JAJSG74C - FEBRUARY 2012 - REVISED SEPTEMBER 2018

DS90C187 低消費電力、1.8Vのデュアル・ピクセルFPD-Link (LVDS)シ リアライザ

1 特長

- 185MHzでの標準消費電力100mW(SIDOモード)
- QXGAおよびWQXGAクラスのディスプレイを駆 動
- 3つの動作モード

TEXAS

INSTRUMENTS

- シングル・ピクセル・イン、シングル・ピクセル・アウト (SISO):最高105MHz
- シングル・ピクセル・イン、デュアル・ピクセル・アウト (SIDO): 最高 185MHz
- デュアル・ピクセル・イン、デュアル・ピクセル・アウト (DIDO): 105MHz
- 24ビットRGBおよび48ビットRGBをサポート
- (オプション)低消費電力モードで18ビットRGB および36ビットRGBをサポート
- 3D+C、4D+C、6D+C、6D+2C、8D+C、8D+2C のLVDS構成をサポート
- FPD-Linkデシリアライザと互換
- 単一の1.8V電源で動作
- 1.8V LVCMOSと直接接続
- スリープ・モードでの消費電力1mW未満
- 拡散スペクトラム・クロック互換
- 小型の7mm×7mm×0.9mm、92ピン、2列のVQFN パッケージ
- 2 アプリケーション
- カメラ監視システム(CMS)
- 車載用ヘッド・ユニット
- スマート・ミラー
- クラスタ

代表的なアプリケーション

3 概要

DS90C187は、携帯用のバッテリ駆動型の低消費電力シ リアライザで、ホストGPUとディスプレイ間のRGBインター フェイスのサイズを低減できます。

DS90C187シリアライザは、ホストとフラット・パネル・ディス プレイとの間で60Hz、QXGA (2048x1536)までの解像度 のデュアル・ピクセル・データ転送をサポートするよう設計 されています。トランスミッタは48ビットまで(24ビット・カ ラーのデュアル・ピクセル)の1.8V LVCMOSデータを、2 チャネルの4データ+クロック(4D+C)、縮小幅インターフェ イスのLVDS互換データ・ストリームに変換します。

DS90C187は、3モードの動作をサポートしています。

- シングル・ピクセル・イン/シングル・ピクセル・アウト・ モードでは、60HzでSXGA+ (1400×1050)までのディ スプレイを駆動できます。このモードでは、デバイスは1 バンクの24ビットRGBデータを、1チャネルの4D+C LVDSデータ・ストリームに変換します。
- シングル・ピクセル・イン/デュアル・ピクセル・アウト・ モードでは、60HzでWUXGA+ (1920×1440)までの ディスプレイを駆動できます。この構成で、デバイスは シングルからデュアルへのピクセル変換を行い、1バン クの24ビットRGBデータを、2チャネルでピクセル・ク ロック速度が半分の4D+C LVDSストリームに変換しま す。

5 概要(続き)

デュアル・ピクセル・イン/デュアル・ピクセル・アウト・モードでは、60HzでQXGA 2048x1536、または30HzでQSXGA 2560x2048までのディスプレイを駆動できます。このモードでは、デバイスは2チャネルの24ビットRGBデータを、2チャネル の4D+C LVDSストリームに変換します。すべてのモードについて、デバイスは18bppおよび24bppカラーをサポートしま す。

DS90C187は、小型の92ピン2列VQFNパッケージで供給され、単一の1.8V電源で動作し、消費電力は最小限です。

7 Specifications

7.1 Absolute Maximum Ratings

See $^{(1)}$

	MIN	MAX	UNIT
Supply Voltage (V _{CC})	-0.3	2.5	V
LVCMOS Input Voltage	-0.3	VDD + 0.3	V
LVDS Driver Output Voltage	-0.3	3.6	V
LVDS Output Short-Circuit Duration	Con	tinuous	
Junction Temperature		150	°C
Storage Temperature (T _{stg})	-65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
		Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±8000	
V _(ESD)	Electrostatic discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 $^{\rm (2)}$	±1250	V
		Machine model	±250	

 JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. [Following sentence optional; see the wiki.] Manufacturing with less than 500-V HBM is possible with the necessary precautions. [Following sentence optional; see the wiki.] Pins listed as ±XXX V may actually have higher performance.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. [Following sentence optional; see the wiki.] Manufacturing with less than 250-V CDM is possible with the necessary precautions. [Following sentence optional; see the wiki.] Pins listed as ±YYY V may actually have higher performance.

