

ADS54T01 シングル、12 ビット、750Mps レシーバ/フィードバック IC

1 特長

- シングル・チャンネル
- 12 ビット分解能
- 最大クロック・レート: 750Mps
- 低スイング・フルスケール入力: 1.0Vpp
- 高インピーダンス入力を備えたアナログ入力バッファ
- 入力帯域幅 (3dB): > 1.2GHz
- データ出力インターフェイス: DDR LVDS
- 196 ピンの NFBGA パッケージ (12mm × 12mm)
- 消費電力: 1.2W
- $f_{in} = 230\text{MHz}$ IF での性能
 - SNR: 60.7dBFS
 - SFDR: 73dBc
- $f_{in} = 700\text{MHz}$ IF での性能
 - SNR: 58.6dBFS
 - SFDR: 64dBc
- 受信モード: ローパス・フィルタまたはハイパス・フィルタによる 2 倍のデシメーション
- フィードバック・モード: 全帯域幅 DPD フィードバックのバースト・モード出力

2 アプリケーション

- テレコミュニケーション
- ワイヤレス・インフラ
- パワーアンプ直線化

3 概要

ADS54T01 は、直線性が高いシングル・チャンネル、12 ビット、750Mps の A/D コンバータ (ADC) で、広帯域レシーバ向けのフロント・エンド・フィルタ設計が容易になります。アナログ入力バッファにより、高インピーダンスの入力を実現し、またオンチップのトラック・アンド・ホールドの内部スイッチングを分離し、信号ソースからの干渉を防止します。

出力データには 2 つの出力モードがあります。データを 2 でデシメーションすること、またはデータをバースト・モードで出力することができます。バースト・モード出力は、特に短時間で高分解能の出力データが利用可能な DPD フィードバック・アプリケーション向けに設計されています。高い SFDR 向けの設計により、ADC は広い入力周波数範囲にわたって、低ノイズ特性と優れたスプリアス・フリー・ダイナミック・レンジを実現します。デバイスは 196 ピン NFBGA パッケージで供給され、 $-40^{\circ}\text{C} \sim 85^{\circ}\text{C}$ の工業用温度範囲全体で動作が規定されています。

製品情報

部品番号	パッケージ ⁽¹⁾	本体サイズ (公称)
ADS54T01	NFBGA (196)	12.00mm × 12.00mm

- (1) 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。

4 Revision History

Changes from Revision A (January 2014) to Revision B (April 2022)	Page
• 「ESD 定格」表、「機能説明」セクション、「デバイスの機能モード」セクション、「アプリケーションと実装」セクション、「電源に関する推奨事項」セクション、「レイアウト」セクション、「デバイスおよびドキュメントのサポート」セクション、「メカニカル、パッケージ、および注文情報」セクションを追加.....	1
• 文書全体にわたって表、図、相互参照の採番方法を更新.....	1
• Changed Revision A History from "Deleted P7, N7" to "Deleted G4, G3".....	2
• Changed <i>Pin Functions</i> table to match TI Standards.....	3

Changes from Revision * (December 2012) to Revision A (January 2014)	Page
• Deleted G4, G3 from TRDYP/N pin numbers.....	3
• Changed package from QFN to nFBGA in THERMAL INFORMATION.....	7
• Added text and figure to TEST PATTERN OUTPUT section.....	22
• Deleted text from last paragraph in INTERLEAVING CORRECTION section.....	26
• Changed second paragraph in MULTI DEVICE SYNCHRONIZATION section.....	28
• Deleted Register Initialization section and added Device Initialization section.....	32
• Changed Register Address 2 Bit D13 from 0 to 1 in SERIAL REGISTER MAP.....	34
• Changed Register Address E Bits D1 and D0 to 0 in SERIAL REGISTER MAP.....	34
• Changed Register Address 38 Bits D3 to D0 from 0 to 1 in SERIAL REGISTER MAP.....	34
• Changed Register Address 2 Bit D13 from 0 to 1 and add D13 Read back 1.....	34
• Changed Register Address E Bit D1 and D0 to 0.....	34
• Changed Register Address 38 Bits D3 to D0 from 0 to 1 and add D3 to D0 Read back 1.....	34
• Changed Register Address 66 D15-D10 to D15-D0 and D11-D10 to D11-D0.....	34

图 6-1. ADS54T01 ZAY Package, 196-Pin NFBGA, Top View (DDR Output Mode)

表 6-1. Pin Functions

PIN		I/O TYPE ⁽¹⁾	DESCRIPTION
NAME	NUMBER		
INPUT/REFERENCE			
INA_P/N	K14, L14	I	Analog ADC differential input signal.
VCM	B14	O	Output of the analog input common mode (nominally 1.9 V). A 0.1-μF capacitor to AGND is recommended, but not required.
VREF	A14	I	Reference voltage input. A 0.1-μF capacitor to AGND is recommended.
CLOCK/SYNC			
CLKINP/N	P14, P13	I	Differential input clock

表 6-1. Pin Functions (continued)

