

具有使能功能的 TPS3431 标准可编程监视器计时器

1 特性

- 出厂编程的精密看门狗计时器：
 - 可在 25°C 条件下实现 $\pm 2.5\%$ (典型值) 的看门狗超时 (WDT) 精度
- 看门狗禁用功能
- 用户可编程看门狗超时
- 输入电压范围： $V_{DD} = 1.8V$ 至 $6.5V$
- 低静态电流： $I_{DD} = 10\mu A$ (典型值)
- 低电平有效的开漏输出
- 使能输入 (EN) 和使能输出 (ENOUT)
- 采用小型 3mm × 3mm 8 引脚 VSON 封装
- 工作结温范围：
 - 40°C 至 +125°C

2 应用

- 蜂窝式模块资产跟踪器
- 能量存储电源转换系统 (PCS)
- 电表
- 运动检测器 (PIR、uWave 等)
- IP 网络摄像头
- 外科手术设备

3 说明

TPS3431 是一款具有使能功能的标准可编程看门狗计时器，适用于各种应用。看门狗超时可在 -40°C 至 +125°C 温度范围内实现 15% 的高计时精度，在 25°C 下实现 2.5% 的典型计时精度，并且可通过外部电容器或工厂编程的默认延迟设置进行编程。在开发过程中，可以通过 Enable 引脚或 SET 逻辑引脚将看门狗禁用，从而避免出现不必要的看门狗超时。

TPS3431 采用小型 3.00mm × 3.00mm 8 引脚 VSON 封装。

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
TPS3431	VSON (8)	3.00mm × 3.00mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

- 也可以将 EN 保持浮动并将其从内部上拉至 VDD
- 也可以将 ENOUT 保持浮动或将其连接至 $\overline{WDO}$

Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
VDD	1	I	Supply voltage pin. For noisy systems, connecting a 0.1- μ F bypass capacitor is recommended.
CWD	2	I	Programmable watchdog timeout input. The watchdog timeout is set by connecting a capacitor between this pin and ground. Connecting via a 10-k Ω resistor to V _{DD} or leaving unconnected further enables the selection of the preset watchdog timeouts; see the CWD Functionality section. The TPS3431 determines the watchdog timeout using 方程式 1
EN	3	I	Enable input pin. This pin is internally pulled up to V _{DD} and must be logic high or left floating. When EN goes logic low, ENOUT goes logic low and WDI is ignored and WDO remains logic high. When EN goes logic high, ENOUT goes high (asserts) after the watchdog reset delay time (t _{RST}). This pin can also be driven with an external push-button, transistor, or microcontroller.
GND	4	—	Ground pin
SET1	5	I	Logic input. Grounding the SET1 pin disables the watchdog timer. SET1 and CWD select the watchdog timeouts; see the SET1 section.
WDI	6	I	Watchdog input. A falling edge must occur at WDI before the timeout (t _{WD}) expires. When the watchdog is not in use, the SET1 pin can be used to disable the watchdog. WDI is ignored when WDO is low (asserted) and when the watchdog is disabled. If the watchdog is disabled, WDI cannot be left unconnected and must be driven to either VDD or GND.
WDO	7	O	Watchdog open-drain active-low output. Connect WDO with a 1-k Ω to 100-k Ω resistor to the correct pull-up voltage rail (V _{PU}). WDO goes low (asserts) when a watchdog timeout occurs. When a watchdog timeout occurs, WDO goes low (asserts) for the watchdog reset delay time (t _{RST}). When EN goes low, WDO is in a high-impedance state and will be pulled to logic high.
ENOUT	8	O	Enable open-drain active-high output. Connect ENOUT with a 1-k Ω to 100-k Ω resistor to the correct pull-up voltage rail (V _{PU}). When EN goes logic high, ENOUT goes high impedance and pulls logic high (asserts) due to the external pull-up resistor after the watchdog reset delay time (t _{RST}). When EN is forced logic low, ENOUT goes low after 200 ns and remains logic low as long as EN is logic low.
Thermal pad		—	Connect the thermal pad to a large-area ground plane. The thermal pad is internally connected to GND.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range	VDD	- 0.3	7	V
Output voltage range	ENOUT, WDO	- 0.3	7	V
Voltage ranges	SET1, WDI, EN	- 0.3	7	V
	CWD	- 0.3	VDD + 0.3 ⁽³⁾	
Output pin current	ENOUT, WDO		±20	mA
Input current (all pins)			±20	mA
Continuous total power dissipation		See § 6.4	See § 6.4	
Temperature	Operating junction, T _J ⁽²⁾	- 40	150	°C
	Operating free-air temperature, T _A ⁽²⁾	- 40	150	
	Storage, T _{stg}	- 65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) T_J = T_A as a result of the low dissipated power in this device.
- (3) The absolute maximum rating is V_{DD} + 0.3 V or 7.0 V, whichever is smaller.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD	Supply pin voltage	1.8		6.5	V
V _{SET1}	SET1 pin voltage	0		6.5	V
C _{CWD}	Watchdog timing capacitor	0.1 ⁽¹⁾		1000 ⁽¹⁾	nF
CWD	Pullup resistor to VDD	9	10	11	kΩ
R _{PU}	Pullup resistor, ENOUT and WDO	1	10	100	kΩ
I _{EN}	EN pin current			10	mA
I _{WDO}	Watchdog output current			10	mA
T _J	Junction Temperature	- 40		125	°C

