

FDC2x1x-Q1 静電容量式センシング アプリケーション用、マルチチャネル、高分解能キャパシタンス デジタル コンバータ

1 特長

- 車載アプリケーション認定済み
- 以下の結果で AEC-Q100 認定済み:
 - デバイス温度グレード 1: 動作時周囲温度範囲 $-40^{\circ}\text{C} \sim +125^{\circ}\text{C}$
 - デバイス HBM ESD 分類レベル 2
 - デバイス CDM ESD 分類レベル C5
- EMI 耐性アーキテクチャ
- 最大出力レート (アクティブ チャネル 1 つ):
 - 13.3kSPS (FDC2112-Q1, FDC2114-Q1)
 - 4.08kSPS (FDC2212-Q1, FDC2214-Q1)
- 最大入力容量: 250nF (10kHz、1mH インダクタ使用時)
- センサ励起周波数: 10kHz ~ 10MHz
- チャネル数: 2、4
- 分解能: 最大 28 ビット
- RMS ノイズ: 100SPS、 $f_{\text{SENSOR}} = 5\text{MHz}$ で 0.3fF
- 電源電圧: 2.7V ~ 3.6V
- 消費電力: アクティブ時: 2.1mA
- 低消費電力スリープ モード: 35μA
- シャットダウン: 200nA
- インターフェイス: I²C
- 温度範囲: $-40^{\circ}\text{C} \sim +125^{\circ}\text{C}$

2 アプリケーション

- 近接センサ
- ジェスチャ認識
- 車載ドア / キック センサ
- 導電性液体用レベル センサ

3 概要

静電容量式センシングは低電力動作、高分解能、非接触のセンシング技法で、近接検出からジェスチャ認識まで幅広いアプリケーションに適用可能です。静電容量式センシング システムのセンサには、任意の金属や導体を使用できるため、柔軟性の高いシステム設計が可能になります。

静電容量式センシング アプリケーションの感度の制約となる主な問題は、センサのノイズ感受性です。FDC2x1x-Q1 では、共振センシング アーキテクチャにより、蛍光灯がある場合でも性能を維持できます。

FDC2x1x-Q1 マルチチャネル ファミリーは、高分解能、高速のキャパシタンス デジタル コンバータであり、静電容量式センシング ソリューションの実装に適しています。これらのデバイスは革新的なナローバンド ベースのアーキテクチャを採用しているため、ノイズの除去性能が高く、高速で高い分解能を実現します。さらに、幅広い励起周波数をサポートしているため、システムを柔軟に設計できます。

パッケージ情報

部品番号	パッケージ ⁽¹⁾	パッケージ サイズ ⁽²⁾
FDC2112-Q1	DNT (WSO, 12)	4mm × 4mm
FDC2114-Q1	RGH (WQFN, 16)	4mm × 4mm
FDC2212-Q1	DNT (WSO, 12)	4mm × 4mm
FDC2214-Q1	RGH (WQFN, 16)	4mm × 4mm

- (1) 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。
- (2) パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

14	IN2B	A	Capacitive sensor input 2 (FDC2114 / FDC2214 only)
15	IN3A	A	Capacitive sensor input 3 (FDC2114 / FDC2214 only)
16	IN3B	A	Capacitive sensor input 3 (FDC2114 / FDC2214 only)
DAP	DAP ⁽²⁾	N/A	Connect to ground

(1) I = Input, O = Output, P=Power, G=Ground, A=Analog

(2) There is an internal electrical connection between the exposed Die Attach Pad (DAP) and the GND pin of the device. Although the DAP can be left floating, connect the DAP to the same potential as the GND pin of the device for best performance. Do not use the DAP as the primary ground for the device. The device GND pin must always be connected to ground.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
VDD	Supply voltage		5	V
Vi	Voltage on any pin	−0.3	VDD + 0.3	V
IA	Input current on any INx pin	−8	8	mA
ID	Input current on any digital pin	−5	5	mA
T _J	Junction temperature	−55	150	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

5.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	V
		Charged-device model (CDM), per AEC Q100-011	
		±2000	
		±750	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

Unless otherwise specified, all limits ensured for T_A = 25°C, VDD = 3.3V

		MIN	NOM	MAX	UNIT
VDD	Supply voltage	2.7		3.6	V
T _A	Operating temperature	−40		125	°C

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		FDC2112 / FDC2212	FDC2214 / FDC2214	UNIT
		DNT (WSON)	RGH (WQFN)	
		12 PINS	16 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	36.7	35.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	36.2	36.2	°C/W
R _{θJB}	Junction-to-board thermal resistance	14	13.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.4	0.4	°C/W
ψ _{JB}	Junction-to-board characterization parameter	14.2	13.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	3.5	3.5	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

5.5 Electrical Characteristics

Unless otherwise specified, all limits ensured for $T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{V}^{(1)}$

PARAMETER		TEST CONDITIONS ⁽²⁾	MIN ⁽³⁾	TYP ⁽⁴⁾	MAX ⁽³⁾	UNIT
POWER						
V _{DD}	Supply voltage	T _A = −40°C to 125°C	2.7		3.6	V
I _{DD}	Supply current (not including sensor current) ⁽⁵⁾	CLKIN = 10MHz ⁽⁶⁾		2.1		mA
I _{DDSL}	Sleep mode supply current ⁽⁵⁾			35	60	μA
I _{SD}	Shutdown mode supply current ⁽⁵⁾			0.2	1	μA
CAPACITIVE SENSOR						
C _{SENSORMAX}	Maximum sensor capacitance	1-mH inductor, 10kHz oscillation		250		nF
C _{IN}	Sensor pin parasitic capacitance			4		pF
N _{BITS}	Number of bits	FDC2112, FDC2114 RCOUNT ≥ 0x0400			12	bits
		FDC2212, FDC2214 RCOUNT = 0xFFFF			28	bits
f _{CS}	Maximum channel sample rate	FDC2112, FDC2114 single active channel continuous conversion, SCL = 400kHz			13.3	kSPS
		FDC2212, FDC2214 single active channel continuous conversion, SCL= 400kHz			4.08	kSPS
EXCITATION						
f _{SENSOR}	Sensor excitation frequency	T _A = −40°C to 125°C	0.01		10	MHz
V _{SENSORMIN}	Minimum sensor oscillation amplitude (pk) ⁽⁷⁾			1.2		V
V _{SENSORMAX}	Maximum sensor oscillation amplitude (pk)			1.8		V
I _{SENSORMAX}	Sensor maximum current drive	HIGH_CURRENT_DRV = b0 DRIVE_CURRENT_CH0 = 0xF800		1.5		mA
		HIGH_CURRENT_DRV = b1 DRIVE_CURRENT_CH0 = 0xF800 Channel 0 only		6		mA

