ADS981x アナログ フロント エンド内蔵、18 ビット、2MSPS/チャネル、デュアル同時サンプリング ADC

1 特長

- 8 チャネル、18 ビット、アナログ フロントエンド内蔵 ADC:
  - デュアル同時サンプリング:4 × 1 チャネル
  - 1MΩ 固定入力インピーダンスのフロントエンド
- プログラム可能なアナログ入力範囲:
  - ±12V、±10V、±7V、±5V、±3.5V、±2.5V
  - シングルエンドおよび差動入力
  - ±12V の同相電圧範囲
  - 入力過電圧保護:最大 ±18V
- アナログ入力帯域幅をユーザーが選択可能:
  - 21kHz と 400kHz
- 低ドリフトの高精度リファレンスを内蔵
  - ADC リファレンス:4.096 V
  - 外部回路用の 2.5V リファレンス出力
- フルスループットでの非常に優れた AC および DC 性能:
  - DNL:±0.5LSB、INL:±0.8LSB
  - 信号対雑音比:92dB、THD:-113dB
- 電源:
  - アナログおよびデジタル:5V および 1.8V
  - デジタル インターフェイス:1.2V～1.8V
- 温度範囲:-40℃～+125℃

2 アプリケーション

- パラメトリック測定ユニット (PMU)
- バッテリ セル形成とテスト機器
- データ アクイジション (DAQ)

3 概要

ADS981x は、デュアル同時サンプリング、18 ビットの逐次比較型 (SAR) A/D コンバータ (ADC) を使用した 8 チャネルのデータ アクイジション (DAQ) システムです。ADS981x は、入力クランプ保護回路、1MΩ の入力インピーダンス、帯域幅をユーザーが選択可能なプログラマブル ゲイン アンプ (PGA) を持つ完全なアナログ フロントエンドを各チャネルに備えています。入力インピーダンスが高いため、センサや変圧器と直接接続でき、外付けのドライバ回路が必要ありません。ADS981x は、最大 ±12V の入力同相電圧でユニポーラ入力またはバイポーラ入力を受け入れるように構成できます。

このデバイスは、ADC 用の 4.096V リファレンスと、外部回路で使用するための 2.5V リファレンス出力も備えています。1.2V ～ 1.8V での動作をサポートするデジタル インターフェイスにより、ADS981x は外部電圧レベル変換なしで使用できます。

パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ(2)
ADS981x	RSH (VQFN、56)	7mm × 7mm

(1) 詳細については、「メカニカル、パッケージ、および注文情報」を参照してください。
(2) パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

製品情報

部品番号	SPEED	総電力
ADS9817	2MSPS / チャネル	232 mW
ADS9815	1MSPS / チャネル	165 mW

4 Pin Configuration and Functions

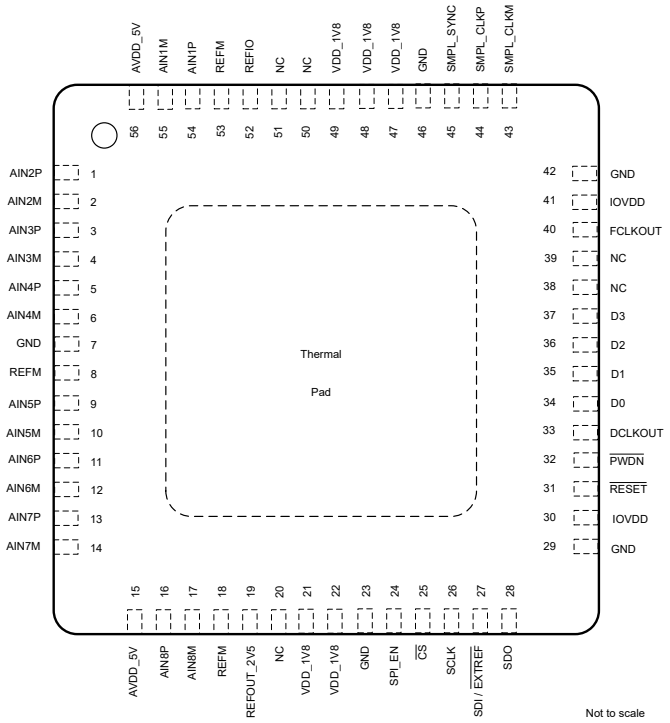

図 4-1. RSH Package, 56-Pin VQFN (Top View)

表 4-1. Pin Functions

PIN		TYPE[1]	DESCRIPTION
NAME	NO.		
AIN1M	55	AI	Analog input channel 1, negative input.
AIN1P	54	AI	Analog input channel 1, positive input.
AIN2M	2	AI	Analog input channel 2, negative input.
AIN2P	1	AI	Analog input channel 2, positive input.
AIN3M	4	AI	Analog input channel 3, negative input.
AIN3P	3	AI	Analog input channel 3, positive input.
AIN4M	6	AI	Analog input channel 4, negative input.
AIN4P	5	AI	Analog input channel 4, positive input.
AIN5M	10	AI	Analog input channel 5, negative input.
AIN5P	9	AI	Analog input channel 5, positive input.
AIN6M	12	AI	Analog input channel 6, negative input.
AIN6P	11	AI	Analog input channel 6, positive input.
AIN7M	14	AI	Analog input channel 7, negative input.
AIN7P	13	AI	Analog input channel 7, positive input.
AIN8M	17	AI	Analog input channel 8, negative input.
AIN8P	16	AI	Analog input channel 8, positive input.
AVDD_5V	15, 56	P	5V analog supply. Connect 1µF and 0.1µF decoupling capacitors to GND.
$\overline{CS}$	25	DI	Chip-select input for SPI interface configuration; active low. This pin has an internal 100kΩ pullup resistor to IOVDD.
D0	34	DO	Serial output data lane 0.
D1	35	DO	Serial data output lane 1.

表 4-1. Pin Functions (続き)

PIN		TYPE[1]	DESCRIPTION
NAME	NO.		
D2	36	DO	Serial data output lane 2.
D3	37	DO	Serial data output lane 3.
DCLKOUT	33	DO	Clock output for data interface.
FCLKOUT	40	DO	Frame synchronization output for data interface.
GND	7, 23, 29, 42, 46	P	Ground.
IOVDD	30, 41	P	Digital I/O supply for data interface. Connect 1µF and 0.1µF decoupling capacitor to GND.
NC	20, 38, 39, 50, 51	—	Not connected. No external connection.
$\overline{\text{PWDN}}$	32	DI	Power-down control; active low. $\overline{\text{PWDN}}$ has an internal 100kΩ pullup resistor to the digital interface supply.
REFIO	52	AI/AO	REFIO acts as an internal reference output when the internal reference is enabled. REFIO functions as an input pin for the external reference when the internal reference is disabled. Connect a 10µF decoupling capacitor to the REFM pins.
REFM	8, 18, 53	AI	Reference ground potential. Connect to GND.
REFOUT_2V5	19	AO	2.5V reference output. Connect a decoupling 10µF capacitor to the REFM pins.
$\overline{\text{RESET}}$	31	DI	Reset input for the device; active low. $\overline{\text{RESET}}$ has an internal 100kΩ pullup resistor to the digital interface supply.
SCLK	26	DI	Serial clock input for the configuration interface. SCLK has an internal 100kΩ pulldown resistor to the digital interface ground.
SDI	27	DI	SDI is a multifunction logic input; pin function is determined by the SPI_EN pin. SDI has an internal 100kΩ pulldown resistor to GND. SPI_EN = 0b: SDI is the logic input to select between the internal or external reference. Connect SDI to GND for the external reference. Connect SDI to IOVDD for the internal reference. SPI_EN = 1b: Serial data input for the configuration interface.
SDO	28	DO	Serial data output for the configuration interface.
SMPL_CLKP	44	DI	Single-ended ADC sampling clock input. SMPL_CLKP is the positive input for the differential sampling clock input to the ADC.
SMPL_CLKM	43	DI	Connect SMPL_CLKM to GND for a single-ended ADC sampling clock input. SMPL_CLKM is the negative input for the differential sampling clock input to the ADC.
SMPL_SYNC	45	DI	Synchronization input. See the *Sample Synchronization* section on how to use the SMPL_SYNC pin.
SPI_EN	24	DI	Logic input to enable the SPI interface configuration ($\overline{\text{CS}}$, SCLK, SDI, and SDO). SPI_EN has an internal 100kΩ pullup resistor to the digital interface supply.
VDD_1V8	21, 22, 47, 48, 49	P	1.8V power-supply. Connect 1µF and 0.1µF decoupling capacitors to GND.
Thermal pad	—	P	Exposed thermal pad; connect to GND.

(1) I = input, O = output, I/O = input or output, G = ground, and P = power.

5 Specifications

5.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
AVDD_5V to GND	–0.3	6	V
VDD_1V8 to GND	–0.3	2.1	V
IOVDD to GND	–0.3	2.1	V
AINxP and AINxM to GND	–18	18	V
REFIO to REFM	REFM – 0.3	AVDD_5V + 0.3	V
REFM to GND	GND – 0.3	GND + 0.3	V
Digital inputs to GND	GND – 0.3	2.1	V
Input current to any pin except supply pins(2)	–10	10	mA
Junction temperature, T_J	–40	150	°C
Storage temperature, T_{stg}	–60	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) Pin current must be limited to 10 mA or less.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
AVDD_5V	Analog power supply	AVDD_5V to GND, 5 V	4.75	5	5.25	V
VDD_1V8	Analog power supply	VDD_1V8 to GND, 1.8 V	1.75	1.8	1.85	V
IOVDD	Digital interface power supply	IOVDD to GND	1.15	1.8	1.85	V
REFERENCE VOLTAGE						
V_{REF}	Reference voltage to the ADC	External reference	4.092	4.096	4.100	V
ANALOG INPUTS						
V_{FSR}	Full-scale input range	RANGE_CHx = 0010b	–2.5		2.5	V
		RANGE_CHx = 0001b	–3.5		3.5	
		RANGE_CHx = 0000b	–5		5	
		RANGE_CHx = 0011b	–7		7	
		RANGE_CHx = 0100b	–10		10	
		RANGE_CHx = 0101b	–12		12	
AINxP	Operating input voltage, positive input		–17		17	V
AINxM	Operating input voltage, negative input		–17		17	V
TEMPERATURE RANGE						
T_A	Ambient temperature		–40	25	125	°C

5.4 Thermal Information

THERMAL METRIC(1)		ADS981x RSH (VQFN) 56 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	23.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	10.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	6.1	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.1	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	6.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.9	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application note.

