5 修订历史记录

Changes from Revision E (January 2015) to Revision F	Page
• 已添加 UL 和 CB 认证。	1
Changes from Revision D (October 2014) to Revision E	Page
• Added R _{LOAD} TEST CONDITIONS to I _{OCP} in the Electrical Characteristics for Current Limit and Short Circuit Protection table.	7
Changes from Revision C (August 2013) to Revision D	Page
• 处理额定值表，特性描述部分，器件功能模式，应用和实施部分，电源相关建议部分，布局部分，器件和文档支持部分以及机械、封装和可订购信息部分。	1
Changes from Original (January 2013) to Revision A	Page
• 已更改产品预览数据表	1
Changes from Revision A (February 2013) to Revision B	Page
• 已将器件状态从：产品预览更改为：量产数据	1
Changes from Revision B (February 2013) to Revision C	Page
• YFF PACKAGE Changed the YFF package dimensions	3

6 Pin Configuration and Functions

**TPD4S214 WCSP (YFF) PIN
MAPPING
(TOP SIDE/SEE-THROUGH VIEW)**

	1	2	3
A	V _{OTG_N}	DET	V _{BUS}
B	V _{OTG_IN}	$\overline{\text{FLT}}$	V _{BUS}
C	EN	GND	ID
D	ADJ	D-	D+

Pin Functions

NAME	PIN	TYPE	DESCRIPTION
D-	D2	I/O	USB data-
D+	D3	I/O	USB data+
ID	C3	I/O	USB ID signal
$\overline{\text{FLT}}$	B2	O	Open-Drain Output. Connect a pull-up resistor from $\overline{\text{FLT}}$ to the supply voltage of the host system.
ADJ	D1	I	Attach external resistor to adjust the current limit
EN	C1	I	Enable Input. Drive EN high to enable the OTG switch.
V _{BUS}	A3, B3	O	USB Power Output
V _{OTG_IN}	A1, B1	I	USB OTG Supply Input
DET	A2	O	Open-Drain Output. Connect a pull-up resistor from DET to the supply voltage of the host system.
GND	C2	Ground	Connect to PCB ground plane

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
T _{stg}	Storage temperature range	–40	85	°C
V _{OTG_IN} , ADJ, EN	Input voltage	–0.5	7	V
V _{BUS}	Output voltage to USB connector	–7	30	V
FLT, DET	Output voltage	–0.5	7	V
	Input clamp current V _I < 0		–50	mA
	I _{OUT} Continuous current through FLT and DET output		10	mA
	I _{GND} Continuous current through GND		100	mA
	T _{J(max)} maximum junction temperature	–65	150	°C
D+, D-, ID, V _{BUS} pins	IEC 61000-4-2 Contact Discharge at 25°C		±15	kV
D+, D-, ID, V _{BUS} pins	IEC 61000-4-2 Air-gap Discharge at 25°C		±15	kV
D+, D-, ID pins	Peak Pulse Current (tp = 8/20 μs) at 25°C		7.8	A
D+, D-, ID pins	Peak Pulse Power (tp = 8/20 μs) at 25°C		84	W

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500
		IEC 61000-4-2 Contact Discharge	±15000
		IEC 61000-4-2 Air-gap Discharge	
		D+, D-, ID, V _{BUS} Pins	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as 2000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as 500 V may actually have higher performance.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	TYP	MAX	UNIT
T _A	Operating free-air temperature		–40		85	°C
V _{IH}	High-level input voltage EN		1.2			V
V _{IL}	Low-level input voltage EN				0.4	V
t _{EN}	EN ramp rate for proper turn on	Valid ramp rate is between 10 μs and 100 ms, rising and falling	0.01		100	ms
t _{UVLO_SLEW}	V _{OTG_IN} ramp rate for proper UVLO operation	Valid ramp rate is between 10 μs and 100 ms, rising and falling	0.01		100	ms
t _{OVLO_SLEW}	V _{BUS} ramp rate for proper OVLO operation	Valid ramp rate is between 10 μs and 100 ms, rising and falling	0.01		100	ms
T _{A_VBUS_ATT}	Time to detect V _{BUS} device attachment and turn on DET				200	ms

