

# INA851 高精度、低ノイズ、完全差動出力計測アンプ、減衰ゲインおよび出力クランプ付き

## 1 特長

- 外付け抵抗を使用して  $G = 0.2 \sim 10,000$  の範囲でゲインをプログラム可能
- 完全差動出力、クランプ機能内蔵
- 低いオフセット電圧:  $10\mu\text{V}$  (標準値)、 $35\mu\text{V}$  (最大値)
- 小さいオフセット・ドリフト:  $0.1\mu\text{V}/^\circ\text{C}$  (標準値)、 $0.3\mu\text{V}/^\circ\text{C}$  (最大値)
- 低い入力バイアス電流:  $5\text{nA}$  (標準値)
- 入力段ノイズ:  $3.2\text{nV}/\sqrt{\text{Hz}}$ 、 $0.8\text{pA}/\sqrt{\text{Hz}}$
- 広い帯域幅:  $G = 0.2$  で  $22\text{MHz}$ 、 $G = 1$  で  $15\text{MHz}$
- 同相除去:  $G = 10$  で  $106\text{dB}$  (最小値)、 $100 \leq G \leq 1000$  で  $120\text{dB}$  (最小値)
- 電源除去:  $110\text{dB}$  (最小値、 $G = 1$ )
- 消費電流:  $6\text{mA}$  (標準値)
- 高低の電源電圧に対して  $\pm 40\text{V}$  までの入力過電圧保護機能
- 電源電圧範囲:
  - 単一電源:  $8\text{V} \sim 36\text{V}$
  - デュアル電源:  $\pm 4\text{V} \sim \pm 18\text{V}$
- 仕様温度範囲:  $-40^\circ\text{C} \sim +125^\circ\text{C}$
- 超小型パッケージ: 16 ピン VQFN

## 2 アプリケーション

- アナログ入力モジュール
- 流量トランスミッタ
- LCD テスト
- 心電図 (ECG)
- 外科用機器
- オシロスコープ (DSO)
- 重量計
- 半導体試験装置

## 3 説明

INA851 は、業界初の完全差動出力を備えた高精度計測アンプです。このデバイスは、完全差動入力を持つ最新の高性能 A/D コンバータ (ADC) の入力駆動用に最適化されています。INA851 は、非常に広い範囲の単一電源またはデュアル電源電圧で動作します。出力段のゲインは、2 本のピンを短絡させると  $0.2$  に設定され、フローティングにすると  $1$  に設定されます。1 個の外付け抵抗により、 $1 \sim 10,000$  の範囲で任意の入力段ゲインを設定できます。

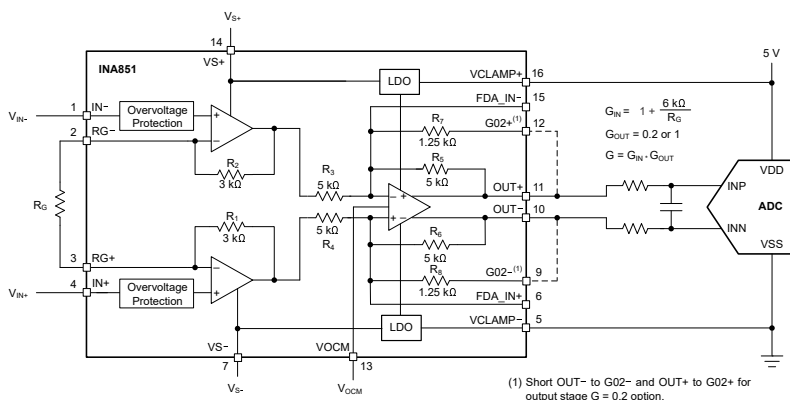

INA851 は、スーパーベータ入力トランジスタを採用したことにより、同じクラスの他のアンプと比較すると、非常に低い入力バイアス電流および入力換算電流ノイズを実現しています。最新の製造プロセスにより、非常に低い電圧ノイズ、入力オフセット電圧、オフセット電圧ドリフトが得られます。追加の回路により、電源電圧を最大  $\pm 40\text{V}$  上回る過電圧からデバイス入力を保護します。デバイス出力にはクランプ回路が内蔵され、オーバードライブによる損傷から ADC または下流のデバイスを保護します。

このデバイスは、最小  $8\text{V}$  から最大  $36\text{V}$  までの単一電源、または  $\pm 4\text{V}$  から  $\pm 18\text{V}$  までのデュアル電源で動作するように設計されています。