7.3 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT

DS90C187 JAJSG74C – FEBRUARY 2012 – REVISED SEPTEMBER 2018

www.tij.co.jp

7.9 Typical Characteristics

8 Detailed Description

8.1 Overview

DS90C187 converts a wide parallel LVCMOS input bus into banks of FPD-Link LVDS data. The device can be configured to support RGB-888 (24-bit color) or RGB-666 (18 bit color) in three main configurations: single pixel in / single pixel out; single pixel out; dual pixel out; dual pixel in / dual pixel out. The DS90C187 has several power saving features including: selectable VOD, 18 bit / 24 bit mode select, and a power down pin control.

8.2 Functional Block Diagrams

Functional Block Diagrams (continued)

DS90C187 JAJSG74C – FEBRUARY 2012 – REVISED SEPTEMBER 2018

Functional Block Diagrams (continued)

8.3 Device Functional Modes

8.3.1 Device Configuration

The MODE0 and MODE1 pins are used to configure the DS90C187 into the three main operation modes as shown in the table below.

MODE1	MODE0	CONFIGURATION
0	0	Single Pixel Input, Single Pixel Output (SISO)
0	1	Single Pixel Input, Dual Pixel Output (SIDO)
1	0	Dual Pixel Input, Dual Pixel Output (DIDO)
1	1	RESERVED

表 1. Mode Configurations

8.3.2 Single Pixel Input / Single Pixel Output

When MODE0 and MODE1 are both set to low, data from INA_[27:0], HS, VS and DE is serialized and driven out on OA_[3:0]+/- with OA_C+/-. If 18B_MODE is LOW, then OA_3+/- is powered down and the corresponding LVCMOS input signals are ignored.

In this configuration IN_CLK can range from 25 MHz to 105 MHz, resulting in a total maximum payload of 700 Mbps (28 bits * 25MHz) to 2.94 Gbps (28 bits * 105 MHz). Each LVDS driver will operate at a speed of 7 bits per input clock cycle, resulting in a serial line rate of 175 Mbps to 735 Mbps. OA_C+/- will operate at the same rate as IN_CLK with a duty cycle ratio of 57:43.

8.3.3 Single Pixel Input / Dual Pixel Output

When MODE0 is HIGH and MODE1 is LOW, data from INA_[27:0], HS, VS and DE is serialized and driven out on OA_[3:0]+/- and OB_[3:0]+/- with OA_C+/- and OB_C+/-. If 18B_MODE is LOW, then OA_3+/- and OB_3+/are powered down and the corresponding LVCMOS input signals are ignored. The input LVCMOS data is split into odd and even pixels starting with the odd (first) pixel outputs OA_[3:0]+/- and then the even (second) pixel outputs OB_[3:0]+/-. The splitting of the data signals starts with DE (data enable) transitioning from logic LOW to HIGH indicating active data (see \boxtimes 10). **The number of clock cycles during blanking must be an EVEN number.** This configuration will allow the user to interface with two FPD-Link receivers or other dual pixel inputs.

In this configuration IN_CLK can range from 50 MHz to 185 MHz, resulting in a total maximum payload of 1.4 Gbps (28 bits * 50 MHz) to 5.18 Gbps (28 bits * 185 MHz). Each LVDS driver will operate at a speed of 7 bits per 2 input clock cycles, resulting in a serial line rate of 175 Mbps to 647.5 Mbps. OA_C+/- and OA_B+/- will operate at ½ the rate as IN_CLK with a duty cycle ratio of 57:43.

- 1. Disable the clock and data.
- 2. Toggle PDB to Low and then High.
- 3. After PDB settles reset the data pattern and enable the clock and data.

