

CDCI6214 PCIe 対応、4 つのプログラム可能出力と EEPROM 搭載の超低消費電力クロック ジェネレータ

1 特長

- 1 つの構成可能な高性能、低消費電力 PLL と 4 つのプログラム可能出力
- RMS ジッタ性能
 - SSC なしで PCIe Gen1、Gen2、Gen3、Gen4 をサポート
- 消費電力 (標準値): 150mW (1.8V 時)⁽²⁾
- ユニバーサル クロック入力
 - 差動 AC 結合または LVCMOS: 1MHz~250MHz
 - 水晶振動子: 8MHz~50MHz
- 柔軟な出力周波数
 - 44.1kHz~350MHz
 - グリッチなしの出力分周器スイッチング
- 4 つの出力を独立に構成可能
 - LVCMOS、LVDS、HCSL
 - スイングをプログラム可能な差動 AC 結合 (LVDS、CML、LVPECL 互換)
- 完全に統合された PLL、構成可能なループ帯域幅: 100kHz~3MHz
- 単一電源または複数電源による動作 (レベル変換用): 1.8V、2.5V、3.3V
- GPIO を構成可能
 - ステータス信号
 - 最大 4 つの個別の出力イネーブル
 - 出力分周器の同期
- 柔軟な構成オプション
 - I²C 互換インターフェイス: 最高 400kHz
 - 2 つのページと外部選択ピンを持つ内蔵 EEPROM
- 100Ω のシステムのみをサポート
- 産業用温度範囲: -40°C~85°C
- 小さい占有面積: 24 ピン VQFN (4mm × 4mm)

2 アプリケーション

- PCIe Gen 1、2、3、4 のクロック処理
- 1G/10G イーサネット スイッチ、NIC、アクセラレータ
- テストおよび測定、ハンドヘルド機器
- プリンタ複合機
- 放送用インフラストラクチャ

3 概要

CDCI6214 デバイスは、超低消費電力のクロック ジェネレータです。このデバイスは位相ロック ループに対して 2 つの独立した基準入力を選択でき、構成可能な差動出力チャンネルに最大 4 つの異なる周波数を生成でき、基準クロックを LVCMOS 出力チャンネルにコピーすることもできます。

4 つの出力チャンネルには、それぞれの構成可能な整数分周器があります。これにより、出力多重化と合わせて最大 5 つの異なる周波数が得られます。クロック分配分周器は決定論的な方法でリセットされるため、クリーンなクロックゲート処理とグリッチのない更新能力が得られます。柔軟なパワーダウン オプションにより、デバイスの消費電力がアクティブとスタンバイの両方の動作で最小になるよう、最適化できます。4 つの 156.25MHz LVDS 出力について、標準の消費電力は 1.8V において 150mW です。標準的な RMS ジッタは 100MHz HCSL 出力について 386fs で、PCIe アプリケーションのシステム マージンが拡張されます。

CDCI6214 は、I²C 互換のシリアル インターフェイスおよび内蔵 EEPROM によりアクセスできる内部レジスタを使用して構成されています。

CDCI6214 を使用すると、1 つの基準クロックで動作する高性能クロック ツリーを非常に低い消費電力と小さなフットプリントで実現できます。CDCI6214 の EEPROM は工場出荷時またはユーザーがプログラム可能で、使いやすく即座にオンになる低消費電力クロック供給機能として設計されています。

パッケージ情報

部品番号	パッケージ ⁽¹⁾	パッケージ サイズ ⁽³⁾
CDCI6214	RGE (VQFN, 24)	4.00mm × 4.00mm

- 供給されているすべてのパッケージについては、[セクション 13](#) を参照してください。
- 4 つの LVDS 出力、156.25MHz、水晶振動子を基準として使用。
- パッケージ サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

5 Pin Configuration and Functions

図 5-1. RGE Package 24-Pin VQFN Top View

表 5-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
XOUT/FB_P	1	IO	Crystal Driver Output / LVCMOS Input / Differential Positive Reference
XIN/FB_N	2	I	Crystal Input / Differential Negative Reference
VDDREF	3	P	Power Supply Pin for Input Path, Digital and EEPROM
REFSEL	4	I	Manual Reference Selection MUX for PLL, $R_{PU} = 50\text{ k}\Omega$, $R_{PD} = 50\text{ k}\Omega$
REFP	5	I	Differential Positive Reference
REFN	6	I	Differential Negative Reference
Y0	7	O	Output 0 Pin
RESETN/SYNC	8	I	Chip Reset. Alternatively, Output Divider Sync, $R_{PU} = 50\text{ k}\Omega$ ⁽¹⁾
Y4N	9	O	Output 4 Negative Pin
Y4P	10	O	Output 4 Positive Pin
OE/GPIO4	11	IO	Global output enable (default) or programmable GPIO, $R_{PU} = 50\text{ k}\Omega$ ⁽¹⁾
SCL/GPIO3	12	IO	Serial interface clock (default) or programmable GPIO
Y3N	13	O	Output 3 Negative Pin
Y3P	14	O	Output 3 Positive Pin
VDDO34	15	P	Power Supply for Outputs 3 and 4
VDDO12	16	P	Power Supply for Outputs 1 and 2
Y2N	17	O	Output 2 Negative Pin
Y2P	18	O	Output 2 Positive Pin

表 5-1. Pin Functions (続き)

PIN		TYPE	DESCRIPTION
NAME	NO.		
SDA/GPIO2	19	IO	Serial interface data (default) or programmable GPIO
STATUS/GPIO1	20	IO	Status (default) or programmable GPIO, $R_{PU} = 50\text{ k}\Omega$ ⁽¹⁾
Y1N	21	O	Output 1 Negative Pin
Y1P	22	O	Output 1 Positive Pin
EEPROMSEL	23	I	EEPROM Page Mode Select, $R_{PU} = 50\text{ k}\Omega$, $R_{PD} = 50\text{ k}\Omega$ ⁽¹⁾
VDDVCO	24	P	Power Supply Pin for VCO / PLL
GND	25	G	Ground, Thermal Pad

(1) R_{PU} is an internal pullup resistor. R_{PD} is an internal pulldown resistor.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
VDDREF, VDDVCO, VDDO12, VDDO34	Supply voltage	−0.3	3.65	V
XIN/FB_P, XOUT/FB_N, REFP, REFN	Input voltage	−0.3	VDDREF + 0.3	V
STATUS/GPIO1, SDA/GPIO2, SCL/GPIO3, OE/GPIO4, REFSEL, EEPROMSEL, RESETN/SYNC	Input voltage	−0.3	VDDREF + 0.3	V
Y0, Y1P, Y1N, Y2P, Y2N, Y3P, Y3N, Y4P, Y4N	Output voltage	−0.3	VDDO _x + 0.3	V
STATUS/GPIO1, SDA/GPIO2, SCL/GPIO3, OE/GPIO4	Output voltage	−0.3	VDDREF + 0.3	V
T _J	Junction temperature		125	°C
T _{stg}	Storage temperature		150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDDREF, VDDVCO	Core supply voltage ⁽¹⁾	1.71		3.465	V
VDDO1	Output supply voltage	1.71		3.465	V
VDDO2	Output supply voltage	1.71		3.465	V
VDDO3	Output supply voltage	1.71		3.465	V
VDDO4	Output supply voltage	1.71		3.465	V
T _A	Ambient temperature	−40°C		85	°C