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPD4S214	UNIT
		YFF	
		12 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	89.1	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	0.5	
R _{θJB}	Junction-to-board thermal resistance	40.0	
ψ _{JT}	Junction-to-top characterization parameter	3.0	
ψ _{JB}	Junction-to-board characterization parameter	39.0	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

7.5 Thermal Shutdown

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	TYP	MAX	UNIT
T _{SHDN+}	Shutdown temp rising		141		°C
T _{SHDN–}	Shutdown temp falling		125		°C
T _{HYST}	Thermal-shutdown Hysteresis		16		°C
P _{MAX}	Maximum power dissipation	V _{OTG_IN} = 5 V, R _{load} = 5 Ω, EN = 5 V, R _{ADJ} = 75 KΩ		0.16	W
T _{JMAX}	Junction Temp at max power dissipation			150	°C

7.6 Electrical Characteristics for EN, $\overline{\text{FLT}}$, DET, D+, D–, V_{BUS}, ID Pins

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{IL_EN}	EN pin input leakage current	EN = 3.3 V			1	μA
I _{OL}	$\overline{\text{FLT}}$, DET pin output leakage current	$\overline{\text{FLT}}$, DET = 3.6 V			1	μA
V _{OL_FLT}	Low-level output voltage $\overline{\text{FLT}}$	V _{BUS} or V _{OTG_IN} = 5 V or 0 V I _{OL} = 100 μA			100	mV
V _{OL_DET}	Low-level output voltage DET	V _{BUS} and V _{OTG_IN} = 5 V or 0 V I _{OL} = 100 μA			100	mV
C _{EN}	Enable capacitance	V _{BIAS} = 1.8 V, f = 1 MHz, 30 mVpp ripple, V _{OTG_IN} = 5 V		4.5		pF
V _D	Diode forward voltage D+, D–, ID pins; lower clamp diode	I _O = 8 mA			0.95	V
I _{L_D}	Leakage current on D+, D–, ID Pins	D+, D–, ID = 3.3 V			100	nA
ΔC _{IO}	Differential capacitance between the D+, D– lines	V _{BIAS} = 1.8 V, f = 1 MHz, 30 mVpp ripple, V _{OTG_IN} = 5 V			0.04	pF
C _{IO}	Capacitance to GND for the D+, D– lines	V _{BIAS} = 1.8 V, f = 1 MHz, 30 mVpp ripple, V _{OTG_IN} = 5 V		1.9		pF
	Capacitance to GND for the ID lines			1.9		
V _{BR}	Breakdown voltage D+, D–, ID pins	I _{br} = 1 mA	6			V
	Breakdown voltage on V _{BUS}	I _{br} = 1 mA	33			V
R _{DYN}	Dynamic on resistance D+, D–, ID clamps			1		Ω

7.7 Electrical characteristics for UVLO / OVLO

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT UNDER-VOLTAGE LOCKOUT						
V _{UVLO+}	Under-voltage lock-out, input power detected threshold rising	V _{OTG_IN} increasing from 0 V to 5 V, No load on V _{BUS} pin	3.4	3.6	3.8	V
V _{UVLO-}	Under-voltage lock-out, input power detected threshold falling	V _{OTG_IN} decreasing from 5 V to 0 V, No load on V _{BUS} pin	3.0	3.2	3.5	V
V _{HYS-UVLO}	Hysteresis on UVLO	Δ of V _{UVLO+} and V _{UVLO-}		260		mV
T _{RUUVLO}	Recovery time from UVLO	V _{OTG_IN} increasing from 0V to 5V, No load on V _{BUS} pin; time from V _{OTG_IN} = V _{UVLO+} to $\overline{\text{FLT}}$ toggles high		18		ms
T _{RESP_UVLO}	Response time for UVLO	V _{OTG_IN} decreasing from 5V to 0V, No load on V _{BUS} pin; time from V _{OTG_IN} = V _{UVLO-} to $\overline{\text{FLT}}$ toggles low		0.18		μs
OUTPUT OVERVOLTAGE LOCKOUT						
V _{OVP+}	OVLO rising threshold	Both V _{OTG_IN} and V _{BUS} increasing from 5 V to 7 V	5.55	6.15	6.45	V
V _{OVP-}	OVLO falling threshold	Both V _{OTG_IN} and V _{BUS} decreasing from 7 V to 5 V	5.4	6	6.3	V
V _{HYS-OVP}	Hysteresis on OVLO	Δ of V _{UVLO+} and V _{UVLO-}		100		mV
T _{ROVLO}	Recovery time from OVLO	Both V _{OTG_IN} and V _{BUS} decreasing from 7 V to 5 V, V _{OTG_IN} = 5 V; time from V _{BUS} = V _{OVP-} to $\overline{\text{FLT}}$ toggles high		9		ms
T _{RESP_OVLO}	Response time for OVLO	Both V _{OTG_IN} and V _{BUS} increasing from 5 V to 7 V, V _{OTG_IN} = 5 V; time from V _{BUS} = V _{OVP+} to $\overline{\text{FLT}}$ toggles low		17		μs

