

INA28x-Q1 車載グレード、-14V～+80V、双方向、高精度、ローサイドまたはハイサイド、電圧出力、電流シャント・モニタ

1 特長

- 車載アプリケーション向けに認定済み
- 下記内容で AEC-Q100 認定済み
 - デバイス温度グレード 1: -40°C～+125°C の周囲動作温度範囲
 - デバイス HBM ESD 分類レベル H2
 - デバイス CDM ESD 分類レベル C5
- 機能安全対応
 - 機能安全システムの設計に役立つ資料を利用可能
- 広い同相モード範囲: -14V～+80V
- オフセット電圧: $\pm 20\mu\text{V}$
- CMRR: 140dB
- 精度:
 - ゲイン誤差 $\pm 1.4\%$ (最大値)
 - オフセット・ドリフト $0.3\mu\text{V}/^\circ\text{C}$
 - ゲイン・ドリフト $0.005\%/^\circ\text{C}$ (最大値)
- 利用可能なゲイン:
 - 50V/V: INA282-Q1
 - 100V/V: INA286-Q1
 - 200V/V: INA283-Q1
 - 500 V/V: INA284-Q1
 - 1000 V/V: INA285-Q1
- 静止電流: 900 μA (最大値)

2 アプリケーション

- EV および HEV のバッテリー管理
- EV および HEV チャージャ
- 電動パワー・ステアリング (EPS) システム
- ボディ・コントロール・モジュール
- ブレーキ・システム
- 横滑り防止装置 (ESC) システム

3 概要

INA28x-Q1 ファミリーには、INA282-Q1、INA283-Q1、INA284-Q1、INA285-Q1、INA286-Q1 デバイスが含まれます。これらのデバイスは、電源電圧にかかわらず -14V～+80V の同相モード電圧でシャント両端の電圧降下を検出できる、電圧出力電流シャント・モニタです。ゼロドリフト・アーキテクチャの低いオフセットにより、シャントでの最大電圧降下がわずか 10mV フルスケールで電流検出が可能です。

これらの電流センス・アンプは 2.7V～18V の単一電源で動作し、消費電流は最大 900 μA です。これらのデバイスは拡張動作温度範囲 (-40°C～+125°C) で動作が規定され、SOIC-8 および VSSOP-8 パッケージで供給されます。

製品情報⁽¹⁾

部品番号	パッケージ	本体サイズ (公称)
INA28x-Q1	SOIC (8)	4.90mm × 3.91mm
	VSSOP (8)	3.00mm × 3.00mm

- (1) 利用可能なすべてのパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	-IN	Analog input	Connection to negative side of shunt resistor.
2	GND	Analog	Ground
3	REF2	Analog input	Reference voltage, 0 V to V+. See セクション 7.4.1 for connection options.
4	NC	—	This pin is not internally connected. The NC pin should either be left floating or connected to GND.
5	OUT	Analog output	Output voltage
6	V+	Analog	Power supply, 2.7 V to 18 V
7	REF1	Analog input	Reference voltage, 0 V to V+. See セクション 7.4.1 for connection options.
8	+IN	Analog input	Connection to positive side of shunt resistor.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range, unless otherwise noted.⁽¹⁾

	MIN	MAX	UNIT
Supply voltage, V+		18	V
Analog inputs, V _{+IN} , V _{-IN} ⁽²⁾	Differential (V _{+IN}) – (V _{-IN}) ⁽³⁾		V
	Common-Mode		V
REF1, REF2, OUT	GND–0.3	(V+) + 0.3	V
Input current into any pin		5	mA
Junction temperature		150	°C
Storage temperature, T _{stg}	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) V_{+IN} and V_{-IN} are the voltages at the +IN and –IN pins, respectively.
- (3) Input voltages must not exceed common-mode rating.

6.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge	Human body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000
	Charged device model (CDM), per AEC Q100-011	±750

- (1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
V _{CM} Common-mode input voltage		12		V
V+ Operating supply voltage		5		V
T _A Operating free-air temperature	–40		125	°C

7 Detailed Description

7.1 Overview

The INA28x-Q1 family of voltage output current-sensing amplifiers are specifically designed to accurately measure voltages developed across current-sensing resistors on common-mode voltages that far exceed the supply voltage powering the devices. This family features a common-mode range that extends 14 V less than the negative supply rail, as well as up to 80 V, allowing for either low-side or high-side current sensing while the device is powered from supply voltages as low as 2.7 V.