- (1) VDDREF and VDDVCO must be powered from the same supply voltage.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		RGE (VQFN)	UNIT
		24 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	39.5	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	29.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	16.9	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	2.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.4	°C/W

THERMAL METRIC ⁽¹⁾	RGE (VQFN)	UNIT
	24 PINS	
Ψ_{JB} Junction-to-board characterization parameter	16.8	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 EEPROM Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
n_{EEcyc} EEPROM programming cycles	each word	10		10,000	cycles
t_{EEret} EEPROM data retention		10			years

6.6 Reference Input, Single-Ended and Differential Mode Characteristics (REFP, REFN, FB_P, FB_N)

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{IN_Ref} Reference frequency		1		250	MHz
V_{IH} Input high voltage	LVC MOS input buffer	$0.8 \times V_{DDREF}$			V
V_{IL} Input low voltage	LVC MOS input buffer			$0.2 \times V_{DDREF}$	V
V_{IN_DIFF} Differential input voltage swing, peak-to-peak	VDDREF = 2.5 V or 3.3 V, AC-coupled differential input buffer	0.5		1.6	V
V_{IN_DIFF} Differential input voltage swing, peak-to-peak	VDDREF = 1.8 V, AC-coupled differential input buffer	0.5		1.0	V
dV_{IN}/dT Input slew rate	20% – 80%	3			V/ns
IDC Input duty cycle		40%		60%	
C_{IN_XOUT/FB_P} Input capacitance	No xtal active, on-chip load disabled, at 25°C		7		pF
C_{IN_XIN/FB_P} Input capacitance	No xtal active, on-chip load disabled, at 25°C		5		pF
C_{IN_REF} Input capacitance	at 25°C		5		pF

6.7 Reference Input, Crystal Mode Characteristics (XIN, XOUT)

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{IN_Xtal} Crystal frequency	Fundamental mode	8		50	MHz
Z_{ESR} Crystal equivalent series resistance	A supported crystal is within	30		100	Ω
C_L Crystal load capacitance	Using on-chip load capacitance. A supported crystal is within.	5		8	pF
P_{XTAL} Crystal tolerated drive power	A supported crystal tolerates up to	100			μ W
C_{XIN_LOAD} On-Chip load capacitance	Programmable in typical 200-fF steps at room temp	3		9.1	pF
DNL_{XIN_LOAD} Differential non-linearity	at room temp		200		fF

6.8 General-Purpose Input and Output Characteristics (GPIO[4:1], SYNC/RESETN)

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IH} Input high voltage		$0.8 \times V_{DDREF}$			V

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V ±5%, 2.5 V ±5%, 3.3 V ±5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{IL}	Input low voltage			0.2 × VDDREF	V
I _{IH}	Input high level current	VIH = VDDREF	–0.02		μA
I _{IH}	Input high level current	VIH = VDDREF, Pin 12, 19	0.004		μA
I _{IL}	Input low level current	VIL = GND	–50		μA
I _{IL}	Input low level current	VIL = GND, Pin 12, 19	–0.004		μA
dV _{IN} /dT	Input slew rate	20% – 80%	0.5		V/ns
C _{IN_GPIO}	Input Capacitance			10	pF
V _{OH}	Output high voltage	only capacitive load	0.8 × VDDREF		V
V _{OL}	Output low voltage	only capacitive load		0.2 × VDDREF	V
dV _{OUT} /dT	Output slew rate	20% - 80%, at 10pF	0.3		V/ns
R _{PU}	Pullup resistance	Pin 11, 20	77		kΩ

6.9 Triple Level Input Characteristics (EEPROMSEL, REFSEL)

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8V ±5%, 2.5V ±5%, 3.3V ±5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{IH}	Input high voltage	0.8 × VDDREF			V
V _{IM}	Input mid voltage	0.41 × VDDREF	0.5 × VDDREF	0.58 × VDDREF	V
V _{IL}	Input low voltage			0.2 × VDDREF	V
I _{IH}	Input high level current	VIH = VDDREF	40		μA
I _{IM}	Input mid level current	VIH = VDDREF/2	–1		μA
I _{IL}	Input low level current	VIL = GND	–40		μA
t _{RIN}	input slew rate	10% - 90%	50		ns
C _{IN_TRI}				10	pF
R _{PDPU}			64		kΩ

6.10 Reference Mux Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V ±5%, 2.5 V ±5%, 3.3 V ±5% and T_A = –40°C to 85°C

PARAMETER ⁽¹⁾	TEST CONDITIONS	MIN	TYP	MAX	UNIT
L _{REF_MUX}	Reference mux isolation XIN = Crystal 25 MHz, REF = 27 MHz		89		dBc
L _{REF_MUX}	Reference mux isolation XIN = Crystal 25 MHz, REF = 24.576 MHz		78		dBc

(1) Mux isolation is defined as the attenuation relative to the carrier base harmonic as a positive dBc number.

6.11 Phase-Locked Loop Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V ±5%, 2.5 V ±5%, 3.3 V ±5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{PFD}	Phase detector frequency	1		100	MHz
f _{VCO}	Voltage-controlled oscillator frequency	2400		2800	MHz
f _{BW}	Configurable closed-loop PLL bandwidth REF = 25 MHz	100		3000	kHz

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = -40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{CLKDIST} Clock distribution frequency		400		700	MHz
K_{VCO} Voltage-controlled oscillator gain	$f_{\text{VCO}} = 2.4 \text{ GHz}$		62		MHz/V
K_{VCO} Voltage-controlled oscillator gain	$f_{\text{VCO}} = 2.5 \text{ GHz}$		62		MHz/V
K_{VCO} Voltage-controlled oscillator gain	$f_{\text{VCO}} = 2.8 \text{ GHz}$		92		MHz/V
$ \Delta T_{\text{CL}} $ Allowable temperature drift for continuous lock	$dT/dt \leq 20 \text{ K / min}$			125	$^{\circ}\text{C}$

6.12 Closed-Loop Output Jitter Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = -40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{\text{RJ_CL}}$ RMS phase jitter	int. Range from 10 kHz to 20 MHz , XIN = Crystal 25 MHz, Integer Output Divider, Yx = 156.25 MHz LVDS		500	750	fs
	int. Range from 10 kHz to 20 MHz , XIN = Crystal 25 MHz, Integer Output Divider, Yx = 100 MHz HCSL		386	800	fs
	PCIe Gen 3/4 Common Clock transfer functions applied, XIN = Crystal 25 MHz, Integer Output Divider, Yx = 100 MHz HCSL			500	fs

6.13 Output Mux Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = -40°C to 85°C

PARAMETER ⁽¹⁾	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$L_{\text{OUT_MUX}}$ Output mux isolation	REF = 27 MHz, XIN = 25 MHz, VCO = 2500 MHz, PSFB = 4, Y_ODD = 312.5 MHz, Y_EVEN = 208.3 MHz, LVPECL		65		dBc
$L_{\text{OUT_MUX}}$ Output mux isolation	REF = 27 MHz, XIN = 25 MHz, VCO = 2500 MHz, PSFB = 4, Y_ODD = 312.5 MHz, Y_EVEN = 250 MHz, LVPECL		63		dBc
$L_{\text{OUT_MUX}}$ Output mux isolation	REF = 27 MHz, XIN = 25 MHz, VCO = 2500 MHz, PSFB = 4, Y_ODD = 312.5 MHz, Y_EVEN = 89.3 MHz, LVPECL		72		dBc
$L_{\text{OUT_MUX}}$ Output mux isolation	REF = 27 MHz, XIN = 25 MHz, VCO = 2500 MHz, PSFB = 4, IODs = 312.5 MHz, Yx=BYPASS (XIN), LVPECL		64		dBc
$L_{\text{OUT_MUX}}$ Output mux isolation	REF = 27 MHz, XIN = 25 MHz, VCO = 2500 MHz, PSFB = 4, Y_ODD = 100 MHz, Y_EVEN = 266.6 MHz, LVPECL		57		dBc

(1) Mux isolation is defined as the attenuation relative to the carrier base harmonic as a positive dBc number.