- (1) Using a C_{CWD} capacitor of 0.1 nF or 1000 nF gives a t_{WDO(typ)} of 62.74 ms or 77.45 seconds, respectively.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS3431	UNIT
		DRB (VSON)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	50.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	51.6	
$R_{\theta JB}$	Junction-to-board thermal resistance	25.8	
ψ_{JT}	Junction-to-top characterization parameter	1.3	
ψ_{JB}	Junction-to-board characterization parameter	25.8	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	7.1	

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

at 1.8 V $\leq V_{DD} \leq 6.5$ V over the operating temperature range of $-40^{\circ}\text{C} \leq T_J \leq +125^{\circ}\text{C}$ (unless otherwise noted); the open-drain pullup resistors are 10 k Ω ; typical values are at $T_J = 25^{\circ}\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
GENERAL CHARACTERISTICS						
V _{DD} ^{(2) (3)}	Supply voltage		1.8		6.5	V
I _{DD}	Supply current			10	19	μA
V _{POR} ⁽¹⁾	Power-on reset voltage	V _{OL(MAX)} = 0.25 V			0.8	V
WINDOW WATCHDOG FUNCTION						
I _{EN}	EN pin internal pullup current	V _{EN} = 0V	500	620	700	nA
I _{CWD}	CWD pin charge current	CWD = 0.5 V	347	375	403	nA
V _{CWD}	CWD pin threshold voltage		1.196	1.21	1.224	V
V _{OL}	ENOUT, $\overline{\text{WDO}}$ output low	VDD = 5 V, I _{SINK} = 3 mA			0.4	V
I _D	ENOUT, $\overline{\text{WDO}}$ output leakage current	VDD = 1.8 V, V _{WDO} = 6.5 V			1	μA
V _{IL}	Low-level input voltage (EN, SET1)				0.25	V
V _{IH}	High-level input voltage (EN, SET1)		0.8			V
V _{IL(WDI)}	Low-level input voltage (WDI)				0.3 × V _{DD}	V
V _{IH(WDI)}	High-level input voltage (WDI)		0.8 × V _{DD}			V

- (1) When V_{DD} falls below V_{POR} , WDI and ENOUT is undefined.
(2) When V_{DD} falls below V_{DDMIN} , WDI is ignored and ENOUT is driven low
(3) During power-on, V_{DD} must be a minimum 1.8 V for at least 300 μs before WDI is active and ENOUT is high impedance.