Unless otherwise specified, all limits ensured for $T_A = 25^\circ\text{C}$, $V_{DD} = 3.3\text{V}$ ⁽¹⁾

PARAMETER		TEST CONDITIONS ⁽²⁾	MIN ⁽³⁾	TYP ⁽⁴⁾	MAX ⁽³⁾	UNIT
CONTROLLER CLOCK						
f_{CLKIN}	External controller clock input frequency (CLKIN)	$T_A = -40^\circ\text{C}$ to 125°C	2		40	MHz
$\text{CLKIN}_{\text{DUTY_MIN}}$	External controller clock minimum acceptable duty cycle (CLKIN)			40%		
$\text{CLKIN}_{\text{DUTY_MAX}}$	External controller clock maximum acceptable duty cycle (CLKIN)			60%		
$V_{\text{CLKIN_LO}}$	CLKIN low voltage threshold				$0.3V_{DD}$	V
$V_{\text{CLKIN_HI}}$	CLKIN high voltage threshold		$0.7 \times V_{DD}$			V
f_{INTCLK}	Internal controller clock frequency range		35	43.4	55	MHz
$T_{\text{Cf_int_}\mu}$	Internal controller clock temperature coefficient mean			-13		ppm/ $^\circ\text{C}$

- (1) *Electrical Characteristics* values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. *Absolute Maximum Ratings* indicate junction temperature limits beyond which the device can be permanently degraded, either mechanically or electrically.
- (2) Register values are represented as either binary (b is the prefix to the digits), or hexadecimal (0x is the prefix to the digits). Decimal values have no prefix.
- (3) Limits are specified by testing, design, or statistical analysis at 25°C . Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.
- (4) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values can vary over time and also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (5) I²C read/write communication and pullup resistors current through SCL, SDA not included.
- (6) Sensor capacitor: 1 layer, $20.9 \times 13.9\text{mm}$, Bourns CMH322522-180KL sensor inductor with $L=18\mu\text{H}$ and 33pF 1% COG/NP0 Target: Grounded aluminum plate ($176 \times 123\text{mm}$), Channel = Channel 0 (continuous mode) $\text{CLKIN} = 40\text{MHz}$, $\text{CHx_FIN_SEL} = \text{b}10$, $\text{CHx_FREF_DIVIDER} = \text{b}00\ 0000\ 0001$ $\text{CH0_RCOUNT} = 0\text{x}FFFF$, $\text{SETTLECOUNT_CH0} = 0\text{x}0100$, $\text{DRIVE_CURRENT_CH0} = 0\text{x}7800$.
- (7) Lower $V_{\text{SENSORMIN}}$ oscillation amplitudes can be used, but will result in lower SNR.

5.6 Timing Requirements

		MIN	NOM	MAX	UNIT
t_{SDWAKEUP}	Wake-up time from SD high-low transition to I ² C readback			2	ms
$t_{\text{SLEEPWAKEUP}}$	Wake-up time from sleep mode			0.05	ms
$t_{\text{WD-TIMEOUT}}$	Sensor recovery time (after watchdog timeout)		5.2		ms
I²C TIMING CHARACTERISTICS					
f_{SCL}	Clock frequency	10		400	kHz
t_{LOW}	Clock low time	1.3			μs
t_{HIGH}	Clock high time	0.6			μs
$t_{\text{HD,STA}}$	Hold time (repeated) START condition: after this period, the first clock pulse is generated	0.6			μs
$t_{\text{SU,STA}}$	Setup time for a repeated START condition	0.6			μs
$t_{\text{HD,DAT}}$	Data hold time	0			μs
$t_{\text{SU,DAT}}$	Data setup time	100			ns
$t_{\text{SU,STO}}$	Setup time for STOP condition	0.6			μs
t_{BUF}	Bus free time between a STOP and START condition	1.3			μs
$t_{\text{VD,DAT}}$	Data valid time			0.9	μs
$t_{\text{VD,ACK}}$	Data valid acknowledge time			0.9	μs
t_{SP}	Pulse width of spikes that must be suppressed by the input filter ⁽¹⁾			50	ns

5.7 Switching Characteristics - I²C

Unless otherwise specified, all limits ensured for T_A = 25°C, V_{DD} = 3.3V

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
VOLTAGE LEVELS					
V _{IH}	Input high voltage	0.7 × V _{DD}			V
V _{IL}	Input low voltage			0.3 × V _{DD}	V
V _{OL}	Output low voltage (3mA sink current)			0.4	V
HYS	Hysteresis		0.1 × V _{DD}		V

(1) This parameter is specified by design and/or characterization and is not tested in production.

6 Detailed Description

6.1 Overview

The FDC2112, FDC2114, FDC2212, and FDC2214 are high-resolution, multichannel capacitance-to-digital converters for implementing capacitive sensing solutions. In contrast to traditional switched-capacitance architectures, the FDC2112, FDC2114, FDC2212, and FDC2214 employ an L-C resonator, also known as L-C tank, as a sensor. The narrow-band architecture allows unprecedented EMI immunity and greatly reduced noise floor when compared to other capacitive sensing solutions.

Using this approach, a change in capacitance of the L-C tank can be observed as a shift in the resonant frequency. Using this principle, the FDC is a capacitance-to-digital converter (FDC) that measures the oscillation frequency of an LC resonator. The device outputs a digital value that is proportional to frequency. This frequency measurement can be converted to an equivalent capacitance

6.2 Functional Block Diagrams

FIG 6-1. Block Diagram for the FDC2112 and FDC2212

FIG 6-2. Block Diagram for the FDC2114 and FDC2214

The FDC is composed of front-end resonant circuit drivers, followed by a multiplexer that sequences through the active channels, connecting them to the core that measures and digitizes the sensor frequency (f_{SENSOR}). The core uses a reference frequency (f_{REF}) to measure the sensor frequency. f_{REF} is derived from either an internal reference clock (oscillator), or an externally supplied clock. The digitized output for each channel is proportional

to the ratio of $f_{\text{SENSOR}}/f_{\text{REF}}$. The I²C interface is used to support device configuration and to transmit the digitized frequency values to a host processor. The FDC can be placed in shutdown mode, saving current, using the SD pin. The INTB pin may be configured to notify the host of changes in system status.

