TPS22969 5.5V，6A，4.4mΩ 导通电阻负载开关

1 特性

- 集成单通道负载开关
- VBIAS 电压范围：2.5V 至 5.5V
- VIN 电压范围：0.8V 至 5.5V
- 超低 R_{ON} 电阻
  - V_{IN} = 1.05V (V_{BIAS} = 5V) 时，R_{ON} = 4.4mΩ
- 6A 最大持续开关电流
- 低静态电流（V_{BIAS} = 5V 时为 20μA（典型值））
- 低关断电流（V_{BIAS} = 5V 时为 1μA（典型值））
- 低控制输入阈值允许使用 1.2V 或更高通用输入输出 (GPIO) 接口
- V_{BIAS} 和 V_{IN} 范围内的受控和固定转换率
  - V_{IN} = 1.05V (V_{BIAS} = 5V) 时，t_R = 599μs
- 快速输出放电 (QOD)
- 带有散热焊盘的小外形尺寸无引线 (SON) 8 端子封装
- 静电放电 (ESD) 性能经测试符合 JESD 22 规范
  - 2kV 人体模型 (HBM)
  - 1kV 充电器件模型 (CDM)

2 应用范围

- Ultrabook™/笔记本电脑
- 台式个人电脑
- 工业用个人电脑
- Chromebook
- 服务器
- 机顶盒
- 电信系统
- 平板电脑

3 说明

TPS22969 是一款小型，超低 R_{ON}，单通道负载开关，此开关具有受控开启功能。 此器件包含一个可在 0.8V 至 5.5V 的输入电压范围内运行的 N 通道金属氧化物半导体场效应晶体管 (MOSFET)，并且支持 6A 的最大持续
电流。

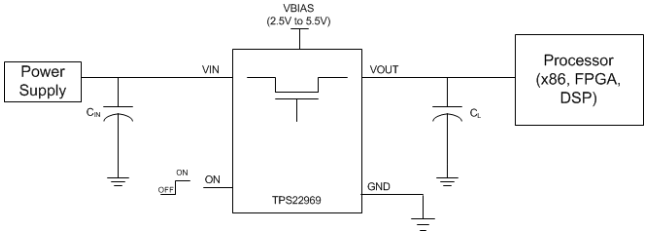
器件的超低 R_{ON} 和高电流处理能力的组合使得此器件非常适合于驱动具有非常严格压降耐受的处理器电源轨。 器件的受控上升时间大大减少了由大容量负载电容导致的涌入电流，从而减少或消除了电源损耗。 此开关可由 ON 端子单独控制，此端子能够与微控制器或低压离散逻辑电路生成的低压控制信号直接对接。 通过集成一个 224Ω 下拉电阻器，在开关关闭时实现快速输出放电 (QOD)，此器件进一步减少总体解决方案尺寸。

TPS22969 采用小型 3mm x 3mm SON-8 封装 (DNY)。 DNY 封装集成有一个散热焊盘，此散热焊盘可在高电流和高温应用中实现高功率耗散。 器件在自然通风环境下的额定运行温度范围为 -40°C 至 85°C。

器件信息

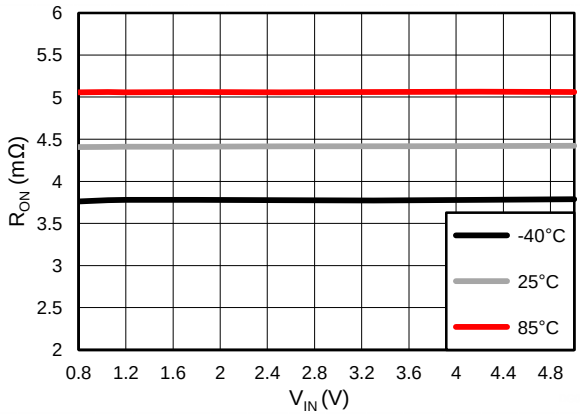
订货编号	封装	封装尺寸
TPS22969DNY	超薄小外形尺寸封装 (WSON) (8)	3mm x 3mm