6.6 Timing Requirements

			MIN	TYP	MAX	UNIT
GENERAL						
t _{INIT}	CWD pin evaluation period ⁽¹⁾		381			μs
	EN, SET1 pin setup time		1			μs
	Startup delay ⁽²⁾		300			μs
DELAY FUNCTION						
t _{EN_ENOUT}	EN to ENOUT delay		200			ns
t _{RST}	Watchdog reset delay		170	200	230	ms
WINDOW WATCHDOG FUNCTION						
t _{WD}	Watchdog timeout	CWD = NC, SET1 = 1	1360	1600	1840	ms
		CWD = 10 k Ω to VDD, SET1 = 1	170	200	230	ms
		CWD = NC, SET1 = 0	Watchdog disabled			
		CWD = 10 k Ω to VDD, SET1 = 0	Watchdog disabled			
t _{WD-setup}	Setup time required for device to respond to changes on WDI after being enabled		150			μs
	Minimum WDI pulse duration		50			ns
t _{WD-del}	WDI to $\overline{WDO}$ delay		50			ns

(1) Refer to [§ 8.1.1.2](#).

(2) During power-on, VDD must be a minimum 1.8 V for at least 300 μ s before WDI is active and ENOUT is high impedance.

7 Detailed Description

7.1 Overview

The TPS3431 is a standard programmable watchdog timer with enable/disable feature. This device includes a precision watchdog timer that achieves 15% timing accuracy over the specified temperature range of -40°C to $+125^{\circ}\text{C}$.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Enable Input (EN) and Enable Output (ENOUT)

The Enable (EN) input allows a processor or other logic circuits to initiate a single cycle watchdog reset by momentarily bringing Enable low, or a permanent disable by keeping Enable low. After EN goes to a logic high and V_{DD} is above $V_{DD(min)}$, ENOUT and $\overline{WDO}$ go logic high after the watchdog reset delay time (t_{RST}). If EN is not controlled externally, then EN can either be connected to V_{DD} or left floating because the EN pin is internally pulled up to V_{DD} . When EN is forced logic low, ENOUT goes low after a propagation delay of 200 ns and $\overline{WDO}$ goes high impedance and pulls to logic high due to the external pull-up resistor. Because $\overline{WDO}$ and ENOUT are both open-drain outputs, these outputs can be tied together to create an OR logic function so that if either output pulls down to logic low, the other will also pull down logic low.

7.3.2 Watchdog Mode

This section provides information for the watchdog mode of operation.

7.3.2.1 CWD

The CWD pin provides the user the functionality of both high-precision, factory-programmed watchdog timing options and user-programmable watchdog timing. The TPS3431 features three options for setting the watchdog timer: connecting a capacitor to the CWD pin, connecting a pull-up resistor to VDD, and leaving the CWD pin unconnected. The configuration of the CWD pin is evaluated by the device every time V_{DD} rises above $V_{DD(min)}$. The pin evaluation is controlled by an internal state machine that determines which option is connected to the CWD pin. The sequence of events typically takes $381\ \mu s$ (t_{INIT}) to determine if the CWD pin is left unconnected, pulled-up through a resistor, or connected to a capacitor. If the CWD pin is being pulled up to VDD, a 10-k Ω resistor is required.

7.3.2.2 Watchdog Input WDI

WDI is the watchdog timer input that controls the $\overline{WDO}$ output. The WDI input is triggered by the falling edge of the input signal. To ensure proper functionality of the watchdog timer, always issue the WDI pulse before $t_{WD(min)}$. If the pulse is issued in this region, then $\overline{WDO}$ remains unasserted. Otherwise, the device asserts $\overline{WDO}$, putting the $\overline{WDO}$ pin into a low-impedance state therefore $\overline{WDO}$ will be logic low.