### パッケージ情報

部品番号	パッケージ (1)	本体サイズ (公称)
INA851	RGT (VQFN、16)	3.00mm × 3.00mm

- (1) 利用可能なパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

## 6 Pin Configuration and Functions

图 6-1. RGT (16-Pin VQFN) Package, Top View

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
FDA_IN–	15	Input	Connection to output driver summing node.
FDA_IN+	6	Input	Connection to output driver summing node.
G02–	9	Input	Connection to gain network. Short to OUT– for output stage gain $G_{OUT}$ of 0.2 V/V.
G02+	12	Input	Connection to gain network. Short to OUT+ for output stage gain $G_{OUT}$ of 0.2 V/V.
IN–	1	Input	Negative (inverting) input.
IN+	4	Input	Positive (noninverting) input.
NC	8	—	No connect
OUT–	10	Output	Negative Output
OUT+	11	Output	Positive Output
RG	2,3	—	Gain setting pin. Place a gain resistor between pin 2 and pin 3.
VCLAMP–	5	Input	Level set for output clamp value. Connect either to an external supply that is at least 1.5 V above VS– or connect to VS– if clamping function is not required.
VCLAMP+	16	Input	Level set for output clamp value. Connect either to an external supply that is at least 1.5 V below VS+ or connect to VS+ if clamping function is not required.
VOCM	13	Input	Level set for output common mode value.
VS–	7	Power	Negative supply
VS+	14	Power	Positive supply
Thermal Pad	Thermal pad	—	The thermal pad must be soldered to the printed-circuit board (PCB). Connect thermal pad to a plane or large copper pour electrically connected to the most negative supply or VS–.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_S$	Supply voltage on VS+, VS– pins; $V_S = (V_{S+}) - (V_{S-})$	0	40	V
$V_{IN}$	Input voltage on IN+, IN– pins	$(V_{S-}) - 40$	$(V_{S+}) + 40$	V
$V_{DIFF}$	Differential input voltage, $V_{DIFF} = (V_{IN+}) - (V_{IN-})$	$G_{IN} = 1 \text{ V/V}$ , continuous	$(-V_S) - 40$	
		$G_{IN} > 1 \text{ V/V}$ <sup>(3)</sup>	$V_S + 40$	
	Output voltage on OUT+, OUT– pins	$(V_{S-}) - 0.5$	$(V_{S+}) + 0.5$	V
	FDA_IN+, FDA_IN–, G02+, G02–, VCLAMP+, VCLAMP–, VOCM pins voltage	$(V_{S-}) - 0.5$	$(V_{S+}) + 0.5$	V
	Output short-circuit <sup>(2)</sup>	Continuous		
$T_A$	Operating temperature	–40	125	°C
$T_J$	Junction temperature		175	°C
$T_{stg}$	Storage temperature	–65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Short-circuit to  $V_S / 2$ .
- (3) Keep operation below 1% duty cycle of device lifecycle.

### 7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2500	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
$V_S$	Supply voltage	Single supply, $V_S = (V_{S+})$ , GND = $(V_{S-})$	8	36	V
		Dual supply, $V_S = (V_{S+}) - (V_{S-})$	±4	±18	
$V_{IN}$	Input voltage on IN+, IN– pins		– $V_S$	$V_S$	V
$V_{DIFF}$	Differential input voltage, $V_{DIFF} = (V_{IN+}) - (V_{IN-})$	$G_{IN} = 1 \text{ V/V}$	– $V_S$	$V_S$	V
		$G_{IN} > 1 \text{ V/V}$ <sup>(1)</sup>	$-1 - (V_S) / G_{IN}$	$1 + (V_S) / G_{IN}$	
$T_A$	Specified temperature		–40	125	°C

- (1) See also [INA851 Calculator Tool](#).

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		INA851	UNIT
		RGT (VQFN)	
		16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	47.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	53.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	22.1	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	1.4	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	22.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	7.8	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

at  $T_A = 25^\circ\text{C}$ ,  $V_S = \pm 15\text{ V}$ ,  $V_{ICM} = V_{OCM} = \text{mid supply}$ ,  $V_{CLAMP+} = V_{S+}$ ,  $V_{CLAMP-} = V_{S-}$ ,  $G = G_{IN} = G_{OUT} = 1\text{ V/V}$ , and  $R_L = 10\text{ k}\Omega$  (unless otherwise noted)

## 8 Detailed Description

## 8.1 Overview

The INA851 is a monolithic, precision instrumentation amplifier that incorporates a current-feedback input stage and a four-resistor, fully differential amplifier output stage. The schematic in [Fig. 8-1](#) shows how the differential input voltage is buffered by  $Q_1$  and  $Q_2$ , and is forced across  $R_G$ , which causes a signal current to flow through  $R_G$ ,  $R_1$ , and  $R_2$ . The fully differential amplifier,  $A_3$ , removes the common-mode component of the input signal and refers the output signal to the VOCM pin. The  $V_{BE}$  and voltage drop across  $R_1$  and  $R_2$  produce output voltages on  $A_1$  and  $A_2$  that are approximately 0.8 V less than the input voltages.