4 简化电路原理图



典型应用：驱动用于处理器的高电流内核电源轨

R_{ON} 与 V_{IN} 之间的关系（此时，V_{BIAS} = 5V，I_{OUT} = -200mA）



PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

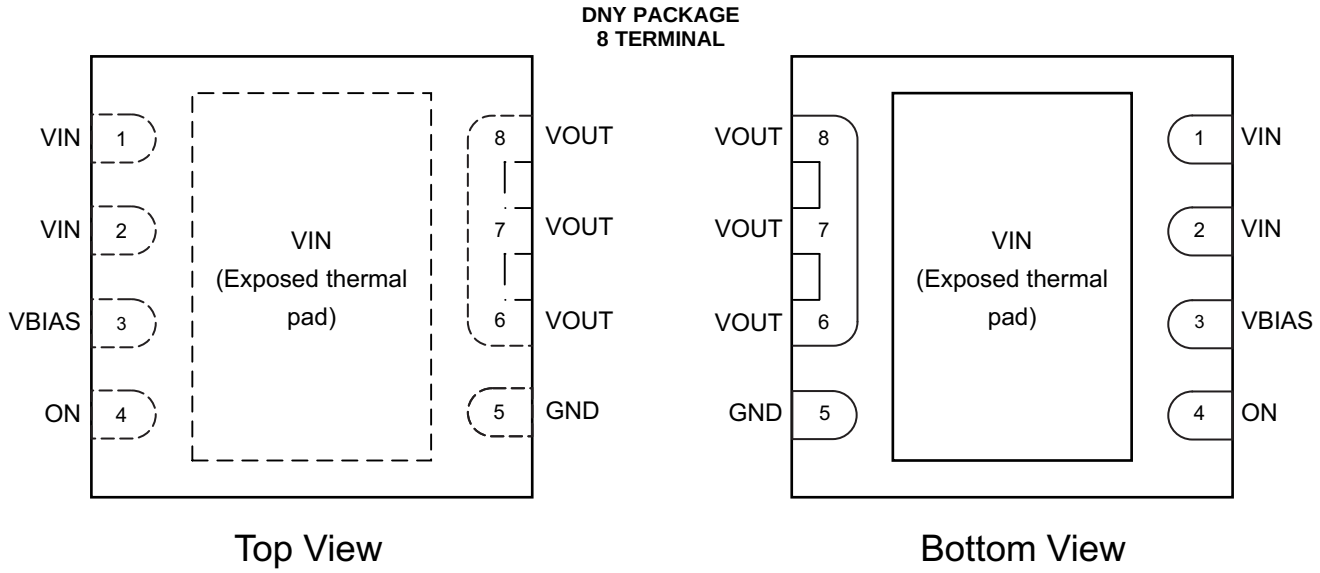
6 Terminal Configuration and Functions



Terminal Functions

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
VIN	1, 2	I	Switch input. Place ceramic bypass capacitor(s) between this terminal and GND. See the Detailed Description section for more information.
VIN	Exposed thermal Pad	I	Switch input. Place ceramic bypass capacitor(s) between this terminal and GND. See the Detailed Description section for more information.
VBIAS	3	I	Bias voltage. Power supply to the device.
ON	4	I	Active high switch control input. Do not leave floating.
GND	5	–	Ground.
VOUT	6, 7, 8	O	Switch output. Place ceramic bypass capacitor(s) between this terminal and GND. See the Detailed Description section for more information.

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
V_{IN}	Input voltage range	–0.3	6	V
V_{BIAS}	Bias voltage range	–0.3	6	V
V_{OUT}	Output voltage range	–0.3	6	V
V_{ON}	ON terminal voltage range	–0.3	6	V
I_{MAX}	Maximum Continuous Switch Current		6	A
I_{PLS}	Maximum Pulsed Switch Current, pulse < 300-µs, 2% duty cycle		8	A
T_A	Operating free-air temperature range	–40	85	°C
T_J	Maximum junction temperature		125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 Handling Ratings

		MIN	MAX	UNIT
T_{STG}	Storage temperature range	–65	150	°C
T_{LEAD}	Maximum lead temperature (10-s soldering time)		300	°C
V_{ESD} (1)	Human-Body Model (HBM) (2)		2	kV
	Charged-Device Model (CDM) (3)		1	kV