6.3 Feature Description

6.3.1 Clocking Architecture

Figure 6-3 shows the clock dividers and multiplexers of the FDC.

Copyright © 2016, Texas Instruments Incorporated

A. FDC2114 / FDC2214 only

Figure 6-3. Clocking Diagram

In Figure 6-3, the key clocks are f_{IN} , f_{REF} , and f_{CLK} . f_{CLK} is selected from either the internal clock source or external clock source (CLKIN). The frequency measurement reference clock, f_{REF} , is derived from the f_{CLK} source. TI recommends that precision applications use an external controller clock that offers the stability and accuracy requirements needed for the application. The internal oscillator may be used in applications that require low cost and do not require high precision. The f_{INx} clock is derived from sensor frequency for a channel x, f_{SENSORx} . f_{REFx} and f_{INx} must meet the requirements listed in Table 6-1, depending on whether f_{CLK} (controller clock) is the internal or external clock.

表 6-1. Clock Configuration Requirements

MODE ⁽¹⁾	CLKIN SOURCE	VALID f_{REFx} RANGE (MHz)	VALID f_{INx} RANGE	SET CHx_FIN_SEL to ⁽²⁾	SET CHx_SETTLECO UNT to	SET CHx_RCOUNT to
Multi-channel	Internal	$f_{REFx} \leq 55$	$< f_{REFx} / 4$	Differential sensor configuration: b01: 0.01MHz to 8.75MHz (divide by 1) b10: 5MHz to 10MHz (divide by 2) Single-ended sensor configuration b10: 0.01MHz to 10MHz (divide by 2)	> 3	> 8
	External	$f_{REFx} \leq 40$				
Single-channel	Either external or internal	$f_{REFx} \leq 35$				

(1) Channels 2 and 3 are only available for FDC2114 and FDC2214.

(2) Refer to [Sensor Configuration](#) for information on differential and single-ended sensor configurations.

表 6-2 shows the clock configuration registers for all channels.

表 6-2. Clock Configuration Registers

CHANNEL ⁽¹⁾	CLOCK	REGISTER	FIELD [BIT(S)]	VALUE
All	f_{CLK} = Controller Clock Source	CONFIG, addr 0x1A	REF_CLK_SRC [9]	b0 = internal oscillator is used as the controller clock b1 = external clock source is used as the controller clock
0	f_{REF0}	CLOCK_DIVIDERS _CH0, addr 0x14	CH0_FREF_DIVIDER [9:0]	$f_{REF0} = f_{CLK} / CH0_FREF_DIVIDER$
1	f_{REF1}	CLOCK_DIVIDERS _CH1, addr 0x15	CH1_FREF_DIVIDER [9:0]	$f_{REF1} = f_{CLK} / CH1_FREF_DIVIDER$
2	f_{REF2}	CLOCK_DIVIDERS _CH2, addr 0x16	CH2_FREF_DIVIDER [9:0]	$f_{REF2} = f_{CLK} / CH2_FREF_DIVIDER$
3	f_{REF3}	CLOCK_DIVIDERS _CH3, addr 0x17	CH3_FREF_DIVIDER [9:0]	$f_{REF3} = f_{CLK} / CH3_FREF_DIVIDER$
0	f_{IN0}	CLOCK_DIVIDERS _CH0, addr 0x14	CH0_FIN_SEL [13:12]	$f_{IN0} = f_{SENSOR0} / CH0_FIN_SEL$
1	f_{IN1}	CLOCK_DIVIDERS _CH1, addr 0x15	CH1_FIN_SEL [13:12]	$f_{IN1} = f_{SENSOR1} / CH1_FIN_SEL$
2	f_{IN2}	CLOCK_DIVIDERS _CH2, addr 0x16	CH2_FIN_SEL [13:12]	$f_{IN2} = f_{SENSOR2} / CH2_FIN_SEL$
3	f_{IN3}	CLOCK_DIVIDERS _CH3, addr 0x17	CH3_FIN_SEL [13:12]	$f_{IN3} = f_{SENSOR3} / CH3_FIN_SEL$

(1) Channels 2 and 3 are only available for FDC2114 and FDC2214

6.3.2 Multi-Channel and Single-Channel Operation

The multi-channel package of the FDC enables the user to save board space and support flexible system design. For example, temperature drift can often cause a shift in component values, resulting in a shift in resonant frequency of the sensor. Using a second sensor as a reference provides the capability to cancel out a temperature shift. When operated in multi-channel mode, the FDC sequentially samples the active channels. In single-channel mode, the FDC samples a single channel, which is selectable. 表 6-3 shows the registers and values that are used to configure either multi-channel or single-channel modes.

表 6-3. Single- and Multi-Channel Configuration Registers

MODE	REGISTER	FIELD [BIT(S)]	VALUE
Single channel	CONFIG, addr 0x1A	ACTIVE_CHAN [15:14]	00 = chan 0
			01 = chan 1
			10 = chan 2
			11 = chan 3
Multi-channel	MUX_CONFIG addr 0x1B	AUTOSCAN_EN [15]	0 = continuous conversion on a single channel (default)
	MUX_CONFIG addr 0x1B	AUTOSCAN_EN [15]	1 = continuous conversion on multiple channels
	MUX_CONFIG addr 0x1B	RR_SEQUENCE [14:13]	00 = Ch0, Ch 1
			01 = Ch0, Ch 1, Ch 2
			10 = Ch0, CH1, Ch2, Ch3

The digitized sensor measurement for each channel (DATA_x) represents the ratio of the sensor frequency to the reference frequency.

The data output (DATA_x) of the FDC2112 and FDC2114 is expressed as the 12 MSBs of a 16-bit result:

$$DATA_x = \frac{f_{SENSORx} * 2^{12}}{f_{REFx}} \quad (1)$$

The data output (DATA_x) of the FDC2212 and FDC2214 is expressed as:

$$DATA_x = \frac{f_{SENSORx} * 2^{28}}{f_{REFx}} \quad (2)$$

表 6-4 lists the registers that contain the fixed point sample values for each channel.