The watchdog input (WDI) is a digital pin. To ensure there is no increase in I_{DD} , drive the WDI pin to either VDD or GND at all times. Putting the pin to an intermediate voltage can cause an increase in supply current (I_{DD}) because of the architecture of the digital logic gates. When EN is logic low, the watchdog is disabled and all signals input to WDI are ignored. When EN is logic high, the device resumes normal operation and no longer ignores the signal on WDI. If the watchdog is disabled, drive the WDI pin to either VDD or GND. 图 7-1 shows the valid region for a WDI pulse to be issued to prevent $\overline{WDO}$ from being triggered and pulled low.

图 7-1. Watchdog Timing Diagram

7.3.2.3 Watchdog Output $\overline{WDO}$

The TPS3431 features an active-low open-drain watchdog output that asserts when a pulse on WDI fails to arrive within the watchdog timeout. When EN is logic high, the $\overline{WDO}$ signal maintains normal operation. When the EN pin is logic low, the $\overline{WDO}$ pin goes to a high-impedance state and pulls logic high due to the external pull-up resistor. Because $\overline{WDO}$ and ENOUT are both open-drain outputs, these outputs can be tied together to create an OR logic function so that if either output pulls down to logic low, the other will also pull down logic low.

7.3.2.4 SET1

The SET1 pin can enable and disable the watchdog timer and should be used when disabling the watchdog timer for longer than one watchdog reset cycle. If SET1 is set to GND, the watchdog timer is disabled and WDI is ignored. If the watchdog timer is disabled, drive the WDI pin to either GND or VDD to ensure that there is no increase in I_{DD} . When SET1 is logic high, the watchdog operates normally. The SET1 pin can be changed dynamically; however, if the watchdog is going from disabled to enabled there is a 150 μ s setup time where the watchdog does not respond to changes on WDI, as shown in 图 7-2. Note: disabling using SET1 pin causes a delay defined by the fixed 150-us setup time when enabling again.

图 7-2. Enabling and Disabling the Watchdog

7.4 Device Functional Modes

表 7-1 summarizes the functional modes of the TPS3431.

表 7-1. Device Functional Modes

V_{DD}	EN	ENOUT	WDI	$\overline{WDO}$
$V_{DD} < V_{POR}$	---	---	---	---
$V_{POR} \leq V_{DD} < V_{DD(min)}$	---	Low	Ignored	High
$V_{DD} > V_{DD(min)}^{(1)}$	High	High	$t_{PULSE} < t_{WD(min)}^{(2)}$	High
$V_{DD} > V_{DD(min)}^{(1)}$	High	High	$t_{PULSE} > t_{WD(min)}^{(2)}$	Low
$V_{DD} > V_{DD(min)}^{(1)}$	Low	Low	Ignored	High

(1) V_{DD} must be above $V_{DD(min)}$ for longer than 300 μ s.

(2) Where t_{pulse} is the time between the falling edges on WDI.

7.4.1 V_{DD} is Below V_{POR} ($V_{DD} < V_{POR}$)

When V_{DD} is less than V_{POR} , $\overline{WDO}$ is undefined and can be either high or low. The state of $\overline{WDO}$ largely depends on the load that the $\overline{WDO}$ pin is experiencing.

7.4.2 Above Power-On-Reset, But Less Than $V_{DD(min)}$ ($V_{POR} \leq V_{DD} < V_{DD(min)}$)

When the voltage on V_{DD} is less than $V_{DD(min)}$, and greater than or equal to V_{POR} , the $\overline{WDO}$ signal is asserted (logic low). When EN is logic low, the watchdog output $\overline{WDO}$ is in a high-impedance state and logic low regardless of the WDI signal that is input to the device.