5.5 Electrical Characteristics

at AVDD_5V = 4.75 V to 5.25 V, VDD_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, V_{REF} = 4.096 V (internal or external), wide-common-mode disabled for analog input ranges ±2.5V, ±3.5V, and ±5V, wide-common-mode enabled for analog input ranges ±7V, ±10V, and ±12V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUTS						
R_{IN}	Input impedance	All input ranges	0.85	1	1.15	MΩ
	Input impedance thermal drift	All input ranges		10	25	ppm/°C
	Input capacitance			10		pF
ANALOG INPUT FILTER						
$BW_{(-3\ dB)}$	Analog input LPF bandwidth –3 dB	All input ranges, low-bandwidth filter		21		kHz
		RANGE = ±2.5V, wide-bandwidth filter		182		
		RANGE = ±3.5V, wide-bandwidth filter		240		
		RANGE = ±5V, wide-bandwidth filter		320		
		RANGE = ±7V, wide-bandwidth filter		400		
		RANGE = ±10V, wide-bandwidth filter		385		
		RANGE = ±12V, wide-bandwidth filter		375		
DC PERFORMANCE						
	Resolution	No missing codes	18			Bits
DNL	Differential nonlinearity[3]	All ranges, wide-CM enabled and disabled	–0.99	±0.5	0.99	LSB
INL	Integral nonlinearity	All ranges, wide-CM enabled and disabled, T_A = 0°C to 70°C	–4	±0.8	4	LSB
		All ranges, wide-CM enabled and disabled, T_A = –40°C to 125°C	–4.5	±0.8	4.5	LSB
	Offset error[2] [5]	RANGE = ±2.5V	–175	±90	175	LSB
		RANGE = ±2.5V, wide-CM enabled		±120		
		RANGE = ±3.5V	–100	±60	100	
		RANGE = ±3.5V, wide-CM enabled		±80		
		RANGE = ±5V	–50	±10	50	
		RANGE = ±5V, wide-CM enabled		±60		
		RANGE = ±7V	–100	±35	100	
		RANGE = ±10V	–50	±10	50	
		RANGE = ±12V	–75	±15	75	
	Offset error thermal drift[2] [4]	All ranges, wide-CM enabled and disabled		0.5	1.5	ppm/°C
	Gain error[2] [5]	RANGE = ±2.5V, ±3.5V, and ±5V	–0.05	±0.02	0.05	%FSR
		RANGE = ±2.5V, ±3.5V, and ±5V, wide-CM enabled		±0.04		
		RANGE = ±7V, ±10V, ±12V	–0.05	±0.02	0.05	
	Gain error thermal drift[2] [4]	Wide-CM enabled and disabled, all ranges		0.7	3	ppm/°C
AC PERFORMANCE						

5.5 Electrical Characteristics (続き)

at AVDD_5V = 4.75 V to 5.25 V, VDD_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, V_{REF} = 4.096 V (internal or external), wide-common-mode disabled for analog input ranges ±2.5V, ±3.5V, and ±5V, wide-common-mode enabled for analog input ranges ±7V, ±10V, and ±12V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C

I_{VDD_1V8}	Supply current from VDD_1V8	Maximum throughput, internal reference		35	43	mA
		Power-down		0.2	8	
I_{IOVDD}	Supply current from IOVDD	Maximum throughput		4	7	mA
		Power-down		0.1	3	

(1) Does not include the variation in voltage resulting from solder shift effects.
(2) These specifications include full temperature range variation but not the error contribution from internal reference. Measured with single-ended inputs as described in *Wide Common-Mode Configuration for Single-Ended Inputs*
(3) Wide-CM refers to wide-common-mode voltage at the analog inputs. See section on *セクション 6.3.1.3* for more details.
(4) Thermal drift is the difference between maximum and minimum error measured over the temperature range, divided by the temperature range.
(5) Minimum and maximum specifications are applicable for low-bandwidth filter setting.

5.6 Timing Requirements

at AVDD_5V = 4.75 V to 5.25 V, VDD_1V8 = 1.75 V to 1.85 V, IOVDD = 1.15 V to 1.85 V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = -40°C to +125°C; typical values at T_A = 25°C

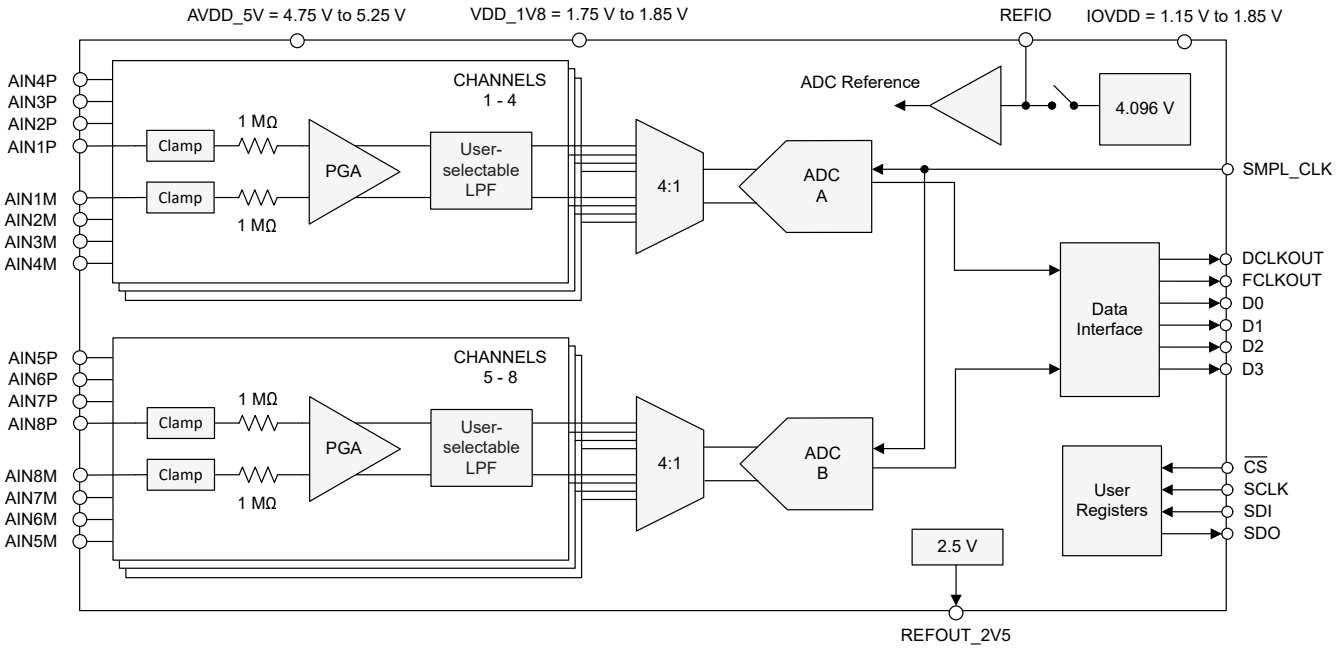
6 Detailed Description

6.1 Overview

The ADS981x is an 18-bit data acquisition (DAQ) system with eight-channel analog inputs that can be configured as either single-ended or differential. Each analog input channel consists of an input clamp protection circuit, and a programmable gain amplifier (PGA) with user-selectable bandwidth options. The input signals are digitized using an 18-bit analog-to-digital converter (ADC), based on the successive approximation register (SAR) architecture. This overall system can achieve a maximum throughput of 2 MSPS/channel for all channels. The device features a 4.096V internal reference with a fast-settling buffer.

The device operates from 5V and 1.8V analog supplies and can accommodate true bipolar input signals. The input clamp protection circuitry can tolerate voltages up to ±18V. The device offers a constant 1MΩ resistive input impedance irrespective of the sampling frequency or the selected input range. The ADS981x offers a simplified end solution without requiring external high-voltage bipolar supplies and complicated driver circuits.

6.2 Functional Block Diagram



6.3 Feature Description

6.3.1 Analog Inputs

The ADS981x incorporates dual, simultaneous-sampling, 18-bit successive approximation register (SAR) analog-to-digital converters (ADCs). Each ADC is connected to four analog input channels through a multiplexer. The device has a total of eight analog input pairs. The ADC digitizes the voltage difference between the analog input pairs AINxP – AINxM. 図 6-1 shows the simplified circuit schematic for each analog input channel, including the input clamp protection circuit, PGA, low-pass filter, multiplexer, high-speed ADC driver, and a precision 18-bit SAR ADC.

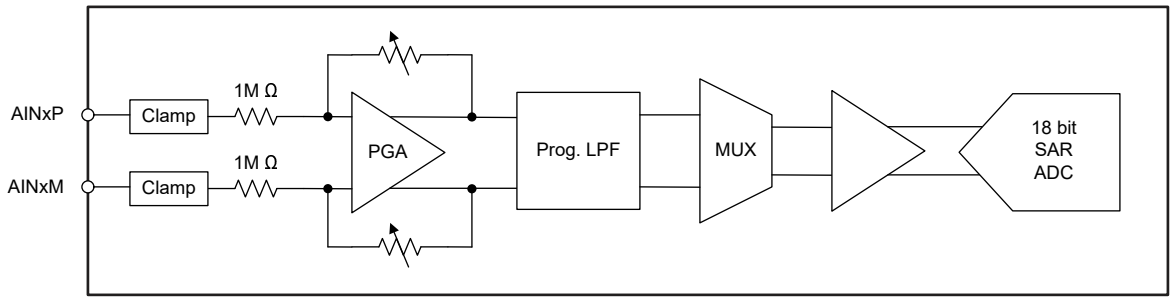


図 6-1. Front-End Circuit Schematic for the Selected Analog Input Channel

6.3.1.1 Input Clamp Protection Circuit

The ADS981x features an internal clamp protection circuit on each of the eight analog input channels, see 図 6-1. The input clamp protection circuit allows each analog input to swing up to a maximum voltage of ±18V. Beyond an input voltage of ±18V, the input clamp circuit turns on and still operates from the single 5V supply. 図 6-2 shows a typical current versus voltage characteristic curve for the input clamp.

