

DRV8300-Q1 : 100V 3 相 BLDC ゲート・ドライバ

1 特長

- 車載アプリケーション向けに AEC-Q100 認定済み
 - 温度グレード 1: $-40^{\circ}\text{C} \leq \text{TA} \leq 125^{\circ}\text{C}$
- 100V 3 相ハーフブリッジ・ゲート・ドライバ
 - N チャネル MOSFET (NMOS) を駆動
 - ゲート・ドライバ電源 (GVDD): 5~20V
 - MOSFET 電源 (SHx) は最大 100V をサポート
- ブートストラップ・ダイオードを内蔵
- ブートストラップ・ゲート駆動アーキテクチャ
 - 750mA のソース電流
 - 1.5A のシンク電流
- 最大 48V の自動車システムをサポート
- SHx ピンの低リーク電流 (55 μA 未満)
- BSTx 電圧の絶対最大定格: 115V
- SHx で -22V までの負過渡電圧をサポート
- クロス導通防止機能を内蔵
- 215ns の固定デッドタイム挿入
- 3.3V および 5V ロジック入力 (絶対最大定格 20V) をサポート
- 4ns (代表値) の伝搬遅延マッチング
- 小型の TSSOP パッケージ
- パワー・ブロックによる効率的なシステム設計
- 保護機能内蔵
 - BST 低電圧誤動作防止 (BSTUV)
 - GVDD 低電圧 (GVDDUV)

2 アプリケーション

48V の車載用および産業用アプリケーション

- 電動アシスト自転車、E-モビリティ
- 電動スクーター
- コンプレッサ
- HVAC (空調) の送風機
- 車載用のファンおよびブロワー

3 概要

DRV8300-Q1 は、ハイサイドおよびローサイド N チャネル・パワー MOSFET を駆動できる 100V 3 相ハーフブリッジ・ゲート・ドライバです。DRV8300-Q1 は、内蔵ブートストラップ・ダイオードと外付けコンデンサを使ってハイサイド MOSFET のために適切なゲート駆動電圧を生成します。GVDD は、ローサイド MOSFET のゲート駆動電圧を生成するために使います。このゲート駆動アーキテクチャは、ピークで最大 750mA のソース電流と 1.5A のシンク電流に対応します。

位相ピン SHx は大きな負電圧過渡に耐えます。一方、ハイサイド・ゲート・ドライバ電源 BSTx および GHx はさらに大きな正電圧過渡 (絶対最大定格電圧 115V) に対応できるため、システムの堅牢性を高めることができます。伝搬遅延が短く、遅延マッチング仕様によりデッドタイムの要件が最小化されるため、さらに効率が向上します。GVDD と BST の低電圧誤動作防止による低電圧保護機能がローサイドとハイサイドの両方に備わっています。

8 Detailed Description

8.1 Overview

The DRV8300-Q1 is a gate driver for three-phase motor drive applications. These devices decrease system component count, saves PCB space and cost by integrating three independent half-bridge gate drivers and optional bootstrap diodes.

DRV8300-Q1 supports external N-channel high-side and low-side power MOSFETs and can drive 750-mA source, 1.5-A sink peak currents with total combined 30-mA average output current. The DRV8300-Q1 is available in 0.65-mm pitch TSSOP surface-mount packages. The TSSOP body size is 6.5 × 4.4 mm (0.65-mm pin pitch) for the 20-pin package.

8.2 Functional Block Diagram

图 8-1. Block Diagram for DRV8300-Q1

8.3 Feature Description

8.3.1 Three BLDC Gate Drivers

The DRV8300-Q1 integrates three half-bridge gate drivers, each capable of driving high-side and low-side N-channel power MOSFETs. Input on GVDD provides the gate bias voltage for the low-side MOSFETs. The high voltage is generated using bootstrap capacitor and GVDD supply. The half-bridge gate drivers can be used in combination to drive a three-phase motor or separately to drive other types of loads.

8.3.1.1 Gate Drive Timings

8.3.1.1.1 Propagation Delay

The propagation delay time (t_{pd}) is measured as the time between an input logic edge to a detected output change. This time has two parts consisting of the input deglitcher delay and the delay through the analog gate drivers.

The input deglitcher prevents high-frequency noise on the input pins from affecting the output state of the gate drivers. The analog gate drivers have a small delay that contributes to the overall propagation delay of the device.