7.8 Electrical Characteristics for DET Circuits

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{BUS_VALID-}	Valid V _{BUS} voltage detect	V _{BUS} = 7 V to 0 V	2.7	2.9	3	V
V _{BUS_VALID+}	Valid V _{BUS} voltage detect	V _{BUS} = 0 V to 7 V	5.3	5.4	5.6	V
T _{DET_DELAY-}	V _{BUS} detect propagation delay–	V _{BUS} 0 V to 4 V, 200 ns ramp; V _{BUS} = V _{BUS_VALID-} MIN to DET toggles high		4.9		μs
T _{DET_DELAY+}	V _{BUS} detect propagation delay+	V _{BUS} 6 V to 4 V, 200 ns ramp; V _{BUS} = V _{BUS_VALID+} MAX to DET toggles low		1.8		μs

7.9 Electrical Characteristics for OTG Switch

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R _{DS_ON}	OTG switch resistance	T _A = 25 °C, V _{BUS} = 5 V, I _{OUT} = 100 mA, R _{ADJ} = 75 kΩ ⁽¹⁾		263	290	mΩ
V _{DROP}	OTG switch voltage drop	V _{BUS} = 5 V, I _{OUT} = 100 mA, R _{ADJ} = 75 kΩ		12.6	29	mV
I _{OTG_OFF_30V}	Leakage current at 30V	Measured at V _{OTG_IN}	V _{BUS} = 30 V, EN = 5 V, V _{OTG_IN} = 5 V		6	μA
I _{OTG_OFF_2V}	Leakage current at –2V		V _{BUS} = 30 V, EN = 5 V, V _{OTG_IN} = 0 V		11	nA
I _{OTG_OFF}	Standby Leakage current		V _{BUS} = –2 V, EN = 5 V, V _{OTG_IN} = 5 V		30	μA
I _{BUS_REV}	Reverse Leakage current		V _{BUS} = 0 V, EN = 0 V, V _{OTG_IN} = 5 V		32	μA
			V _{BUS} = 5 V, EN = 0 V, V _{OTG_IN} = 0 V		10	nA
			V _{BUS} = 5 V, EN = 5 V, V _{OTG_IN} = 0V		1	nA
			V _{BUS} = 5.5 V, EN = 5 V, V _{OTG_IN} = 5 V		6	μA
T _{ON}	Turn-ON time	R _L = 100 Ω, C _L = 1 μF, R _{ADJ} = 75 kΩ		16		ms
T _{OFF_EN}	Turn-OFF time	R _L = 100 Ω, C _L = 1 μF, R _{ADJ} = 75 kΩ, toggle EN		80		μs
T _{OFF_OTG}	Turn-OFF time	R _L = 100 Ω, C _L = 1 μF, R _{ADJ} = 75 kΩ, toggle V _{OTG_IN}		0.5		μs
T _{RISE}	Output rise time	R _L = 100 Ω, C _L = 1 μF, R _{ADJ} = 75 kΩ		137		μs
T _{FALL}	Output fall time	R _L = 100 Ω, C _L = 1 μF, R _{ADJ} = 75 kΩ		1.6		μs