8.3.4 Dual Pixel Input / Dual Pixel Output

When MODE0 is LOW and MODE1 is set to HIGH, data from INA_[27:0], HS, VS and DE is serialized and driven out on OA_[3:0]+/- with OA_C+/-, while data from INB_[27:0], HS, VS and DE is serializer and driven out on OB_[3:0]+/- with OB_C+/-. If 18B_MODE is LOW, then OA_3+/- and OB_3+/- is powered down and the corresponding LVCMOS input signals are ignored.

In this configuration IN_CLK can range from 25 MHz to 105 MHz, resulting in a total maximum payload of 1.325 Gbps (53 bits * 25 MHz) to 5.565 Gbps (53 bits * 105 MHz). Each LVDS driver will operate at a speed of 7 bits per input clock cycle, resulting in a serial line rate of 175 Mbps to 735 Mbps. OA_C+/- and OB_C+/- will operate at the same rate as IN_CLK with a duty cycle ratio of 57:43.

8.3.5 Pixel Clock Edge Select (RFB)

The RFB pin determines the edge that the input LVCMOS data is latched on. If RFB is HIGH, input data is latched on the RISING EDGE of the pixel clock (IN_CLK). If RFB is LOW, the input data is latched on the FALLING EDGE of the pixel clock. Note: This can be set independently of receiver's output clock strobe.

www<u>.tij.co.jp</u>

表 2. Pixel Clock Edge

RFB	Result
0	FALLING edge
1	RISING edge

8.3.6 Power Management

The DS90C187 has several features to assist with managing power consumption. The device can be configured through the MODE0 and MODE1 control pins to enable only the required number of LVDS drivers for each application. The 18B_MODE pin allows the DS90C187 to power down the unused LVDS driver(s) for RGB-666 (18 bit color) applications for an additional level of power management. If no clock is applied to the IN_CLK pin, the DS90C187 will enter a low power state. To place the DS90C187 in its lowest power state, the device can be powered down by driving the PDB pin to LOW.

8.3.7 Sleep Mode (PDB)

The DS90C187 provides a power down feature. When the device has been powered down, current draw through the supply pins is minimized and the PLL is shut down. The LVDS drivers are also powered down with their outputs pulled to GND through $100-\Omega$ resistors (not tri-stated).

表 3. Power I	Down Select
--------------	-------------

PDB	Result
0	SLEEP Mode (default)
1	ACTIVE (enabled)

8.3.8 LVDS Outputs

The DS90C187's LVDS drivers are compatible with ANSI/TIA/EIA-644-A LVDS receivers. The LVDS drivers can output a power saving low V_{OD} , or a high V_{OD} to enable longer trace and cable lengths by configuring the VODSEL pin.

VODSEL	Result
0	±220 mV (440 mVpp)
1	±340 mV (680 mVpp)

Any unused LVDS outputs that are not powered down or put into TRI-STATE® due to the MODE0, MODE1, or 18B pins should be externally terminated differentially with a 100 ohm resistor. For example, when driving a timing controller (TCON) that only requires an 8D + C LVDS interface, rather than 8D + 2C, the unused clock line should be terminated near the package of the DS90C187. For more information regarding the output state of unused LVDS drivers, refer to the next section, 18 bit / 24 bit Color Mode (18B). For more information regarding the electrical characteristics of the LVDS outputs, refer to the LVDS DC Characteristics and LVDS Switching Specifications.

8.3.9 18 bit / 24 bit Color Mode (18B)

The 18B pin can be used to further save power by powering down the 4th LVDS driver in each used bank when the application requires only 18 bit color or 3D+C LVDS. Set the 18B pin to logic HIGH to TRI-STATE® OA_3+/- and OB_3+/- (if the device is configured for dual pixel output). For 24 bit color applications this pin should be set to logic LOW. Note that the power down function takes priority over the TRI-STATE® function. So if the device is configured for 18 bit color Single Pixel In/Single Pixel Out, LVDS channel OB_3+/- will be powered down and not TRI-STATE®. If an LVDS driver is powered down, each output terminal is pulled low by a 100 ohm resistor to ground.