6.14 LVCMOS Output Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = -40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$f_{\text{O_LVCMOS}}$ Output frequency	VDDO_x = 2.5 V or 3.3 V, normal drive	0.1		350	MHz
$f_{\text{O_LVCMOS}}$ Output frequency	VDDO_x = 1.8 V, normal drive	0.1		250	MHz

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V ±5%, 2.5 V ±5%, 3.3 V ±5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OH_LVCMOS} Output high voltage	Normal mode, only capacitive load	0.8 × VDDREF			V
V _{OL_LVCMOS} Output low voltage	Normal mode, only capacitive load			0.2 × VDDREF	V
V _{OH_LVCMOS} Output high voltage	Slow mode, only capacitive load	0.7 × VDDREF			V
V _{OL_LVCMOS} Output low voltage	Slow mode, only capacitive load			0.3 × VDDREF	V
R _{ON_LVCMOS} Output impedance	Normal mode		28		Ω
R _{ON_LVCMOS} Output impedance	Weak mode		80		Ω
L _{LVC MOS_100M} Phase noise floor, single side band	f _{CARRIER} = 100 MHz, f _{OFFSET} = 10 MHz		–148		dBc/Hz

6.15 HCSL Output Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V ±5%, 2.5 V ±5%, 3.3 V ±5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{O_HCSL} Output frequency		0.1		350	MHz
V _{CM_HCSL} Output common mode		0.2	0.34	0.55	V
V _{OD} Differential output voltage	f _{O_HCSL} = 100 MHz	0.4		1.0	V
V _{SS} Differential output voltage, peak to peak	f _{O_HCSL} = 100 MHz	0.8		2.0	V _{pp}
V _{CROSS} Absolute crossing point	R _p = 49.9 Ω ±5%, f _{O_HCSL} = 100 MHz	250		550	mV
ΔV _{CROSS} Relative crossing point variation	w.r.t to average crossing point, f _{O_HCSL} = 100 MHz		100		mV
dV/dt Slew rate for rising and falling edge	Differential, at V _{CROSS} ±150 mV, f _{O_HCSL} = 100 MHz ⁽¹⁾	1		4	V/ns
ΔdV/dt Slew rate matching	Single-ended, at V _{CROSS} ±75 mV, f _{O_HCSL} = 100 MHz ⁽¹⁾			20%	
ODC Output duty cycle	Not in PLL bypass mode	45%		55%	
R _p Parallel termination	R _p = 49.9 Ω ±5% required	45		55	Ω
L _{HCSL_100M} Phase noise floor, single side band	f _{CARRIER} = 100 MHz, f _{OFFSET} = 10 MHz		–152		dBc/Hz

(1) PCIe test load slew rate

6.16 LVDS DC-Coupled Output Characteristics

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V ±5%, 2.5 V ±5%, 3.3 V ±5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
f _{O_PRG_AC} Output frequency		0.1		350	MHz
V _{CM} Output common mode	VDDO_X = 2.5 V, 3.3 V, chx_lvds_cmtrim_inc = 2	1.125	1.2	1.375	V
V _{CM} Output common mode	VDDO_X = 1.8 V, chx_lvds_cmtrim_inc = 2	0.8	0.9	1	V
V _{OD} Differential output voltage	LVDS	0.25	0.3	0.45	V
t _{RF} Output rise/fall times	LVDS (20% to 80%)		675		ps
ODC Output duty cycle	Not in PLL bypass mode	45%		55%	

VDDVCO, VDDO12, VDDO34, VDDREF = 1.8 V $\pm$ 5%, 2.5 V $\pm$ 5%, 3.3 V $\pm$ 5% and T_A = –40°C to 85°C

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$L_{LVDS_DC_100M}$ Phase noise floor, single side band	$f_{CARRIER} = 100MHz$, $f_{OFFSET} = 10MHz$		–152		dBc/Hz

8 Detailed Description

8.1 Overview

The CDCI6214 clock generator is a phase-locked loop with integrated loop filter and selectable input reference. The output of the integrated voltage-controlled oscillator (VCO) is connected to a clock distribution network, which includes multiple frequency dividers and feeds four output channels with configurable differential and single-ended output buffers.

8.2 Functional Block Diagram

图 8-1. CDCI6214 Clock Generator With Four Outputs

8.3 Feature Description

The following sections describe the individual blocks of the CDCI6214 ultra-low power clock generator.

8.3.1 Reference Block

A reference clock to the PLL is fed to pins 1 (XOUT/FB_P) and 2 (XIN/FB_N) or to pins 5 (REFP) and 6 (REFN). There are multiple input stages available to adapt to many clock references. The bit-field that controls the reference input type selection is [xin_inbuf_ctrl](#).

The reference mux selects the reference for the PLL and the PLL-bypass path. For debug purposes [ip_byp_mux](#) allows to connect the reference divider or doubler output to the clock distribution.

The buffers for the PLL-bypass path can be individually enabled and disabled using [ip_byp_en_ch\[4:1\]](#) and [ip_byp_en_y0](#).

8-2. Reference Block

8.3.1.1 Input Stages

8.3.1.1.1 Crystal Oscillator

The XIN and XOUT pins provide a crystal oscillator stage to drive a fundamental mode crystal in the range of 8 MHz to 50 MHz. The crystal input stage integrates a tunable load capacitor array up to 9 pF using `ip_xo_cload`. The drive capability of the oscillator is adjusted using `ip_xo_gm`.

8.3.1.1.2 LVCMOS

The LVCMOS input buffer threshold voltage follows VDDREF. This helps to use the device as a level shifter as the outputs have separate supplies.

8.3.1.1.3 Differential AC-Coupled

The differential input stage has an internal bias generator and should only be used with AC-coupled reference inputs.

8.3.1.2 Reference Mux

Either XIN or REF can be selected as reference to the PLL and clock distribution path. The reference mux is controlled using the REFSEL pin with `ref_mux_src` or the `ref_mux` bit-field with `ref_mux_src`.

8.3.1.3 Reference Divider

A reference divider can be used to divide higher input frequencies to the permitted PFD range. It supports division values of 1 to 255 using `ip_rdiv`.

8.3.1.3.1 Doubler

The reference path contains a doubler circuit. It is used to double the input frequency and can be used to achieve the highest PFD update frequency of 100 MHz using a 50-MHz crystal. The doubler activates using [ip_rdiv](#) = 0.

8.3.1.4 Bypass-Mux

The input reference or the input to the PFD can be routed to the bypass path using [ip_byp_mux](#).

8.3.1.5 Zero Delay, Internal and External Path

In zero delay mode the REF input clock is used as reference clock at the PFD. The FB_P clock (LVCMOS) or FB_P/N clock (differential) can be used to feed an external source as feedback clock to the PFD. The external feedback path is recommended for zero delay operation. Moreover there is an additional internal feedback path which is sourced by output channel 2.