The zero-drift topology enables high-precision measurements with maximum input offset voltages as low as 70 μV with a maximum temperature contribution of 1.5 $\mu\text{V}/^\circ\text{C}$ over the full temperature range of -40°C to 125°C .

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Selecting R_S

The zero-drift offset performance of the INA28x-Q1 family offers several benefits. Most often, the primary advantage of the low offset characteristic enables lower full-scale drops across the shunt. For example, nonzero-drift, current-shunt monitors typically require a full-scale range of 100 mV. The INA28x-Q1 family gives equivalent accuracy at a full-scale range on the order of 10 mV. This accuracy reduces shunt dissipation by an order of magnitude, with many additional benefits. Alternatively, applications that must measure current over a wide dynamic range can take advantage of the low offset on the low end of the measurement. Most often, these applications can use the lower gains of the INA282-Q1, INA286-Q1, or INA283-Q1 to accommodate larger shunt drops on the upper end of the scale. For instance, an INA282-Q1 operating on a 3.3-V supply can easily handle a full-scale shunt drop of 55 mV, with only 70 μ V of offset.

7.3.2 Effective Bandwidth

The extremely high DC CMRR of the INA28x-Q1 results from the switched capacitor input structure. Because of this architecture, the INA28x-Q1 exhibits discrete time system behaviors as illustrated in the gain versus frequency graph of [Figure 6-3](#) and the step response curves of [Figure 6-21](#) through [Figure 6-28](#). The response to a step input depends somewhat on the phase of the internal INA28x-Q1 clock when the input step occurs. It is possible to overload the input amplifier with a rapid change in input common-mode voltage (see [Figure 6-4](#)). Errors as a result of common-mode voltage steps and/or overload situations typically disappear within 15 μ s after the disturbance is removed.

7.3.3 Transient Protection

The –14-V to 80-V common-mode range of the INA28x-Q1 is ideal for withstanding automotive fault conditions that range from 12-V battery reversal up to 80-V transients; no additional protective components are needed up to those levels. In the event that the INA28x-Q1 is exposed to transients on the inputs in excess of its ratings, then external transient absorption with semiconductor transient absorbers (Zener or *Transzorbs*) will be necessary. Use of MOVs or VDRs is not recommended except when they are used in addition to a semiconductor transient absorber. Select the transient absorber such that it cannot allow the INA28x-Q1 to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance, as well as additional voltage as a result of transient absorber dynamic impedance). Despite the use of internal zener-type electrostatic discharge (ESD) protection, the INA28x-Q1 does not lend itself to using external resistors in series with the inputs without degrading gain accuracy.

7.4 Device Functional Modes

7.4.1 Reference Pin Connection Options

Figure 7-1 illustrates a test circuit for reference divider accuracy. The output of the INA28x-Q1 can be connected for unidirectional or bidirectional operation. Neither the REF1 pin nor the REF2 pin may be connected to any voltage source lower than GND or higher than V+, and that the effective reference voltage $(REF1 + REF2)/2$ must be 9 V or less. This parameter means that the V+ reference output connection shown in Figure 7-3 is not allowed for V+ greater than 9 V. However, the split-supply reference connection shown in Figure 7-5 is allowed for all values of V+ up to 18 V.

- A. Reference divider accuracy is determined by measuring the output with the reference voltage applied to alternate reference resistors, and calculating a result such that the amplifier offset is cancelled in the final measurement.

Figure 7-1. Test Circuit for Reference Divider Accuracy

7.4.1.1 Unidirectional Operation

Unidirectional operation allows the INA28x-Q1 to measure currents through a resistive shunt in one direction. In the case of unidirectional operation, the output could be set at the negative rail (near ground, and the most common connection) or at the positive rail (near V+) when the differential input is 0V. The output moves to the opposite rail when a correct polarity differential input voltage is applied.

The required polarity of the differential input depends on the output voltage setting. If the output is set at the positive rail, the input polarity must be negative to move the output down. If the output is set at ground, the polarity is positive to move the output up.

The following sections describe how to configure the output for unidirectional operation.

7.4.1.1.1 Ground Referenced Output

When using the INA28x-Q1 in this mode, both reference inputs are connected to ground; this configuration takes the output to the negative rail when there is 0V differential at the input (as Figure 7-2 shows).