(1) Electrostatic discharge (ESD) to measure device sensitivity and immunity to damage caused by assembly line electrostatic discharges in to the device.
(2) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(3) Level listed above is the passing level per EIA-JEDEC JESD22-C101. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V_{IN}	Input voltage range		0.8	V_{BIAS}	V
V_{BIAS}	Bias voltage range		2.5	5.5	V
V_{ON}	ON voltage range		0	5.5	V
V_{OUT}	Output voltage range			V_{IN}	V
$V_{IH, ON}$	High-level voltage, ON	V_{BIAS} = 2.5V to 5.5V	1.2	5.5	V
$V_{IL, ON}$	Low-level voltage, ON	V_{BIAS} = 2.5V to 5.5V	0	0.5	V
C_{IN}	Input Capacitor		1 (1)		µF

(1) Refer to Detailed Description section.

7.4 Thermal Information

THERMAL METRIC (1)		TPS22969 DNY 8 TERMINALS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	44.6	°C/W
$R_{\theta JCtop}$	Junction-to-case (top) thermal resistance	44.4	
$R_{\theta JB}$	Junction-to-board thermal resistance	17.6	
ψ_{JT}	Junction-to-top characterization parameter	0.4	
ψ_{JB}	Junction-to-board characterization parameter	17.4	
$R_{\theta JCbot}$	Junction-to-case (bottom) thermal resistance	1.1	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