表 8-1. Zero Delay Operation

Operation ⁽¹⁾	Reference					Feedback							
	REFSEL	ref_mux	ref_mux_s_rc	ip_rdiv	ref_inbuf_ctrl	xin_inbuf_ctrl	zdm_mod_e	zdm_clock_sel	zdm_auto	pll_psfb	#none# pll_psa	pll_ndiv	ch2_iod_d iv ⁽²⁾
Normal PLL, XIN Reference	L	x	0	1	x	0	0	x	x	x	x	x	x
Normal PLL, REF Reference	H	x	0	1	x	x	0	x	x	x	x	x	x
Normal PLL, REF Reference	x	1	1	1	x	x	0	x	x	x	x	x	x
Zero Delay, Internal Feedback	x	1	1	1	A	A	1	0	1	B	B	C	C
Zero Delay, External Feedback	x	1	1	1	A	A	1	1	1	B	B	C	C

(1) 'x' allows any possible bit-field value. An entry of 'A', 'B' or 'C' indicates the same bit-field value.

(2) For internal feedback channel 2 is required. For external feedback the output clock connected to FB_P/N is recommended to have same settings as default PLL feedback path.

8.3.2 Phase-Locked Loop

The CDCI6214 contains a fully integrated phase-locked loop circuit. The error between a reference phase and an internal feedback phase is compared at the phase-frequency-detector. The comparison result is fed to a charge pump that is connected to an integrated loop filter. The control voltage resulting from the loop filter tunes an internal voltage-controlled oscillator (VCO). The frequency of the VCO is fed through a pre-scaler feedback divider (PSFB) and another feedback divider back to the PFD.

The PLL closed-loop bandwidth is configurable using registers PLL0, PLL1, and PLL2.

- Integer PLL
- PFD operates 1 MHz to 100 MHz
- Live Lock-Detector provides PLL lock status on status pin and bit [lock_det](#) (there is an additional sticky bit [unlock_s](#))
- Integrated selectable loop filter components
- For 25-MHz PFD bandwidths between 100 kHz and 3000 kHz can be achieved to optimize PLL to input reference
- Voltage-Controlled Oscillator (VCO) tuning range of 2400 to 2800 MHz
- VCO is compatible to 0.5% spread spectrum (SSC) references at 100 MHz.

f _{VCO} in MHz ⁽¹⁾	f _{PDF} in MHz	BW in MHz	Phase Margin in °	Damping Factor	I _{CP} in mA	C _{Pcap} IN pF	R _{Res} IN kΩ	C _{Zcap} IN pF

2800	100	1.00	68	1.0	1.3	17.5	1.5	450

- HCSL must be directly connected to a load termination to ground. A series resistance can be used to adapt to the trace impedance.
- LVDS requires a differential termination connected between the positive and negative output buffer pins. The termination can be connected directly or using AC-coupling. When using the LVDS output type, set [ch1_1p8vdet](#), [ch2_1p8vdet](#), [ch3_1p8vdet](#), and [ch4_1p8vdet](#) to match the VDDO12 and VDDO34.
- CML and LVPECL are only supported in an AC-coupled configuration. The receiver and the termination may only be connected through AC-coupling capacitors to the device pins.

- LVCMOS outputs are designed for capacitive loads only. A series resistance should be used to adapt the driver impedance to the trace impedance. For a typical 50-Ω trace, a resistor between 22 Ω to 33 Ω should be used. The polarity of the positive and negative pins can be adjusted separately.

The output buffers support a wide frequency range of up to 350 MHz. Higher output frequencies up to 700 MHz are functional, but are not covered by electrical specifications.

8.3.3.1 Output Channel

8.3.3.2 Divider Glitch-Less Update

The bit fields `ch1_glitchless_en` can be used to enable glitch-less output divider update. This feature ensures that the high pulse of a clock period is not cut off by the output divider update process. It ensures that setup and hold time of a receiver is not violated. The low pulse in the *transition* from earlier period to the new period is extended accordingly.

図 8-6. Glitch-Less Divider Update

8.3.4 Control Pins

The ultra-low power clock generator is controlled by multiple LVCMOS input pins.

EEPROMSEL acts as EEPROM page select. The CDCI6214 clock generator contains two pages of configuration settings. The level of this pin is sampled after device power-up. A low level selects page zero. A high level selects page one. The EEPROMSEL pin is a tri-level input pin. This third voltage level is automatically applied by an internal voltage divider. The mid-level is used to select an internal default where the serial interface is enabled.

RESETN/SYNC (pin 8), SCL (pin 12), and SDA (pin 19) have a secondary functionality and can act as general-purpose inputs and outputs (GPIO). This means that either the serial interface or the GPIO functionality can be active.

RESETN/SYNC resets the internal circuitry and is used in the initial power-up sequence. The pin can be reconfigured to act as synchronization input. The differential outputs are kept in mute while SYNC is low. When SYNC is high, outputs are active. Moreover status signals can be driven by this pin.

SCL can act as general-purpose input.

SDA can act as general-purpose input and output.

REFSEL is used to select between the input references to the PLL. A low level selects the crystal reference on XIN. A high level selects the differential input reference on REFP, REFN.

12	BUF_SYNC	buffered SYNC pin
13	BUF_SCL	buffered SCL pin
14	BUF_SDA	buffered received SDA pin

(1) Signals from this list are available on pin 8 (RESETN/SYNC or GPIO0), pin 11 (OE / GPIO4) and pin 20 (STATUS / GPIO1).

8.3.4.1 Global and Individual Output Enable: OE and OE_Y[4:1]

The output enable functionality allows to enable or disable all or a specific output buffer. The bypass copy on Y0 is excluded from the global output enable signal. When an output is disabled, it drives a configurable mute-state, [ch\[4:1\]_mute-sel](#). When the serial interface is deactivated one can use all individual output enable signals at the same time, see [mode](#). The individual output enable signal controls the respective output channel integer divider to gate the clock. Therefore each integer divider needs to be active. When multiple outputs are sourced from the same integer divider, the respective OE signal will enable/disable the output(s). ¹

注

When multiple output enable signals are configured on multiple-GPIO pins, then the global output enable OE has higher priority than the individual output enable OE[4:1]. An individual output enable OE[4:1] may only be configured on a single pin.

The individual output enable signal enables and disables the respective output in a deterministic way. Therefore the high and low level of the signal is qualified by counting four cycles of the respective output clock. The following steps can be seen in 図 8-7:

1. The OE falling edge which disables the outputs.
2. Transition from *logic high to logic low* / *logic low to logic high* for Y2 after four rising edges.
3. Transition from *logic high to logic low* / *logic low to logic high* for Y1 after four rising edges.
4. The OE rising edge which enables the outputs.
5. Output Y2 starts toggling after four rising edges.
6. Output Y1 starts toggling after four rising edges.

MUTE_SEL= Logic Low

MUTE_SEL= Logic High

図 8-7. Individual Output Enable and Disable

注

The deterministic behaviour of the individual output enable is designed for an output frequency up to 200 MHz.

8.3.5 Operation Modes

The device can operate in different modes.

Following operating modes can be set and the GPIOs configured. An operating mode change only becomes effective when it is loaded from the EEPROM after a power cycle.

¹ The GPIO direction of pins 12 and 19 is automatically set through the mode bit. Pin 11 and 20 must be set as inputs using gpio1_dir_sel and gpio4_dir_sel bit in the 表 10-3 table.