8.3.1.1.2 Deadtime and Cross-Conduction Prevention

In the DRV8300-Q1, high-side and low-side inputs operate independently, with an exception to prevent cross conduction when high and low side are turned ON at same time. The DRV8300-Q1 turns OFF high-side and low-side output to prevent shoot through when the both high-side and low-side inputs are at logic HIGH at same time.

Fixed deadtime of 215 ns (typical value) is inserted to prevent high and low side gate output turning ON at same time.

8-2. Cross Conduction Prevention and Deadtime Insertion

8.3.1.2 Gate Driver Outputs

Figure 8-3 shows the relation between INHx and INLx inputs and GHx and GLx outputs for DRV8300-Q1.

Figure 8-3. Non-Inverted INLx inputs

8.3.2 Pin Diagrams

Figure 8-4 shows the input structure for the logic level pins INHx, INLx.

Figure 8-4. INHx and INLx Logic-Level Input Pin Structure

8.3.3 Gate Driver Protective Circuits

The DRV8300-Q1 is protected against BSTx undervoltage and GVDD undervoltage events.

Table 8-1. Fault Action and Response

FAULT	CONDITION	GATE DRIVER	RECOVERY
V_{BSTx} undervoltage (BSTUV)	$V_{BSTx} < V_{BSTUV}$	GHx - Hi-Z	Automatic: $V_{BSTx} > V_{BSTUV}$ and low to high PWM edge detected on INHx pin
GVDD undervoltage (GVDDUV)	$V_{GVDD} < V_{GVDDUV}$	Hi-Z	Automatic: $V_{GVDD} > V_{GVDDUV}$

8.3.3.1 V_{BSTx} Undervoltage Lockout (BSTUV)

The DRV8300-Q1 has separate voltage comparator to detect undervoltage condition for each phases. If at any time the voltage on the BSTx pin falls lower than the V_{BSTUV} threshold, high side external MOSFETs of that particular phase is disabled by disabling (Hi-Z) GHx pin. Normal operation starts again when the BSTUV condition clears and low to high PWM edge is detected on INHx input of the same phase that BSTUV condition was detected. BSTUV protection ensures that high-side MOSFETs are not driven when the BSTx pins has lower value.

8.3.3.2 GVDD Undervoltage Lockout (GVDDUV)

If at any time the voltage on the GVDD pin falls lower than the V_{GVDDUV} threshold voltage, all of the external MOSFETs are disabled. Normal operation starts again when the GVDDUV condition clears. GVDDUV protection ensures that external MOSFETs are not driven when the GVDD input is at lower value.

8.4 Device Functional Modes

The DRV8300-Q1 is in operating (active) mode, whenever the GVDD and BST pins are higher than the UV threshold ($V_{GVDD} > V_{GVDDUV}$ and $V_{BSTx} > V_{BSTUV}$). In active mode, the gate driver output GHx and GLx will follow respective inputs INHx and INLx.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DRV8300-Q1 family of devices is primarily used in applications for three-phase brushless DC motor control. The design procedures in the *Typical Application* section highlight how to use and configure the DRV8300-Q1.

9.2 Typical Application

9-1. Application Schematic

9.2.1 Design Requirements

表 9-1 lists the example design input parameters for system design.

表 9-1. Design Parameters

EXAMPLE DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
MOSFET	-	CSD19532Q5B
Gate Supply Voltage	V_{GVDD}	12 V
Gate Charge	Q_G	48 nC

9.2.2 Bootstrap Capacitor and GVDD Capacitor Selection

The bootstrap capacitor must be sized to maintain the bootstrap voltage above the undervoltage lockout for normal operation. 式 1 calculates the maximum allowable voltage drop across the bootstrap capacitor:

$$\Delta V_{BSTX} = V_{GVDD} - V_{BOOTD} - V_{BSTUV} \quad (1)$$

$$= 12 \text{ V} - 0.85 \text{ V} - 4.5 \text{ V} = 6.65 \text{ V}$$

where

- V_{GVDD} is the supply voltage of the gate drive
- V_{BOOTD} is the forward voltage drop of the bootstrap diode
- V_{BSTUV} is the threshold of the bootstrap undervoltage lockout

In this example the allowed voltage drop across bootstrap capacitor is 6.65 V. It is generally recommended that ripple voltage on both the bootstrap capacitor and GVDD capacitor should be minimized as much as possible. Many of commercial, industrial, and automotive applications use ripple value between 0.5 V to 1 V.