Figure 7-2. Ground Referenced Output

7.4.1.1.2 V+ Referenced Output

This mode is set when both reference pins are connected to the positive supply. It is typically used when a diagnostic scheme requires detection of the amplifier and the wiring before power is applied to the load (as shown in [Figure 7-3](#)).

Figure 7-3. V+ Referenced Output

7.4.1.2 Bidirectional Operation

Bidirectional operation allows the INA28x-Q1 to measure currents through a resistive shunt in two directions. In this case, the output can be set anywhere within the limits of what the reference inputs allow (that is, from 0 V to 9 V, but never to exceed the supply voltage). Typically, it is set at half-scale for equal range in both directions. In some cases, however, it is set at a voltage other than half-scale when the bidirectional current is nonsymmetrical.

The quiescent output voltage is set by applying voltage(s) to the reference inputs. REF1 and REF2 are connected to internal resistors that connect to an internal offset node. There is no operational difference between the pins.

7.4.1.2.1 External Reference Output

Connecting both pins together and to a reference produces an output at the reference voltage when there is no differential input; this configuration is illustrated in [Figure 7-4](#). The output moves down from the reference voltage when the input is negative relative to the –IN pin and up when the input is positive relative to the –IN pin. This technique is the most accurate way to bias the output to a precise voltage.

Figure 7-4. External Reference Output

7.4.1.2.2 Splitting the Supply

By connecting one reference pin to V+ and the other to the ground pin, the output is set at half of the supply when there is no differential input, as shown in [Figure 7-5](#). This method creates a midscale offset that is ratiometric to the supply voltage; thus, if the supply increases or decreases, the output remains at half the supply.

Figure 7-5. Split-Supply Output

7.4.1.2.3 Splitting an External Reference

In this case, an external reference is divided by 2 with an accuracy of approximately 0.5% by connecting one REF pin to ground and the other REF pin to the reference (as [Figure 7-6](#) illustrates).

Figure 7-6. Split Reference Output

7.4.2 Shutdown

While the INA28x-Q1 family does not provide a shutdown pin, the quiescent current of 600 μ A enables the device to be powered from the output of a logic gate. Take the gate low to shut down the INA28x-Q1 family devices.

7.4.3 Extended Negative Common-Mode Range

Using a negative power supply can extend the common-mode range 14 V more negative than the supply used. For instance, a -10 V supply allows up to -24 -V negative common-mode. Remember to keep the total voltage between the GND pin and V+ pin to less than 18 V. The positive common-mode decreases by the same amount.

The reference input simplifies this type of operation because the output quiescent bias point is always based on the reference connections. [Figure 7-7](#) shows a circuit configuration for common-mode ranges from -24 V to 70 V.

A. Connect the REF pins as desired; however, they cannot exceed 9 V greater than the GND pin voltage.

图 7-7. Circuit Configuration for Common-Mode Ranges from -24 V to 70 V

7.4.4 Calculating Total Error

The electrical specifications for the INA28x-Q1 family of devices include the typical individual error terms such as gain error, offset error, and nonlinearity error. Total error including all of these individual error components is not specified in [セクション 6.5](#). To accurately calculate the expected error of the device, the operating conditions of the device must first be known. Some current shunt monitors specify a total error in the product data sheet. However, this total error term is accurate under only one particular set of operating conditions. Specifying the total error at this one point has little practical value because any deviation from these specific operating conditions no longer yields the same total error value. This section discusses the individual error sources, with information on how to apply them to calculate the total error value for the device under any normal operating conditions.

The typical error sources that have the largest impact on the total error of the device are input offset voltage, common-mode rejection ratio, gain error, and nonlinearity error. For the INA28x-Q1, an additional error source referred to as *reference voltage rejection ratio* is also included in the total error value.

The nonlinearity error of the INA28x-Q1 is relatively low compared to the gain error specification. This low error results in a gain error that can be expected to be relatively constant throughout the linear input range of the device. While the gain error remains constant across the linear input range of the device, the error associated with the input offset voltage does not. As the differential input voltage developed across a shunt resistor at the input of the INA28x-Q1 decreases, the inherent input offset voltage of the device becomes a larger percentage of the measured input signal resulting in an increase in error in the measurement. This varying error is present among all current shunt monitors, given the input offset voltage ratio to the voltage being sensed by the device. The relatively low input offset voltages present in the INA28x-Q1 devices limit the amount of contribution the offset voltage has on the total error term.