表 8-9. Modes of Operation

DESCRIPTION	MODE	REFSEL	EEPROMSEL	GPIO4	GPIO3	GPIO2	GPIO1
I ² C + GPIOs	Fallback	M	M	I/O	SCL	SDA	I/O
I ² C + GPIOs	0	LH	LH	I/O	SCL	SDA	I/O
OE _s	1	LH	LH	OE4	OE3	OE2	OE1

8.3.6 Divider Synchronization - SYNC

The output dividers can be reset in a deterministic way. This can be achieved using the [sync](#) bit or the pin 8 configured for SYNC function using [gpio0_input_sel](#) and [gpio0_dir_sel](#). The level of the pin is qualified internally using the reference frequency at the PFD. A low level will mute the outputs. A high level will synchronously release all output dividers to operation, so that all outputs share a common rising edge, see [図 8-8](#). The first rising edge can be individually delayed in steps of the respective pre-scaler period, up to 32 cycles using [ch1_sync_delay](#). This allows to compensate external delays like routing mismatch, cables or inherent delays introduced by logic gates in an FPGA design. Each channel can be included or excluded from the SYNC process using [ch1_sync_en](#).^{2 3}

For a deterministic behaviour over power-cycles seen from input to output the reference divider must be set to 1. It should not divide the reference clock nor should the reference doubler be used.

図 8-8. Divider Synchronization

表 8-10. Digital Delay Step Size

VCO FREQUENCY IN MHz	PRE-SCALER STEP IN ns		
	/4	/5	/6
2400	1.67	2.08	2.50
2457.6	1.63	2.03	2.44
2500	1.60	2.00	2.40
2800	1.43	1.79	2.14

8.3.7 EEPROM - Cyclic Redundancy Check

The device contains a cyclic redundancy check (CRC) function for reads from the EEPROM to the device registers. At start-up the EEPROM will be read internally and a CRC value calculated. One of the EEPROM words contains an earlier stored CRC value. The [stored](#) and the [actual](#) CRC value are compared and the result

² ch[4:1]_sync_en may only be activated with an active clock source selected in ch1_iod_mux bit in the [表 10-31](#) table.

³ The LVCMOS bypass output Y0 is not part of the SYNC process, neither are the dividers of the PLL.

transferred to STATUS1 register. The CRC calculation can be triggered again by writing a '1' to the update_crc bit. A mismatch between stored and calculated CRC value is informational only and non-blocking to the device operation. Just reading back the CRC status bit and the live CRC value can speed up in-system EEPROM programming and avoid reading back each word of the EEPROM for known configurations.

The polynomial used is CCITT-CRC16: $x^{16} + x^{12} + x^5 + 1$.

図 8-9. EEPROM CRC

8.3.8 Power Supplies

The CDCI6214 provides multiple power supply pins. Each of the power supplies supports 1.8 V, 2.5 V, or 3.3 V. Internal low-dropout regulators (LDO) source the internal blocks and allow each pin to be supplied with its individual supply voltage. The VDDREF pin supplies the control pins and the serial interface. Therefore, any pullup resistors shall be connected to the same domain as VDDREF. By default the LDOs are configured for 1.8-V $\pm 5\%$ operation.

8.3.8.1 Power Management

The device is very flexible with respect to internal power management. Each block offers a power-down bit and can be disabled to save power when the block is not required. The available bits are illustrated in 図 8-10. The bypass output Y0 is connected to the pdn_ch4 bit. Each output channel has a bit which should be adapted to the applied supply voltage, ch[4:1]_1p8vdet.

図 8-10. Power Management

8.4 Device Functional Modes

8.4.1 Pin Mode

In pin mode, pins 12 and 19 are input pins that act as *individual output enable* pins. Together with pins 11 and 20, this mode allows for one output enable pin per output channel.

8.4.2 Serial Interface Mode

In serial interface mode, pins 12 and 19 are configured as an I²C interface.

8.4.2.1 Fall-Back Mode

As the programming interface can be intentionally deactivated using the EEPROM, an accidental disabling of the I²C blocks further access to the device. The serial interface can be forced using the fall-back mode. To enter this mode, the user leaves pin 4 and pin 23 floating while the supply voltage is applied to VDDREF. In this mode, pin 11 is preconfigured as an input and pin 20 is configured as an output.

8.5 Programming

The CDCI6214 ultra-low power clock generator provides an I²C-compatible serial interface for register and EEPROM access. The device is compatible to standard-mode I²C at 100 kHz and the fast-mode I²C at 400-kHz clock frequency.

表 8-11. I²C-Compatible Serial Interface, Target Address Byte

7	6	5	4	3	2	1	0
Target Address A[6:0] ⁽¹⁾							R/W# Bit ⁽²⁾

(1) The target address consists of two sections. The hardwired MSBs A[6:2] and the software-selectable LSBs A[1:0].

(2) The R/W# bit indicates a read (1) or a write (0) transfer.

表 8-12 shows the target address decoding with respect to EEPROMSEL pin. This enables the user to avoid in-system conflicts with different configurations, as the selected EEPROM page can be reflected in the target address least significant bit A0. Moreover a device being powered up in the silicon default, can always be expected under the default address of 0xE9 for reads (or 0xE8 for writes).

表 8-12. I²C-Compatible Serial Interface, Programmable Target Address

A6	A5	A4	A3	A2	A1	A0	EEPROMSEL	DESCRIPTION
1	1	1	0	1	0	0	MID	Device Default
					1	I2C_A0 ⁽¹⁾	LOW	EEPROM, Page 0
					1	I2C_A0 ⁽²⁾	HIGH	EEPROM, Page 1

(1) Configuration Bit in EEPROM Page 0, default value of 0.

(2) Configuration Bit in EEPROM Page 1, default value of 1.

The serial interface uses the following protocol as shown in 図 8-11. The target address is followed by a word-wide register offset and a word-wide register value.

8-11. I²C-Compatible Serial Interface, Supported Protocol

8.5.1 Recommended Programming Procedure

TI recommends programming the registers of the device in the following way:

1. Ensure that [ee_lock](#) is set when overwriting the EEPROM.
2. Configure the voltage domain bits appropriately `ch[4:1]_1p8vdetch[4:1]_1p8vdet`.
3. Program register addresses in descending order from 0x44 to 0x00 including all register addresses with reserved values.

8.5.2 EEPROM Access

注

The EEPROM word write access time is typically 8 ms. The EEPROM_BUSY signal indicates when the EEPROM is busy and can be observed as a status signal on a GPIO pin to optimally time the writes (for example, in [gpio4_output_sel](#)).

There are two methods to write into the internal EEPROM:

1. Register Commit
2. EEPROM Direct Access

Use the following steps to bring the device into a known state and be able to conduct the programming:

1. Power down all device supplies
2. Apply RESETN=LOW.
3. Apply REFSEL=MID (leave tri-stated).
4. Apply EEPROMSEL=MID (leave tri-stated).
5. Apply 1.8 V/2.5 V/3.3 V to all device supplies. When device operation is not required, only apply 1.8 V/2.5V/3.3 V to VDDREF.
6. Apply RESETN=HIGH.
7. Use the I²C interface to configure the device using target address 0x74. See [表 8-12](#) for more details.