PIN		I/O TYPE ⁽¹⁾	DESCRIPTION
NAME	NUMBER		
SYNCP/N	P9, N9	I	Synchronization input. Inactive if logic low. When clocked in a high state initially, this is used for resetting internal clocks and digital logic and starting the SYNCOUT signal. Internal 100-Ω termination.
CONTROL/SERIAL			
SRESET	B12	I	Serial interface reset input. Active low. Initialized internal registers during high-to-low transition. Asynchronous. Internal 50-kΩ pullup resistor to IOVDD.
ENABLE	B11	I	Chip enable – active high. Power-down function can be controlled through SPI register assignment. Internal 50-kΩ pullup resistor to IOVDD.
SCLK	A12	I	Serial interface clock. Internal 50-kΩ pulldown resistor.
SDIO	A11	I/O	Bidirectional serial data in 3-pin mode (default). In 4-pin interface mode (register x00, D16), the SDIO pin in an input only. Internal 50-kΩ pulldown resistor.
SDENB	A13	I	Serial interface enable. Internal 50-kΩ pulldown resistor.
SDO	A10	O	Uni-directional serial interface data in 4-pin mode (register x00, D16). The SDO pin is tri-stated in 3-pin interface mode (default). Internal 50-kΩ pulldown resistor.
DATA INTERFACE			
DA[11:0]P/N	P3, N3, P2, N2, P1, N1, M4, M3, M2, M1, L4, L3, L2, L1, K4, K3, K2, K1, J4, J3, J2, J1, H4, H3	O	ADC A Data Bits 11 (MSB) to 0 (LSB) in DDR output mode. Standard LVDS output.
DACLKP/N	H2, H1	O	DDR differential output data clock for Bus A. Register programmable to provide either rising or falling edge to center of stable data nominal timing.
SYNCOUTP/N	P5, N5	O	Synchronization output signal for synchronizing multiple ADCs. Can be disabled through the SPI.
OVRAP/N	M5, L5	O	Bus A, Overrange indicator, LVDS output. A logic high signals an analog input in excess of the full-scale range. Optional SYNC output.
TRIGGERP/N	P10, N10	I	Trigger used for high-resolution output data in feedback mode. Internal 100-Ω termination.
TRDYP/N	P7, N7	O	Trigger ready output indicator
HRESP/N	P6, N6	O	Indicator for high-resolution output data; logic high signals 12-bit output data.
NO CONNECT			
NC	A1, A2, A3, A4, A5, A6, A7, B1, B2, B3, B4, B5, B6, B7, C1, C2, C3, C4, C5, D1, D2, D3, D4, D5, D14, E1, E2, E3, E4, E14, F1, F2, F3, F4, G1, G2, G3, G4, N4, P4	–	Do not connect to pin, leave floating.
TESTMODE	B13	–	Used for factory internal test. Do not connect to pin, leave floating.
POWER SUPPLY			
AVDD33	D12, E12, F12, G12, H12, J12, K12, L12, N12, P12	P	3.3-V analog supply
AVDDC	G14, H14	P	1.8-V supply for clock input
AVDD18	D10, D11, E11, F11, G11, H11, J11, K11, L10, L11, N11, P11	P	1.8-V analog supply

表 6-1. Pin Functions (continued)

PIN		I/O TYPE ⁽¹⁾	DESCRIPTION
NAME	NUMBER		
DVDD	A8, A9, B8, B9, C8, D8, L8, M8, N8, P8	P	1.8-V supply for digital block
DVDDLVDs	C6, C7, D6, D7, L6, L7, M6, M7	P	1.8-V supply for LVDS outputs
IOVDD	B10	P	1.8-V for digital I/Os
GND	C9, C10, C11, C12, C13, C14, D9, D13, E5, E6, E7, E8, E9, E10, E13, F5, F6, F7, F8, F9, F10, F13, F14, G5, G6, G7, G8, G9, G10, H5, H6, H7, H8, H9, H10, J5, J6, J7, J8, J9, J10, K5, K6, K7, K8, K9, K10, L9, M9, M10, M11, M12, M13, M14, N13, N14	GND	Ground

(1) The definitions below define the I/O type for each pin.

- I = Input
- O = Output
- I/O = Input / Output
- P = Power Supply
- G = Ground

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	AVDD33	–0.5	4	V
	AVDDC	–0.5	2.3	V
	AVDD18	–0.5	2.3	V
	DVDD	–0.5	2.3	V
	DVDDLVDs	–0.5	2.3	V
	IOVDD	–0.5	4	V
Voltage applied to input pins	INA_P, INA_N	–0.5	AVDD33 + 0.5	V
	CLKINP, CLKINN	–0.5	AVDDC + 0.5	V
	SYNCP, SYNCN	–0.5	AVDD33 + 0.5	V
	SRESET, SDENB, SCLK, SDIO, SDO, ENABLE	–0.5	IOVDD + 0.5	V
Operating free-air temperature, T _A		–40	85	°C
Operating junction temperature, T _J			150	°C
Storage temperature, T _{stg}		–65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T _J	Recommended operating junction temperature			105	°C
	Maximum rated operating junction temperature ⁽¹⁾	125			
T _A	Recommended free-air temperature	–40	25	85	°C

(1) Prolonged use at this junction temperature may increase the device failure-in-time (FIT) rate.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS54T01	UNIT
		ZAY (NFBGA)	
		196 PINS	
θ _{JA}	Junction-to-ambient thermal resistance ⁽²⁾	37.6	°C/W
θ _{JCTop}	Junction-to-case (top) thermal resistance ⁽³⁾	6.8	°C/W
θ _{JB}	Junction-to-board thermal resistance ⁽⁴⁾	16.8	°C/W
ψ _{JT}	Junction-to-top characterization parameter ⁽⁵⁾	0.2	°C/W
ψ _{JB}	Junction-to-board characterization parameter ⁽⁶⁾	16.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining R_{θJA}, using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining R_{θJA}, using a procedure described in JESD51-2a (sections 6 and 7).