 (1) R_{DS(ON)} is measured at 25°C

7.10 Electrical Characteristics for Current Limit and Short Circuit Protection

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{OCP} Current-limit threshold (maximum DC output current IOUT delivered to load)	$V_{OTG_IN} = 5\text{ V}$, $R_{LOAD} = 2.0\ \Omega$	$R_{ADJ} = 226\text{ k}\Omega^{(1)}$	235	245	281
		$R_{ADJ} = 75\text{ k}\Omega^{(1)}$	735	792	830
		$R_{ADJ} = 62\text{ k}\Omega^{(1)}$	885	959	1005
		$R_{ADJ} = 45\text{ k}\Omega^{(1)}$	1128	1200	1363
T_{BLANK} Blanking time after enable	$V_{OTG_IN} = 5\text{ V}$		4		ms
T_{DEGL} Deglitch time while enabled	$V_{OTG_IN} = 5\text{ V}$, $R_L = 100\ \Omega$, $CL = 1\ \mu\text{F}$, $R_{ADJ} = 75\text{ k}\Omega$, apply short to ground		9.4		ms
T_{DET_SC} Response time to short circuit			10		μs
T_{REG} Short circuit regulation time		Hiccup pulse width; auto-retry time	13		ms
T_{OCP} Short circuit over current protection time		Hiccup pulse period	153		ms
V_{SHORT} Short circuit threshold			4		V
I_{INRUSH} Inrush current during a startup	See Figure 23 under test configuration	$R_L = 100\ \Omega$, $CL = 22\ \mu\text{F}$, $R_{ADJ} = 75\text{ k}\Omega$	726		mA

(1) External resistor tolerance is $\pm 1\%$

7.11 Supply Current Consumption

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	TYP	MAX	UNIT
I_{VOTG_INON} High-level V_{OTG_IN} operating current consumption	$V_{OTG_IN} = 5\text{ V}$, No load on V_{BUS} , $EN = 5\text{ V}$	$R_{ADJ} = 75\text{ k}\Omega$	162	200
		$R_{ADJ} = 226\text{ k}\Omega$	150	200

Figure 16. V_{BUS} Valid Detect Upper

Figure 17. V_{BUS} Valid Detect Lower

8.3 Feature Description

8.3.1 Input Voltage Protection at V_{BUS} from -7 V to 30 V

The V_{BUS} pin can handle continuous voltage ranging from -7 V to 30 V . The OVLO at the V_{BUS} pin ensures that if there is a fault condition at the V_{BUS} line, TPD4S214 is able to isolate the fault and protect the internal circuitry from damage.

8.3.2 IEC 61000-4-2 Level 4 ESD Protection

The I/O pins can withstand ESD events up to $\pm 15\text{-kV}$ contact and air gap. An ESD clamp diverts the current to ground.

8.3.3 Low $R_{DS(ON)}$ N-CH FET Switch for High Efficiency

A Low $R_{DS(ON)}$ ensures there is minimal voltage loss when supplying high current to OTG devices.

8.3.4 Compliant with USB2.0 and USB3.0 OTG spec

The capability of TPD4S214 to supply greater than 1.2 A of current on V_{BUS} meets or exceeds the USB2.0 and USB3.0 OTG specification.

8.3.5 User Adjustable Current Limit From 250 mA to Beyond 1.2 A

The designer can select the over current protection level by selecting the proper R_{ADJ} .

8.3.6 Built-in Soft-start

The soft start feature waits 16 ms to turn on the OTG switch after all operating conditions are met.

8.3.7 Reverse Current Blocking

If V_{BUS} is greater than V_{OTG_IN} by 50 mV , the OTG switch is disabled in 17.5 ms .

8.3.8 Over Voltage Lock Out for V_{BUS}

OVLO ensures that an over voltage condition on V_{BUS} disables the OTG switch to protect the system.

8.3.9 Under Voltage Lock Out for V_{OTG_IN}

UVLO ensures that an under voltage condition on V_{BUS} disables the OTG switch to protect the system.

8.3.10 Thermal Shutdown and Short Circuit Protection

TPD4S214 has an over-temperature protection circuit to protect against system faults or improper use. The basic function of the thermal shutdown (TSD) circuit is to sense when the junction temperature has exceeded the absolute maximum rating and shut down the device until the junction temperature has cooled to a safe level. Short circuit protection prevents any damaging current demand from the system.

8.3.11 Auto Retry on any Fault; no Latching off States

In any fault condition, TPD4S214 will reassess V_{BUS} , V_{OTG_IN} , and thermal conditions until a safe state is reached and then enable the OTG switch, eliminating any latched off states.