For input voltages above the clamp threshold, make sure that the input current never exceeds ±10mA. A resistor placed in series with the analog inputs is an effective way to limit the input current. In addition to limiting the input current, the series resistor can also provide an antialiasing, low-pass filter (LPF) when coupled with a capacitor. Matching the external source impedance on the AINxP and AINxM pins cancels any additional offset error.

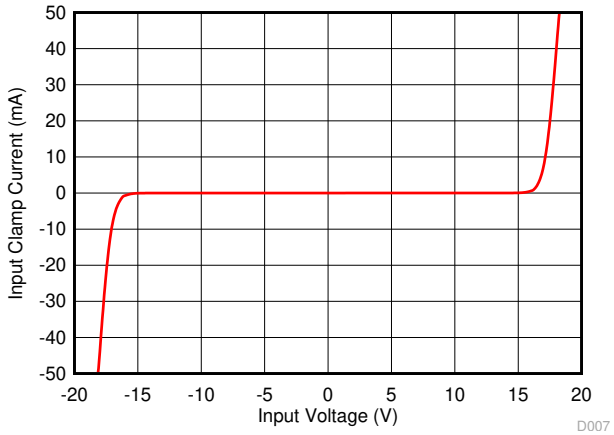

図 6-2. Input Protection Clamp Profile, Input Clamp Current vs Source Voltage

6.3.1.2 Programmable Gain Amplifier (PGA)

The ADS981x features a PGA at every analog input channel. The PGA supports single-ended and differential inputs with a bipolar signal swing. 表 6-1 lists the supported analog input ranges. The analog input range can be configured independently for each channel by using the RANGE_CHx register fields in address 0xC2 and address 0xC3.

表 6-1. Analog Input Ranges

DIFFERENTIAL INPUTS	SINGLE-ENDED INPUTS	RANGE_CHx CONFIGURATION
±12V	±12V	5
±10V	±10V	4
±7V	±7V	3
±5V	±5V	0
±3.5V	±3.5V	1
±2.5V	±2.5V	2

Each analog input channel features an antialiasing, low-pass filter (LPF) at the output of the PGA. 表 6-2 lists the various programmable LPF options available in the ADS981x corresponding to the analog input range. 図 5-14 and 図 5-15 illustrate the frequency responses for low-bandwidth and wide-bandwidth LPF configurations. The analog input bandwidth for the eight analog input channels can be can be selected using the ANA_BW[7:0] bits in address 0xC0 of register bank 1.

表 6-2. Low-Pass Filter Corner Frequency

LPF	ANALOG INPUT RANGE	CORNER FREQUENCY (–3dB)
Low-bandwidth	All input ranges	21kHz
Wide-bandwidth	±12V	375kHz
	±10V	385kHz
	±7V	400kHz
	±5V	320kHz
	±3.5V	240kHz
	±2.5V	182kHz

6.3.1.3 Wide-Common-Mode Voltage Rejection Circuit

The ADS981x features a common-mode (CM) rejection circuit at the analog inputs that supports CM voltages up to ±12V. The CM voltage for differential inputs is given by 式 1. On power-up or after reset, the common-mode voltage range for the analog input channels is ±12V (CM_CTRL_EN = 0b). Voltage at the analog inputs, in all cases, must be within the *Absolute Maximum Ratings*.

$$\text{Common mode voltage} = \frac{(\text{Voltage on AINP}) + (\text{Voltage on AINM})}{2} \quad (1)$$

As described in 表 6-3, the CM voltage rejection circuit can be optimized for various CM voltages for differential inputs.

表 6-3. Wide Common-Mode Configuration for Differential Inputs

COMMON-MODE (CM) RANGE	CM_CTRL_EN	ADC A (ANALOG INPUT CHANNELS 1–4)		ADC B (ANALOG INPUT CHANNELS 5–8)	
		CM_EN_CH[4:1]	CM_RNG_CH[4:1]	CM_EN_CH[8:5]	CM_RNG_CH[8:5]
CM ≤ ±1V	1	0	Don't care	0	Don't care
CM ≤ ±RANGE / 2		1	0	1	0
CM ≤ ±6V			1		1
CM ≤ ±12V			2		2

The CM voltage rejection circuit must be configured depending on the analog input range of the PGA when using single-ended inputs as well. 表 6-4 lists the recommended configuration for single-ended inputs for various analog input voltage ranges.

表 6-4. Wide Common-Mode Configuration for Single-Ended Inputs

PGA ANALOG INPUT RANGE	CM_CTRL_EN	ADC A (ANALOG INPUT CHANNELS 1–4)		ADC B (ANALOG INPUT CHANNELS 5–8)	
		CM_EN_CH[4:1]	CM_RNG_CH[4:1]	CM_EN_CH[8:5]	CM_RNG_CH[8:5]
±2.5V, ±3.5V, and ±5V	1	0	Don't care	0	Don't care
±7V, ±10V, and ±12V		1	0	1	0

6.3.1.4 Gain Error Calibration

The ADS981x features calibration logic to minimize gain error from the analog inputs. Enable gain error calibration for minimum gain error. Gain error calibration can be enabled by configuring the GE_CAL_EN1 (address = 0xD), GE_CAL_EN2, GE_CAL_EN3 (address = 0x33), and GE_CAL_EN4 (address = 0x34).

If gain error calibration is not enabled as shown in 表 6-5, the full-scale analog input ranges are increased by a factor of 1.024.

表 6-5. Analog Input Ranges vs Gain-Error Calibration

RANGE_CHx CONFIGURATION	ANALOG INPUT RANGE WITH CALIBRATION	ANALOG INPUT RANGE WITHOUT CALIBRATION
5	±12V	±12.288V
4	±10V	±10.24V
3	±7V	±7.168V
0	±5V	±5.12V
1	±3.5V	±3.584V
2	±2.5V	±2.56V

6.3.2 ADC Transfer Function

The ADS981x outputs 18 bits of conversion data in either straight-binary or binary two's-complement formats. The format for the output codes is the same across all analog channels. The format for the output codes can be selected using the DATA_FORMAT field in address 0xD in register bank 1. 図 6-3 and 表 6-6 show the transfer characteristics for the ADS981x. The LSB size depends on the analog input range selected, gain-error calibration, and system gain error calibration as shown in 式 2.

$$LSB = \frac{Analog\ input\ range}{2^{18}} \times \left(1 + G \times 0.024\right) \quad (2)$$

where:

- G is 0 when gain-error calibration is enabled, otherwise G is1; see the *Gain Error Calibration* section

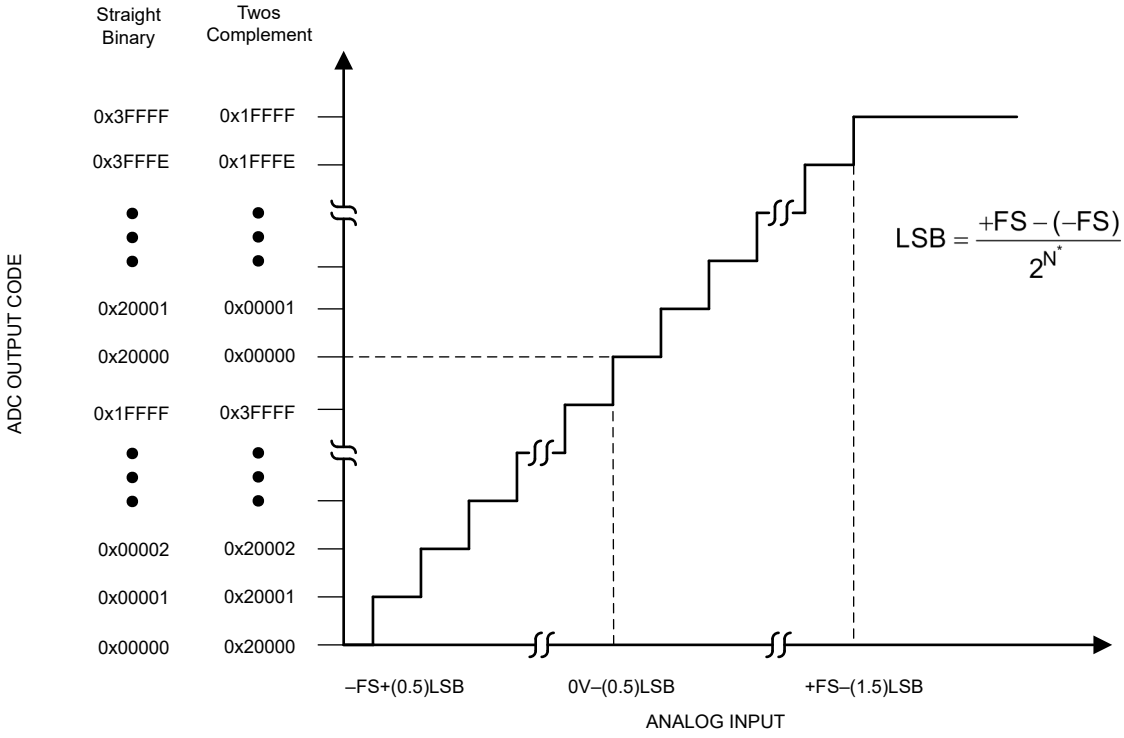

図 6-3. Transfer Characteristics

表 6-6. ADC Full-Scale Range and LSB Size

RANGE	+FS	MIDSCALE	–FS	LSB
±2.5V	2.5V	0V	–2.5V	19.07µV
±3.5V	3.5V	0V	–3.5V	26.70µV
±5V	5V	0V	–5V	38.15µV
±7V	7V	0V	–7V	53.41µV
±10V	10V	0V	–10V	76.29µV
±12V	12V	0V	–12V	91.55µV

6.3.3 ADC Sampling Clock Input

Use a low-jitter external clock with a high slew rate to maximize SNR performance. The ADS981x can be operated with a differential or a single-ended clock input. Clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, provide a clock signal with fast slew rates that maximizes swing between IOVDD and GND levels.