表 5. Color DepthCo	nfigurations
--------------------	--------------

18B	Result
0	24bpp, LVDS 4D+C or 8D+2C
1	18bpp, LVDS 3D+C or 6D+2C

8.3.10 LVCMOS Inputs

The DS90C187 has two banks of 24 data inputs, one set of video control signal (HS, VS and DE) inputs and several device configuration LVCMOS pins. All LVCMOS input pins are designed for 1.8 V LVCMOS logic. All LVCMOS inputs, including clock, data and configuration pins, have an internal pull down resistor to set a default state. If any inputs are unused, they can be left as no connect (NC) or connected to ground.

8.4 Programming

8.4.1 LVDS Interface / TFT Color Data Recommended Mapping

Different color mapping options exist. Check with the color mapping of the Deserializer / TCON device that is used to ensure compatible mapping for the application. The DS90C187 supports three modes of operation for single and dual pixel applications supporting either 24bpp or 18bpp color depths.

Programming (continued)

In the Dual Pixel / 24bpp mode, eight LVDS data lines are provided along with two LVDS clock lines (8D+2C). The Deserializer may utilize one or two clock lines. The 53 bit interface typically assigns 24 bits to RGB for the odd pixel, 24 bits to RGB for the even pixel, 3 bits for the video control signals (HS, VS and DE), 1 bit for odd pixel and 1 bit for even pixel which can be ignored or used for general purpose data, control or L/R signaling.

A reduced width input interface is also supported with a Single-to-Dual Pixel conversion where the data is presented at double rate (same clock edge, 2X speed, see) and the DE transition is used to flag the first pixel. Also note in both 8D+2C configurations, the three video control signals are sent over **both** the A and B outputs. The DES / TCON may recover one set, or both depending upon its implementation. The Dual Pixel / 24bpp 8D+2C LVDS Interface Mapping is shown in .

A Dual Pixel / 18bpp mode is also supported. In this configuration OA3 and OB3 LVDS output channels are placed in TRI-STATE® to save power. Their respective inputs are ignored. (215)

In the Single Pixel / 24bpp mode, four LVDS data lines are provided along with a LVDS clock line (4D+C). The 28 bit interface typically assigns 24 bits to RGB color data, 3 bits to video control (HS, VS and DE) and one spare bit can be ignored, used for L/R signaling or function as a general purpose bit. The Single Pixel / 24bpp 4D+C LVDS Interface Mapping is shown in .

A Single Pixel / 18bpp mode is also supported. In this configuration the OA3 LVDS output channel is placed in TRI-STATE® to save power. Its respective inputs are ignored. (217)

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DS90C187 is a Low Power Bridge for automotive application that reduces the size of the RGB interface between the host GPU and the Display. It is designed to support single pixel data transmission between Host and Flat Panel Display up to QXGA (2048x1536) at 60 Hz resolutions. The transmitter converts up to 24 bits (Single Pixel 24 bit color) of 1.8-V LVCMOS data into two channels of 4 data + clock (4D+C) reduced width interface LVDS compatible data streams.

9.2 Typical Application

図 18. Single Pixel In Dual Pixel Out (SIDO) Mode

9.2.1 Design Requirements

The DS90C187 is used to convert 24-bit color to two channels of LVDS datastreams.

表 10. Design Parameters

DESIGN PARAMETER	VALUE
Supply	1.8V
Display Driven	SXGA+, WUXGA+
Pixel Depth	24 bits

9.2.2 Detailed Design Procedure

9.2.2.1 LVDS Interconnect Guidelines

Refer to the AN-1108 Channel-Link PCB and Interconnect Design-In Guidelines (SNLA008) and Transmission Line RAPIDESIGNER Operation and Applications Guide (SNLA035) for full details.

- Use 100-Ω coupled differential pairs
- Use differential connectors when above 500 Mbps
- Minimize skew within the pair
- Use the S/2S/3S rule in spacings
 - S = space between the pairs
 - 2S = space between pairs
 - 3S = space to LVCMOS signals
- Place ground vias next to signal vias when changing between layers
- When a signal changes reference planes, place a bypass cap and vias between the new and old reference plane

For more tips and detailed suggestions regarding high speed board layout principles, see the LVDS Owner's Manual at http://www.ti.com/lvds

9.2.3 Application Curves

10 Power Supply Recommendations

10.1 Power Up Sequence

The V_{DD} power supply pins do not require a specific power on sequence and can be powered on in any order. However, the PDB pin should only be set to logic HIGH once the power sent to all supply pins is stable. Active data inputs should not be applied to the DS90C187 until all of the input power pins have been powered on, settled to the recommended operating voltage and the PDB pin has be set to logic HIGH.