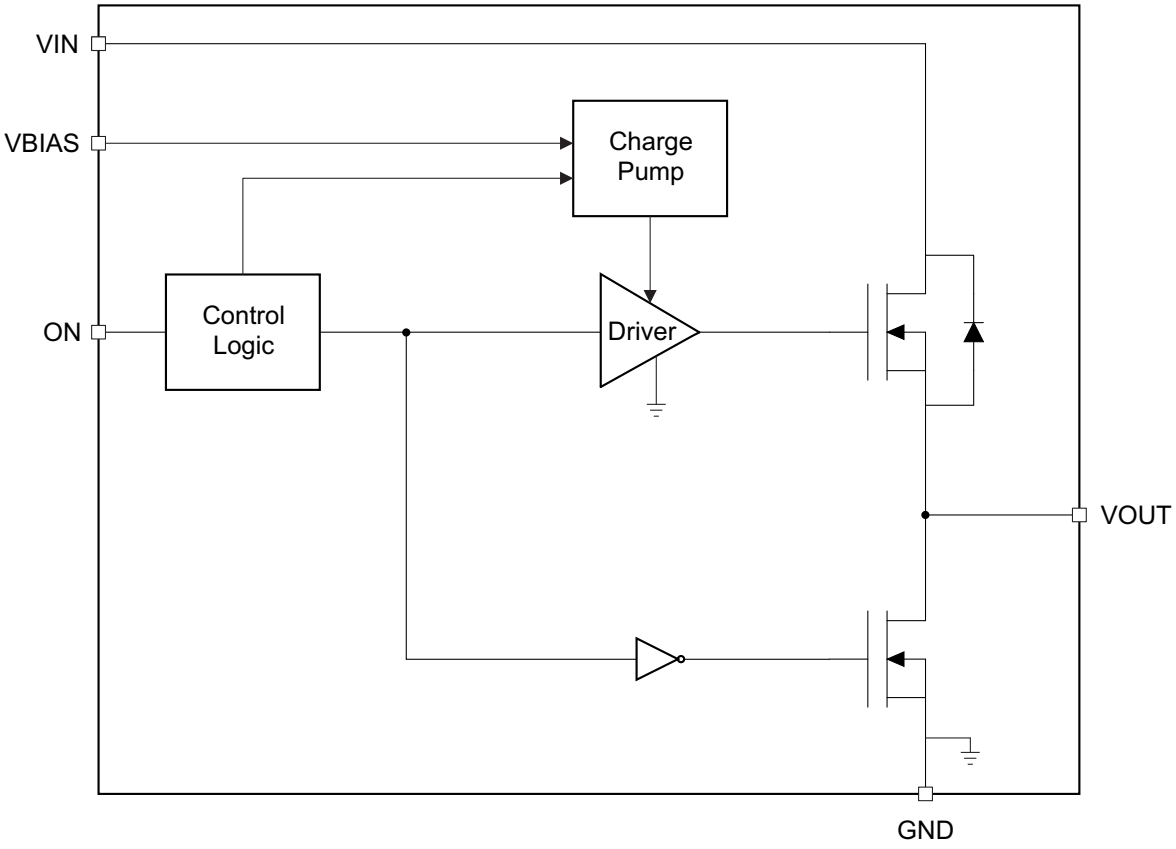
8 Detailed Description

8.1 Overview

The device is a 5.5V, 6A load switch in a 8-terminal SON package. To reduce voltage drop for low voltage and high current rails, the device implements an ultra-low resistance N-channel MOSFET which reduces the drop out voltage through the device.

The device has a controlled and fixed slew rate which helps reduce or eliminate power supply droop due to large inrush currents. During shutdown, the device has very low leakage currents, thereby reducing unneccessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components, which reduces solution size and BOM count.

8.2 Functional Block Diagram



Copyright © 2014, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 On/off Control

The ON terminal controls the state of the load switch, and asserting the terminal high (active high) enables the switch. The ON terminal is compatible with standard GPIO logic threshold and can be used with any microcontroller or discrete logic with 1.2-V or higher GPIO voltage. This terminal cannot be left floating and must be tied either high or low for proper functionality.

8.3.2 Input Capacitor (C_{IN})

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch turns on into a discharged load capacitor or short-circuit, a capacitor needs to be placed between VIN and GND. A 1-µF ceramic capacitor, C_{IN}, placed close to the terminals, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop in high-current application. When switching heavy loads, it is recommended to have an input capacitor 10 times higher than the output capacitor to avoid excessive voltage drop; however, a 10 to 1 ratio for capacitance is not required for proper functionality of the device, but a ratio smaller than 10 to 1 (such as 1 to 1) could cause a V_{IN} dip upon turn-on due to inrush currents based on external factor such as board parasitics and output bulk capacitance.

8.3.3 Output Capacitor (C_L)

Due to the integrated body diode in the N-channel MOSFET, a C_{IN} greater than C_L is highly recommended. A C_L greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This could result in current flow through the body diode from VOUT to VIN. A C_{IN} to C_L ratio of 10 to 1 is recommended for minimizing V_{IN} dip caused by inrush currents during startup, however a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1) could cause a V_{IN} dip upon turn-on due to inrush currents based on external factor such as board parasitics and output bulk capacitance.

8.3.4 V_{IN} and V_{BIAS} Voltage Range

For optimal R_{ON} performance, make sure $V_{IN} \leq V_{BIAS}$. The device may still be functional if $V_{IN} > V_{BIAS}$ but it will exhibit R_{ON} greater than what is listed in the Electrical Characteristics table. See Figure 28 for an example of a typical device. Notice the increasing R_{ON} as V_{IN} increases. Be sure to never exceed the maximum voltage rating for V_{IN} and V_{BIAS}. Performance of the device is not guaranteed for $V_{IN} > V_{BIAS}$.

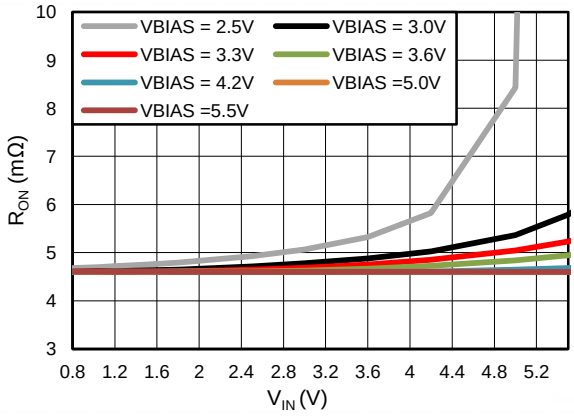


Figure 28. R_{ON} vs V_{IN} ($V_{IN} > V_{BIAS}$)

9 Applications and Implementation

9.1 Application Information

This section will highlight some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com for further aid.