The sampling clock must be a free-running continuous clock. The ADC generates a valid output data, data clock, and frame clock after a free-running sampling clock is applied. The ADC is powered down and output data, data clock, and frame clock are invalid when the sampling clock is stopped.

図 6-4 shows a diagram of the differential sampling clock input. For this configuration, connect the differential sampling clock input to the SMPL_CLKP and SMPL_CLKM pins. 図 6-5 shows a diagram of the single-ended sampling clock input. In this configuration, connect the single-ended sampling clock to SMPL_CLKP and connect SMPL_CLKM to ground.

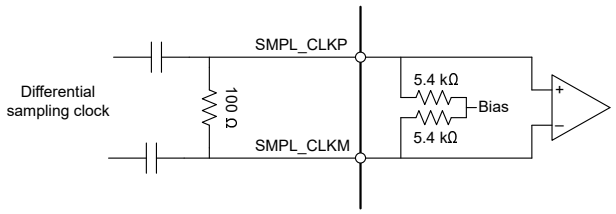

図 6-4. AC-Coupled Differential Sampling Clock

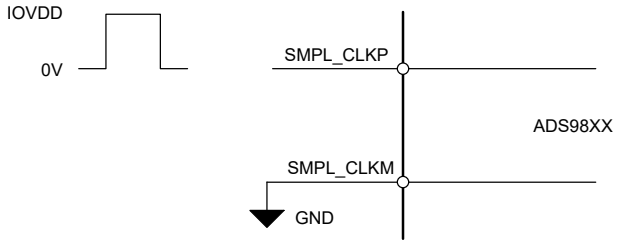

図 6-5. Single-Ended Sampling Clock

6.3.4 Reference

The ADS981x has a precision, low-drift voltage reference internal to the device. For best performance, filter the internal reference noise by connecting a 10µF ceramic bypass capacitor to the REFIO pin. An external reference can also be connected at the REFIO pin and the internal reference voltage can be disabled by writing to PD_REF = 1b in address 0xC1 of register bank 1.

6.3.4.1 Internal Reference Voltage

The ADS981x features an internal reference voltage with a nominal output voltage of 4.096V. On power-up, the internal reference is enabled by default. As shown in 図 6-6, place a minimum 10µF decoupling capacitor between the REFIO and REFM pins.

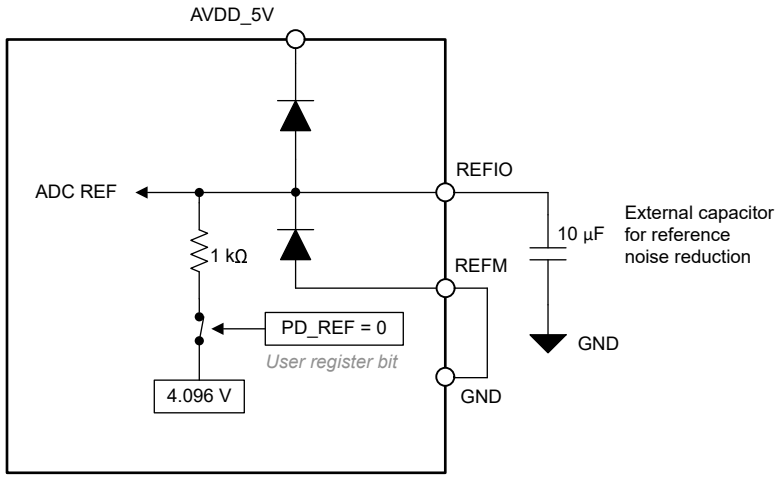

図 6-6. Internal Reference Voltage

6.3.4.2 External Reference Voltage

An external 4.096V reference voltage, as shown in 図 6-7, can be connected at the REFIO pin with an appropriate decoupling capacitor placed between the REFIO and REFM pins. For improved thermal drift performance, the REF7040 is recommended. To disable the internal reference, set PD_REF = 1b in address 0xC1 in register bank 1. The REFIO pin has ESD protection diodes connected to the AVDD_5V and REFM pins.

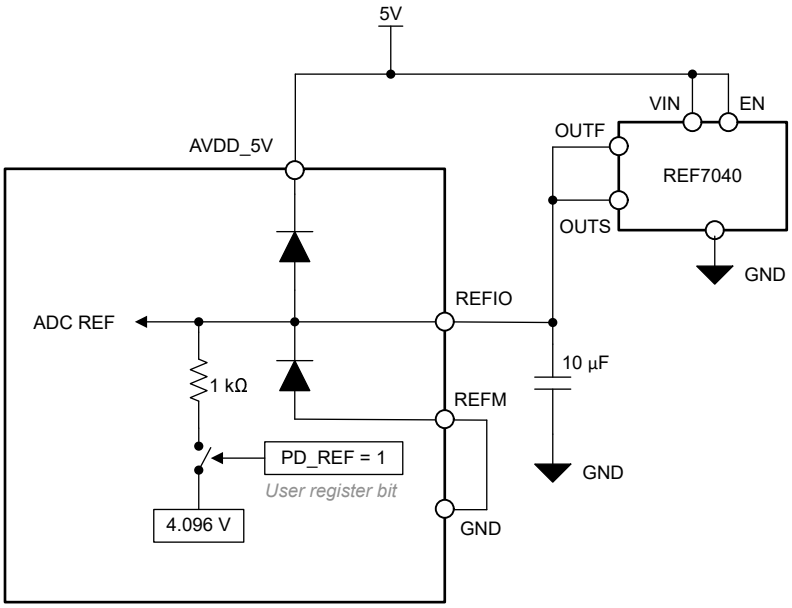

図 6-7. External Reference Voltage

6.3.5 Sample Synchronization

As illustrated in 図 5-2, 図 5-3, 図 5-4, and 図 5-5, the SMPL_SYNC pin synchronizes multiple ADCs using an external SYNC signal. The SMPL_SYNC pin is latched in by the falling edge of the sampling clock.

The synchronization signal is only required one time after power-up with the sampling clock free-running, or after restarting sampling clock, or after a device reset. As illustrated in 図 5-2, 図 5-3, 図 5-4, and 図 5-5, the SYNC signal resets the internal analog channel selection logic and aligns the FCLKOUT signal to the data frame. If no SYNC signal is given, the internal analog channel selection logic and FCLKOUT are not synchronized, which can lead to a different alignment between the sequence of channel output data and FCLKOUT. When using multiple ADCs with the same sampling clock, the SYNC signal makes sure all ADCs sample the same respective analog input channel at the same time.

6.3.6 Data Interface

The ADS981x supports 2-lane and 4-lane mode with single-data-rate (SDR) and double-data-rate (DDR) interface modes. The data interface can be selected using the configuration SPI as described in 表 6-7. The ADC generates the data (D[3:0]), data clock (DCLKOUT), and frame clock (FCLKOUT) in response to the sampling clock signal on the SMPL_CLK input pin. The 18-bit ADC conversion result is output MSB first in a 24-bit data packet and the last six bits are zeroes.

The data interface signals can be described as:

- D[3:0]: Data output from the ADC. In 4-lane mode all four lanes are used, whereas in 2-lane mode D3 and D1 are used to output ADC data.
- DCLKOUT: Data clock output from the ADC.
- FCLKOUT: Frame clock output from the ADC delimiting each set of 8-channel data. A SYNC pulse is required on power-up or after device reset to align the rising edge of FCLKOUT with channel 1 data output, as described in the *Sample Synchronization* section.

Use the registers in 表 6-7 to configure the data interface.

表 6-7. Register Configurations For Interface Modes

INTERFACE MODE	FIGURE	DATA_RATE (Address = 0xC1)	DATA_LANES (Address = 0xC1)
4-lane, DDR	図 5-2	0	0
2-lane, DDR	図 5-3	0	1
4-lane, SDR	図 5-4	1	0
2-lane, SDR	図 5-5	1	1

6.3.6.1 Data Clock Output

The ADS981x features a source-synchronous data interface where the ADC provides the output data and the clock to capture the data. The clock to capture the data is output on the DCLKOUT pin. The clock frequency depends on the sampling clock speed, data rate (SDR or DDR), and number of output lanes (four lanes or two lanes) and is given by 式 3. The frame clock frequency is given by 式 4.

$$\text{Data clock frequency} = \frac{24\ \text{bits/channel} \times 8\ \text{channels}}{\text{Number of data lanes} \times \text{Data rate (SDR} = 1,\ \text{DDR} = 2)} \times \text{Frame clock frequency} \quad (3)$$

$$\text{Frame clock frequency} = \frac{\text{Sampling clock frequency}}{4} \quad (4)$$

表 6-8 shows the data clock frequency for the maximum sampling rates for the ADS9817 and ADS9815 for various interface modes.

表 6-8. Data Clock Frequency for Interface Modes

INTERFACE MODE	ADS9815 (f_{SMPL_CLK} = 4MHz)	ADS9817 (f_{SMPL_CLK} = 8MHz)
4-lane, DDR	24MHz	48MHz
2-lane, DDR	48MHz	96MHz
4-lane, SDR	48MHz	96MHz
2-lane, SDR	96MHz	Not supported

6.3.6.2 ADC Output Data Randomizer

As shown in 図 6-8, the ADS981x features a data output randomizer. When enabled, the ADC conversion result is bit-wise exclusive-ORed (XOR) with the LSB of the conversion result. The LSB of the ADC conversion result has equal probability of being either 1 or 0. As a result of the XOR operation, the data output from the ADS981x is randomized. The ground bounce created by the transmission of this randomized result over the data interface is uncorrelated with the analog input voltage. This uncorrelated transmission helps minimize interference between data transmission and analog performance of the ADC when the PCB layout does not minimize ground bounce.