表 6-4. Sample Data Registers

CHANNEL ⁽²⁾	REGISTER ⁽¹⁾	FIELD NAME [BITS(S)] AND VALUE (FDC2112, FDC2114)	FIELD NAME [BITS(S)] AND VALUE (FDC2212, FDC2214) ^{(3) (4)}
0	DATA_CH0, addr 0x00	DATA0 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range	DATA0 [27:16]: 12 MSBs of the 28 bit conversion result
	DATA_LSB_CH0, addr 0x01	Not applicable	DATA0 [15:0]: 16 LSBs of the 28 bit conversion result
1	DATA_CH1, addr 0x02	DATA1 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range	DATA1 [27:16]: 12 MSBs of the 28 bit conversion result
	DATA_LSB_CH1, addr 0x03	Not applicable	DATA1 [15:0]: 16 LSBs of the 28 bit conversion result
2	DATA_CH2, addr 0x04	DATA2 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range	DATA2 [27:16]: 12 MSBs of the 28 bit conversion result
	DATA_LSB_CH2, addr 0x05	Not applicable	DATA2 [15:0]: 16 LSBs of the 28 bit conversion result

表 6-4. Sample Data Registers (続き)

CHANNEL ⁽²⁾	REGISTER ⁽¹⁾	FIELD NAME [BITS(S)] AND VALUE (FDC2112, FDC2114)	FIELD NAME [BITS(S)] AND VALUE (FDC2212, FDC2214) ^{(3) (4)}
3	DATA_CH3, addr 0x06	DATA3 [11:0]: 12 bits of the 16 bit conversion result. 0x000 = under range 0xfff = over range	DATA3 [27:16]: 12 MSBs of the 28 bit conversion result
	DATA_LSB_CH3, addr 0x07	Not applicable	DATA3 [15:0]: 16 LSBs of the 28 bit conversion result

- (1) The DATA_CHx.DATAx register must always be read first, followed by the DATA_LSB_CHx.DATAx register of the same channel to ensure data coherency.
(2) Channels 2 and 3 are only available for FDC2114 and FDC2214.
(3) A DATA value of 0x0000000 = under range for FDC2212/FDC2214.
(4) A DATA value of 0xffffffff = over range for FDC2212/FDC2214.

When the FDC sequences through the channels in multi-channel mode, the dwell time interval for each channel is the sum of three parts:

1. sensor activation time
2. conversion time
3. channel switch delay

The sensor activation time is the amount of settling time required for the sensor oscillation to stabilize, as shown in 図 6-4. The settling wait time is programmable, and TI recommends setting the wait time to a value that is long enough to allow stable oscillation. The settling wait time for channel x is given by:

$$t_{Sx} = (\text{CHX_SETTLECOUNT} \times 16) / f_{\text{REFx}} \quad (3)$$

表 6-5 illustrates the registers and values for configuring the settling time for each channel.

図 6-4. Multi-Channel Mode Sequencing

図 6-5. Single-Channel Mode Sequencing

表 6-5. Settling Time Register Configuration

CHANNEL ⁽¹⁾	REGISTER	FIELD	CONVERSION TIME ⁽²⁾
0	SETTLECOUNT_CH0, addr 0x10	CH0_SETTLECOUNT [15:0]	(CH0_SETTLECOUNT*16)/f _{REF0}
1	SETTLECOUNT_CH1, addr 0x11	CH1_SETTLECOUNT [15:0]	(CH1_SETTLECOUNT*16)/f _{REF1}
2	SETTLECOUNT_CH2, addr 0x12	CH2_SETTLECOUNT [15:0]	(CH2_SETTLECOUNT*16)/f _{REF2}
3	SETTLECOUNT_CH3, addr 0x13	CH3_SETTLECOUNT [15:0]	(CH3_SETTLECOUNT*16)/f _{REF3}

(1) Channels 2 and 3 are available only in the FDC2114 and FDC2214.

(2) f_{REFx} is the reference frequency configured for the channel.

The SETTLECOUNT for any channel x must satisfy:

- $CHx_SETTLECOUNT > V_{pk} \times f_{REFx} \times C \times \pi^2 / (32 \times IDRIVE_x)$ (4)
- where
 - V_{pk} = Peak oscillation amplitude at the programmed IDRIVE setting
 - f_{REFx} = Reference frequency for Channel x
 - C = sensor capacitance including parasitic PCB capacitance
 - IDRIVE_x = setting programmed into the IDRIVE register in amps
- Round the result to the next highest integer (for example, if 式 4 recommends a minimum value of 6.08, program the register to 7 or higher).
- The conversion time represents the number of reference clock cycles used to measure the sensor frequency and is set by the CHx_RCOUNT register for the channel. The conversion time for any channel x is:
- $t_{Cx} = (CHx_RCOUNT \times 16 + 4) / f_{REFx}$ (5)
- The reference count value must be chosen to support the required number of effective bits (ENOB). For example, if an ENOB of 13 bits is required, then a minimum conversion time of 2¹³ = 8192 clock cycles is required. 8192 clock cycles correspond to a CHx_RCOUNT value of 0x0200.

表 6-6. Conversion Time Configuration Registers, Channels 0 - 3⁽¹⁾

CHANNEL	REGISTER	FIELD [BIT(S)]	CONVERSION TIME
0	RCOUNT_CH0, addr 0x08	CH0_RCOUNT [15:0]	(CH0_RCOUNT × 16)/f _{REF0}
1	RCOUNT_CH1, addr 0x09	CH1_RCOUNT [15:0]	(CH1_RCOUNT × 16)/f _{REF1}
2	RCOUNT_CH2, addr 0x0A	CH2_RCOUNT [15:0]	(CH2_RCOUNT × 16)/f _{REF2}
3	RCOUNT_CH3, addr 0x0B	CH3_RCOUNT [15:0]	(CH3_RCOUNT × 16)/f _{REF3}

(1) Channels 2 and 3 are available only for FDC2114 and FDC2214.

The typical channel switch delay time between the end of conversion and the beginning of sensor activation of the subsequent channel is:

$$\text{Channel Switch Delay} = 692\text{ns} + 5 / f_{ref} \quad (6)$$

The deterministic conversion time of the FDC allows data polling at a fixed interval. For example, if the programmed SETTLECOUNT is 128 F_{REF} cycles (SETTLECOUNT = 0x0008) and RCOUNT is 512 F_{REF} cycles (RCOUNT=0x0020), then one conversion takes 3.2ms (sensor-activation time) + 12.8ms (conversion time) + 0.8μs (channel-switch delay) = 16.0ms per channel. If the FDC is configured for dual-channel operation by setting AUTOSCAN_EN = 1 and RR_SEQUENCE = 00, then one full set of conversion results is available from the data registers every 32ms.