The user experience can be impacted by the way a system powers up and powers down an LCD screen. The following sequence is recommended:

Power up sequence (DS90C187 PDB input initially LOW):

- 1. Ramp up LCD power (maybe 0.5ms to 10ms) but keep backlight turned off.
- 2. Toggle DS90C187 power down pin to PDB = V_{DD} .
- 3. Enable clock and wait for additional 0-200ms to ensure display noise won't occur.
- 4. Enable video source output; start sending black video data.
- 5. Send >1ms of black video data; this allows the DS90C187 to be phase locked, and the display to show black data first.
- 6. Start sending true image data.
- 7. Enable backlight.

Power Down sequence (DS90C187 PDB input initially HIGH):

- 1. Disable LCD backlight; wait for the minimum time specified in the LCD data sheet for the backlight to go low.
- 2. Video source output data switch from active video data to black image data (all visible pixel turn black); drive this for >2 frame times.
- 3. Set DS90C187 power down pin to PDB = GND.
- 4. Disable the video output of the video source.
- 5. Remove power from the LCD panel for lowest system power.

The DS90C187 is highly sensitive to the VDD input. Even small levels on the VDD pin prior to full power up should be avoided. The user should additionally take care to not drive or pull up the CMOS inputs to the device prior to device power up so as to ensure proper power on behavior.

10.2 Power Supply Filtering

The DS90C187 has several power supply pins at 1.8 V. It is important that these pins all be connected and properly bypassed. Bypassing should consist of at least one 0.1 μ F capacitor placed on each pin, with an additional 4.7 μ F - 22 μ F capacitor placed on the PLL supply pin (VDDP). 0.01 μ F capacitors are typically recommended for each pin. Additional filtering including ferrite beads may be necessary for noisy systems. It is recommended to place a 0 ohm resistor at the bypass capacitors that connect to each power pin to allow for additional filtering if needed. A large bulk capacitor is recommended at the point of power entry. This is typically in the 50 μ F — 100 μ F range.

11 Layout

11.1 Layout Guidelines

Circuit board layout and stack-up for the LVDS devices should be designed to provide low-noise power feed to the device. Good layout practice will also separate high frequency or high-level inputs and outputs to minimize unwanted stray noise pickup, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mils) for power / ground sandwiches. This arrangement provides plane capacitance for the PCB power system with low-inductance parasitics, which has proven especially effective at high frequencies, and makes the value and placement of external bypass capacitors less critical. This practice is easier to implement in dense pcbs with many layers and may not be practical in simpler boards. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01 uF to 0.1 uF. Tantalum capacitors may be in the 2.2 uF to 10 uF range. Voltage rating of the tantalum capacitors should be at least 5X the power supply voltage being used.

Surface mount capacitors are recommended due to their smaller parasitics. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. It is recommended to connect power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with vias on both ends of the capacitor.

A small body size X7R chip capacitor, such as 0603, is recommended for external bypass. Its small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20-30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency. Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different sections of the circuit. Separate planes on the PCB are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter many be used to provide clean power to sensitive circuits such as PLLs.

Use at least a four layer board with a power and ground plane. Locate LVCMOS signals away from the LVDS lines to prevent coupling from the LVCMOS lines to the LVDS lines. Closely coupled differential lines of 100 Ohms are typically recommended for LVDS interconnect. The closely coupled lines help to ensure that coupled noise will appear as common mode and thus is rejected by the receivers. The tightly coupled lines will also radiate less.

For more information on the VQFN package, refer to the AN-1187 Leadless Leadframe Package (LLP) application note (SNOA401).

⁽¹⁾ **Status:** For more details on status, see our product life cycle.

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