8.3.12 Integrated V_{BUS} Detection Circuit

TPD4S214 has a V_{BUS} detection feature facilitating communication between the USB host and peripheral device. The use of this feature is optional.

8.3.13 Low Capacitance TVS ESD Clamp for USB2.0 High Speed Data Rate

The High Speed data lines have a capacitance less than 2 pF , supporting a bandwidth greater than 3 GHz . This easily accommodates the 480-Mbps data rate defined in the USB2.0 specification.

Feature Description (continued)

8.3.14 Internal 16ms Startup Delay

The built-in start up delay allows for voltages on V_{BUS} to reach a steady state after which a 1- μ A trickle charge slowly turns on the main switch. During the inrush period, the peak inrush current will be limited to no more than the current limit set by the external resistor R_{ADJ} .

8.3.15 Space Saving WCSP (12-YFF) Package

The 1.69 mm $\times$ 1.39 mm (Max) WCSP package is valuable in space constrained designs.

8.3.16 Inrush Current Protection

As soon as TPD4S214 is enabled, its logic block detects the presence of any fault conditions highlighted in [Table 2](#). In the absence of any fault condition, a counter waits for 16 ms, after which a 1- μ A trickle charge slowly turns on the main switch. During the inrush period, the peak inrush current will be limited to no more than the current limit set by the external resistor R_{ADJ} .

8.3.17 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch turns on into a discharged load capacitor or short-circuit, a capacitor needs to be placed between V_{OTG_IN} and GND. A 10- μ F ceramic capacitor, C_{IN} , placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high-current application. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

8.3.18 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, a C_{IN} greater than C_{LOAD} is highly recommended. A C_{LOAD} greater than C_{IN} can cause V_{BUS} to exceed V_{OTG_IN} when the system supply is removed. A C_{IN} to C_{LOAD} ratio of 10 to 1 is recommended for minimizing V_{OTG_IN} dip caused by inrush currents during startup.

8.3.19 Current Limit

The TPD4S214 provides current limiting protection, which is set by an external resistor connected from the ADJ pin to ground shown in [Figure 18](#). The current limiting threshold I_{OCP} is set by the external resistor R_{ADJ} . [Figure 19](#) shows the typical current limit for a corresponding R_{ADJ} value with $\pm 1\%$ tolerance across the operating temperature range.

Figure 18. Current Limit Diagram

$$R_{ADJ} = \frac{55.358}{I_{OCP}} \quad (1)$$

Where:

R_{ADJ} = external resistor used to set the current limit (k Ω)

I_{OCP} = current limit set by the external R_{ADJ} resistor (A)

R_{ADJ} is placed between the ADJ pin and ground, shown in [Figure 18](#), providing a maximum current limit between 250 mA and 1.2 A.

Feature Description (continued)

The temperature derating curve shown in [Figure 20](#) graphs the line where TPD4S214 will have a Mean Time Before Failure (MTBF) of 5 years at a 100% duty cycle for a given junction temperature, T_j , and current on V_{BUS} , or I_{BUS} . MTBF of 5 years at a 100% duty cycle is equivalent to 7.5 years at a 75% duty cycle, or 10 years at a 50% duty cycle. See [Equation 2](#) to calculate the junction temperature. If a current and junction temperature point lie below the curve on the graph then the MTBF will exceed 5 years at a 100% duty cycle, or its equivalent. If above the curve, the MTBF will be decreased.

8.3.20 Thermal Shutdown

When the device is ON, current flowing through the device will cause the device to heat up. Overheating can lead to permanent damage to the device. To prevent this, an over temperature protection has been designed into the device. Whenever the junction temperature exceeds 141°C, the switch will turn off, thereby limiting the temperature. Once the device cools down to below 125°C the switch will turn on if the EN is active and the V_{BUS} voltage is within the UVLO and OVP thresholds. While the over temperature protection in the device will not kick-in unless the die temperature reaches 141°C, it is generally recommended that care is taken to keep the junction temperature below 125°C. Operation of the device above 125°C for extended periods of time can affect the long-term reliability of the part.