7.5 Electrical Characteristics

Typical values at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 85°C, ADC sampling rate = 750 Msps, 50% clock duty cycle, AVDD33 = 3.3 V, AVDDC/AVDD18/DVDD/DVDDLVDs/IOVDD = 1.8 V, –1-dBFS differential input (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNITS
ADC Clock Frequency			40		750	MSPS
Resolution			12			Bits
SUPPLY						
AVDD33			3.15	3.3	3.45	V
AVDDC, AVDD18, DVDD, DVDDLVS			1.7	1.8	1.9	V
IOVDD			1.7	1.8	3.45	V
POWER SUPPLY						
I _{AVDD33}	3.3-V Analog supply current			154	170	mA
I _{AVDD18}	1.8-V Analog supply current			66	80	mA
I _{AVDDC}	1.8-V Clock supply current			42	60	mA
I _{DVDD}	1.8-V Digital supply current	Auto Correction Enabled		250	280	mA
I _{DVDD}	1.8-V Digital supply current	Auto Correction Disabled		215		mA
I _{DVDD}	1.8-V Digital supply current	Auto Correction Disabled, decimation filter enabled		234		mA
I _{DVDDLVS}	1.8-V LVDS supply current			66	90	mA
I _{IOVDD}	1.8-V I/O Voltage supply current			1	2	mA

7.5 Electrical Characteristics (continued)

Typical values at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, ADC sampling rate = 750 Msps, 50% clock duty cycle, AVDD33 = 3.3 V, AVDDC/AVDD18/DVDD/DVDDLVD/IOVDD = 1.8 V, –1-dBFS differential input (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNITS
P _{dis}	Total power dissipation	Auto Correction Enabled, decimation filter disabled	1.28		1.75	W
P _{dis}	Total power dissipation	Auto Correction Disabled, decimation filter disabled	1.2			W
PSRR		250 kHz to 500 MHz	40			dB
Shutdown power dissipation			7			mW
Shutdown wake-up time			2.5			ms
Standby power dissipation			7			mW
Standby wake-up time			100			μs
Deep-sleep mode power dissipation		Auto correction disabled	350			mW
		Auto correction enabled	475			mW
Deep-sleep mode wake-up time			20			μs
Light-sleep mode power dissipation		Auto correction disabled	655			mW
		Auto correction enabled	780			mW
Light-sleep mode wake-up time			2			μs

7.6 Electrical Characteristics

Typical values at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, ADC sampling rate = 750 Msps, 50% clock duty cycle, AVDD3V = 3.3 V, AVDD/DRVDD/IOVDD = 1.8 V, -1-dBFS differential input (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS
ANALOG INPUTS					
Differential input full-scale		1.0	1.25		V _{pp}
Input common-mode voltage		1.9	±0.1		V
Input resistance	Differential at DC	1			kΩ
Input capacitance	Each input to GND	2			pF
VCM common-mode voltage output		1.9			V
Analog input bandwidth (3 dB)		1200			MHz
DYNAMIC ACCURACY					
Offset Error	Auto Correction Disabled	-20	-7.5	20	mV
	Auto Correction Enabled	-1	0	1	mV
Offset temperature coefficient			-6.5		μV/°C
Gain error		-5		5	%FS
Gain temperature coefficient			0.005		%FS/°C
Differential nonlinearity	$f_{\text{IN}} = 230 \text{ MHz}$	-1	±0.9	2	LSB
Integral nonlinearity	$f_{\text{IN}} = 230 \text{ MHz}$	-5	±1.5	5	LSB
CLOCK INPUT					
Input clock frequency		40		750	MHz
Input clock amplitude			2		V _{pp}
Input clock duty cycle		40%	50%	60%	
Internal clock biasing			0.9		V

7.7 Electrical Characteristics

Typical values at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, ADC sampling rate = 750 Msps, 50% clock duty cycle, AVDD33 = 3.3 V, AVDDC/AVDD18/DVDD/DVDDLVS/IOVDD = 1.8 V, –1-dBFS differential input (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	MIN	TYP	MAX	UNITS
Auto Correction			Enabled			Disabled			Vpp
DYNAMIC AC CHARACTERISTICS ⁽¹⁾ – Burst Mode Enabled: 12-bit High Resolution Output Data									
SNR	Signal to Noise Ratio	f _{IN} = 10 MHz		61.1		61.2			dBFS
		f _{IN} = 100 MHz		61.1		61.1			
		f _{IN} = 230 MHz	59	60.7		60.9			
		f _{IN} = 450 MHz		59.9		60.5

IMD3	Inter modulation distortion	F _{in} = 184.5 and 185.5 MHz, –7 dBFS		82		83			dBFS
		F _{in} = 549.5 and 550.5 MHz, –7 dBFS		76		77			
	Crosstalk			90		90			dB
ENOB	Effective number of bits	f _{IN} = 230 MHz		9.8		9.8			LSB

(1) SFDR and SNR calculations do not include the DC or Fs/2 bins when Auto Correction is disabled.