In the *Register Commit* flow all bits from the device registers are copied into the EEPROM. The recommended flow is:

1. Pre-configure the device as desired, except the serial interface using [mode](#).
2. Write 1 to [recal](#) to calibrate the VCO in this operation mode.
3. Select the EEPROM page, to copy the register settings into, using [regcommit_page](#).
4. Unlock the EEPROM for write access with [ee_lock](#) = 0x5
5. Start the commit operation by writing a 1 to [regcommit](#)
6. Force a CRC update by writing a 1 to [update_crc](#).
7. Read back the calculated CRC in [nvmlcrc](#).
8. Store the read CRC value in the EEPROM by writing 0x3F to [nvm_wr_addr](#) and then the CRC value to [nvm_wr_data](#).

In the *EEPROM Direct Access* flow the EEPROM words are directly accessed using the address and the data bit-fields. The recommended flow is:

1. Prepare an EEPROM image consisting of 64 words.
2. Unlock the EEPROM for write access with [ee_lock](#) = 0x5
3. Write the initial address offset to the address bit-field. Write a 0x00 to [nvm_wr_addr](#).
4. Loop through the EEPROM image from address 0 to 63 by writing each word from the image to [nvm_wr_data](#). The EEPROM word address is automatically incremented by every write access to [nvm_wr_data](#).
5. The EEPROM read is similar to EEPROM write. First write 0x00 to [nvm_rd_addr](#), then loop through all bytes by reading from [nvm_rd_data](#). The EEPROM word address is automatically incremented by every write access to [nvm_rd_data](#).

図 8-12. EEPROM Direct Access Using I²C

8.5.3 Device Defaults

The CDCI6214 contains the following defaults:

9 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

An ultra-low power clock generator is designed to drive clocks in industrial, portable and data center applications. The device is flexible in its configuration and be pre-preprogrammed with two separate configuration. For example a production test and an application configuration, or two different configurations for two flavors of a product. The internal EEPROM is protected by a CRC hash which is available as a status bit. The two EEPROM pages are selected using a control pin. As each major block of the device is powered by its own supply pin, the device can easily be used for signal translation and to accommodate various supply voltages which may be available in a system. Up to five different frequencies can be generated from a single device and feed different parts of an application. Each of the four differential outputs supports various signal standards. The general purpose pin functionality can provide status information to other parts of the system and can add modularity and flexibility to an application. Clock outputs can be muted individually or globally, the division ratio updated, the output dividers synchronized and a spread spectrum function enabled or disabled. The clock generator PLL can also be used in a zero delay mode which will compensate most of the seen phase delay between an external reference clock and the output clocks. Together with an external feedback option this allows to compensate traces on top of the digital delay steps provided inside the device. All these features make the ultra-low power clock generator for design library integration and re-use in modular projects.

9.2 Typical Applications

Copyright © 2017, Texas Instruments Incorporated

図 9-1. Typical Serial Interface Application Schematic

図 9-2. Typical Individual Output Enable Application Schematic

9.2.1 Design Requirements

For this example, the design parameters are listed in 表 9-1

表 9-1. Design Parameters

PARAMETER	EXAMPLE VALUE
t_{VDD}	Larger than 50 μ s and smaller than 3 ms
t_{PWL_SYNC}	Larger than $(1 / f_{XIN})$
f_{XIN}	Crystal 8 MHz to 50 MHz
dV_{IN} / dT	Input slew rate for external clock reference better than 3 V / ns

9.2.2 Detailed Design Procedure

For this application, TI recommends the following steps:

1. Decide how the device shall receive the register settings to plan for in-system programming of the EEPROM.
2. Choose which operation mode to use on the device (I²C or GPIOs) and which pins are inputs and which are outputs (see registers

GENERIC0

,

GENERIC1

, and

GENERIC2

).

3. Consider that the serial interface and the GPIOs are supplied by VDDREF as well as the input pins (for example, a 3.3-V crystal oscillator (XO) driving XIN forces uses 3.3-V I²C).

4. Keep track of which voltage levels the output supplies will have. There are configuration bits in the output channels (see CH1_CTRL5, CH2_CTRL5, CH3_CTRL5, and CH4_CTRL5).
5. Consider which output frequency has the most stringent phase noise specifications. Select this frequency to decide on the reference and VCO frequency.
6. Cross-check if your specific bandwidth requirement for an external reference can be achieved using the internal loop filter components (see registers [PLL1](#) and [PLL2](#)).
7. Optimize the clock distribution using output muxes to run the least amount of blocks to conserve power,

8. For HCSL output buffer format, optimize the signal integrity and slew rate at the receiver input using a series resistor between device pin and the 50 Ω termination to GND. Y1, Y4 provide higher slew rates compared to Y2, Y3.

Use 式 1 through 式 4 to calculate the a basic frequency plan or use the provided software TICS Pro to generate settings.

注

The user has to ensure PLL stability is given by applying the adequate loop filter and charge pump settings. A phase margin of $\geq 68^\circ$ is recommended. The target bandwidth is recommended between 600 kHz .. 1100 kHz.

$$f_{Y0} = f_{XIN} = f_{REF} \quad (1)$$

$$f_{PFD} = f_{REF} / ip_ref_div \quad (2)$$

where

- $ip_ref_div \geq 1$
- $1 \text{ MHz} \leq f_{PFD} \leq 100 \text{ MHz}$

$$f_{VCO} = f_{PFD} \cdot pll_nc \cdot (pll_ps + 4) \quad (3)$$

with

- $2400 \leq f_{VCO} \leq 2800$
- $0 \leq pll_ps \leq 2$

$$f_{Y[4:1]} = f_{VCO} / ((pll_ps[ab] + 4) \cdot ch[4:1]_{iod_div}) \quad (4)$$

with

- $0 \leq pll_ps[ab] \leq 2$
- $1 \leq ch[4:1]_{iod_div} \leq 16383$
- $44.1 \text{ kHz} \leq f_{Y[4:1]} \leq 350 \text{ MHz}$

- $0 \leq PLL_PS[AB]_{MODE} \leq 2$
- $1 \leq CH[4:1]_{IOD_DIV} \leq 16383$
- $44.1 \text{ kHz} \leq f_{Y[4:1]} \leq 350 \text{ MHz}$

9.2.3 Application Curves

9.3 Do's and Don'ts

The maximum swing and level must match to the applied VDDREF (for example, for a 3.3-V XO as reference, VDDREF must be 3.3 V).

VDDREF and VDDVCO must be powered from the same supply voltage.

9.4 Initialization Setup

The device digital logic starts after the internal power-on-release circuit triggered (POR). The digital core is connected to the VDDREF domain. The EEPROM settings are loaded into the device registers and the new settings applied to the device. The EEPROM page is selected according to the EEPROMSEL pin logic level. A low level loads *page 0*, and a logic high level loads *page 1*. By default, the differential outputs are muted for the initial VCO calibration and PLL lock process. After the PLL circuit achieved a phase lock to the input reference, the output dividers are synchronized and then released to operation. By default, pin 8 is configured as RESETN pin (see [gpio0_dir_sel](#) and [gpio0_input_sel](#)). The start of the initialization sequence, as well the as serial interface, can be kept in reset using RESETN= LOW. When pin 8 is not configured as RESETN, the device initialization relies on the POR triggered by application of VDDREF.

図 9-5. Initialization Flow Chart

The pins 8, 11, 12, 19, and 20 are general-purpose inputs and outputs (GPIO). The functions are determined through the register settings saved in the selected EEPROM page. See [Generic0](#), [Generic1](#), and [Generic2](#) for the relevant bit-fields.

