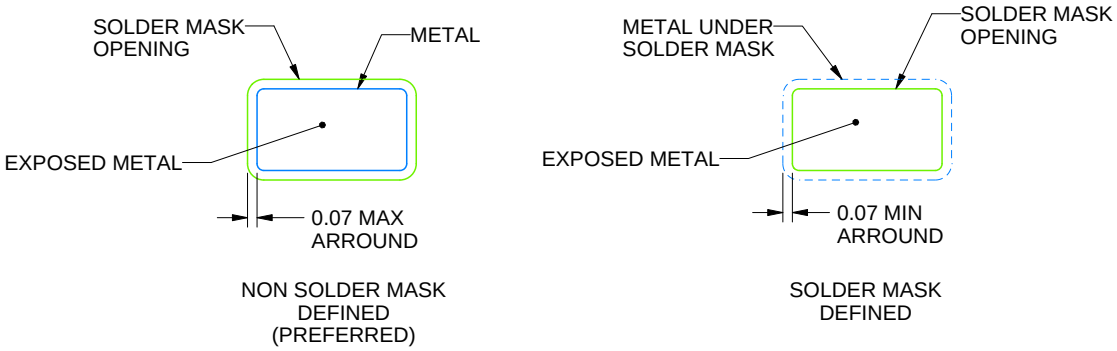
4214839/K 08/2024

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Refernce JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
5. Support pin may differ or may not be present.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

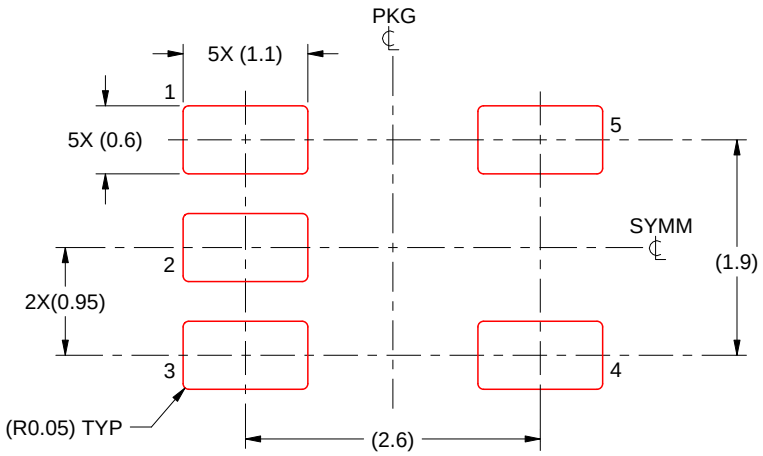


SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