A data ready flag (DRDY) is also available for interrupt driven system designs (see the STATUS register description in [Register Maps](#)).

6.3.3 Current Drive Control Registers

The registers listed in 表 6-7 are used to control the sensor drive current. Follow the recommendations listed in the last column of the table.

表 6-7. Current Drive Control Registers

CHANNEL ⁽¹⁾	REGISTER	FIELD [BIT(S)]	VALUE
All	CONFIG, addr 0x1A	SENSOR_ACTIVATE_SEL [11]	Sets current drive for sensor activation. Recommended value is b0 (full current mode).
0	CONFIG, addr 0x1A	HIGH_CURRENT_DRV [6]	b0 = normal current drive (1.5mA) b1 = Increased current drive (> 1.5mA) for Ch 0 in single channel mode only. Cannot be used in multi-channel mode.
0	DRIVE_CURRENT_CH0, addr 0x1E	CH0_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 0. Set such that $1.2V \leq$ sensor oscillation amplitude (pk) $\leq$ 1.8V
1	DRIVE_CURRENT_CH1, addr 0x1F	CH1_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 1. Set such that $1.2V \leq$ sensor oscillation amplitude (pk) $\leq$ 1.8V
2	DRIVE_CURRENT_CH2, addr 0x20	CH2_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 2. Set such that $1.2V \leq$ sensor oscillation amplitude (pk) $\leq$ 1.8V
3	DRIVE_CURRENT_CH3, addr 0x21	CH3_IDRIVE [15:11]	Drive current used during the settling and conversion time for Ch. 3. Set such that $1.2V \leq$ sensor oscillation amplitude (pk) $\leq$ 1.8V

(1) Channels 2 and 3 are available for FDC2114 and FDC2214 only.

Program the CHx_IDRIVE field such that the sensor oscillates at an amplitude between 1.2Vpk ($V_{\text{SENSORMIN}}$) and 1.8Vpk ($V_{\text{SENSORMAX}}$). An IDRIVE value of 00000 corresponds to 16 μ A, and IDRIVE = b11111 corresponds to 1563 μ A.

A high sensor current drive mode can be enabled to drive sensor coils with > 1.5mA on channel 0, only in single channel mode. This feature can be used when the sensor minimum recommended oscillation amplitude of 1.2V cannot be achieved with the highest IDRIVE setting. Set the HIGH_CURRENT_DRV register bit to b1 to enable this mode.

6.3.4 Device Status Registers

The registers listed in 表 6-8 may be used to read device status.

表 6-8. Status Registers

CHANNEL ⁽¹⁾	REGISTER	FIELDS [BIT(S)]	VALUES
All	STATUS, addr 0x18	12 fields are available that contain various status bits [15:0]	Refer to Register Maps for a description of the individual status bits.
All	STATUS_CONFIG, addr 0x19	12 fields are available that are used to configure status reporting [15:0]	Refer to Register Maps for a description of the individual error configuration bits.

(1) Channels 2 and 3 are available for FDC2114 and FDC2214 only.

See the STATUS and STATUS_CONFIG register description in [Register Maps](#). These registers can be configured to trigger an interrupt on the INTB pin for certain events. The following conditions must be met:

1. The error or status register must be unmasked by enabling the appropriate register bit in the STATUS_CONFIG register

2. The INTB function must be enabled by setting CONFIG.INTB_DIS to 0

When a bit field in the STATUS register is set, the entire STATUS register content is held until read or until the DATA_CHx register is read. Reading also deasserts INTB.

Interrupts are cleared by one of the following events:

1. Entering sleep mode
2. Power-on reset (POR)
3. Device enters shutdown mode (SD is asserted)
4. S/W reset
5. I²C read of the STATUS register: Reading the STATUS register clears any error status bit set in STATUS along with the ERR_CHAN field and deassert INTB

Setting register CONFIG.INTB_DIS to b1 disables the INTB function and holds the INTB pin high.

6.3.5 Input Deglitch Filter

The input deglitch filter suppresses EMI and ringing above the sensor frequency. The input deglitch filter does not impact the conversion result as long as its bandwidth is configured to be above the maximum sensor frequency. The input deglitch filter can be configured in MUX_CONFIG.DEGLITCH register field as shown in 表 6-9. For optimal performance, TI recommends selection of the lowest setting that exceeds the sensor oscillation frequency. For example, if the maximum sensor frequency is 2MHz, choose MUX_CONFIG.DEGLITCH = b100 (3.3MHz).

表 6-9. Input Deglitch Filter Register

CHANNEL ⁽¹⁾	MUX_CONFIG.DEGLITCH (addr 0x1B) REGISTER VALUE	DEGLITCH FREQUENCY
ALL	001	1MHz
ALL	100	3.3MHz
ALL	101	10MHz
ALL	011	33MHz

(1) Channels 2 and 3 are available for FDC2114 / FDC2214 only.

6.4 Device Functional Modes

6.4.1 Start-Up Mode

When the FDC powers up, the FDC enters sleep mode and waits for configuration. When the device is configured, exit sleep mode by setting CONFIG.SLEEP_MODE_EN to b0.

TI recommends configuring the FDC while in sleep mode. If a setting on the FDC needs to be changed, return the device to sleep mode, change the appropriate register, and then exit sleep mode.

6.4.2 Normal (Conversion) Mode

When operating in the normal (conversion) mode, the FDC is periodically sampling the frequency of the sensor(s) and generating sample outputs for the active channel(s).

6.4.3 Sleep Mode

Sleep mode is entered by setting the CONFIG.SLEEP_MODE_EN register field to 1. While in this mode, the device configuration is maintained. To exit sleep mode, set the CONFIG.SLEEP_MODE_EN register field to 0. After setting CONFIG.SLEEP_MODE_EN to b0, sensor activation for the first conversion begins after 16,384 f_{INT} clock cycles. While in sleep mode the I²C interface is functional so that register reads and writes can be performed. While in sleep mode, no conversions are performed. In addition, entering sleep mode clears conversion results, any error condition, and deassert the INTB pin.

6.4.4 Shutdown Mode

When the SD pin is set to high, the FDC enters shutdown mode. Shutdown mode is the lowest power state. To exit shutdown mode, set the SD pin to low. Entering shutdown mode returns all registers to their default state.

While in shutdown mode, no conversions are performed. In addition, entering shutdown mode clears any error condition and deasserts the INTB pin. While the device is in shutdown mode, is not possible to read to or write from the device via the I²C interface.