The EEPROM allows to choose between two modes of operation: pin Mode and serial interface mode. This is done using [mode](#).

9.5 Power Supply Recommendations

9.5.1 Power-Up Sequence

There are no restrictions from the device for applying power to the supply pins. From an application perspective, TI recommends to either apply all VDDs at the same time or apply VDDREF first. The digital core is connected to VDDREF, and thus the settings of the EEPROM are applied automatically. All VDDs should reach 95% of final value within 2 ms. RESETN should be held low before VDDREF reaches 95% of the final value.

TI recommends adding a 4.7-k Ω pullup resistor on RESETN and a 470-nF capacitor to ground to provide additional delay in release of RESETN at power-up. When powering up the CDCI6214 from reset, the rise of the RESETN pin must be delayed to allow the voltage on the VDD pins to stabilize.

An unstable voltage on the VDD pin may cause an improper device startup with the rise of the RESETN pin, resulting in a PLL unlock. VDD instability may occur in cases where VDD is toggled repeatedly and does not ramp with appropriate settling time. The power supply must ramp and be stable within the time specified in the *Timing Characteristics* table. In the event of a PLL unlock at startup, recalibrate the PLL. Either setting the recal bit, R0[4], to a '1' or pulling the RESETN pin low then high will recalibrate the PLL.

9.5.2 De-Coupling

TI recommends isolating all power supplies using a ferrite bead and provide decoupling for each of the supplies. TI also recommends optimizing the decoupling for the respective layout and consider the power supply impedance and optimize for the individual frequency plan.

An example for a decoupling per supply pin: 1x 4.7 μ F, 1x 470 nF, and 1x 100 nF.

9.6 Layout

9.6.1 Layout Guidelines

For this example, follow these guidelines:

- Isolate inputs and outputs using a GND shield. [Figure 9-6](#) routes all inputs and outputs as differential pairs.
- Isolate outputs to adjacent outputs when generating multiple frequencies.
- Isolate the crystal area, connect the GND pads of the crystal package and flood the adjacent area. [Figure 9-7](#) shows a foot print which supports multiple crystal sizes.
- Try to avoid impedance jumps in the fan-in and fan-out areas when possible.
- Use five VIAs to connect the thermal pad to a solid GND plane. Full-through VIAs are preferred.
- Place decoupling capacitors with small capacitance values very close to the supply pins. Try to place them very close on the same layer or directly on the backside layer. Larger values can be placed more far away. [Figure 9-7](#) shows three de-coupling capacitors close to the device. Ferrite beads are recommended to isolate the different frequency domains and the VDDVCO domain.
- Preferably use multiple VIAs to connect wide supply traces to the respective power planes.

10 Register Maps

10.1 CDCI6214 Registers

表 10-1 lists the memory-mapped registers for the CDCI6214.

注

All register offset addresses not listed in 表 10-1 should be considered as reserved locations and the register contents should not be modified.

注

All bit-field combinations not listed in the description column should be considered as reserved combinations and should only be programmed using the given values.

Table 10-3. GENERIC0 Register Field Descriptions

BIT	FIELD	TYPE	RESET	DESCRIPTION
15	i2c_a0	R/W	0h	When regcommit is used to program an EEPROM page, using regcommit_page , this defines the LSB of the I ² C target address. When a configuration is loaded into the registers from an EEPROM page, this represents the saved LSB bit.
14	gpio0_input_sel	R/W	0h	Input signal select for GPIO0, Pin 8. 0h = RESETN 1h = SYNC
13	gpio4_dir_sel	R/W	0h	GPIO4 direction select. 0h = Input 1h = Output
12	gpio1_dir_sel	R/W	0h	GPIO1 direction select. 0h = Input 1h = Output
11	gpio0_dir_sel	R/W	0h	Direction select for Pin 8. 0h = Input 1h = Output
10	zdm_clocksel	R/W	0h	Selects the internal or external clock for calibration, in the ZDM mode. In non-ZDM mode, always internal clock will be selected and this register doesn't have any meaning. 0h = Internal Feedback 1h = External Feedback
9	RESERVED	R/W	0h	RESERVED
8	zdm_mode	R/W	0h	Zero Delay Mode 0h = ZDM Off 1h = ZDM On
7	RESERVED	R/W	0h	RESERVED.
6	pll_rst_lockdet	R/W	0h	Reset (active high) to PLL lock detect circuit.

表 10-3. GENERIC0 Register Field Descriptions (続き)

BIT	FIELD	TYPE	RESET	DESCRIPTION
5	sync	R/WSC	0h	Generates sync pulse (for output decoder). This is a self clearing register bit and writing '1' will create the SYNC pulse.
4	recal	R/WSC	0h	Self clearing bit. Writing '1' will do the re-calibration. For example - after the configuration followed by calibration if '1' is written to this register the calibration engine will start with the current capcode and cross code.
3	resetn_soft	R/W	0h	Configure the pin RESETN/SYNC as a soft reset. 0h = Hard Reset (reset state machines and registers) 1h = Soft Reset (state machines only, register content stays as is)
2	swrst	R/WSC	0h	Soft reset bit. This is a self clearing bit. Writing a '0' has no effect and writing a '1' creates a reset pulse which resets the digital logic except the programmable registers. Also, this soft reset has similar effect on digital logic as hard reset (RESETN/SYNC). Soft reset will restart the configuration and calibration.
1	powerdown	R/WPD	0h	Analog Power Down. 0h = Active 1h = Power down
0	mode	R/W	0h	Mode of Operation. 0h = Serial Interface, I2C 1h = Pin Mode, Output Enable

表 10-6. GENERIC3 Register Field Descriptions

BIT	FIELD	TYPE	RESET	DESCRIPTION
15	disable_crc	R/W	0h	Disable the CRC computation. However if Page is selected CRC will happen after PoR (power on reset from analog). For example- after the calibration if this bit is set to '1' and apply a soft reset (or reset through pin) the configuration will bypass the CRC computation.
14	update_crc	R/WMC	0h	This is a self clearing register bit. Writing a '1' will cause the re-computation of CRC. The computed CRC can be read from the live CRC (nvmlcrc) register after the status bit nvmbusyh = 0.
13	nvmcommit	R/WSC	0h	Commits contents of the EEPROM page selected by REGCOMMIT_PAGE to internal register. This register will self-clear
12	regcommit	R/WSC	0h	Commits contents of the registers to EEPROM selected by REGCOMMIT_PAGE register. This register will self-clear.
11	regcommit_page	R/W	0h	Decide which page of EEPROM to use for the Register/NVM commit operations. Note= this register is used only after the initial power-up configuration from EEPROM if any. Once power-up configuration is done with the page chosen by EEPROMSEL the value of this register will be used for subsequent configurations using Register/NVM commit operations. 0h = Page 0 1h = Page 1

BIT	FIELD	TYPE	RESET	DESCRIPTION
15-12	RESERVED	R	0h	Reserved.
11	lock_det_a	R	0h	Reads the PLL Lock status. 0h: PLL is Unlocked. 1h: PLL is locked.
10	pll_vco_cal_ready	R	0h	VCO Buffer LDO POR can be read through this register.
9	nvm_rd_error	RC	0h	Occurs when any NVM operation is issued during Read Phase of the NVM. The Read Phase of the NVM includes CRC calculation or a simple read through RD NVM Addr/Data registers from any NVM location or a NVM commit operation.
8	nvm_wr_error	RC	0h	Occurs when any NVM operation is issued during Write Phase of the NVM. Write Phase of the NVM includes a simple write into any NVM location through WR NVM Addr/Data registers or a Register Commit operation.
7	rd_error	R	0h	Reading using the I2C interface with an address above the address of the last register gives this error.
6	wr_error	R	0h	Writing using the I2C interface with an address above the address of the last register gives this error.
5	nvmrcrerr	R	0h	NVM CRC Error Indication. The NVMCRCERR bit is set to 1 if a CRC Error has been detected when reading back from on-chip EEPROM during device configuration. This bit will be cleared when NVMCOMMIT is submitted or Update CRC is issued.