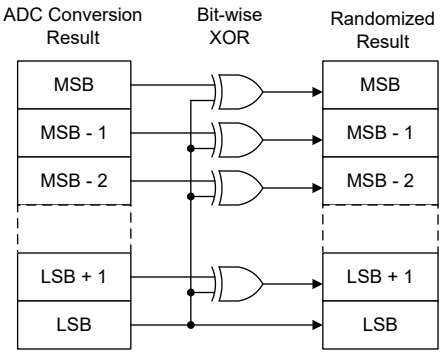

図 6-8. Bit-Wise XOR Operation

6.3.6.3 Test Patterns for Data Interface

As shown in 図 6-9, the ADS981x features test patterns used by the host for debugging and verifying the data interface. The test patterns replace the ADC output data with predefined digital data. Enable the test patterns by configuring the corresponding register addresses 0x13 through 0x1B in bank 1.

表 6-9 lists the test patterns supported by the ADS981x.

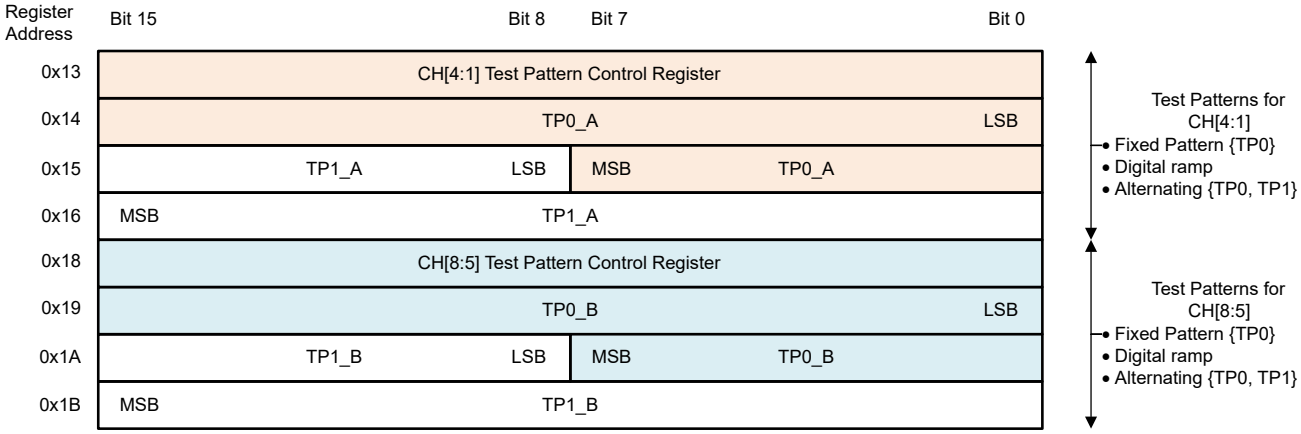

図 6-9. Register Bank for Test Patterns

表 6-9. Test Pattern Configurations

ADC OUTPUT	TP_EN_CH[4:1] TP_EN_CH[8:5]	TP_MODE_CH[4:1] TP_MODE_CH[8:5]	SECTION	RESULT(1)
ADC conversion result	0			
Fixed pattern	1	0 or 1	Fixed Pattern	CH[4:1] = TP0_A CH[8:5] = TP0_B
Digital ramp	1	2	Digital Ramp	CH[4:1] = Digital ramp CH[8:5] = Digital ramp
Alternating test patterns	1	3	Alternating Test Pattern	CH[4:1] = TP0_A, TP1_A CH[8:5] = TP0_B, TP1_B

(1) Configure the test patterns for two separate channel groups CH[4:1] and CH[8:5].

6.3.6.3.1 Fixed Pattern

The ADC outputs fixed patterns defined in the TP0_A and TP0_B registers in place of the CH[4:1] and CH[8:5] data, respectively.

- Configure the test patterns in TP0_A and TP0_B

- Set TP_EN_CH[4:1] = 1, TP_MODE_CH[4:1] = 0 (address = 0x13), TP_EN_CH[8:5] = 1, and TP_MODE_CH[8:5] = 0 (address = 0x18)

6.3.6.3.2 Digital Ramp

The ADC outputs digital ramp values with increments specified in the RAMP_INC_A and RAMP_INC_B registers in place of the CH[4:1] and CH[8:5] data, respectively.

- Configure the increment value between two successive steps of the digital ramp in the RAMP_INC_A (address = 0x13) and RAMP_INC_B (address = 0x18) registers, respectively. The digital ramp increments by N + 1, where N is the value configured in these registers.
- Set TP_EN_CH[4:1] = 1, TP_MODE_CH[4:1] = 2 (address = 0x13), TP_EN_CH[8:5] = 1, and TP_MODE_CH[8:5] = 2 (address = 0x18)

6.3.6.3.3 Alternating Test Pattern

The ADC outputs alternating test patterns defined in the TP0_A, TP1_A and TP0_B, TP1_B registers in place of the CH[4:1] and CH[8:5] data, respectively.

- Configure the test patterns in TP0_A, TP1_A, TP0_B, and TP1_B
- Set TP_EN_CH[4:1] = 1, TP_MODE_CH[4:1] = 3 (address = 0x13), TP_EN_CH[8:5] = 1, and TP_MODE_CH[8:5] = 3 (address = 0x18)

6.4 Device Functional Modes

6.4.1 Power-Down

The ADS981x is powered-down by either a logic 0 on the $\overline{\text{PWDN}}$ pin or by writing 11b to the PD_CH field in address 0xC0 in register bank 1. The device registers settings are retained.

6.4.2 Reset

The ADS981x is powered down and reset by either a logic 0 on the $\overline{\text{RESET}}$ pin or by writing 1b to the RESET field in address 0x00 in register bank 0. The device registers are initialized to the default values after reset and the device must be initialized with a sequence of register write operations; see the *Initialization Sequence* section.

6.4.3 Initialization Sequence

As shown in 表 6-10, the ADS981x must be initialized by a sequence of register writes after device power-up or reset. A free-running sampling clock must be connected to the ADC before executing the initialization sequence. The ADS981x registers are initialized with the default value after the initialization sequence is complete.

STEP	REGISTER			COMMENT
	BANK	ADDRESS	VALUE[15:0]	
1	1	0xC1	<user-defined>	Configure data interface (data rate, number of lanes) and select internal or external reference
2	1	0xC2 and 0xC3	<user-defined>	Select analog input ranges. See 表 6-1
3	1	0xC0	<user-defined>	Select analog input bandwidth. See 表 6-2
4	1	0xC4 and 0xC5	<user-defined>	Select common-mode range for analog inputs. See 表 6-3 and 表 6-4

6.4.4 Normal Operation

After the ADS981x is initialized (see 表 6-10), the ADS981x converts analog input voltages to digital output. A free-running sampling clock is required for normal device operation; see the *ADC Sampling Clock Input* section.

6.5 Programming

6.5.1 Register Write

Register write access is enabled by setting SPI_RD_EN = 0b. The 16-bit configuration registers are grouped in three register banks and are addressable with an 8-bit register address. Register bank 1 and register bank 2 are selected for read or write operation by configuring the REG_BANK_SEL bits. Registers in bank 0 are always accessible, irrespective of the REG_BANK_SEL bits. The register addresses in bank 0 are unique and are not used in register banks 1 and 2.

As shown in 図 6-10, steps to write to a register are:

1. Frame 1: Write to register address 0x03 in register bank 0 to select either register bank 1 or bank 2 for a subsequent register write. This frame has no effect when writing to registers in bank 0.
2. Frame 2: Write to a register in the bank selected in frame 1. Repeat this step for writing to multiple registers in the same register bank.

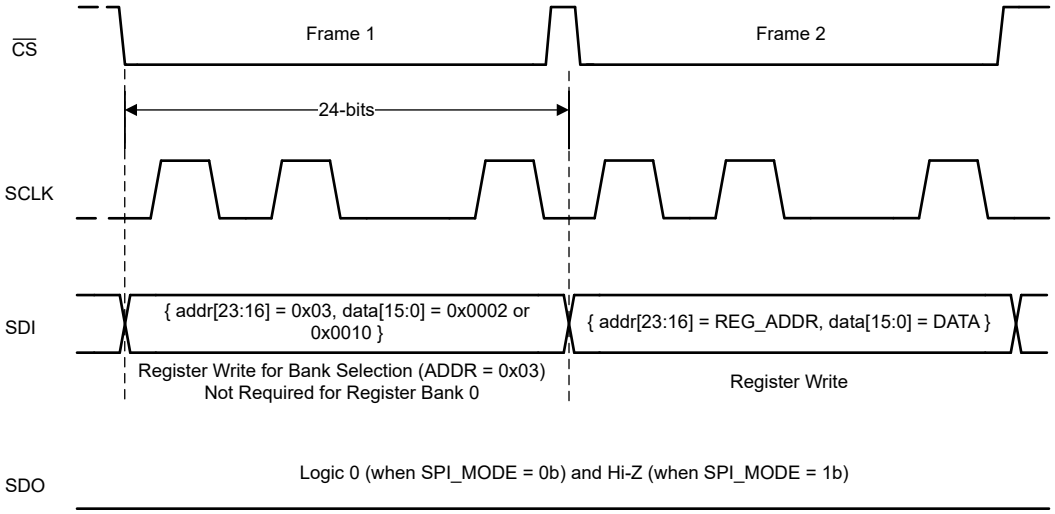

図 6-10. Register Write

6.5.2 Register Read

Select the desired register bank by writing to register address 0x03 in register bank 0. Register read access is enabled by setting SPI_RD_EN = 1b and SPI_MODE = 1b in register bank 0. As illustrated in 図 6-11, registers are read using two 24-bit SPI frames after SPI_RD_EN and SPI_MODE are set. The first SPI frame selects the register bank. The ADC returns the 16-bit register value in the second SPI frame corresponding to the 8-bit register address.