The junction temperature of the device can be calculated using the below formula:

$$T_j = T_A + P_D R_{\theta JA} \quad (2)$$

Where:

T_j = Junction temperature

T_A = Ambient temperature

$R_{\theta JA}$ = Thermal resistance

P_D = Power Dissipated in device

$$P_D = I^2 R_{DS(ON)} \quad (3)$$

I = Current through device

$R_{DS(ON)}$ = Max on resistance of device

Example

At 0.5 A, the continuous current power dissipation is given by:

$$P_D = 0.5^2 \times 0.3 = 0.075 \text{ W} \quad (4)$$

If the ambient temperature is about 85 °C the junction temperature will be:

$$T_j = 85 + (0.075 \times 89.1) = 91.7^\circ\text{C} \quad (5)$$

Feature Description (continued)

This implies that, at an ambient temperature of 85°C, TPD4S214 can pass a continuous 0.5 A without sustaining damage. Conversely, the above calculation can also be used to calculate the total continuous current the TPD4S214 can handle at any given temperature.

The MTBF can be estimated by examining [Figure 20](#). Locating 0.5 A and 91.7 °C, the point is below the curve. This implies that the MTBF for this calculation is longer than 5 years at a 100% duty cycle. If the duty cycle is 50% then MTBF exceeds 10 years.

8.3.21 V_{BUS} Detection

There are several important protocols defined in [OTG and EH Supplement] that governs communication between Targeted Hosts (A-device) and USB peripherals (B-device). Communication between host and peripheral is usually done on the ID pin only. In the case when two OTG devices that could both act as either host or peripheral are connected, measuring voltage level on V_{BUS} will aid in the handshaking process. If an embedded host instead of a USB peripheral is connected to the OTG device, OTG charging would not be required and the system's OTG source should remain off to conserve power. The TPD4S214 V_{BUS} detection block aids power conservation and is powered from V_{BUS}. See [Functional Block Diagram](#). The DET pin is an open drain PMOS output with default state low.

In the event when an A-plug is attached, the system detects ID pin as FALSE, in which case ID pin resistance to ground is less than 10 Ω. For a B-plug, the system detects ID pin as TRUE and ID pin resistance to ground is greater than 100 kΩ. For the system to power a USB device through OTG switch once it is connected, voltage on V_{BUS} should remain below V_{BUS_VALID MIN} within T_{A_VBUS_ATT} of the ID pin becoming FALSE. After this event, the system confirms that the USB device requires power and enables both TPD4S214 and OTG source. However, if V_{BUS_VALID} is detected on V_{BUS} within T_{A_VBUS_ATT} of the ID pin becoming FALSE, there is either a system error or the device connected does not require charging. OTG source remains switched off and the entire sequence would restart when the system detects another FALSE on the ID pin.

Table 1. V_{BUS} Detection scheme

EN	V _{OTG_IN} (V _{BUS} Detect Power)	V _{BUS}	DET	Condition
X	X	V _{BUS_VALID} [−] < V _{BUS} < V _{BUS_VALID} ⁺	H	V _{BUS} within V _{BUS_VALID}
X	X	V _{BUS_VALID} [−] > V _{BUS} OR V _{BUS} > V _{BUS_VALID} ⁺	L	V _{BUS} outside of V _{BUS_VALID}

X = Don't Care, H = Signal High, and L = Signal Low

[Figure 21](#) and [Figure 22](#) shows suggested system level timing diagrams for detecting V_{BUS} according to [OTG and EH Supplement]. [Figure 28](#) shows the application diagram. In [Figure 21](#), DET pin remains low after ID pin becomes FALSE, indicating there is not an active voltage source on V_{BUS}. The USB controller proceeds to turn on OTG 5-V source and the TPD4S214 respectively; this sequence is recommended because TPD4S214 is powered through the OTG source. After a period of t_{ON}, current starts to flow through the OTG switch and V_{BUS} is ramped to the voltage level of V_{OTG_IN}.

Figure 21. Timing Diagram for Valid USB Device

In Figure 22, DET pin toggles high after an active voltage is detected on V_{BUS} within $T_{A_VBUS_ATT}$. This indicates that the USB device attached is not suitable for OTG charging and both OTG 5-V source and TPD4S214 remain off.

Figure 22. System Level Timing Diagram for invalid USB Device

8.3.22 Test Configuration

Figure 23. Inrush Current Test Configuration.

Enable is toggled from low to high. See the [Application Information](#) section for C_{IN} and C_{LOAD} value recommendations.