表 10-10. STATUS1 Register Field Descriptions (続き)

BIT	FIELD	TYPE	RESET	DESCRIPTION
4	nvmbusy	R	0h	NVM Program Busy Indication. The NVMBUSY bit is 1 during an on-chip EEPROM Erase/Program cycle. While NVMBUSY is 1 the on-chip EEPROM cannot be accessed. When the NVM operation is completed this bit will be cleared. NVM related operations are REGcommit NVMcommit CRC calculation or simple Read/Write through RD/WR NVM.
3	cal_done	R	0h	1h = Calibration (Two rounds of Amplitude followed by calibration) is done.
2	config_done	R	0h	1 h = Configuration (CRC Check followed by transfer of EEPROM to registers) is done.
1	unlock_s	R/WEX	0h	Lock Detect Sticky Bit. This indicates the loss of lock of the PLL and this is cleared only by recalibration or a hard reset through RESETN/ SYNC pin 0h = locked 1h = unlocked
0	lock_det	R	0h	When the calibration is done frequency may or may not be locked. 1h = Frequency is locked. 0h = Otherwise 0h = unlocked 1h = locked

10.1.9 STATUS2 Register (Address = 8h) [reset = 0h]

10.2 EEPROM Map

The EEPROM is split into a common base page which holds common settings. Then there are two pages for customized settings. Page 0 is selected using EEPROMSEL = Low. Page 1 is selected using EEPROMSEL = High.

The CRC value is stored at the end of page 1 in word 0x3F.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Development Support

Contact your TI representative for more information.

11.1.2 Device Nomenclature

CDCI6214 – 62= clock generator 1= 1x PLL 4=4x outputs I = individual output enables

11.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

11.3 サポート・リソース

テキサス・インスツルメンツ E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

11.4 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

11.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

11.6 用語集

[テキサス・インスツルメンツ用語集](#) この用語集には、用語や略語の一覧および定義が記載されています。

12 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision E (October 2019) to Revision F (January 2024)	Page
• 文書全体にわたって表、図、相互参照の採番方法を更新.....	1
• I ² C に言及している場合、すべての旧式の用語をコントローラおよびターゲットに変更.....	1
• Changed Power supply ramp footnote in the <i>Timing Characteristics</i> table	11
• Added additional details on VDD instability and instruction to set recal bit to a '1' to recalibrate the PLL.....	44
• Updated references of chx_lvds_cmtrim_inc = 2 to chx_lvds_cmtrim_inc = 0.....	47

Changes from Revision D (June 2019) to Revision E (October 2019)	Page
• データシートから分数出力分周器 (FOD) およびスペクトラム拡散クロック (SSC) の情報を削除.....	1
• Added footnote to <i>Timing Characteristics</i> table	11

• Removed FOD from <i>Functional Block Diagram</i>	18
• Changed REFSEL selection from L to H.....	20
• Removed <i>Output Channel Divider Types and Delay</i> table	22
• Removed the FOD control bits in the <i>Power Management</i> graphic.....	27
• Added Page-mode EEPROM read instructions.....	30
• Changed <i>Pre-Configured EEPROM Page 0</i> graphic.....	32
• Changed <i>Pre-Configured EEPROM Page 1</i> graphic.....	32
• Added additional details on pullup resistor and load capacitor added to power-up sequence.....	44
• Removed fractional output divider information from the registers	47
• Removed FOD information from the <i>CDCI6214 Registers</i> table.....	47

Changes from Revision C (November 2018) to Revision D (June 2019)	Page
• Added VDDREF and tablenote to the output supply voltage parameter in the <i>Recommended Operating Conditions</i>	5
• Added statement on chX_1p8vdet setting	21
• Changed <i>CDCI6214 - Pre-Configured EEPROM Page 0</i> graphic.....	32

Changes from Revision B (April 2018) to Revision C (November 2018)	Page
• Changed pin names for pins 1 and 2 from: XIN and XOUT to: XOUT/FB_P and XIN/FB_N.....	3
• Changed descriptions for pins 1 and 2.....	3
• Changed pin names for pins 1 and 2 in <i>Absolute Maximum Ratings</i>	5
• Changed pin names for pins 1 and 2 in <i>Reference Input, Single-Ended and Differential Mode Characteristics (REFP, REFN, FB_P, FB_N)</i>	6
• Changed Input capacitance specification symbols in <i>Reference Input, Single-Ended and Differential Mode Characteristics (REFP, REFN, FB_P, FB_N)</i> from: C _{IN_XOUT} and C _{IN_XIN} to: C _{IN_XOUT/FB_P} and C _{IN_XIN/FB_P} ..	6
• Changed pins 1 and 2 from: XIN and XOUT to: XOUT/FB_P and XIN/FB_N in the <i>Functional Block Diagram</i> .	18
• Changed pins 1 and 2 from: XIN and XOUT to: XOUT/FB_P and XIN/FB_N in the <i>Reference Block</i> graphic	19
• Changed External (XIN) pin to: FB_P/N in the <i>Phase-Locked Loop Circuit</i> graphic.....	20
• Changed pins 1 and 2 from: XIN and XOUT to: XOUT/FB_P and XIN/FB_N in the <i>CDCI6214 - Pre-Configured EEPROM Page 0</i> and <i>CDCI6214 - Pre-Configured EEPROM Page 1</i> graphics.....	32
• Changed pins XIN and XOUT to: XOUT/FB_P and XIN/FB_N in the <i>Typical Applications</i> schematics.....	38
• Changed design parameter superscript to a subscript	39

Changes from Revision A (October 2017) to Revision B (April 2018)	Page
• Changed pinout pins 5 and 6 from NC to REFP, REFN inputs.....	3
• Changed supply voltage maximum from: 3.6 V to: 3.65 V.....	5
• Removed Skew between HCSL maximum from the <i>Output Skew and Delay Characteristics</i> table.....	10

Changes from Revision * (July 2017) to Revision A (October 2017)	Page
• デバイスのステータスを「事前情報」から「量産データ」に変更.....	1
• Changed REFSEL pin description to reflx REFMUX control.	23

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

RGE0024B

PACKAGE OUTLINE

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4219013/A 05/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RGE0024B

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

4219013/A 05/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN**RGE0024B****VQFN - 1 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 25
 78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
 SCALE:20X

4219013/A 05/2017

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した テキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている テキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、[テキサス・インスツルメンツの販売条件](#)、または [ti.com](https://www.ti.com) やかかる テキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。テキサス・インスツルメンツがこれらのリソースを提供することは、適用されるテキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。

CDCI6214RGET	NRND	Production	VQFN (RGE) 24	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	CDCI 6214A1
CDCI6214RGET.A	NRND	Production	VQFN (RGE) 24	250 SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	CDCI 6214A1

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