The total charge needed per switching cycle can be estimated with 式 2:

$$Q_{TOT} = Q_G + \frac{I_{LBS_TRANS}}{f_{SW}} \quad (2)$$

$$= 48 \text{ nC} + 220 \mu\text{A} / 20 \text{ kHz} = 50 \text{ nC} + 11 \text{ nC} = 61 \text{ nC}$$

where

- Q_G is the total MOSFET gate charge
- I_{LBS_TRAN} is the bootstrap pin leakage current
- f_{SW} is the PWM frequency

The minimum bootstrap capacitor can then be estimated as below assuming 1V ΔV_{BSTX} :

$$C_{BST_MIN} = Q_{TOT} / \Delta V_{BSTX} \quad (3)$$

$$= 61 \text{ nC} / 1 \text{ V} = 61 \text{ nF}$$

The calculated value of minimum bootstrap capacitor is 61 nF. It should be noted that, this value of capacitance is needed at full bias voltage. In practice, the value of the bootstrap capacitor must be greater than calculated value to allow for situations where the power stage may skip pulse due to various transient conditions. It is recommended to use a 100 nF bootstrap capacitor in this example. It is also recommended to include enough margin and place the bootstrap capacitor as close to the BSTx and SHx pins as possible.

$$C_{GVDD} \geq 10 \times C_{BSTX} \quad (4)$$

$$= 10 \times 100 \text{ nF} = 1 \mu\text{F}$$

For this example application choose 1 μF C_{GVDD} capacitor. Choose a capacitor with a voltage rating at least twice the maximum voltage that it will be exposed to because most ceramic capacitors lose significant capacitance when biased. This value also improves the long term reliability of the system.

9.2.3 Application Curves

9-2. Gate voltages, SHx rising with 15 ohm gate resistor and CSD19532Q5B MOSFET

9-3. Gate voltages, SHx falling with 15 ohm gate resistor and CSD19532Q5B MOSFET

10 Power Supply Recommendations

The DRV8300-Q1 is designed to operate from an input voltage supply (GVDD) range from 4.8 V to 20 V. A local bypass capacitor should be placed between the GVDD and GND pins. This capacitor should be located as close to the device as possible. A low ESR, ceramic surface mount capacitor is recommended. It is recommended to use two capacitors across GVDD and GND: a low capacitance ceramic surface-mount capacitor for high frequency filtering placed very close to GVDD and GND pin, and another high capacitance value surfacemount capacitor for device bias requirements. In a similar manner, the current pulses delivered by the GHx pins are sourced from the BSTx pins. Therefore, capacitor across the BSTx to SHx is recommended, it should be high enough capacitance value capacitor to deliver GHx pulses

11 Layout

11.1 Layout Guidelines

- Low ESR/ESL capacitors must be connected close to the device between GVDD and GND and between BSTx and SHx pins to support high peak currents drawn from GVDD and BSTx pins during the turn-on of the external MOSFETs.
- To prevent large voltage transients at the drain of the top MOSFET, a low ESR electrolytic capacitor and a good quality ceramic capacitor must be connected between the high side MOSFET drain and ground.
- In order to avoid large negative transients on the switch node (SHx) pin, the parasitic inductances between the source of the high-side MOSFET and the source of the low-side MOSFET must be minimized.
- In order to avoid unexpected transients, the parasitic inductance of the GHx, SHx, and GLx connections must be minimized. Minimize the trace length and number of vias wherever possible. Minimum 10 mil and typical 15 mil trace width is recommended.
- Place the gate driver as close to the MOSFETs as possible. Confine the high peak currents that charge and discharge the MOSFET gates to a minimal physical area by reducing trace length. This confinement decreases the loop inductance and minimize noise issues on the gate terminals of the MOSFETs.
- Refer to sections *General Routing Techniques* and *MOSFET Placement and Power Stage Routing* in [Application Report](#)

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 サポート・リソース

[TI E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
DRV8300DPWRQ1	Active	Production	TSSOP (PW) 20	3000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	8300D-Q
DRV8300DPWRQ1.A	Active	Production	TSSOP (PW) 20	3000 LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	8300D-Q

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF DRV8300-Q1 :

- Catalog : [DRV8300](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product

4220206/A 02/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

EXAMPLE BOARD LAYOUT

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

4220206/A 02/2017

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

PW0020A

TSSOP - 1.2 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE: 10X

4220206/A 02/2017

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