7.8 Electrical Characteristics

Typical values at $T_A = 25^\circ\text{C}$, full temperature range is $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = 85^\circ\text{C}$, ADC sampling rate = 500 Msps, 50% clock duty cycle, AVDD33 = 3.3 V, AVDDC/AVDD18/DVDD/DVDDLVS/IOVDD = 1.8 V, –1-dBFS differential input (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNITS
OVER-DRIVE RECOVERY ERROR					
Input overload recovery	Recovery to within 5% (of final value) for 6-dB overload with sine wave input		2		ns
SAMPLE TIMING CHARACTERISTICS					
rms Aperture Jitter	Sample uncertainty		100		fs rms
Data Latency	ADC sample to digital output, Auto correction disabled		38		Clock Cycles
	ADC sample to digital output, Auto correction enabled		50		
	ADC sample to digital output, Decimation filter enabled, Auto correction disabled		74		Sampling clock Cycles
Over-range Latency	ADC sample to over-range output		12		Clock Cycles

7.9 Electrical Characteristics

The DC specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level 0 or 1. AVDD33 = 3.3 V, AVDDC/AVDD18/DVDD/DVDDLVS/IOVDD = 1.8 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNITS
DIGITAL INPUTS – SRESET, SCLK, SDENB, SDIO, ENABLE						
High-level input voltage		All digital inputs support 1.8-V and 3.3-V logic levels.	0.7 x IOVDD		V	
Low-level input voltage			0.3 x IOVDD		V	
High-level input current			–50	200	μA	
Low-level input current			–50	50	μA	
Input capacitance			5		pF	
DIGITAL OUTPUTS – SDO						
High-level output voltage		Iload = -100 μA	IOVDD – 0.2		V	
		Iload = -2 mA	0.8 x IOVDD			
Low-level output voltage		Iload = 100 μA	0.2		V	
		Iload = 2 mA	0.22 x IOVDD			
DIGITAL INPUTS – SYNC/P/N, TRIGGER/P/N

8 Detailed Description

8.1 Overview

The ADS54T01 is a 12-bit, single channel ADC that operates at sampling rates of up to 750 Msps. This device has excellent SFDR over a large input frequency range and low noise performance. The ADC accepts differential signals for the clock input and analog input buffers. The analog input buffer provides an isolated signal from the source with a high-impedance input.

8.2 Functional Block Diagram

8-1. Functional Block Diagram

8.3 Feature Description

8.3.1 Test Pattern Output

The ADS54T01 can be configured to output different test patterns that can be used to verify the digital interface is connected and working properly.

To enable the test pattern mode, the high-performance mode 1 has to be disabled first through the SPI register write. Then different test patterns can be selected by configuring registers x3C, x3D, and x3E. All three registers must be configured for the test pattern to work properly.

First set HP1 = 0 (Addr 0x01, D01)

Internally the test pattern replaces the sampled data from the ADC. However at the LVDS outputs the output data is still subject to burst mode operation. In low-resolution output, the LSBs of the test pattern are replaced with 0 s.

图 8-2. Test Pattern Selection

表 8-1. Test Pattern Register Setting

Register Address	All 0s	All 1s	Toggle (0xAAA => 0x555)	Toggle (0xFFF => 0x000)
0x3C	0x8000	0xBFFC	0x9554	0xBFFC
0x3D	0x0000	0x3FFC	0x2AA8	0x0000
0x3E	0x0000	0x3FFC	0x1554	0x3FFC

表 8-2. Custom Pattern Register Setting

Register Address	Custom Pattern															
	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
x3C	1	0	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	0	0
x3D	0	0													0	0
x3E	0	0													0	0

For normal operation, set HP1 = 1 (Addr 0x01, D01) and 0x3C, 0x3D, and 0x3E all to 0.

8.3.2 Clock Inputs

The ADS54T01 clock input can be driven differentially with a sine wave, LVPECL, or LVDS source with little or no difference in performance. The common-mode voltage of the clock input is set to 0.9 V using internal 2-k Ω resistors. This allows for AC coupling of the clock inputs. The termination resistors should be placed as close to the clock inputs as possible to minimize signal reflections and jitter degradation.

Recommended differential clock driving circuit

图 8-3. Recommended Differential Clock Driving Circuit

8.3.3 SNR and Clock Jitter

The signal-to-noise ratio of the ADC is limited by three different factors: the quantization noise is typically not noticeable in pipeline converters and is 72 dB for a 12-bit ADC. The thermal noise limits the SNR at low input frequencies while the clock jitter sets the SNR for higher input frequencies.

$$\text{SNR}_{\text{ADC}}[\text{dBc}] = -20 \times \log \sqrt{\left(10 - \frac{\text{SNR}_{\text{Quantization_Noise}}}{20}\right)^2 + \left(10 - \frac{\text{SNR}_{\text{ThermalNoise}}}{20}\right)^2 + \left(10 - \frac{\text{SNR}_{\text{Jitter}}}{20}\right)^2} \quad (1)$$

Use 式 2 to calculate the SNR limitation due to sample clock jitter.

$$\text{SNR}_{\text{Jitter}}[\text{dBc}] = -20 \times \log(2\pi \times f_{\text{IN}} \times t_{\text{Jitter}}) \quad (2)$$

The total clock jitter (t_{Jitter}) has three components: the internal aperture jitter (100 fs for ADS54T01) which is set by the noise of the clock input buffer, the external clock jitter, and the jitter from the analog input signal. Use 式 3 to calculate the total clock jitter.

$$T_{\text{Jitter}} = \sqrt{(T_{\text{Jitter,Ext.Clock_Input}})^2 + (T_{\text{Aperture_ADC}})^2} \quad (3)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as bandpass filters at the clock input while a faster clock slew rate improves the ADC aperture jitter.

The ADS54T01 has a thermal noise of 61.2 dBFS and internal aperture jitter of 100 fs. 图 8-4 shows the SNR depending on amount of external jitter for different input frequencies.

图 8-4. SNR vs. Frequency and External Clock Jitter

8.3.4 Analog Inputs

The ADS54T01 analog signal input is designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. As a result of the analog buffer, the input pins present a high impedance input across a very wide frequency range to the external driving source which enables great flexibility in the external analog filter design as well as excellent 50 Ω matching for RF applications. The buffer also helps isolate the external driving circuit from the internal switching currents of the sampling circuit which results in a more constant SFDR performance across input frequencies.

