

HD3SS3202 2チャンネル差動2:1/1:2 USB3.1マルチプレクサ/デマルチプレクサ

1 特長

- USB 3.1 Gen 1およびGen 2データ速度で、USB Type-C™エコシステム用のマルチプレクサ/デマルチプレクサ・ソリューションを提供
- MIPI DSI/CSI-2 DPHY、LVDS、PCIE Gen III、SATA Express、SATAと互換
- 最高10Gbpsで動作
- 8GHzを超える広い-3dB差動帯域幅
- 優れた動特性(5GHz時)
 - クロストーク = -41dB
 - オフ絶縁 = -20dB
 - 挿入損失 = -2.4dB
 - 反射損失 = -8dB
- 双方向「マルチプレクサ/デマルチプレクサ」差動スイッチ
- 0~2Vの同相電圧をサポート
- V_{CC} が3.3V±10%の単一電源
- 商業用温度範囲: 0°C~70°C (HD3SS3202)
- 工業用温度範囲: -40°C~85°C (HD3SS3202I)

2 アプリケーション

- USB Type-C™エコシステム
- デスクトップPCおよびノートPC
- 共有I/Oポート
- ドッキング・ステーション
- モニタ、テレビ
- セットトップ・ボックス
- ネットワーク・セキュリティ・カメラ

3 概要

HD3SS3202は、マルチプレクサまたはデマルチプレクサ構成の高速双方向パッシブ・スイッチで、USB 3.1 Gen 1およびGen 2データ速度をサポートするUSB Type-C™アプリケーションに適しています。このデバイスは制御ピンSELに従い、ポートBまたはポートCとポートAとの間で差動チャンネルのスイッチングを行います。

HD3SS3202は汎用のアナログ差動パッシブ・スイッチです。0~2Vの同相電圧範囲と、最大1800mVppの差動振幅での差動信号処理を必要とする、任意の高速インターフェイス・アプリケーションで動作します。このデバイスには適応型トラッキング機能があり、同相電圧範囲の全体にわたってチャンネルが変化せず維持されることを保証します。

このデバイスにより、信号のアイ・ダイアグラムへの減衰を最小限に抑え、追加のジッタもほとんどなしに、高速なスイッチングが可能になります。動作時の消費電力は1.65mW未満(標準値)です。OEnピンによるシャットダウン・モードがあり、シャットダウン時の消費電力は0.02μW未満(標準値)です。

8 Detailed Description

8.1 Overview

The HD3SS3202 is a generic analog differential passive switch that can work for any high-speed interface applications requiring a common mode voltage range of 0 to 2 V and differential signaling with differential amplitude up to 1800 mVpp. It uses adaptive tracking to ensure the channel remains unchanged for the entire common mode voltage range.

Excellent dynamic characteristics of the device allow high-speed switching with minimum attenuation to the signal eye diagram with little added jitter. It consumes < 1.65 mW (typ) of power when operational and has a shutdown mode exercisable by OEn pin resulting in < .02 μ W (typical).

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Output Enable and Power Savings

The HD3SS3202 has two power modes, active/normal operating mode and standby/shutdown mode. During standby mode, the device consumes little current to save the maximum power. To enter standby mode, the OEn control pin is pulled high through a resistor and must remain high. For active/normal operation, the OEn control pin should be pulled low to GND.

HD3SS3202 consumes < 1.65 mW (typ) of power when operational and has a shutdown mode exercisable by the OEn pin resulting in < .02 μ W (typ).

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The HD3SS3202 is a generic 2-channel high-speed mux/demux type of switch that can be used for routing high-speed signals between two different locations on a circuit board. The HD3SS3202 supports several high-speed data protocols with a differential amplitude of <1800 mVpp and a common mode voltage of < 2 V, as with USB 3.1 and DisplayPort 1.2. The device has one select input (SEL) pin that can be controlled by an available GPIO pin within a system or from a microcontroller.

The HD3SS3202 with its adaptive common mode tracking technology can support applications where the common mode is different between the RX and TX pair. The two USB3.1 Type C connector applications show both a host and device side. The cable between the two connectors swivels the pairs to properly route the signals to the correct pin. The other applications are more generic because different connectors can be used.

Many interfaces require AC coupling between the transmitter and receiver. The 0201 capacitors are the preferred option to provide AC coupling; 0402 size capacitors also work. Avoid the capacitors greater than 0402 and C-packs. When placing AC coupling capacitors, symmetric placement is best. The designer should place them along the TX pairs on the system board, which are usually routed on the top layer of the board.

The AC coupling capacitors have several placement options. Because the HD3SS3202 requires a bias voltage, the designer must place the capacitors on one side of the switch. If they are placed on both sides of the switch, a biasing voltage should be provided. 5 shows a few placement options. The coupling capacitors are placed between the HD3SS3202 and endpoint. In this situation, the HD3SS3202 is biased by the system/host controller.

图 5. AC Coupling Capacitors between HD3SS3202 TX and Endpoint TX

Application Information (continued)

In [Figure 6](#), the coupling capacitors are placed on the host transmit pair and endpoint transmit pair. In this situation, the switch on top is biased by the endpoint and the lower switch is biased by the host controller.

Figure 6. AC Coupling Capacitors on Host TX and Endpoint TX

If the common mode voltage in the system is higher than 2 V, the coupling capacitors are placed on both sides of the switch (shown in [Figure 7](#)). A biasing voltage of < 2 V is required in this case.

V_{BIAS} can be GND

Capacitor and resistor values depend upon application.

Figure 7. AC Coupling Capacitors on Both Sides of Switch

Application Information (continued)

The HD3SS3202 can be used with the USB Type C connector to support the connector's flip ability.  8 provides the generic location for the AC coupling capacitors for this application.

图 9. Down Facing Port for USB3.1 Type C Connector

9.2.1.1 Design Requirements

The HD3SS3202 can be designed into many different applications. All the applications have certain requirements for the system to work properly. The HD3SS3202 requires 3.3-V $\pm 10\%$ V_{CC} rail. The OEn pin must be low for device to work; otherwise, it disables the outputs. This pin can be driven by a processor. The expectation is that one side of the device has AC coupling capacitors. 表 2 provides information on expected values to perform properly.

表 2. Design Parameters

DESIGN PARAMETER	VALUE
V_{CC}	3.3 V
AXp/n, BXp/n, CXp/n CM input voltage	0 to 2 V
Control/OEn pin max voltage for low	0.8 V
Control/OEn pin min voltage for high	2.0 V
AC coupling capacitor	75 nF to 265 nF.
R_{BIAS} (图 9) when needed	100 kΩ

9.2.1.2 Detailed Design Procedure

The HD3SS3202 is a high-speed passive switch device that can behave as a mux or demux. Because this is a passive switch, signal integrity is important because the device provides no signal conditioning capability. The device can support 1 to 2 inches of board trace and a connector on either end.

To design in the HD3SS3202, the designer needs to understand the following.

- Determine the loss profile between circuits that are to be muxed or demuxed.
- Provide clean impedance and electrical length matched board traces.
- Depending upon the application, determine the best place to put the 100-nF coupling capacitor.
- Provide a control signal for the SEL and OEn pins. It may be necessary to include a 0.01μF to GND on each of these pins to help with noise immunity.
- See the application schematics on recommended decouple capacitors from V_{CC} pins to ground

10 Power Supply Recommendations

The HD3SS3202 does not require a power supply sequence. TI recommends placing a 100nF de-coupling capacitor at the device V_{CC} near the pin.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