6.4.4.1 Reset

The FDC can be reset by writing to RESET_DEV.RESET_DEV. Any active conversion stops, and all register values return to their default value. This register bit always returns 0b when read.

6.5 Programming

The FDC device uses an I²C interface to access control and data registers.

6.5.1 I²C Interface Specifications

The FDC uses an extended start sequence with I²C for register access. The maximum speed of the I²C interface is 400 kbit/s. This sequence follows the standard I²C 7-bit target address followed by an 8-bit pointer register byte to set the register address. When the ADDR pin is set low, the FDC I²C address is 0x2A; when the ADDR pin is set high, the FDC I²C address is 0x2B. The ADDR pin must not change state after the FDC exits Shutdown Mode.

图 6-6. I²C Write Register Sequence

图 6-7. I²C Read Register Sequence

6.6 Register Maps

6.6.1 Register List

Fields indicated with Reserved must be written only with indicated values, otherwise improper device operation may occur. The R/W column indicates the Read-Write status of the corresponding field. A 'R/W' entry indicates read and write capability, a 'R' indicates read-only, and a 'W' indicates write-only.

図 6-8. Register List

ADDRESS	NAME	DEFAULT VALUE	DESCRIPTION

7 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

7.1 Application Information

7.1.1 Sensor Configuration

The FDC supports two sensor configurations. Both configurations use an LC tank to set the frequency of oscillation. A typical choice is an 18- μ H shielded SMD inductor in parallel with a 33pF capacitor, which result in a 6.5MHz oscillation frequency. In the single-ended configuration in [Figure 7-1](#), a conductive plate is connected to IN0A. Together with a target object, the conductive plate forms a variable capacitor.

Copyright © 2016, Texas Instruments Incorporated

Figure 7-1. Single-Ended Sensor Configuration

In the differential sensor configuration in [Figure 7-2](#), one conductive plate is connected to IN0A, and a second conductive plate is connected to IN0B. Together, they form a variable capacitor. When using an single-ended sensor configuration, set CHx_FIN_SEL to b10 (divide by 2).

Copyright © 2016, Texas Instruments Incorporated

Figure 7-2. Differential Sensor Configuration

The single-ended configuration allows higher sensing range than the differential configuration for a given total sensor plate area. In applications in which high sensitivity at close proximity is desired, the differential configuration performs better than the single-ended configuration.

7.1.2 Shield

in order to minimize interference from external objects, some applications require an additional plate which acts as a shield. The shield can either be:

- actively driven shield: The shield is a buffered signal of the INxA pin. The signal is buffered by an external amplifier with a gain of 1.
- passive shield: The shield is connected to GND. Adding a passive shield decreases sensitivity of the sensor, but is dependent on the distance between the sensing plate and the shield. Adjust the distance between the sensing plate and the shield to achieve the required sensitivity.

7.1.3 Power-Cycled Applications

For applications which do not require high sample rates or maximum conversion resolution, the total active conversion time of the FDC can be minimized to reduce power consumption. This can be done by either by using sleep mode or shutdown mode during times in which conversions are not required (see [Device Functional Modes](#)).

As an example, for an application which only needs 10 samples per second with a resolution of 16 bits can utilize the low-power modes. The sensor requires SETTLECOUNT = 16 and IDRIVE of 01111b (0.146mA). Given FREF = 40MHz and RCOUNT = 4096 will provide the resolution required. This corresponds to $4096 \times 16 \times 10 / 40\text{MHz} \rightarrow 16.4\text{ms}$ of active conversion time per second. Start-up time and channel switch delay account for an additional 0.34ms. For the remainder of the time, the device can be in sleep mode: Therefore, the average current is $19.4\text{ms} \times 3.6\text{mA}$ active current + 980.6ms of $35\mu\text{A}$ of sleep current, which is approximately $104.6\mu\text{A}$ of average supply current. Sleep mode retains register settings and therefore requires less I²C writes to wake up the FDC than shutdown mode.

Greater current savings can be realized by use of shutdown mode during inactive periods. In shutdown mode, device configuration is not retained, so the device must be configured for each sample. For this example, configuring each sample takes approximately 1.2ms (13 registers $\times$ 92.5 μs per register). The total active time is 20.6ms. The average current is $20\text{ms} \times 3.6\text{mA}$ active current + $980\text{ms} \times 2\mu\text{A}$ of shutdown current, which is approximately $75\mu\text{A}$ of average supply current.

For further information on power-cycled applications, refer to [Power Reduction Techniques for the FDC2214/2212/2114/2112 in Capacitive Sensing Applications](#).

7.1.4 Inductor Self-Resonant Frequency

Every inductor has a distributed parasitic capacitance, which is dependent on construction and geometry. At the self-resonant frequency (SRF), the reactance of the inductor cancels the reactance of the parasitic capacitance. Above the SRF, the inductor electrically appears to be a capacitor. The parasitic capacitance is not well-controlled or stable, therefore TI recommends $f_{\text{SENSOR}} < 0.8 \times f_{\text{SR}}$.

図 7-3. Example Coil Inductance vs Frequency

The example inductor in [図 7-3](#), has a SRF at 6.38MHz; therefore, the inductor must not be operated above $0.8 \times 6.38\text{MHz}$, or 5.1MHz.

7.1.5 Application Curves for Proximity Sensing

Common test conditions (unless specified otherwise): Sensor capacitor: 1 layer, 20.9 × 13.9mm, Bourns CMH322522-180KL sensor inductor with L=18μH and 33pF 1% COG/NP0 Target: Grounded aluminum plate (176 × 123mm), Channel = Channel 0 (continuous mode) CLKIN = 40MHz, CHx_FIN_SEL = b10, CHx_FREF_DIVIDER = b00 0000 0001 CH0_RCOUNT = 0xFFFF, SETTLECOUNT_CH0 = 0x0100, DRIVE_CURRENT_CH0 = 0x7800

Figure 7-4. FDC2212 / FDC2214: Capacitance vs Target Distance (0mm to 20mm)

Figure 7-5. FDC2112 / FDC2114: Capacitance vs Target Distance (20mm to 40mm)

Figure 7-6. FDC2212 / FDC2214: Capacitance vs Target Distance (40mm to 60mm)

7.2 Typical Application

The FDC can be used to measure liquid level in non-conductive containers. Due to very high excitation rate capability, the FDC is able to measure soapy water, ink, soap, and other conductive liquids. Capacitive sensors can be attached to the outside of the container or be located remotely from the container, allowing for contactless measurements.