7.4.3 Normal Operation ($V_{DD} \geq V_{DD(min)}$)

When V_{DD} is greater than or equal to $V_{DD(min)}$ and EN is logic high, the $\overline{WDO}$ signal is determined by WDI. When WDI is within the watchdog timeout, the internal MOSFET turns off and $\overline{WDO}$ is pulled high through external pull-up resistor. When WDI is not within the watchdog timeout, the internal MOSFET turns on and $\overline{WDO}$ is pulled to logic low. When EN is logic low, ENOUT goes to logic low and $\overline{WDO}$ goes to a high-impedance state and pulls to logic high due to the external pull-up resistor.

8 Application and Implementation

Note

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

8.1 Application Information

The following sections describe in detail proper device implementation, depending on the final application requirements.

8.1.1 CWD Functionality

The TPS3431 features three options for setting the watchdog timeout: connecting a capacitor to the CWD pin, connecting a pull-up resistor to VDD, and leaving the CWD pin unconnected. 图 8-1 shows a schematic drawing of all three options. If this pin is connected to VDD through a 10-k Ω pullup resistor or left unconnected (high impedance), then the factory-programmed watchdog timeouts are enabled; see the 节 8.1.1.1 section. Otherwise, the watchdog timeout can be adjusted by placing a capacitor from the CWD pin to ground.

图 8-1. CWD Charging Circuit

8.1.1.1 Factory-Programmed Timing Options

If using the factory-programmed timing options (listed in 表 8-1), the CWD pin must either be unconnected or pulled up to VDD through a 10-k Ω pull-up resistor. Using these options enables high-precision, 15% accurate watchdog timing.

表 8-1. Factory Programmed Watchdog Timing

INPUT		STANDARD WATCHDOG TIMEOUT WDT (t_{WD})			UNIT
CWD	SET1	MIN	TYP	MAX	
NC	0	Watchdog disabled			
NC	1	1360	1600	1840	ms
10 k Ω to VDD	0	Watchdog disabled			
10 k Ω to VDD	1	170	200	230	ms

8.1.1.2 CWD Adjustable Capacitor Watchdog Timeout

Adjustable capacitor timing is achievable by connecting a capacitor to the CWD pin. If a capacitor is connected to CWD, then a 375-nA, constant-current source charges C_{CWD} until $V_{CWD} = 1.21$ V. 表 8-2 shows how to

calculate t_{WD} using 方程式 1 and the SET1 pin. The TPS3431 determines the watchdog timeout with the formulas given in 方程式 1, where C_{CWD} is in nanofarads and t_{WD} is in milliseconds.

$$t_{WD}(ms) = 77.4 \times C_{CWD}(nF) + 55 (ms) \quad (1)$$

The TPS3431 is designed and tested using C_{CWD} capacitors between 100 pF and 1 μ F. Note that 方程式 1 is for ideal capacitors and capacitor tolerances vary the actual device timing. For the most accurate timing, use ceramic capacitors with COG dielectric material. If a C_{CWD} capacitor is used, 方程式 1 can be used to set t_{WD} for the watchdog timeout. 表 8-3 shows the minimum and maximum calculated t_{WD} values using an ideal capacitor.

表 8-2. Programmable CWD Timing

INPUT		WATCHDOG TIMEOUT WDT (t_{WD}) ⁽¹⁾			UNIT
CWD	SET1	MIN	TYP	MAX	
C_{CWD}	0	Watchdog disabled			
C_{CWD}	1	$t_{WD} \times 0.905$	t_{WD} 方程式 1	$t_{WD} \times 1.095$	ms

(1) Calculated from 方程式 1 using an ideal capacitor.

表 8-3. t_{WD} Values for Common Ideal Capacitor Values

C_{CWD}	WATCHDOG TIMEOUT WDT (t_{WD})			UNIT
	MIN ⁽¹⁾	TYP	MAX ⁽¹⁾	
100 pF	56.77	62.74	68.7	ms
1 nF	119.82	132.4	144.98	ms
10 nF	750	829	908	ms
100 nF	7054	7795	8536	ms
1 μ F	70096	77455	84814	ms

(1) The minimum and maximum values are calculated using an ideal capacitor.