9.2 Typical Application

This application demonstrates how the TPS22969 can be used to power downstream modules with large capacitances. The example below is powering a 100-µF capacitive output load.

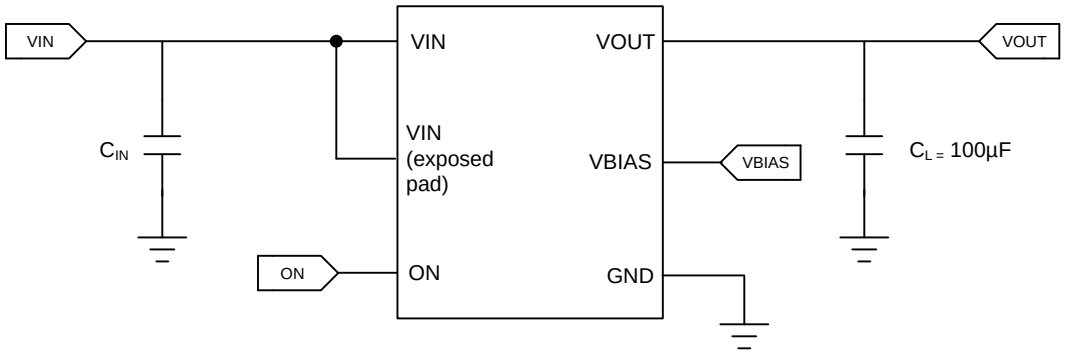

Figure 29. Typical Application Schematic for Powering a Downstream Module

9.2.1 Design Requirements

For this design example, use the following as the input parameters.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{IN}	1.05V
V_{BIAS}	5.0V
Load current	6A

9.2.2 Detailed Design Procedure

To begin the design process, the designer needs to know the following:

- VIN voltage
- VBIAS voltage
- Load current

9.2.2.1 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the R_{ON} of the device and the load current. The R_{ON} of the device depends upon the V_{IN} and V_{BIAS} conditions of the device. Refer to the R_{ON} specification of the device in the Electrical Characteristics table of this datasheet. Once the R_{ON} of the device is determined based upon the V_{IN} and V_{BIAS} conditions, use Equation 1 to calculate the VIN to VOUT voltage drop:

$$\Delta V = I_{LOAD} \times R_{ON} \quad (1)$$

where

- ΔV = voltage drop from VIN to VOUT
- I_{LOAD} = load current
- R_{ON} = On-resistance of the device for a specific V_{IN} and V_{BIAS} combination

An appropriate I_{LOAD} must be chosen such that the I_{MAX} specification of the device is not violated.

Copyright © 2014, Texas Instruments Incorporated

9.2.2.2 Inrush Current

To determine how much inrush current will be caused by the C_L capacitor, use Equation 2:

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt} \quad (2)$$

where

- I_{INRUSH} = amount of inrush caused by C_L
- C_L = capacitance on VOUT
- dt = time it takes for change in V_{OUT} during the ramp up of VOUT when the device is enabled
- dV_{OUT} = change in V_{OUT} during the ramp up of VOUT when the device is enabled

An appropriate C_L value should be placed on VOUT such that the I_{MAX} and I_{PLS} specficiations of the device are not violated.