The working principle is based on a ratiometric measurement; Figure 7-7 shows a possible system implementation which uses three electrodes. The level electrode provides a capacitance value proportional to the liquid level. The reference environmental electrode and the reference liquid electrode are used as references. The reference liquid electrode accounts for the liquid dielectric constant and its variation, while the reference environmental electrode is used to compensate for any other environmental variations that are not due to the liquid itself. Note that the reference environmental electrode and the reference liquid electrode are the same physical size (hREF).

For this application, single-ended measurements on the active channels are appropriate, as the tank is grounded. Use 式 7 to determine the liquid level from the measured capacitances:

$$Level = h_{ref} \frac{C_{Lev} - C_{Lev}(0)}{C_{RL} - C_{RE}} \quad (7)$$

where

- C_{RE} is the capacitance of the reference environmental electrode,
- C_{RL} is the capacitance of the reference liquid electrode,
- C_{Lev} is the current value of the capacitance measured at the level electrode sensor,
- $C_{Lev}(0)$ is the capacitance of the Level electrode when the container is empty, and
- h_{REF} is the height in the desired units of the container or liquid reference electrodes.

The ratio between the capacitance of the level and the reference electrodes allows simple calculation of the liquid level inside the container itself. Very high sensitivity values (that is, many LSB/mm) can be obtained due to the high resolution of the FDC2x1x, even when the sensors are located remotely from the container. Note that this approach assumes that the container has a uniform cross section from top to bottom, so that each incremental increase or decrease in the liquid represents a change in volume that is directly related to the height of the liquid.

Copyright © 2016, Texas Instruments Incorporated

図 7-7. FDC (Liquid Level Measurement)

7.2.1 Design Requirements

Make sure the liquid level measurement is independent of the liquid, which can be achieved using the 3-electrode design described above. Moreover, isolate the sensor from environmental interferences such as a human body, other objects, or EMI.

7.2.2 Detailed Design Procedure

In capacitive sensing systems, the design of the sensor plays an important role in determining system performance and capabilities. In most cases the sensor is simply a metal plate that can be designed on the PCB.

The sensor used in this example is implemented with a two-layer PCB. On the top layer, which faces the tank, there are the 3 electrodes (reference environmental, reference liquid, and level) with a ground plane surrounding the electrodes.

Depending on the shape of the container, the FDC can be located on the sensor PCB to minimize the length of the traces between the input channels and the sensors. In case the shape of the container or other mechanical constraints do not allow having the sensors and the FDC on the same PCB, the traces which connect the channels to the sensor need to be shielded with the appropriate shield.

7.2.2.1 Recommended Initial Register Configuration Values

The application requires 100SPS ($T_{\text{SAMPLE}} = 10\text{ms}$). A sensor with an 18- μH inductor and a 33pF capacitor is used. Additional pin, trace, and wire capacitance accounts for 20pF, so the total capacitance is 53pF.

Using L and C, $f_{\text{SENSOR}} = 1/2\pi\sqrt{LC} = 1/2\pi\sqrt{(18 \times 10^{-6} \times 50 \times 10^{-12})} = 5.15\text{MHz}$. This represents the maximum sensor frequency. When the sensor capacitance is added, the frequency decreases.

Using a system controller clock of 40MHz applied to the CLKIN pin allows flexibility for setting the internal clock frequencies. The sensor coils are connected to channel 0 (IN0A and IN0B pins), channel 1 (IN1A and IN1B pins), and channel 2 (IN2A and IN2B pins).

After powering on the FDC, the FDC enters into Sleep Mode. Program the registers as follows (example sets registers for channel 0 only; channel 1 and channel 2 registers can use equivalent configuration):

1. Set the dividers for channel 0.
 - a. The sensor is in a single-ended configuration, therefore set the sensor frequency select register to 2, which means setting field CH0_FIN_SEL to b10.
 - b. The design constraint for f_{REF0} is $> 4 \times f_{\text{SENSOR}}$. To satisfy this constraint, f_{REF0} must be greater than 20.6MHz, so set the reference divider to 1. This is done by setting the CH0_FREF_DIVIDER field to 0x01.
 - c. The combined value for Chan. 0 divider register (0x14) is 0x2001.
2. Sensor drive current: to ensure that the oscillation amplitude is between 1.2V and 1.8V, measure the oscillation amplitude on an oscilloscope and adjust the IDRIVE value, or use the integrated FDC GUI feature to determine the optimal setting. In this case, set the IDRIVE value to 15 (decimal), which results in an oscillation amplitude of 1.68V(pk). Set the INIT_DRIVE current field to 0x00. The combined value for the DRIVE_CURRENT_CH0 register (addr 0x1E) is 0x7C00.
3. Program the settling time for Channel 0 (see [Multi-Channel and Single-Channel Operation](#)).
 - a. $\text{CHx_SETTLECOUNT} > V_{\text{pk}} \times f_{\text{REFx}} \times C \times \pi^2 / (32 \times \text{IDRIVE}_x) \rightarrow 7.5$, rounded up to 8. To provide margin to account for system tolerances, a higher value of 10 is chosen.
 - b. Program Register 0x10 to a minimum of 10.
 - c. The settle time is: $(10 \times 16)/40,000,000 = 4\mu\text{s}$
 - d. The value for Channel 0 SETTLECOUNT register (0x10) is 0x000A.
4. The channel switching delay is approximately 1 μs for $f_{\text{REF}} = 40\text{MHz}$ (see [Multi-Channel and Single-Channel Operation](#))
5. Set the conversion time by programming the reference count for Channel 0. The budget for the conversion time is: $1/N \times (T_{\text{SAMPLE}} - \text{settling time} - \text{channel switching delay}) = 1/3 (10,000 - 4 - 1) = 3.33\text{ms}$
 - a. To determine the conversion time register value, use the following equation and solve for CH0_RCOUNT: Conversion Time (t_{CO}) = $(\text{CH0_RCOUNT} \times 16)/f_{\text{REF0}}$.
 - b. This results in CH0_RCOUNT having a value of 8329 decimal (rounded down). Note that this yields an ENOB > 13 bits.
 - c. Set the CH0_RCOUNT register (0x08) to 0x2089.