The common-mode voltage of the signal inputs is internally biased to 1.9 V using 500- Ω resistors which allows for AC coupling of the input drive network. Each input pin (INP, INM) must swing symmetrically between ($V_{\text{CM}} + 0.25 \text{ V}$) and ($V_{\text{CM}} - 0.25 \text{ V}$), resulting in a 1.0 V_{pp} (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 1.2 GHz.

8-5. Analog Input Internal Circuitry

8.3.5 Over-Range Indication

The ADS54T01 provides a fast over-range indication on the OVRA/B pins. The fast OVR is triggered if the input voltage exceeds the programmable overrange threshold and it gets presented after just 12 clock cycles enabling a quicker reaction to an overrange event. The OVR threshold can be configured using SPI register writes.

The input voltage level at which the overload is detected is referred to as the threshold and is programmable using the over-range threshold bits. The threshold at which fast OVR is triggered is (full-scale × [the decimal value of the FAST OVR THRESH bits] / 16). After reset, the default value of the over-range threshold is set to 15 (decimal) which corresponds to a threshold of 0.56 dB below full scale ($20 \times \log(15/16)$).

8-6. OVR Detection Threshold

8.3.6 Interleaving Correction

The data converter channel consists of two interleaved ADCs each operating at half of the ADC sampling rate but 180° out of phase from each other. The front end track and hold circuitry is operating at the full ADC sampling rate which minimizes the timing mismatch between the two interleaved ADCs. In addition, the ADS54T01 is equipped with internal interleaving correction logic that can be enabled through a SPI register write.

8-7. Interleaving Correction Block Diagram

The interleaving operation creates 2 distinct and interleaving products:

- $F_s/2 - F_{in}$: this spur is created by gain timing mismatch between the ADCs. Since internally the front end track and hold is operated at the full sampling rate, this component is greatly improved and mostly dependent on gain mismatch.
- $F_s/2$ Spur: due to offset mismatch between ADCs

8-8. Interleaving Correction Spurs

The auto correction loop can be enabled through a SPI register write in address 0x01. By default, the auto correction function is disabled for lowest possible power consumption. The default settings for the auto correction function should work for most applications. However please contact Texas Instruments if further fine tuning of the algorithm is required.

The auto correction function yields best performance for input frequencies below 250 MHz.

8.3.7 High-Resolution Output Data

After trigger, the data outputs DA[11..0] are 12-bit resolution for 2^N samples, where N is a programmable register with a range $10 \leq N \leq 25$ (corresponding to 1024 to 33554432 samples).

8-9. High-Resolution Data Output Timing

After the high-resolution data, the data output returns to low-resolution mode, the logic level of the HRES flag returns low and the trigger is locked out for $2^{(N+3)}$ samples. N is the sample integer resulting in a maximum output duty cycle of 1/9. During the trigger lockout time, a low to high transition on TRIGGERP/N will be ignored. After the 2^{N+3} low-resolution samples, the TRIGGERP/N is re-enabled for the next valid data burst.

8.3.8 Low-Resolution Output Data

There are two different options for the low-resolution output data and the selection is made through SPI register control. The data can either be output at full speed (ADC sampling rate) with the output resolution limited to 7 bit (7 MSBs). Alternatively the output resolution can be selected to 11 bit (11 MSBs) but at a reduced effective data rate where every 4th sample gets repeated four times.

8.3.9 Full Speed – 7 Bit

The output data rate and timing is exactly the same as the high-resolution data, only the output resolution is limited to the 7 MSBs.

8-10. Full-Rate, Low-Resolution Output Data Timing

8.3.10 Decimated Low-Resolution Output Data

In decimated low-resolution mode, the output data is limited to 11 bits and every sample is repeated four times, so the effective data rate is 1/4 of ADC sampling rate. The latency of the ADC sample to output sample is exactly the same as for high-resolution data—there is no uncertainty in which conversion sample results in the valid output data. This is because the output continues to run at the ADC sample rate in decimated low-resolution mode where only the resolution is changed and three out of four samples are deleted.

FIG 8-11. Decimated Low-Resolution Output Data Timing Diagram

8.3.11 Multi Device Synchronization

The ADS54T01 simplifies the synchronization of data from multiple ADCs in one common receiver. Upon receiving the initial SYNC input signal, the ADS54T01 resets all the internal clocks and digital logic while also starting a SYNCOUT signal which operates on a 5-bit counter (32 clock cycles). Therefore, by providing a common SYNC signal to multiple ADCs, their output data can be synchronized as the SYNCOUT signal marks a specific sample with the same latency in all ADCs. The SYNCOUT signal then can be used in the receiving device to synchronize the FIFO pointers across the different input data streams. Thus the output data of multiple ADCs can be aligned properly even if there are different trace lengths between the different ADCs.

FIG 8-12. Multi Device SYNC

The SYNC input signal should be a one-time pulse to trigger the periodic 5-bit counter for SYNCOUT or a periodic signal repeating every 32 CLKIN clock cycles. The signal is registered on the rising edge of the ADC input clock (CLKIN). Upon registering the initial rising edge of the SYNC signal, the internal clocks and logic get reset which results in invalid output data for 36 samples (1 complete sync cycle and 4 additional samples). The SYNCOUT signal starts with the next output clock (DACLK) rising edge and operates on a 5-bit counter. If a SYNCIN rising edge gets registered at a new position, the counter gets reset and SYNCOUT starts from the new position.

