JAJSNB0E – SEPTEMBER 1997 – REVISED APRIL 2022

CD74HC390、CDx4HCT390 ハイスピード CMOS ロジック、デュアル 10 進リップル・カウンタ

1 特長

- 2 つの BCD 10 進またはバイクイナリ・カウンタ
- 1 つのパッケージで 2、4、5、10、20、25、50、100 分周に構成可能
- 各 10 進カウンタを個別にクリアするための 2 つのコントローラ・リセット入力
- ファンアウト (全温度範囲にわたって)
  - 標準出力:10 個の LSTTL 負荷
  - バス・ドライバ出力:15 個の LSTTL 負荷
- 広い動作温度範囲:-55℃～125℃
- 平衡のとれた伝搬遅延と遷移時間
- LSTTL ロジック IC に比べて消費電力を大幅削減
- HC タイプ
  - 2V～6V で動作
  - 優れたノイズ耐性:V_{CC} に対して N_{IL} = 30%、N_{IH} = 30% (V_{CC} = 5V 時)
- HCT タイプ
  - 4.5V～5.5V で動作
  - LSTTL 入力ロジックと直接互換、V_{IL} = 0.8V (最大値)、V_{IH} = 2V (最小値)
  - CMOS 入力互換、V_{OL}、V_{OH} で $I_I \leq 1\mu A$

2 概要

SN74HC390 および HCT390 デバイスには、非同期クリアの立ち下がりエッジでクロックされる 2 つの独立した 4 ビット 10 進リップル・カウンタが内蔵されています。各カウンタは 2 つの部分 (2 分周カウンタと 5 分周カウンタ) に分かれており、それらの部分はそれぞれ独立したクロック入力を備えています。そのため本デバイスは非常に柔軟に構成できます。

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

5.2 Recommended Operating Conditions(1)

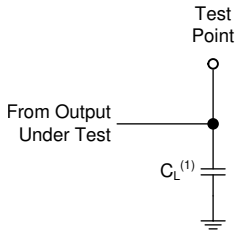
(4) C_L = 15 pF

6 Parameter Measurement Information

Phase relationships between waveforms were chosen arbitrarily. All input pulses are supplied by generators having the following characteristics: PRR ≤ 1 MHz, Z_O = 50 Ω, t_t < 6 ns.

For clock inputs, f_{max} is measured when the input duty cycle is 50%.

The outputs are measured one at a time with one input transition per measurement.



(1) C_L includes probe and test-fixture capacitance.

7 Detailed Description

7.1 Overview

The CD74HC390 and 'HCT390 dual 4-bit decade ripple counters are high-speed silicon-gate CMOS devices and are pin compatible with low-power Schottky TTL (LSTTL). These devices are divided into four separately clocked sections. The counters have two divide-by-2 sections and two divide-by-5 sections. These sections are normally used in a BCD decade or bi-quinary configuration, since they share a common controller reset (nCLR). If the two controller reset inputs (1CLR and 2CLR) are used to simultaneously clear all 8 bits of the counter, a number of counting configurations are possible within one package. The separate clock inputs ($n\overline{CLK}_A$ and $n\overline{CLK}_B$) of each section allow ripple counter or frequency division applications of divide-by-2, 4, 5, 10, 20, 25, 50, or 100. Each section is triggered by the High-to-Low transition of the input pulses ($n\overline{CLK}_A$ and $n\overline{CLK}_B$).

For BCD decade operation, the nQ_A output is connected to the $n\overline{CLK}_B$ input of the divide-by-5 section. For bi-quinary decade operation, the nQ_D output is connected to the $n\overline{CLK}_A$ input and nQ_A becomes the decade output.

The controller reset inputs (1CLR and 2CLR) are active-High asynchronous inputs to each decade counter which operates on the portion of the counter identified by the "1" and "2" prefixes in the pin configuration. A High level on the nCLR input overrides the clock and sets the four outputs Low.

8 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the *Recommended Operating Conditions*. Each V_{CC} terminal should have a good bypass capacitor to prevent power disturbance. A 0.1-µF capacitor is recommended for this device. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. The 0.1-µF and 1-µF capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results.

9 Layout

9.1 Layout Guidelines

When using multiple-input and multiple-channel logic devices inputs must not ever be left floating. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such unused input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. All unused inputs of digital logic devices must be connected to a logic high or logic low voltage, as defined by the input voltage specifications, to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally, the inputs are tied to GND or V_{CC}, whichever makes more sense for the logic function or is more convenient.

10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