As illustrated in 図 6-11, steps to read a register are:

1. Frame 1: With SPI_RD_EN = 0b, write to register address 0x03 in register bank 0 to select the desired register bank for reading.
2. Frame 2: Set SPI_RD_EN = 1b and SPI_MODE = 1b in register address 0x00 in register bank 0.
3. Frame 3: Read any register in the selected bank using a 24-bit SPI frame containing the desired register address. Repeat this step with the address of any register in the selected bank to read the corresponding register.
4. Frame 4: Set SPI_RD_EN = 0 to disable register reads and re-enable register writes.
5. Repeat steps 1 through 4 to read registers in a different bank.

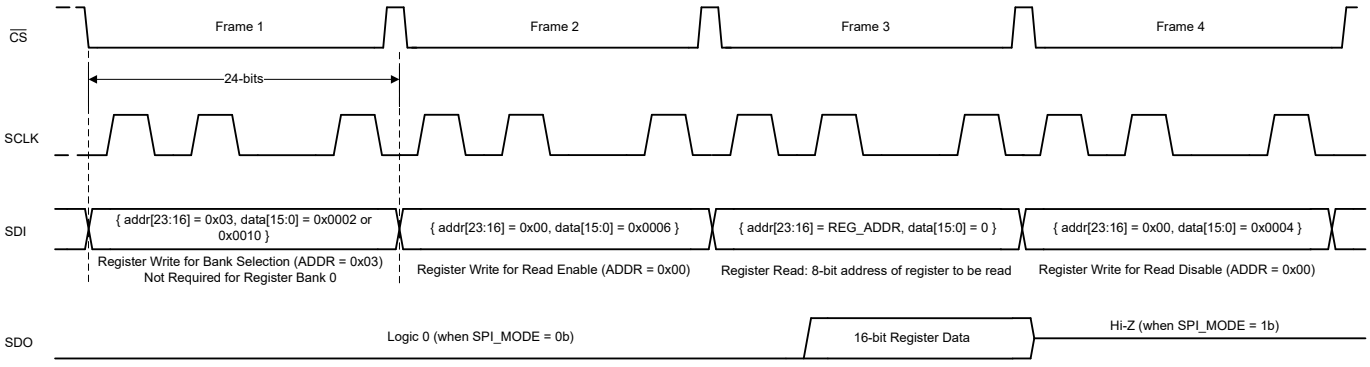

図 6-11. Register Read

6.5.3 Multiple Devices: Daisy-Chain Topology for SPI Configuration

図 6-12 shows a typical connection diagram showing multiple devices in a daisy-chain topology.

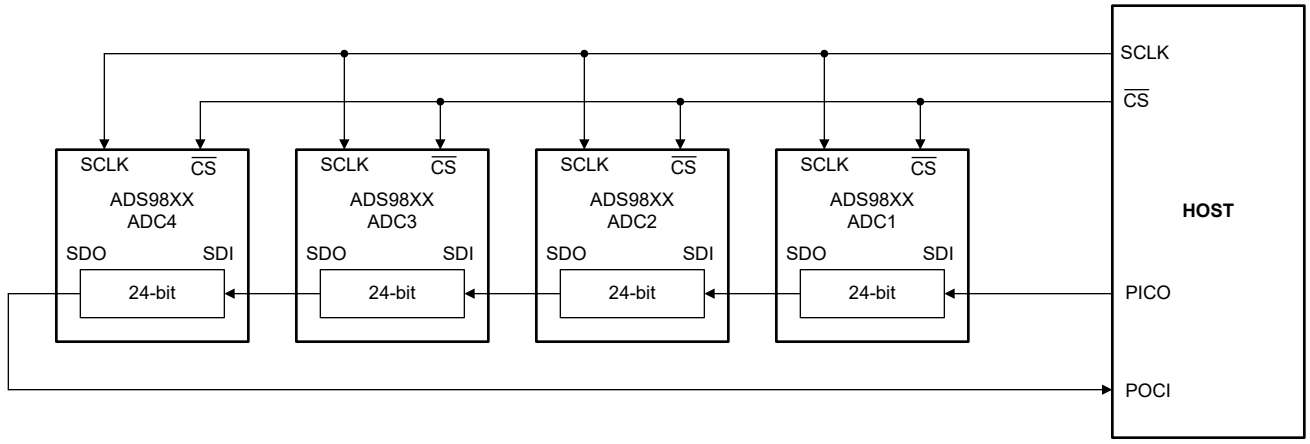

図 6-12. Daisy-Chain Connections for SPI Configuration

The $\overline{CS}$ and SCLK inputs of all ADCs are connected together and controlled by a single $\overline{CS}$ and SCLK pin of the controller, respectively. The SDI input pin of the first ADC in the chain (ADC1) is connected to the peripheral IN controller OUT (PICO) pin of the controller, the SDO output pin of ADC1 is connected to the SDI input pin of ADC2, and so on. The SDO output pin of the last ADC in the chain (ADC4) is connected to the peripheral OUT controller IN (POCI) pin of the controller. The data on the PICO pin passes through ADC1 with a 24-SCLK delay, as long as $\overline{CS}$ is active.

The daisy-chain mode must be enabled after power-up or after the device is reset. Set the daisy-chain length in the DAISY_CHAIN_LEN register to enable daisy-chain mode. The daisy-chain length is the number of ADCs in the chain excluding ADC1. In 図 6-12, the DAISY_CHAIN_LEN = 3.

6.5.3.1 Register Write With Daisy-Chain

Writing to registers in a daisy-chain configuration requires N × 24-SCLKs in one SPI frame. A register write in a daisy-chain containing four ADCs, as shown in 図 6-13, requires 96 SCLKs.

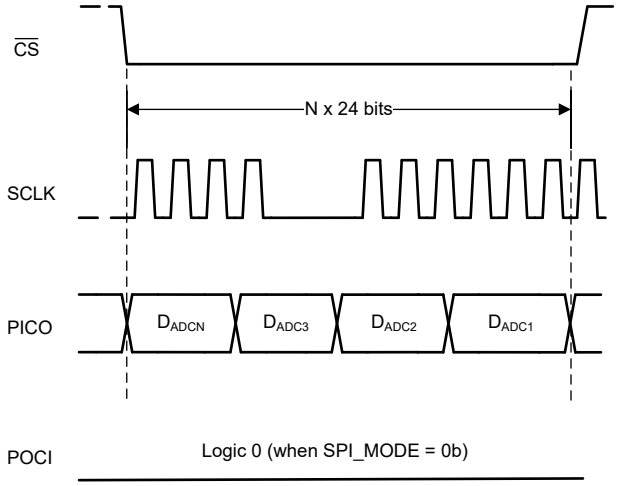

図 6-13. Register Write With Daisy-Chain

Daisy-chain mode is enabled on power-up or after device reset. Configure the DAISY_CHAIN_LEN field to enable daisy-chain mode. The waveform shown in 図 6-13 must be repeated N times, where N is the number of ADCs in the daisy-chain. 図 6-14 provides the SPI waveform, containing N SPI frames, for enabling daisy-chain mode for N ADCs.

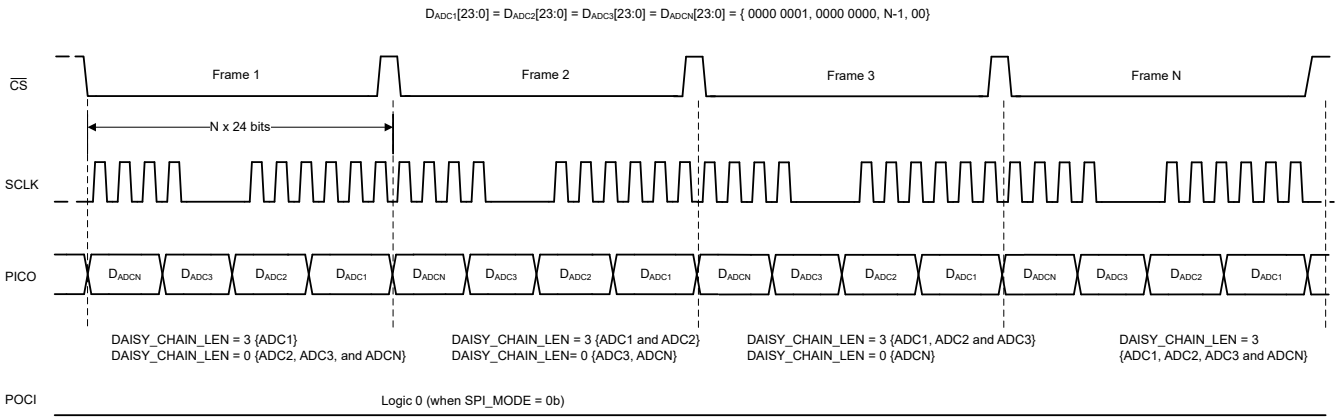

図 6-14. Register Write to Configure Daisy-Chain Length

6.5.3.2 Register Read With Daisy-Chain

図 6-15 illustrates an SPI waveform for reading registers in a daisy-chain configuration. The steps for reading registers from N ADCs connected in a daisy-chain are as follows:

1. Register read is enabled by writing to the following registers using the *Register Write With Daisy-Chain*:
   a. Write to PAGE_SEL to select the desired register bank
   b. Enable register read by writing SPI_RD_EN = 0b and SPI_MODE = 0b (default on power-up)
2. With the register bank selected, the controller can read register data in the following two steps:
   a. N × 24-bit SPI frame containing the 8-bit register address to be read: N-times {0xFE, 0x00, 8-bit register address}
   b. N × 24-bit SPI frame to read out register data: N-times {0xFF, 0xFF, 0xFF}

The 0xFE in step 2a configures the ADC for register read from the specified 8-bit address. At the end of step 2a, the output shift register in the ADC is loaded with register data. The ADC returns the 8-bit register address and corresponding 16-bit register data in step 2b.

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The ADS981x enables high-precision measurement of up to eight analog signals. The following section gives an example application circuit and recommendations for using the ADS981x in automated test equipment (ATE) systems.