8.4 Device Functional Modes

Table 2. Device Operation

EN	V_{OTG_IN}	V_{BUS}	OCP	OTP	OTG SW	$\overline{FLT}$	FAULT CONDITION
X	0	0	F	F	OFF	L	SW Disabled
X	X	X	X	T	OFF	L	Over Temperature

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

A USB OTG device's one and only connector is the AB receptacle, which accepts either an A or B plug. When an A-plug is inserted, the OTG device is called the A-device and when a B-plug is inserted it is called the B-device. A-device is often times referred to as "Targeted Host" and B-device as "USB peripheral". TPD4S214 supports an OTG device when TPD4S214's system is acting as an A-device and powering the USB interface. The TPD4S214 may also be used in non-OTG applications where it resides on the current source side.

9.2 Typical Application

The TPD4S214 is placed next to the USB connector to provide over voltage, over current, and ESD protection for the OTG 5-V source and USB Controller.

9.2.1 USB 2.0 Without Using On-chip V_{BUS} Detect

An example using TPD4S214 to protect an OTG 5-V source and USB 2.0 Controller is shown below. This USB Controller does not utilize V_{BUS} detection with the DET pin, so DET is tied to GND. TPD4S214 is placed in the transmitter channel immediately adjacent to the USB connector. The D+, D-, ID pins on TPD4S214 are interchangeable so that each can protect either of the D+, D-, ID pins on the USB connector, the naming convention is just a suggestion.

Figure 24. USB2.0 Application Diagram Without Using On-chip V_{BUS} Detect

* C_{OTG} and C_{BUS} have minimum recommended values of 1 μ F each

Typical Application (continued)

9.2.1.1 Design Requirements

For this example, use the following table as input parameters:

Design Parameters	Example Value
Signal range on V _{OTG_IN}	3.8 V – 5.5 V
Signal range on V _{BUS}	0 V – 5.3 V nominal, withstand -7 V to 30 V
I _{BUS_MAX}	500 mA
R _{ADJ}	100 kΩ
Drive EN low (disabled)	0 V – 0.4 V
Drive EN high (enabled)	1.2 V – 5.5 V

9.2.1.2 Detailed Design Procedure

To begin the design process, determine the maximum current expected under normal usage. In this example, the maximum expected current is 500 mA so an R_{ADJ} of 100 kΩ was selected to begin current limiting at around 550 mA and protect the OTG system. Fault conditions are monitored by the USB controller by using the FLT Pin. DET is not used and is grounded and can optionally be left floating instead.

9.2.1.3 Application Curves

9.2.2 USB 2.0 Using On-chip V_{BUS} Detect

An example using TPD4S214 to protect an OTG 5-V source and USB 2.0 Controller is shown below. This USB Controller monitors V_{BUS} detection with the DET pin. This can be advantageous when a peripheral with an Embedded Host is attached. In this case, if there is a valid voltage present on V_{BUS} there is no need to provide OTG power, so the USB Controller can be programmed to disable the OTG 5-V source, resulting in a power savings. The D+, D-, ID pins on TPD4S214 are interchangeable so that each can protect either of the D+, D-, ID pins on the USB connector, the naming convention is just a suggestion.

Figure 28. USB 2.0 Application Diagram Using On-chip V_{BUS} Detect

* C_{OTG} and C_{BUS} each have minimum recommended values of 1 μ F

9.2.2.1 Design Requirements

For this example, use the following table as input parameters:

Design Parameters	Example Value
Signal range on V_{OTG_IN}	3.8 V – 5.5 V
Signal range on V_{BUS}	0 V – 5.3 V nominal, withstand –7 V to 30 V
I_{BUS_MAX}	500 mA
R_{ADJ}	100 k Ω
Drive EN low (disabled)	0 V – 0.4 V
Drive EN high (enabled)	1.2 V – 5.5 V

9.2.2.2 Detailed Design Procedure

To begin the design process, determine the maximum current expected under normal usage. In this example, the maximum expected current is 500 mA so an R_{ADJ} of 100 k Ω was selected to begin current limiting at around 550 mA and protect the OTG system. Fault conditions are monitored by the USB controller by using the FLT Pin. DET Pin is used to facilitate detecting between a USB host and peripheral device on V_{BUS} .

9.2.2.3 Application Curves

Refer to [Application Curves](#) for related application curves.