6. Use the default values for the ERROR_CONFIG register (address 0x19). By default, no interrupts are enabled
7. Program the MUX_CONFIG register
 - a. Set the AUTOSCAN_EN to b1 bit to enable sequential mode
 - b. Set RR_SEQUENCE to b10 to enable data conversion on three channels (channel 0, channel 1, channel 2)
 - c. Set DEGLITCH to b101 to set the input deglitch filter bandwidth to 10MHz, the lowest setting that exceeds the oscillation tank frequency.
 - d. The combined value for the MUX_CONFIG register (address 0x1B) is 0xC20D
8. Finally, program the CONFIG register as follows:
 - a. Set the ACTIVE_CHAN field to b00 to select channel 0.
 - b. Set SLEEP_MODE_EN field to b0 to enable conversion.
 - c. Set SENSOR_ACTIVATE_SEL = b0, for full current drive during sensor activation
 - d. Set the REF_CLK_SRC field to b1 to use the external clock source.
 - e. Set the other fields to their default values.
 - f. The combined value for the CONFIG register (address 0x1A) is 0x1601.

We then read the conversion results for channel 0 to channel 2 every 10ms from register addresses 0x00 to 0x05.

Based on the example configuration above, TI recommends the following register write sequence is recommended:

表 7-1. Recommended Initial Register Configuration Values (Multi-Channel Operation)

ADDRESS	VALUE	REGISTER NAME	COMMENTS
0x08	0x8329	RCOUNT_CH0	Reference count calculated from timing requirements (100SPS) and resolution requirements
0x09	0x8329	RCOUNT_CH1	Reference count calculated from timing requirements (100SPS) and resolution requirements
0x0A	0x8329	RCOUNT_CH2	Reference count calculated from timing requirements (100SPS) and resolution requirements
0x10	0x000A	SETTLECOUNT_CH0	Minimum settling time for chosen sensor
0x11	0x000A	SETTLECOUNT_CH1	Minimum settling time for chosen sensor
0x12	0x000A	SETTLECOUNT_CH2	Minimum settling time for chosen sensor
0x14	0x2002	CLOCK_DIVIDER_CH0	CH0_FIN_DIVIDER = 1, CH0_FREF_DIVIDER = 2
0x15	0x2002	CLOCK_DIVIDER_CH1	CH1_FIN_DIVIDER = 1, CH1_FREF_DIVIDER = 2
0x16	0x2002	CLOCK_DIVIDER_CH2	CH1_FIN_DIVIDER = 1, CH1_FREF_DIVIDER = 2
0x19	0x0000	ERROR_CONFIG	Can be changed from default to report status and error conditions
0x1B	0xC20D	MUX_CONFIG	Enable Ch 0 , Ch 1, and Ch 2 (sequential mode), set Input deglitch bandwidth to 10MHz
0x1E	0x7C00	DRIVE_CURRENT_CH0	Sets sensor drive current on ch 0
0x1F	0x7C00	DRIVE_CURRENT_CH1	Sets sensor drive current on ch 1
0x20	0x7C00	DRIVE_CURRENT_CH2	Sets sensor drive current on ch 2
0x1A	0x1601	CONFIG	Enable full current drive during sensor activation, select external clock source, wake up device to start conversion. This register write must occur last because device configuration is not permitted while the FDC is in active mode.

7.2.3 Application Curve

A liquid level sensor with 3 electrodes like the one shown in the schematic was connected to the EVM. The plot shows the capacitance measured by Level sensor at different levels of liquid in the tank. The capacitance of the Reference Liquid and Reference Environmental sensors have a steady value because they experience

consistent exposure to liquid and air, while the capacitance of the level sensor (Level) increases linearly with the height of the liquid in the tank.

7-8. Electrode Capacitance vs Liquid Level

7.3 Best Design Practices

- Do leave a small gap between sensor plates in differential configurations. TI recommends a 2mm to 3mm minimum separation.
- The FDC does not support hot-swapping of the sensors. Do not hot-swap sensors, for example by using external multiplexers.

7.4 Power Supply Recommendations

The FDC requires a voltage supply within 2.7V and 3.6V. TI recommends multilayer ceramic bypass X7R capacitors of 0.1 μ F and 1 μ F between the VDD and GND pins. If the supply is located more than a few inches from the FDC, additional bulk capacitance can be required in addition to the ceramic bypass capacitors. An electrolytic capacitor with a value of 10 μ F is a typical choice.

The optimum placement is closest to the VDD and GND pins of the device. Take care to minimize the loop area formed by the bypass capacitor connection, the VDD pin, and the GND pin of the device. See 7-9 and 7-12 for layout examples.

7.5 Layout

7.5.1 Layout Guidelines

- Avoid long traces to connect the sensor to the FDC. Short traces reduce parasitic capacitances between sensor inductor and offer higher system performance.
- Systems that require matched channel response need to have matched trace length on all active channels.

7.5.2 Layout Examples

7-9 to 7-12 show the FDC2114 / FDC2214 evaluation module (EVM) layout.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF FDC2112-Q1, FDC2114-Q1, FDC2212-Q1, FDC2214-Q1 :

- Catalog : [FDC2112](#), [FDC2114](#), [FDC2212](#), [FDC2214](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
FDC2112QDNTRQ1	WSO	DNT	12	4500	330.0	12.4	4.3	4.3	1.3	8.0	12.0	Q1
FDC2114QRGHRQ1	WQFN	RGH	16	4500	330.0	12.4	4.3	4.3	1.3	8.0	12.0	Q1
FDC2212QDNTRQ1	WSO	DNT	12	4500	330.0	12.4	4.3	4.3	1.3	8.0	12.0	Q1
FDC2214QRGHRQ1	WQFN	RGH	16	4500	330.0	12.4	4.3	4.3	1.3	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
FDC2112QDNTRQ1	WSON	DNT	12	4500	356.0	356.0	36.0
FDC2114QRGHRQ1	WQFN	RGH	16	4500	356.0	356.0	36.0
FDC2212QDNTRQ1	WSON	DNT	12	4500	356.0	356.0	36.0
FDC2214QRGHRQ1	WQFN	RGH	16	4500	356.0	356.0	36.0

4214978/B 01/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

RGH0016A

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214978/B 01/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sl原因271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RGH0016A

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 17
78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:20X

4214978/B 01/2017

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

EXAMPLE BOARD LAYOUT

DNT0012B

WSN - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214928/C 10/2021

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

EXAMPLE STENCIL DESIGN

DNT0012B

WSN - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
EXPOSED PAD
77% PRINTED SOLDER COVERAGE BY AREA
SCALE:20X

4214928/C 10/2021

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