8.2 Typical Application

- A. EN can also be left floating and is internally pulled-up to VDD
- B. ENOUT can also be left floating or tied to WDO

图 8-2. Monitoring a Microcontroller with Standard Watchdog Timer

8.2.1 Design 1 Requirements

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Output logic voltage	3.3V Open-Drain	3.3V Open-Drain
Watchdog Timeout	Leave CWD disconnected: 1.6 seconds (typical)	$t_{WD(min)} = 1360 \text{ ms}$, $t_{WD(TYP)} = 1600 \text{ ms}$, $t_{WD(max)} = 1840 \text{ ms}$
Maximum device current consumption	35 μA	33 μA when $\overline{WDO}$ is asserted

8.2.2 Detailed Design 1 Procedure

8.2.2.1 Calculating $\overline{WDO}$ Pullup Resistor Design 1

The TPS3431 uses an open-drain configuration for the $\overline{WDO}$ circuit, as shown in 图 8-3. When the internal MOSFET is off, the external pull-up resistor pulls the drain of the transistor to VDD and when the MOSFET is turned on, the MOSFET attempts to pull the drain to ground, thus creating an effective resistor divider. The resistors in this divider must be chosen to ensure that V_{OL} is below the maximum value.

To choose the proper pull-up resistor, there are three key specifications to keep in mind: the pull-up voltage (V_{PU}), the recommended maximum $\overline{WDO}$ pin current ($I_{\overline{WDO}}$), and V_{OL} .

The maximum V_{OL} is 0.4 V, meaning that the effective resistor divider created must be able to bring the voltage on the reset pin below 0.4 V with $I_{\overline{WDO}}$ kept below 10 mA. For this example, with a V_{PU} of 3.3 V, a resistor must be chosen to keep $I_{\overline{WDO}}$ below 35 μA because this value is the maximum consumption current allowed. To ensure this specification is met, a pull-up resistor value of 100 k Ω was selected, which sinks a maximum of 33 μA when $\overline{WDO}$ is asserted.

图 8-3. $\overline{WDO}$ Open-Drain Configuration

8.2.2.2 Setting the Watchdog Design 1

As illustrated in 图 8-1 there are three options for setting the watchdog timer. The design specifications in this application allow for a factory-programmed timing option by leaving CWD floating. To ensure proper functionality, a falling edge must be issued before $t_{WD(min)}$ with is set for 1.36 seconds when CWD is not connected. 图 8-8 illustrates that a WDI signal with a period of 1 second keeps WDO from asserting.

图 8-4 shows $\overline{WDO}$ asserting when the WDI signal has a period longer than $t_{WD(max)}$ which is 1.84 seconds when CWD is not connected. 图 8-5 shows a watchdog fault caused by missing WDI pulse followed by correct timing WDI pulses to deactivate $\overline{WDO}$.

8.2.3 Application Curves Design 1

Unless otherwise stated, application curves were taken at $T_A = 25^\circ\text{C}$.

图 8-4. $\overline{WDO}$ Fault Caused by WDI Pulse Arriving Too Late (After $t_{WD(max)}$)

图 8-5. $\overline{WDO}$ Fault Caused by missing WDI Pulses Followed by Correct Timing WDI Pulses

图 8-6. Monitoring the Supply Voltage and Watchdog Supervision of a Microcontroller