8.2 Typical Application

8.2.1 Parametric Measurement Unit (PMU)

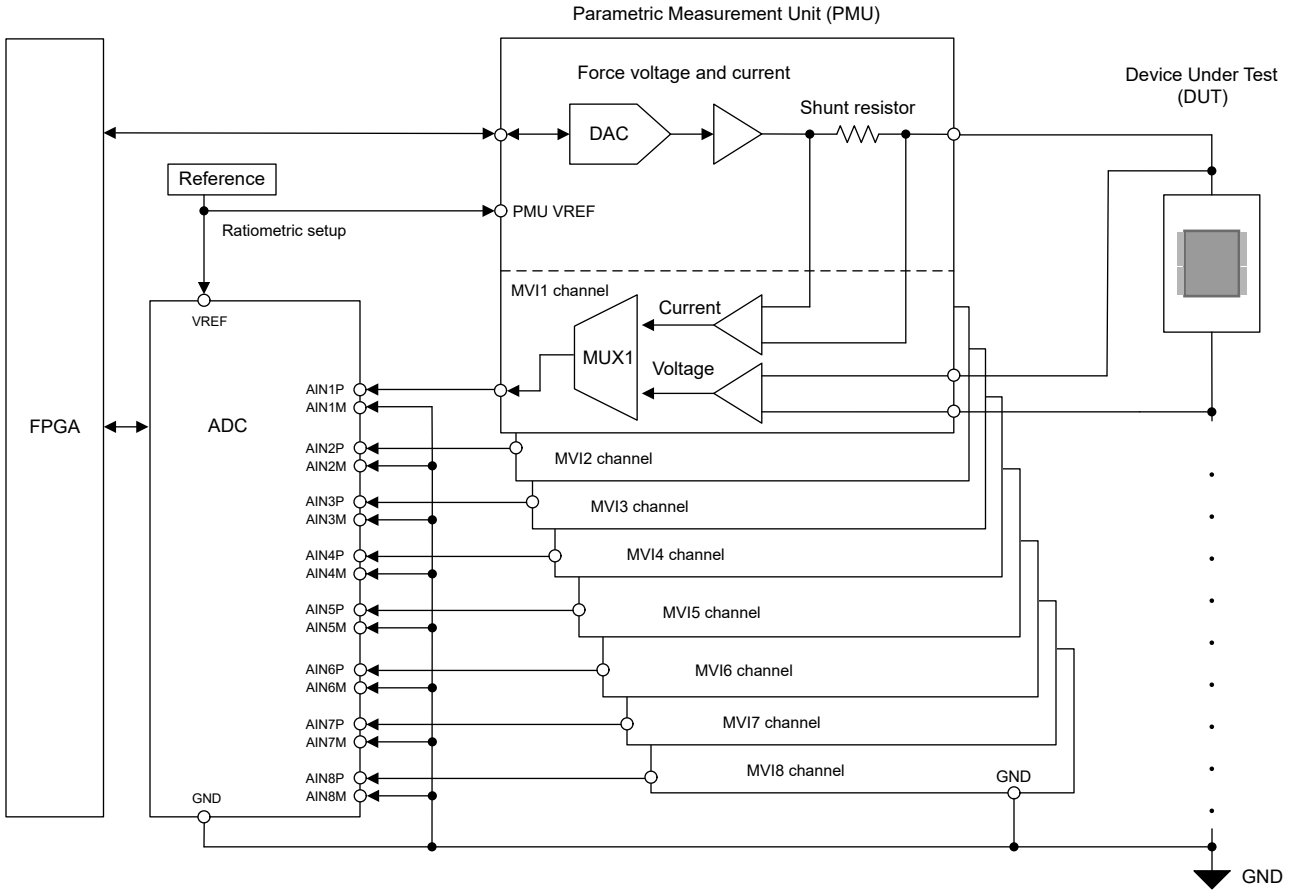

図 8-1. Typical PMU

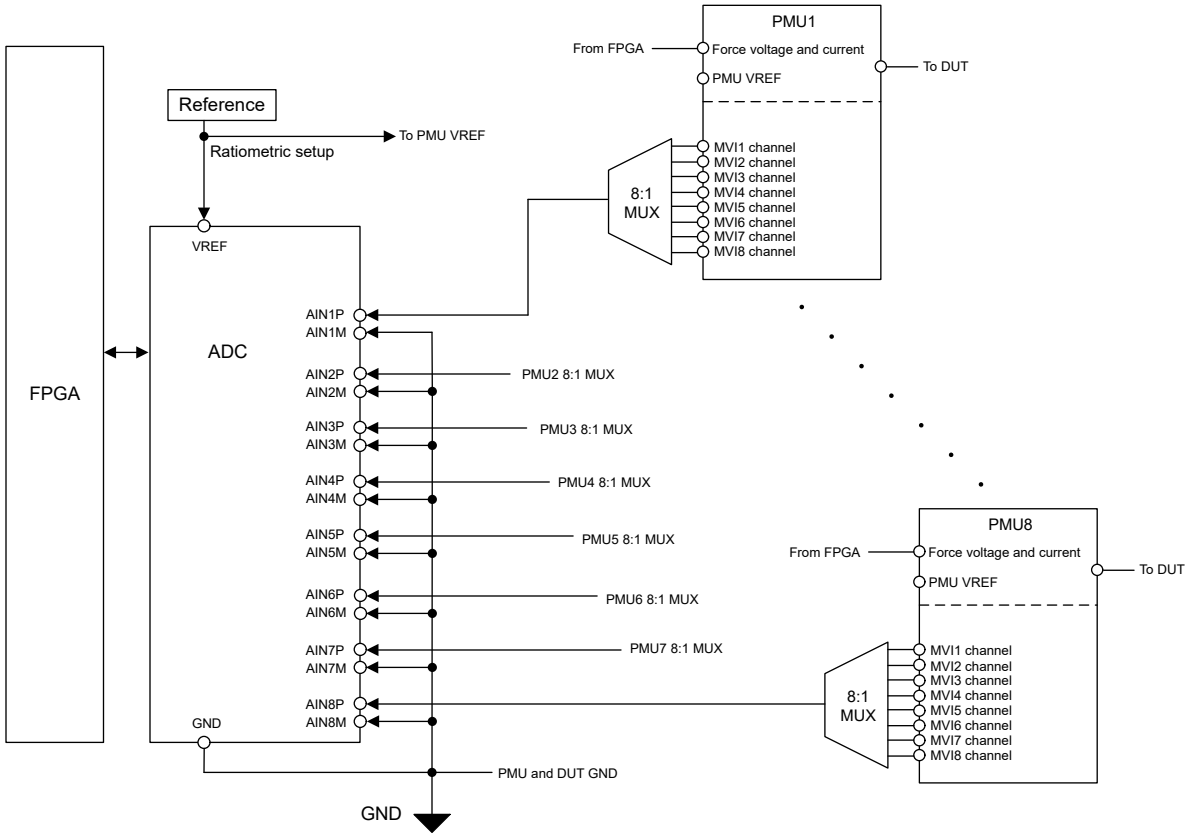

図 8-2. PMU With a Multiplexer

8.2.2 Design Requirements

The goal of this application is to select an ADC for ATE applications. 表 8-1 shows the parameters for this design example.

表 8-1. Design Parameters

PARAMETER	VALUE
Sampling rate	Up to 2MSPS/channel
Total unadjusted error (TUE) over 25°C ±5°C	<0.01% with calibration
Supports external switches or multiplexer	Full-scale step settling to 99.99% of full-scale in <1.8µs

8.2.3 Detailed Design Procedure

The ADS981x is an eight-channel, 18-bit, 2MSPS data acquisition (DAQ) system. The device has a built-in analog front-end that makes the ATE signal chain easier to design and more accurate.

The ADC accuracy is based on the total-unadjusted-error (TUE), which combines INL, offset, and gain errors. Calibrate the external system for offset and gain errors at a specified temperature and supply voltage. When calibrated (as described in 表 8-2), only the INL, thermal offset drift, and thermal gain drift contribute to the TUE. The ADS981x has a TUE of 0.0016% at 25°C ±5°C post-calibration, meeting the design error requirement.

表 8-2. TUE at T_A = 25°C Calculation

CALIBRATION	INL (ppm)	OFFSET ERROR (ppm)	GAIN ERROR (ppm)	TUE (ppm)	ERROR (%)
No calibration	15.26	495.9	183.1	528.8	0.053
Post-calibration	15.26	0	0	15.3	0.0015
Post-calibration ±5°C	15.26	2.5	3.5	15.9	0.0016

The pin-electronics subsystem manages the PMU outputs. The subsystem connects each PMU output to separate ADC channels (図 8-1) or uses a multiplexer to link multiple PMU outputs to one ADC channel (図 8-2). This subsystem allows more pin-electronics channels on the card. The ADC requires more bandwidth with multiplexers (表 8-3) for fast settling when switching PMU channels. The ADS981x has two bandwidth modes: Low-noise (up to 21kHz) and wide-bandwidth (up to 400kHz). As described in 表 8-3 the wide-bandwidth mode samples multiplexed PMU signals and settles to 99.99% FS in 13µs.

表 8-3. Step-Settling Performance

ANALOG INPUT BANDWIDTH	SETTLING TIME		
	99.90% of FS	99.95% of FS	99.99% of FS
Low BW (21kHz)	56µs	61µs	76µs
Wide BW (400kHz)	7µs	8µs	13µs

8.2.4 Application Curve

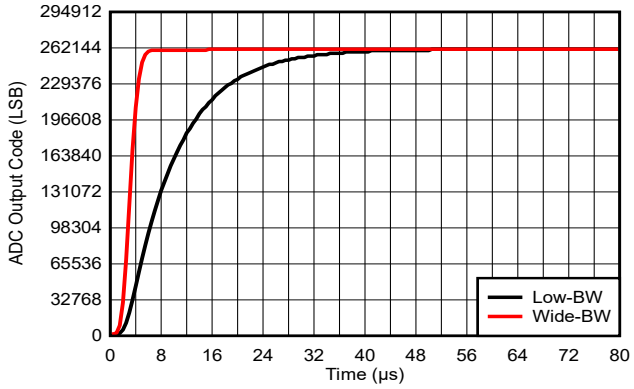

図 8-3. Step-Settling Performance

8.3 Power Supply Recommendations

The ADS981x has three separate power supplies: AVDD_5V, VDD_1V8, and IOVDD. There is no requirement for a specific power-up sequence. The data and configuration digital interfaces are powered by IOVDD. A common 1.8V supply powers the VDD_1V8 and IOVDD pins. 図 8-4 illustrates the decoupling capacitor connections for the respective power supplies. Make sure each power-supply pin has separate decoupling capacitors.