The ADS54T01 output interface operates with a DDR clock, therefore the synchronization can happen on the rising edge or falling edge sample. Synchronization on the falling edge sample will result in a half cycle clock stretch of DACLK. For convenience, the SYNCOUT signal is available on the ChA output LVDS bus.

When using decimation, the SYNCOUT signal still operates on 32 clock cycles of CLKIN, but because the output data is decimated by 2, only the first 18 samples should be discarded.

图 8-13. SYNC Timing Diagram

8.4 Device Functional Modes

8.4.1 Power-Down Modes

The ADS54T01 can be configured through a SPI write (address x37) to a standby, light, or deep sleep power mode which is controlled by the ENABLE pin. The sleep modes are active when the ENABLE pin goes low. Different internal functions stay powered up which results in different power consumption and wake up time between the two sleep modes.

表 8-3. Sleep Mode Power Consumption

Sleep Mode	Wake-Up Time	Power Consumption With Auto Correction Disabled	Power Consumption With Auto Correction Enabled
Complete Shutdown	2.5 ms	7 mW	7 mW
Standby	100 μ s	7 mW	7 mW
Deep Sleep	20 μ s	350 mW	475 mW
Light Sleep	2 μ s	655 mW	780 mW

8.4.2 Feedback Mode: Burst Mode

In burst mode, the output data is alternated between a high-resolution, 12-bit output of 2^N samples and a low-resolution, 7-bit or 11-bit output of 2^{N+3} samples. Burst mode is enabled through a SPI register write and there are two basic operating modes available: a manual trigger mode where the high-resolution output is initiated through an external trigger and an auto-trigger mode where the internal logic transitions to a high-resolution output immediately after transmitting the last low-resolution sample. After burst mode is enabled through a SPI register write, the ADS54T01 transmits 2^{13} low-resolution samples and the trigger command is locked out until completion.

The parameter N can be changed through the SPI at any time. The change will go into effect with the next output cycle, starting with the transmission of low-resolution samples. The default value for N after reset is N=10.

表 8-4. Burst Mode Samples Per Cycle

N limit	10 (minimum)	25 (maximum)
Number of low resolution samples per cycle (2^{N+3})	8,192	268,435,456
Number of high resolution samples per cycle (2^N)	1,024	33,554,432
Total amount of samples per cycle	9,216	301,989,888

表 8-4. Burst Mode Samples Per Cycle (continued)

N limit	10 (minimum)	25 (maximum)
Maximum number of high resolution (12-bit) samples per 1 second	83.3M	83.3M

8.4.3 Receive Mode: Decimation Filter

☒ 8-14 shows that each channel has a digital filter in the data path.

**☒ 8-14. Decimation Filter Block Diagram**

The filter can be programmed as a low-pass or a high-pass filter and the normalized frequency response of both filters. The decimation filter response has a 0.1-dB pass-band ripple with approximately 41% pass-band bandwidth. The stop-band attenuation is approximately 40 dB.

**☒ 8-15. Decimation Filter Response****☒ 8-16. Decimation Filter Response**

8.4.4 Manual Trigger Mode

The control of the high-resolution output is shown below along with the two output flags (TRDY and HRES).

8-17. Triggering High Resolution Mode and Lockout Time

After enabling burst mode, the output data DA[11..0] are forced to low-resolution mode for 2^{13} samples. During that period, any trigger signal is ignored. The completion of the low-resolution sample cycle is signaled by a logic high on the TRDY output pins indicating that a high-resolution (12-bit) data output burst can be triggered by a low-to-high transition on the TRIGGER input. The ADC monitors the TRIGGER input at each rising edge of the input clock.

The high-resolution output data starts with a delay of $t_{TRIG_DELAY} = 1-2$ DACLK clock cycles and is indicated through the HRES data flag which stays high for all 2^N high-resolution samples. At completion the register value for N is verified and transmission of $2^{(N+3)}$ low-resolution data immediately follows. When the last low-resolution sample is output on the output data bus, the flag TRDY is asserted high again indicating the end of the lockout period and the next 2^N high-resolution samples can be triggered again.

8.4.5 Auto Trigger Mode

This mode is enabled by setting the auto trigger bit through a SPI register write and the DA data outputs start in low resolution for 2^{13} samples. Immediately following completion of transmission of the last low resolution sample, the outputs automatically start transmitting 2^{10} high-resolution samples without the need for external trigger ensuring maximum efficiency. Any input signal on the TRIGGER pins is ignored and the TRDY flag will go high only for one clock cycle with the start of the high-resolution data.

The output flag HRES is aligned with the 2^N high-resolution output samples and the parameter N can be changed until the next output cycle starts again with low-resolution output data.

8-18. Auto Trigger Mode Timing Diagram

8.5 Programming

The serial interface (SIF) included in the ADS54T01 is a simple 3 or 4 pin interface. In normal mode, 3 pins are used to communicate with the device. There is an enable (SDENB), a clock (SCLK) and a bidirectional IO port (SDIO). If the user would like to use the 4-pin interface one write must be implemented in the 3-pin mode to enable 4-pin communications. In this mode, the SDO pin becomes the dedicated output. The serial interface has an 8-bit address word and a 16-bit data word. The first rising edge of SCLK after SDENB goes low will latch the read/write bit. If a high is registered, then a read is requested. If it is low, then a write is requested. SDENB must be brought high again before another transfer can be requested. The signal diagram is shown below:

8.5.1 Device Initialization

After power up, TI recommends to initialize the device through a hardware reset by applying a logic low pulse on the SRESETb pin (of width greater than 20 ns), as shown in [Figure 8-19](#). This resets all internal digital blocks (including SPI registers) to their default condition.