8.3.1 Design 2 Requirements

PARAMETER	DESIGN REQUIREMENT	DESIGN RESULT
Watchdog disable for initialization period	Watchdog must remain disabled for 5 seconds until logic enables the watchdog timer	5.02 seconds (typ)
Programmable disable feature	Microcontroller controls SET1 on TPS3431 via a GPIO	The Microcontroller can disable TPS3431 via SET1 and thus disable the watchdog for any reason.
Output logic voltage	1.8-V Open-Drain	1.8V Open-Drain
Monitored rail (TPS3890)	1.8 V with a 5% threshold and 1% accuracy	Worst-case $V_{ITN} = 1.714 \text{ V} - 4.7\%$
Watchdog timeout (TPS3431)	265 ms typical	$t_{WD(min)} = 213 \text{ ms}$, $t_{WD(TYP)} = 264 \text{ ms}$, $t_{WD(max)} = 319 \text{ ms}$
Maximum device current consumption	50 μA	37 μA when $\overline{\text{WDO}}$ is asserted

8.3.2 Detailed Design 2 Procedure

8.3.2.1 Calculating $\overline{\text{WDO}}$ Pullup Resistor Design 2

The TPS3431 uses an open-drain configuration for the $\overline{\text{WDO}}$ circuit. When the internal MOSFET is off, the external pull-up resistor pulls the drain of the transistor to VDD and when the MOSFET is turned on, the MOSFET attempts to pull the drain to ground, thus creating an effective resistor divider. The resistors in this divider must be chosen to ensure that V_{OL} is below the maximum value. To choose the proper pull-up resistor, there are three key specifications to keep in mind: the pull-up voltage (V_{PU}), the recommended maximum $\overline{\text{WDO}}$ pin current ($I_{\overline{\text{WDO}}}$), and V_{OL} . The maximum V_{OL} is 0.4 V, meaning that the effective resistor divider created must be able to bring the voltage on the reset pin below 0.4 V with $I_{\overline{\text{WDO}}}$ kept below 10 mA. For this example, with a V_{PU} of 1.8 V, a resistor must be chosen to keep $I_{\overline{\text{WDO}}}$ below 50 μA because this value is the maximum consumption current allowed. To ensure this specification is met, a pull-up resistor value of 100 k Ω was selected, which sinks a maximum of 18 μA when $\overline{\text{WDO}}$ is asserted.

8.3.2.2 Setting the Watchdog Design 2

As illustrated in 图 8-1 there are three options for setting the watchdog timer. The design specifications in this application require the programmable timing option (external capacitor connected to CWD). When a capacitor is connected to the CWD pin, the watchdog timer is governed by 方程式 1. This equation estimation is only valid for ideal capacitors and any temperature or voltage derating must be accounted for separately.

$$C_{\text{CWD}} (\text{nF}) = (t_{\text{WD}}(\text{ms}) - 55) / 77.4 = (265 - 55) / 77.4 = 2.71 \text{ nF} \quad (2)$$

The nearest standard capacitor value is 2.7 nF. Selecting 2.7 nF for the C_{CWD} capacitor gives the following minimum and maximum timing parameters:

$$t_{WD(MIN)} = 0.905 \times t_{WD(TYP)} = 0.905 \times (77.4 \times 2.7 + 55) = 238.902 \text{ ms} \quad (3)$$

$$t_{WD(MAX)} = 1.095 \times t_{WD(TYP)} = 1.095 \times (77.4 \times 2.7 + 55) = 289.058 \text{ ms} \quad (4)$$

Capacitor tolerance also influences $t_{WD(MIN)}$ and $t_{WD(MAX)}$. Select a ceramic COG dielectric capacitor for high accuracy. For 2.7 nF, COG capacitors are readily available with 5% tolerances. This selection results in a 5% decrease in $t_{WD(MIN)}$ and a 5% increase in $t_{WD(MAX)}$, giving 213.16 ms and 318.75 ms, respectively. To ensure proper functionality, a falling edge must be issued before $t_{WD(min)}$. 图 8-8 illustrates that a WDI signal with a period of 260 ms keeps $\overline{WDO}$ from asserting.