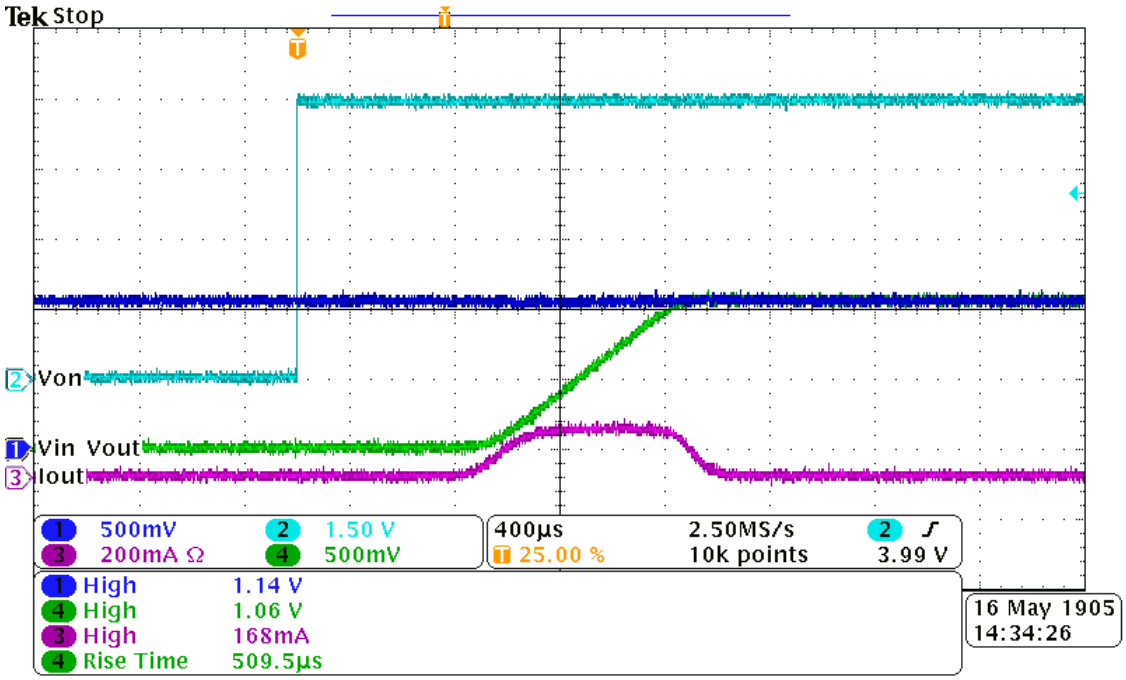

Figure 30. Inrush current (V_{BIAS} = 5V, V_{IN} = 1.05V, C_L = 100µF)

9.2.2.3 Thermal Considerations

The maximum IC junction temperature should be restricted to 125°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given output current and ambient temperature, use Equation 3.

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}} \quad (3)$$

where

- $P_{D(max)}$ = maximum allowable power dissipation
- $T_{J(max)}$ = maximum allowable junction temperature (125°C for the TPS22969)
- T_A = ambient temperature of the device
- Θ_{JA} = junction to air thermal impedance. See Thermal Information section. This parameter is highly dependent upon board layout.

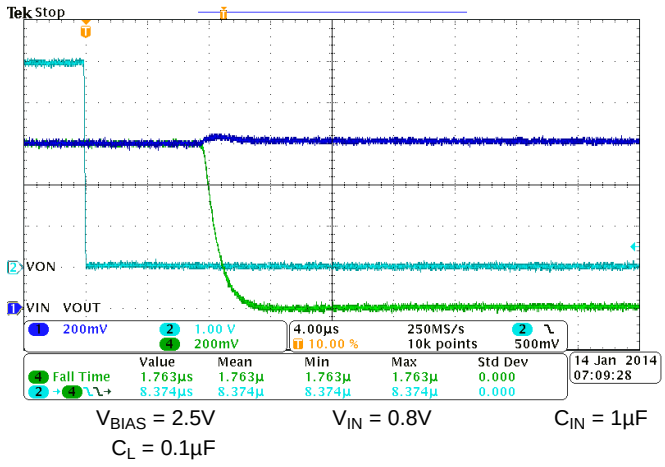

Figure 38. t_F at V_{BIAS} = 2.5V

10 Power Supply Recommendations

The device is designed to operate from a V_{BIAS} range of 2.5-V to 5.5-V and V_{IN} range of 0.8-V to 5.5-V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1µF bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 10-µF may be sufficient.

11 Layout

11.1 Layout Guidelines

- VIN and VOUT traces should be as short and wide as possible to accommodate for high current.
- Use vias under the exposed thermal pad for thermal relief for high current operation.
- The VIN terminal should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1-µF ceramic with X5R or X7R dielectric. This capacitor should be placed as close to the device terminals as possible.
- The VOUT terminal should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is one-tenth of the VIN bypass capacitor of X5R or X7R dielectric rating. This capacitor should be placed as close to the device terminals as possible.
- The VBIAS terminal should be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 0.1-µF ceramic with X5R or X7R dielectric.