图 8-19. Device Initialization Timing Diagram

表 8-5. Reset Timing

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
t ₁	Power-on delay	Delay from power up to active low RESET pulse	3			ms
t ₂	Reset pulse width	Active low RESET pulse width	20			ns
t ₃	Register write delay	Delay from RESET disable to SDENb active	100			ns

Recommended Device Initialization Sequence:

1. Power up
2. Reset ADS54T01 using hardware reset.
3. Apply clock and input signal.
4. Set register 0x01 bit D15 to "1" (ChA Corr EN) to enable gain/offset correction circuit and other desired registers.
5. Set register 0x03 bit D14 to "1" (Start Auto Corr ChA). This clears and resets the accumulator values in the DC and gain correction loop.
6. Set register 0x03 bit D14 to "0" (Start Auto Corr ChA). This starts the DC and gain auto-correction loop.

8.5.2 Serial Register Write

The internal register of the ADS54T01 can be programmed following these steps:

1. Drive SDENB pin low
2. Set the R/W bit to "0" (bit A7 of the 8-bit address)

- Initiate a serial interface cycle specifying the address of the register (A6 to A0) whose content has to be written
- Write 16-bit data which is latched on the rising edge of SCLK

8-20. Serial Register Write Timing Diagram

表 8-6. Timing Requirements

PARAMETER		MIN	TYP ⁽¹⁾	MAX	UNIT
f _{SCLK}	SCLK frequency (equal to 1/t _{SCLK})	>DC		20	MHz
t _{SLOADS}	SDENB to SCLK setup time	25			ns
t _{SLOADH}	SCLK to SDENB hold time	25			ns
t _{DSU}	SDIO setup time	25			ns
t _{DH}	SDIO hold time	25			ns

(1) Typical values at +25°C; minimum and maximum values across the full temperature range: TMIN = –40°C to TMAX = +85°C, AVDD3V = 3.3 V, AVDD, DRVDD = 1.9 V, unless otherwise noted.

8.5.3 Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back using the SDO/SDIO pins. This read-back mode may be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC.

- Drive SDENB pin low
- Set the RW bit (A7) to "1". This setting disables any further writes to the registers
- Initiate a serial interface cycle specifying the address of the register (A6 to A0) whose content has to be read.
- The device outputs the contents (D15 to D0) of the selected register on the SDO/SDIO pin
- The external controller can latch the contents at the SCLK rising edge.
- To enable register writes, reset the RW register bit to "0".

(1) Multiple functions in a register can be programmed in a single write operation.

8.6.2 Description of Serial Interface Registers

Register Address	Register Data															
A7–A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	3/4 Wire SPI	Dec Fil/ Burst	0	High/ Low Pass	0	0	0	0	0	0	Burst rate	0	0	Auto Trigger	0	0

D15	3/4 Wire SPI Default 0	Enables 4-bit serial interface when set
0	3-wire SPI is used with SDIO pin operating as bidirectional I/O port	
1	4-wire SPI is used with SDIO pin operating as data input and SDO pin as data output port.	
D14	DecFil/ Burst Default 0	2x decimation filter (Receive Mode) is enabled when bit is set
0	Burst mode enable	
1	2x decimation filter enabled	
D12	High/Low Pass Default 0	(Decimation filter must be enabled first: set bit D14)
0	Low Pass	
1	High Pass	
D5	Burst Rate Default 0	Low resolution output data rate in burst mode
0	Low resolution (9-bit) full output rate	
1	Decimated low resolution output (4x decimation, 11-bit resolution)	
D2	Auto Trigger Default 0	Enables auto trigger mode in burst mode without the need to control the trigger pin.
0	Manual trigger mode using the external trigger input pin	
1	Auto trigger mode enabled	

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	Corr EN	0	0	0	0	0	0	0	0	0	0	0	Data Format	0	HP Mode1	0

D15 Corr EN (should be enabled for maximum performance)
Default 0

0 auto gain correction disabled
1 auto gain correction enabled

D3 Data Format
Default 0

0 Two's complement
1 Offset Binary

D1 HP Mode 1
Default 0

1 Must be set to 1 for optimum performance

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
2	0	1	1	0	0	Over-range threshold				0	0	0	0	0	0	0

D14 Read back 1.

D13 Read back 1.

D10-D7 Over-range threshold

The over-range detection is triggered 12 output clock cycles after the overload condition occurs. The threshold at which the OVR is triggered = $1.0V \times [\text{decimal value of } \langle \text{Over-range threshold} \rangle / 16]$. After power up or reset, the default value is 15 (decimal) which corresponds to a OVR threshold of 0.56dB below fullscale ($20 \cdot \log(15/16)$). This OVR threshold is applicable to both channels.

Default 1111

8-22. Over-range Threshold vs. Programmed Value

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
3	0	DC Offset Coff	0	0	1	0	1	1	0	0	0	1	1	0	0	0

D14 DC Offset Corr Starts DC offset correction loop
Default 1

0 Starts offset correction loop

1 DC offset correction loop is cleared

D11, 9, 8, 4, 3 Must be set to 1 for maximum performance
Default 1

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
E	Sync Select														0	0

D15-D2 **Sync Select** Sync selection for the clock generator block (also need to see address
Default 1010 1010 1010 10 0x0F)

0000 0000 0000 00 Sync is disabled

0101 0101 0101 01 Sync is set to one shot (one time synchronization only)

1010 1010 1010 10 Sync is derived from SYNC input pins

1111 1111 1111 11 not supported

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
F	Sync Select				0	0	0	0	0	VREF Sel			0	0	0	0