The term *reference voltage rejection ratio* refers to the amount of error induced by applying a reference voltage to the INA28x-Q1 device that deviates from the inherent bias voltage present at the output of the first stage of the device. The output of the switched-capacitor network and first-stage amplifier has an inherent bias voltage of approximately 2.048 V. Applying a reference voltage of 2.048 V to the INA28x-Q1 reference pins results in no additional error term contribution. Applying a voltage to the reference pins that differs from 2.048 V creates a voltage potential in the internal difference amplifier, resulting in additional current flowing through the resistor network. As a result of resistor tolerances, this additional current flow causes additional error at the output because of resistor mismatches. Additionally, as a result of resistor tolerances, this additional current flow causes additional error at the output based on the common-mode rejection ratio of the output stage amplifier. This error term is referred back to the input of the device as additional input offset voltage. Increasing the difference between the 2.048-V internal bias and the external reference voltage results in a higher input offset voltage. Also, as the error at the output is referred back to the input, there is a larger impact on the input-referred offset, V_{OS} , for the lower-gain versions of the device.

Two examples are provided that detail how different operating conditions can affect the total error calculations. Typical and maximum calculations are shown as well, to provide the user more information on how much error variance is present from device to device.

7.4.4.1 Example 1 INA282-Q1

表 7-1. $V_+ = 5\text{ V}$; $V_{CM} = 12\text{ V}$; $V_{REF1} = V_{REF2} = 2.048\text{ V}$; $V_{SENSE} = 10\text{ mV}$

TERM	SYMBOL	EQUATION	TYPICAL VALUE	MAXIMUM VALUE
Initial input offset voltage	V_{OS}	—	20 μV	70 μV
Added input offset voltage because of common-mode voltage	V_{OS_CM}	$\frac{1}{10^{\left(\frac{CMRR_{dB}}{20}\right)}} \times (V_{CM} - 12\text{V})$	0 μV	0 μV
Added input offset voltage because of reference voltage	V_{OS_REF}	$RVRR \times (2.048\text{ V} - V_{REF})$	0 μV	0 μV
Total input offset voltage	V_{OS_Total}	$\sqrt{(V_{OS})^2 + (V_{OS_CM})^2 + (V_{OS_REF})^2}$	20 μV	70 μV
Error from input offset voltage	Error_ V_{OS}	$\frac{V_{OS_Total}}{V_{SENSE}} \times 100$	0.20%	0.70%
Gain error	Error_Gain	—	0.40%	1.40%
Nonlinearity error	Error_Lin	—	0.01%	0.01%
Total error	—	$\sqrt{(\text{Error_}V_{OS})^2 + (\text{Error_Gain})^2 + (\text{Error_Lin})^2}$	0.45%	1.56%

7.4.4.2 Example 2 INA286-Q1

表 7-2. $V_+ = 5\text{ V}$; $V_{CM} = 24\text{ V}$; $V_{REF1} = V_{REF2} = 0\text{ V}$; $V_{SENSE} = 10\text{ mV}$

TERM	SYMBOL	EQUATION	TYPICAL VALUE	MAXIMUM VALUE
Initial input offset voltage	V_{OS}	—	20 μV	70 μV
Added input offset voltage because of common-mode voltage	V_{OS_CM}	$\frac{1}{10^{\left(\frac{CMRR_{dB}}{20}\right)}} \times (V_{CM} - 12\text{V})$	1.2 μV	12 μV
Added input offset voltage because of reference voltage	V_{OS_REF}	$RVRR \times (2.048\text{ V} - V_{REF})$	34.8 μV	92.2 μV
Total input offset voltage	V_{OS_Total}	$\sqrt{(V_{OS})^2 + (V_{OS_CM})^2 + (V_{OS_REF})^2}$	40.2 μV	116.4 μV
Error from input offset voltage	Error_ V_{OS}	$\frac{V_{OS_Total}}{V_{SENSE}} \times 100$	0.40%	1.16%
Gain error	Error_Gain	—	0.40%	1.40%
Nonlinearity error	Error_Lin	—	0.01%	0.01%
Total error	—	$\sqrt{(\text{Error_}V_{OS})^2 + (\text{Error_Gain})^2 + (\text{Error_Lin})^2}$	0.57%	1.82%

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。また、お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The INA28x-Q1 family of devices measure the voltage developed across a current-sensing resistor when current passes through it. The ability to drive the reference pins to adjust the functionality of the output signal is shown in multiple configurations.