9.2.3 USB 3.0 Without Using On-chip V_{BUS} Detect

An example using TPD4S214 to protect an OTG 5-V source and USB 3.0 Controller is shown below. This USB Controller does not utilize V_{BUS} detection with the DET pin, so it is tied to GND. The D+, D-, ID pins on TPD4S214 are interchangeable so that each can protect either of the D+, D-, ID pins on the USB connector, the naming convention is just a suggestion.

* C_{BUS} and C_{OTG} each have minimum recommended values of 1 μ F

Figure 29. USB 3.0 Application Diagram Without Using On-chip V_{BUS} Detect

9.2.3.1 Design Requirements

For this example, use the following table as input parameters:

Design Parameters	Example Value
Signal range on V_{OTG_IN}	3.8 V – 5.5 V
Signal range on V_{BUS}	0 V – 5.3 V nominal, withstand –7 V to 30 V
I_{BUS_MAX}	900 mA
R_{ADJ}	56 k Ω
Drive EN low (disabled)	0 V – 0.4 V
Drive EN high (enabled)	1.2 V – 5.5 V

9.2.3.2 Detailed Design Procedure

To begin the design process, determine the maximum current expected under normal usage. In this example, the maximum expected current is 900 mA so an R_{ADJ} of 56 k Ω was selected to begin current limiting at around 1 A and protect the OTG system. Fault conditions are monitored by the USB controller by the $\overline{FLT}$ Pin. DET is not used and is grounded and can optionally be left floating instead.

9.2.3.3 Application Curves

Refer to [Application Curves](#) for related application curves.

10 Power Supply Recommendations

TPD4S214 is designed to receive power from an OTG 5-V power source. It can operate normally (nFET ON) between 3.8 V and 5.55 V. Thus, the power supply (with a ripple of V_{RIPPLE}) requirement for TPD4S214 to be able to switch the nFET ON is between $3.8 \text{ V} + V_{\text{RIPPLE}}$ and $5.55 \text{ V} - V_{\text{RIPPLE}}$.

11 Layout

11.1 Layout Guidelines

- The optimum placement is as close to the connector as possible.
 - EMI during an ESD event can couple from the trace being struck to other nearby unprotected traces, resulting in early system failures. Therefore, the PCB designer needs to minimize the possibility of EMI coupling by keeping any unprotected traces away from the protected traces which are between the TVS and the connector.
- Route the protected traces as straight as possible.
- Avoid using VIAs between the connector and an I/O protection pin on TPD4S214.
- Avoid 90° turns in traces.
 - Electric fields tend to build up on corners, increasing EMI coupling.
- Minimize impedance on the path to GND for maximum ESD dissipation.
- The capacitors on V_{BUS} and $V_{\text{OTG_IN}}$ should be placed close to their respective pins on TPD4S214.

11.2 Layout Example

Figure 30. TPD4S214 Layout Example

Successful dissipation of an ESD event is largely dependent on minimizing the impedance along the designated electrical path to ground. For this reason any TVS, including TPD4S214, needs to have the lowest possible impedance to GND. The BGA footprint of this device constrains the path to ground through a VIA in the GND pad of TPD4S214. Due to the "skin effect," maximizing the surface area of the VIA minimizes the impedance of the path to GND. For this reason make both the VIA pad diameter and the VIA drill diameter as large as possible, thus maximizing the surface area of the outside of the VIA surface and the inside of the VIA surface. The GND plane should not be broken in the vicinity of the GND VIA. If possible, attaching the GND VIA to a GND plane on multiple layers minimizes the impedance. The GND VIA should be filled with a non-conductive filler (like epoxy) as opposed to a conductive filler, in order to keep the surface area of the inside of the VIA created by the drill. The GND VIA should be plated over at the SMD pad.

13 机械封装和可订购信息

以下页中包括机械封装和可订购信息。 这些信息是针对指定器件可提供的最新数据。 这些数据会在无通知且不对本文档进行修订的情况下发生改变。 欲获得该数据表的浏览器版本, 请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPD4S214YFFR	Active	Production	DSBGA (YFF) 12	3000 LARGE T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	B3214
TPD4S214YFFR.A	Active	Production	DSBGA (YFF) 12	3000 LARGE T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	B3214

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