D15-D12 **Sync Select** Sync selection for the clock generator block
Default 1010 1010 1010 10

0000 Sync is disabled

0101 Sync is set to one shot (one time synchronization only)

1010 Sync is derived from SYNC input pins

1111 not supported

D6-D4 **VREF SEL** Internal voltage reference selection
Default 000

000 1.0 V

001 1.25 V

010 0.9 V

011 0.8 V

100 1.15 V

Others external reference

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1A	0	0	0	0	1	0	1	1	0	0	0	1	1	0	0	0

D14, 11, 9, 8, 4, 3 Must be set to 1 for maximum performance
Default 1

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
2B	0	0	0	0	0	0	0	Temp Sensor								

D8-D0 **Temp Sensor** Internal temperature sensor value – read only

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
2C	Reset															

D15-D0 **Reset** This is a software reset to reset all SPI registers to their default value. Self clears to 0.
Default 0000

1101001011110000 Perform software reset

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
34	0	0	Burst Mode N				0	0	0	0	0	0	0	0	0	0

D13-D10 **Burst Mode N** This is the parameter that sets the amount of high resolution samples in burst mode
 Default 0000
 0000 N = 10
 0001 N = 11

 1111 N = 25

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
37	Sleep Modes						0	0	0	0	0	0	0	0	0	0

D15-D14 **Sleep Modes** Sleep mode selection which is controlled by the ENABLE pin. Sleep modes are active when ENABLE pin goes low.
 Default 00
 000000 Complete shut down Wake up time 2.5 ms
 100000 Standby mode Wake up time 100 µs
 110000 Deep sleep mode Wake up time 20 µs
 110101 Light sleep mode Wake up time 2 µs

Register Address	Register Data

38	HP Mode 2							LP Mode	TEMP EN	FUSE Bias EN	SYNC EN	TRIG EN	1	1	1	1

D15-D9 **HP Mode 2** Default 111111111
 1 Set to 1 for normal operation
 D8 **LP Mode** Low power mode
 Default 1
 0 Set to 0 to turn off unused output buffers
 D7 **TEMP EN** Temperature sensor enable
 Default 1
 1 Set to 1 to enable the temperature sensor
 D6 **FUSE BIAS EN** Enables internal bias voltages. Can be disabled after power up for power savings.
 Default 1
 0 Internal fuse bias powered down
 1 Internal fuse bias enabled
 D5 **SYNC EN** Enables the SYNC input buffer.
 Default 1
 0 SYNC input buffer disabled
 1 SYNC input bffer enabled
 D4 **TRIG EN** Enables the TRIGGER input buffer.
 Default 1
 0 TRIGGER input buffer disabled
 1 TRIGGER input bffer enabled
 D3-D0 Read back 1

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
3A	LVDS Current Strength			LVDS SW		Internal LVDS Termination		0	0	0	0	DACLK EN	0	0	OVRA EN	0

D15-D13	LVDS Current Strength Default 000	LVDS output current strength.														
000	2 mA	100	3 mA													
001	2.25 mA	101	3.25 mA													
010	2.5 mA	110	3.5 mA													
011	2.75 mA	111	3.75 mA													
D12-D11	LVDS SW Default 01	LVDS driver internal switch setting – correct range must be set for setting in D15-D13														
01	2 mA to 2.75 mA															
11	3mA to 3.75mA															
D10-D9	Internal LVDS Termination Default 00	Internal termination														
00	2 kΩ															
01	200 Ω															
10	200 Ω															
11	100 Ω															
D4	DACLK EN Default 1	Enable DACLK output buffer														
0	DACLK output buffer powered down															
1	DACLK output buffer enabled															
D1	OVRA EN Default 1	Enable OVRA output buffer														
0	OVRA output buffer powered down															
1	OVRA output buffer enabled															

Register Address	Register Data															
A7-A0 in hex	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
66	LVDS Output Bus EN															

D15-D0	LVDS Output Bus EN Default FFFF	Individual LVDS output pin power down														
0	Output is powered down															
1	Output is enabled															
D15	corresponds to TRDYP/N (pins N7, P7)															
D14	corresponds to HRESP/N (pins N6, P6)															
D13	SYNCOUTP/N (pins N5, P5)															
D12	Pins N4, P4 (no connect pins) which are not used and should be powered down for power savings															
D11-D0	corresponds to DA11-DA0															

9 Power Supply Recommendations

The device requires a 1.8-V nominal supply for AVDDC, AVDD18, DVDD, DVDDLVD, and IOVDD. The device also requires a 3.3-V supply for AVDD33. There are no specific sequence power-supply requirements during device power-up. AVDDC, AVDD18, DVDD, DVDDLVD, IOVDD and AVDD33 can power up in any order.

10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

10.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.2 サポート・リソース

[TI E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
ADS54T01IZAY	Active	Production	NFBGA (ZAY) 196	160 JEDEC TRAY (5+1)	Yes	SNAGCU	Level-3-260C-168 HR	-40 to 85	ADS54T01I
ADS54T01IZAY.B	Active	Production	NFBGA (ZAY) 196	160 JEDEC TRAY (5+1)	Yes	SNAGCU	Level-3-260C-168 HR	-40 to 85	ADS54T01I
ADS54T01IZAYR	Active	Production	NFBGA (ZAY) 196	1000 LARGE T&R	Yes	SNAGCU	Level-3-260C-168 HR	-40 to 85	ADS54T01I
ADS54T01IZAYR.B	Active	Production	NFBGA (ZAY) 196	1000 LARGE T&R	Yes	SNAGCU	Level-3-260C-168 HR	-40 to 85	ADS54T01I

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