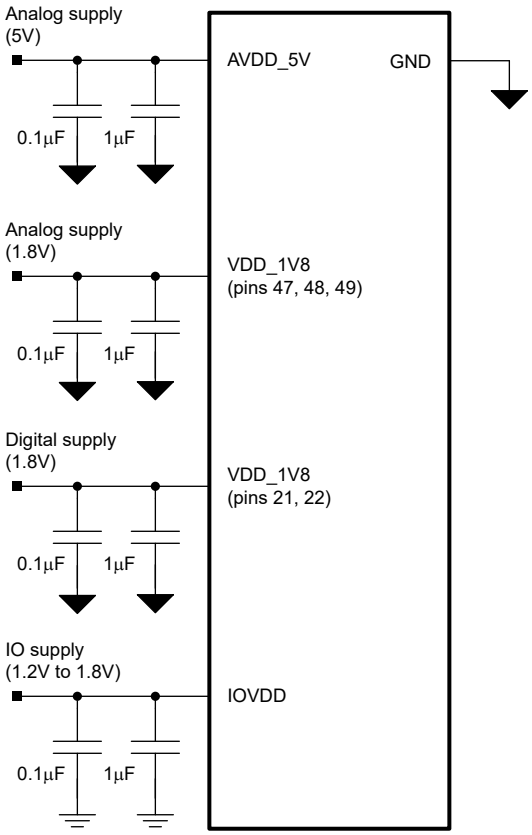

図 8-4. Power-Supply Decoupling

8.4 Layout

8.4.1 Layout Guidelines

図 8-5 illustrates a board layout example for the ADS981x. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference signals away from noise sources.

Use 0.1µF ceramic bypass capacitors in close proximity to the AVDD_5V, VDD_1V8, and IOVDD power-supply pins. Avoid placing vias between the power-supply pins and the bypass capacitors.

Place the reference decoupling capacitor close to the device REFIO and REFM pins. Avoid placing vias between the REFIO pin and the bypass capacitors. Connect the GND, REFM, and GND pins to a ground plane using short, low-impedance paths.

8.4.2 Layout Example

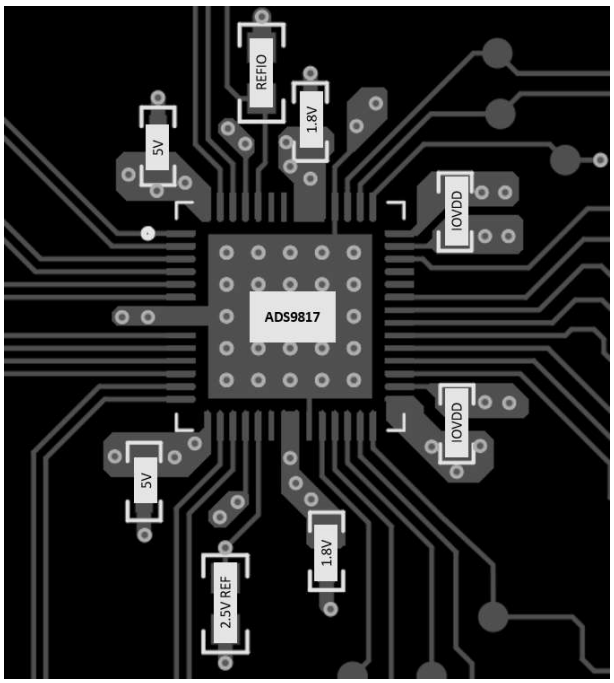

図 8-5. Example Layout

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

9.1 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

9.2 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計で必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの使用条件を参照してください。

9.3 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.
すべての商標は、それぞれの所有者に帰属します。

9.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

9.5 用語集

テキサス・インスツルメンツ用語集　　この用語集には、用語や略語の一覧および定義が記載されています。

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

RSH (S–PVQFN–N56) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

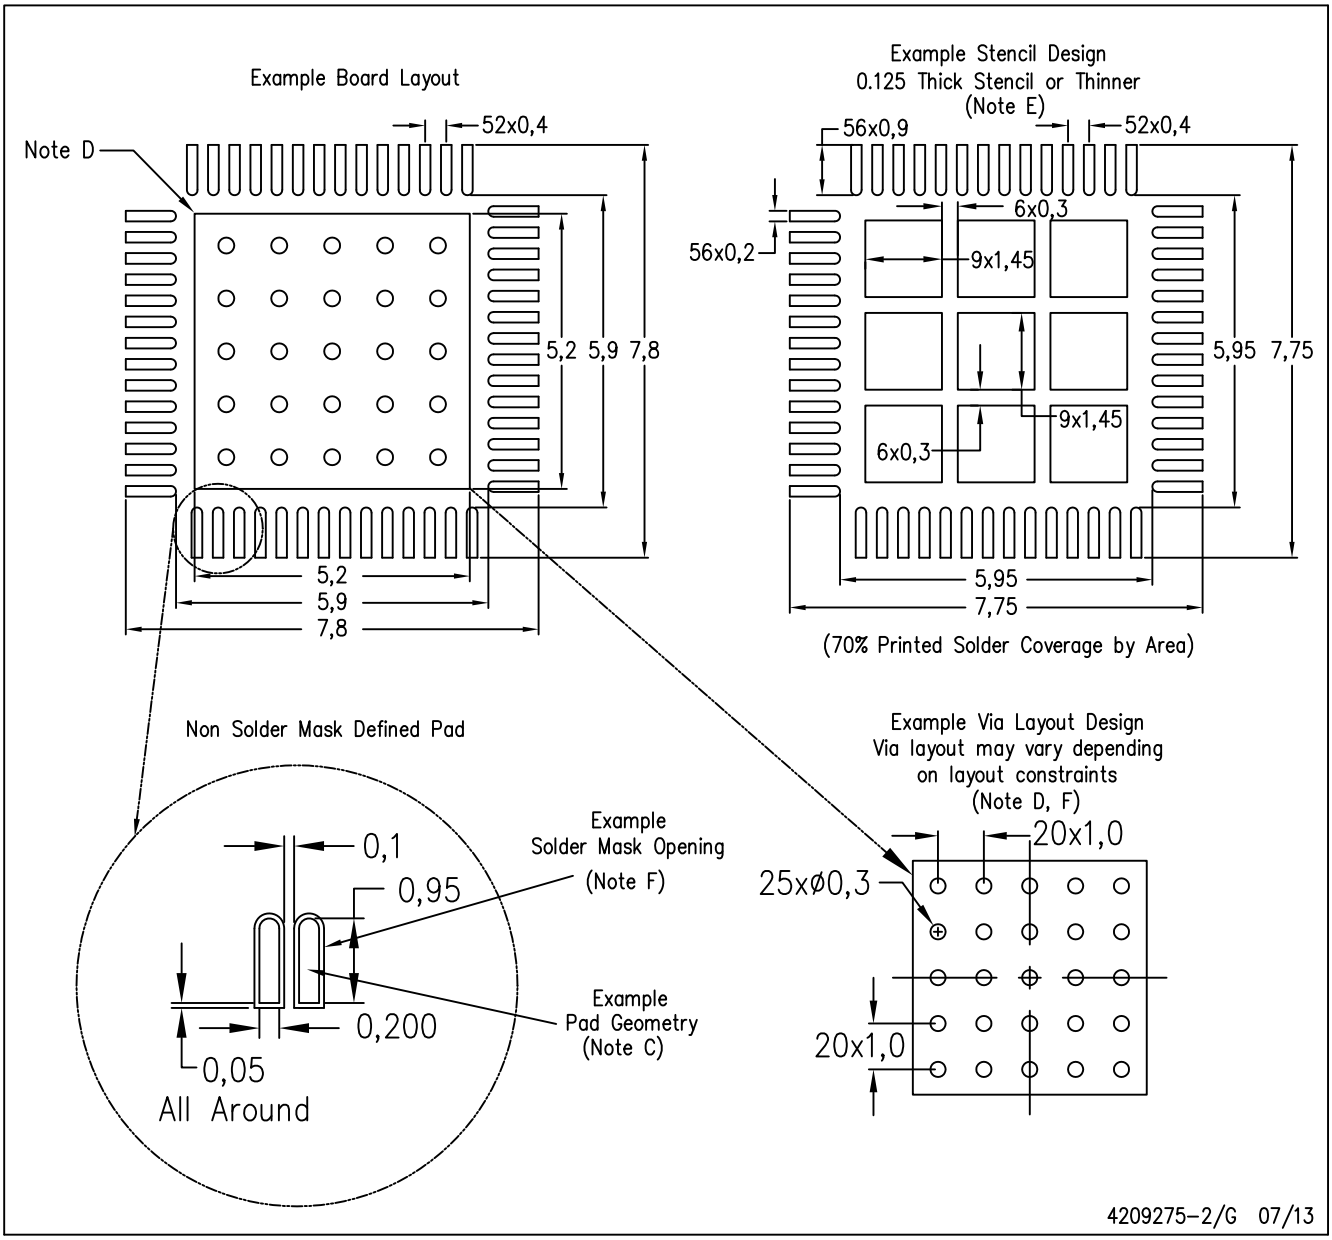
NOTE: All linear dimensions are in millimeters

RSH (S–PVQFN–N56) PLASTIC QUAD FLATPACK NO–LEAD



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat–Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、 テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した テキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている テキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、 テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。 テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、 テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、 テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、 テキサス・インスツルメンツの販売条件、または ti.com やかかる テキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。 テキサス・インスツルメンツがこれらのリソースを提供することは、適用される テキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、 テキサス・インスツルメンツはそれらに異議を唱え、拒否します。