12 器件和文档支持

12.1 Trademarks

Ultrabook is a trademark of Intel.

12.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.3 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms and definitions.

13 机械封装和可订购信息

以下页中包括机械封装和可订购信息。 这些信息是针对指定器件可提供的最新数据。 这些数据会在无通知且不对本文档进行修订的情况下发生改变。 欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

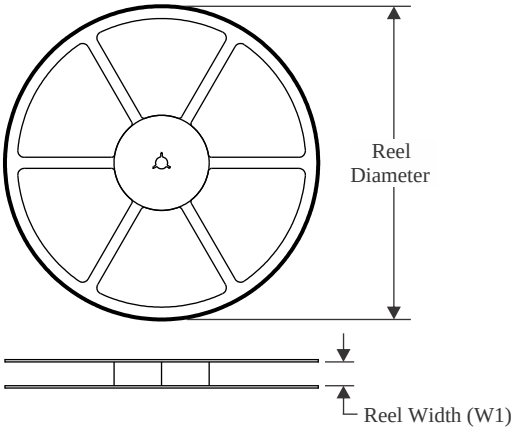
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

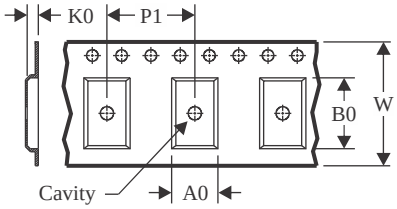
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