8.3.2.3 Watchdog Disabled During Initialization Period Design 2

The watchdog is often needed to be disabled during startup to allow for an initialization period. When the initialization period is over, the watchdog timer is turned back on to allow the microcontroller to be monitored by the TPS3431. To achieve this setup, EN on TPS3431 is controlled by TPS3890 supervisor. In this application, the TPS3890 was chosen to monitor VDD as well, which means that the $\overline{RESET}$ on the TPS3890 stays low until VDD rises above V_{ITN} . When VDD comes up, the delay time can be adjusted through the CT capacitor on the TPS3890. With this approach, the $\overline{RESET}$ delay can be adjusted from a minimum of 25 μ s to a maximum of 30 seconds. For this design, a typical delay of 5 seconds is needed before the watchdog timer is enabled. The CT capacitor calculation (see the TPS3890 data sheet) yields an ideal capacitance of 4.67 μ F, giving a closest standard ceramic capacitor value of 4.7 μ F. When connecting a 4.7 μ F capacitor from CT to GND, the typical delay time is 5 seconds. 图 8-7 shows that when the watchdog is disabled, the $\overline{WDO}$ output remains high. However when SET1 goes high and there is no WDI signal, $\overline{WDO}$ begins to assert. See the TPS3890 datasheet for detailed information on the TPS3890. The ENOUT pin on the TPS3431 reflects the status of the EN pin and can be connected to the microcontroller for monitoring or can be left floating if not being used. When the TPS3431 is disabled, ENOUT is logic low and $\overline{WDO}$ is logic high so the user can also tie ENOUT to $\overline{WDO}$ to force $\overline{WDO}$ to logic low when TPS3431 is disabled.

8.3.2.4 Programmable Disable Feature Design 2

The watchdog is often needed to be disabled during operation to prevent false watchdog faults. When the watchdog is disabled, all pulses or lack of pulses on WDI are ignored and $\overline{WDO}$ is high impedance as shown in 图 8-9. When the watchdog is re-enabled, the watchdog timer is turned back on after a watchdog start-up delay of 150 μ s to allow the microcontroller to be monitored by the TPS3431. To achieve this setup, SET1 on TPS3431 is controlled by a GPIO on the microcontroller and must be logic high to enable the watchdog. To disable the watchdog, the microcontroller sets the GPIO connected to SET1 to logic low. To re-enable the watchdog, the microcontroller sets the GPIO connected to SET1 back to logic high. This configuration is useful when another device or signal is already using the EN pin on TPS3431, and a programmable disable feature with minimal delay upon enable is still required. When the watchdog is disabled using SET1 instead of EN, ENOUT remains unaffected which is useful when needing to disable the watchdog but not causing another device connected to ENOUT to be disabled.

8.3.3 Application Curves Design 2

Unless otherwise stated, application curves were taken at $T_A = 25^\circ\text{C}$.

9 Power Supply Recommendations

This device is designed to operate from an input supply with a voltage range between 1.8 V and 6.5 V. An input supply capacitor is not required for this device; however, if the input supply is noisy, then good analog practice is to place a 0.1- μ F capacitor between the VDD pin and the GND pin.

10 Layout

10.1 Layout Guidelines

- Make sure that the connection to the VDD pin is low impedance. Good analog design practice is to place a 0.1- μ F ceramic capacitor as near as possible to the VDD pin.
- If a C_{CWD} capacitor or pull-up resistor is used, place these components as close as possible to the CWD pin. If the CWD pin is left unconnected, make sure to minimize the amount of parasitic capacitance on the pin.
- Place the pull-up resistor on $\overline{WDO}$ as close to the pin as possible.

10.2 Layout Example

- A. EN can also be left floating and is internally pulled-up to VDD
 B. ENOUT can also be left floating or tied to $\overline{WDO}$

图 10-1. TPS3431 Recommended Layout

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS3431SDRBR	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	431DD
TPS3431SDRBR.A	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	431DD
TPS3431SDRBRG4	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	431DD
TPS3431SDRBRG4.A	Active	Production	SON (DRB) 8	3000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	431DD

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