8.1.1 Basic Connections

図 8-1 shows the basic connection of an INA28x-Q1 family device. Connect the input pins, +IN and –IN, as close as possible to the shunt resistor to minimize any resistance in series with the shunt resistance.

図 8-1. Basic Connections

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Connect bypass capacitors close to the device pins.

8.2 Typical Applications

8.2.1 Current Summing

The outputs of multiple INA28x-Q1 family devices are easily summed by connecting the output of one INA28x-Q1 family device to the reference input of a second INA28x-Q1 family device. The circuit configuration shown in [Figure 8-1](#) is an easy way to achieve current summing.

NOTE: The voltage applied to the reference inputs must not exceed 9 V.

Figure 8-2. Summing the Outputs of Multiple INA28x-Q1 Family Devices

8.2.1.1 Design Requirements

In order to sum multiple load currents, multiple INA28x-Q1 devices must be connected.  8-2 shows summing for two devices. Summing beyond two devices is possible by repeating this connection. The reference input of the first INA28x-Q1 family device sets the output quiescent level for all the devices in the string.

8.2.1.2 Detailed Design Procedures

Connect the output of one INA28x-Q1 family device to the reference input of the next INA28x-Q1 family device in the chain. Use the reference input of the first circuit to set the reference of the final summed output. The currents sensed at each circuit in the chain are summed at the output of the last device in the chain.

8.2.1.3 Application Curve

 8-3 shows an example output response of a summing configuration. The reference pins of the first circuit are connected to ground, and sine waves at different frequencies are applied to the two circuits to produce a summed output as shown. The sine wave voltage input for the first circuit is offset so that the whole wave is above GND.

 8-3. Current Summing Application Output Response

8.2.2 Current Differencing

Occasionally, the need arises to confirm that the current into a load is identical to the current out of a load, usually as part of diagnostic testing or fault detection. This situation requires precision current differencing, which is the same as summing except that the two amplifiers have the inputs connected opposite of each other.

NOTE: The voltage applied to the reference inputs must not exceed 9 V.

8-4. Current Differencing Using an INA28x-Q1 Device

8.2.2.1 Design Requirements

For current differencing, connect two INA28x-Q1 devices, and connect the inputs opposite to each other, as shown in [Figure 8-4](#). The reference input of the first INA28x-Q1 family device sets the output quiescent level for all the devices in the string.

8.2.2.2 Detailed Design Procedure

Connect the output of one INA28x-Q1 family device to the reference input of the second INA28x-Q1 family device. The reference input of the first circuit sets the reference at the output. This circuit example is identical to the current summing example, except that the two shunt inputs are reversed in polarity. Under normal operating conditions, the final output is very close to the reference value and proportional to any current difference. This current differencing circuit is useful in detecting when current into and out of a load do not match.

8.2.2.3 Application Curve

[Figure 8-5](#) shows an example output response of a difference configuration. The reference pins of the first circuit are connected to a reference voltage of 2.048 V. The inputs to each circuit is a 100-Hz sine wave, 180° out of phase with each other, resulting in a zero output as shown. The sine wave input to the first circuit is offset so that the input wave is completely above GND.

Figure 8-5. Current Differencing Application Output Response

9 Power Supply Recommendations

The INA28x-Q1 can make accurate measurements well outside of its own power-supply voltage, $V+$, because its inputs (+IN and –IN) may operate anywhere from -14 V to 80 V independent of $V+$. For example, the $V+$ power supply can be 5 V while the common-mode voltage being monitored by the shunt may be as high as 80 V . Of course, the output voltage range of the INA28x-Q1 is constrained by the supply voltage that powers it on $V+$. When the power to the INA28x-Q1 is off (that is, no voltage is supplied to the $V+$ pin), the input pins (+IN and –IN) are high impedance with respect to ground and typically leak less than $\pm 1\text{ }\mu\text{A}$ over the full common-mode range of -14 V to 80 V .

10 Layout

10.1 Layout Guidelines

Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique makes sure that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance causes significant measurement errors.

Place the power-supply bypass capacitor as close as possible to the supply and ground pins. TI recommends a bypass capacitor with a value of $0.1\text{ }\mu\text{F}$. Add additional decoupling capacitance to compensate for noisy or high-impedance power supplies.

11.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい ESD 対策をとらないと、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