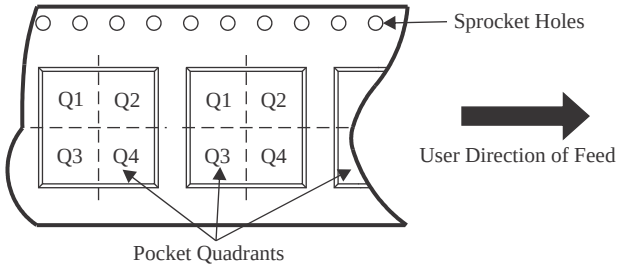


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

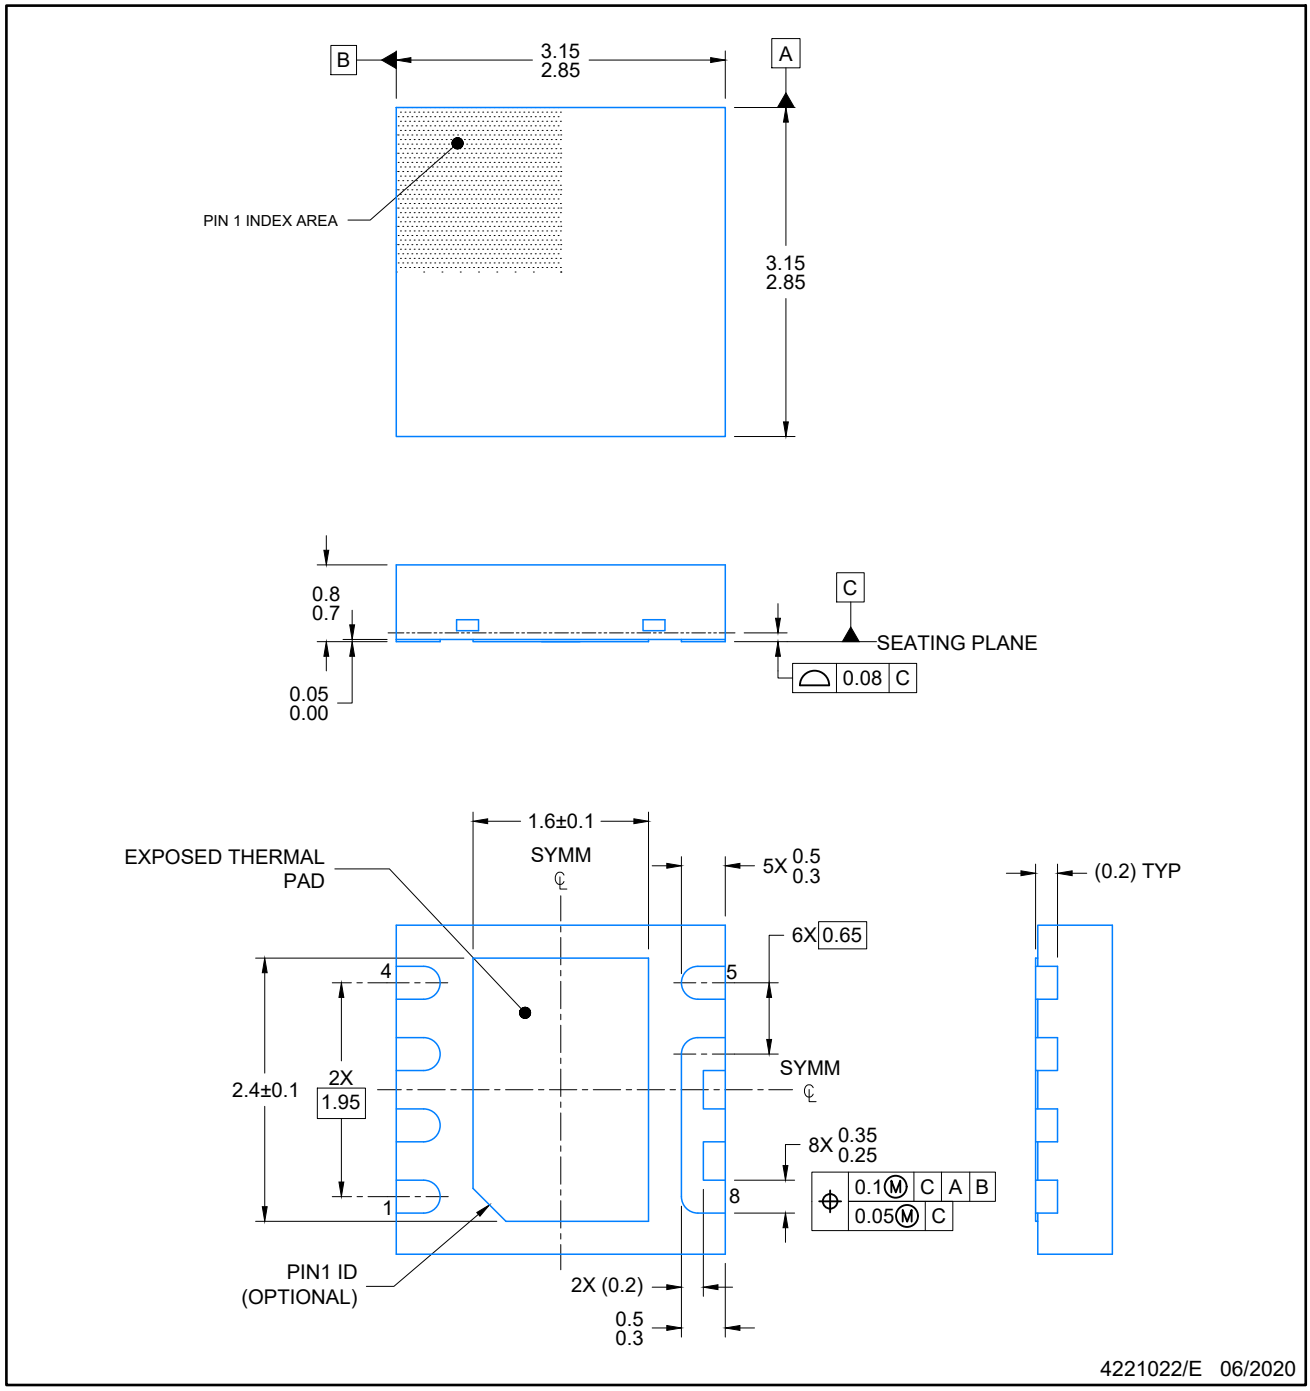
PACKAGE OUTLINE

DNY0008A

WSON - 0.8 mm max height

PLASTIC QUAD FLATPACK- NO LEAD



NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