### 8-1. Detailed Schematic

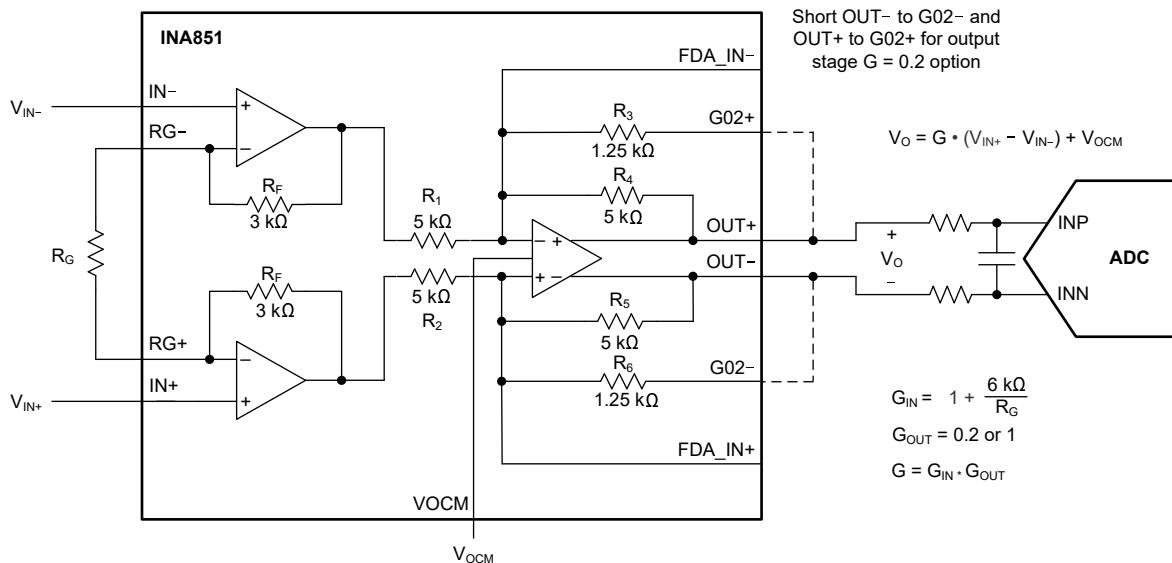

## 8.2 Functional Block Diagram

## 8.3 Feature Description

### 8.3.1 Adjustable Gain Setting

Figure 8-2 shows that the INA851 input-stage gain is set by a single external resistor ( $R_G$ ) connected between the RG pins. The gain of the output stage can be set to a unity gain of 1 V/V by floating the G02+ and G02- pins, or to an attenuating gain of 0.2 V/V by shorting those pins to the respective OUT+ and OUT- pins.

**Figure 8-2. Simplified Diagram of the INA851 With Gain Equations**

If the output stage is in the unity gain configuration, the value of  $R_G$  is selected according to the following equation:

$$G = \left(1 + \frac{6k\Omega}{R_G}\right) \quad (1)$$

When OUT+ is shorted to G02+ (pin 11 to pin 12) and OUT- is shorted to G02- (pin 9 to pin 10) so that the output stage is in the attenuating configuration, the gain equation becomes:

$$G = 0.2 \times \left(1 + \frac{6k\Omega}{R_G}\right) \quad (2)$$

Table 8-1 lists several commonly used gains and resistor values, as well as the additional gain error that is contributed by the gain resistors. The 6-kΩ term in the gain equation is a result of the sum of the two internal 3-kΩ feedback resistors. These on-chip resistors are laser-trimmed to accurate absolute values. The accuracy and temperature coefficients of these resistors are included in the gain accuracy and drift specifications of the

INA851. The 5-k $\Omega$  and 1.25-k $\Omega$  resistors used in the output stage are ratiometrically matched to achieve stable 1-V/V and 0.2-V/V gain terms; although, the resistor values can shift up to 15%, depending on production.

**表 8-1. Commonly Used Gains and Resistor Values**

DESIRED GAIN (V/V)	$R_G$ ( $\Omega$ )	NEAREST 1% $R_G$ ( $\Omega$ )	CALCULATED GAIN (V/V)	CONTRIBUTED GAIN ERROR (%)
0.2	NC, short OUT+ to G02+ and OUT– to G02–	NC	0.200	N/A
0.5	4 k, short OUT+ to G02+ and OUT– to G02–	4.02 k	0.499	0.30
1	NC	NC	1.000	N/A
2	6 k	5.97 k	2.005	–0.25
5	1.5 k	1.5 k	5.000	0.00
10	666.67	665	10.023	–0.23
20	315.79	316	19.987	0.06
50	122.45	124	49.387	1.23
100	60.61	60.4	100.338	–0.34
200	30.15	30.1	200.336	–0.17
500	12.02	12.1	496.868	0.63
1000	6.01	6.04	994.377	0.56
10000	600 m	604 m	9934.775	0.65

As shown in [図 8-2](#) and explained in more detail in [セクション 9.4](#), make sure to connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground, and to place these capacitors as close as possible to the device pins.

### 8.3.1.1 Gain Drift

The stability and temperature drift of external gain setting resistor  $R_G$  also affects gain. The contribution of  $R_G$  to gain accuracy and drift is determined from [式 1](#). The best gain drift of 5 ppm/ $^{\circ}$ C (maximum) is achieved when the INA851 uses  $G = 1$  in the input stage, without  $R_G$  connected. In this case, gain drift is limited by the mismatch of the temperature coefficient of the integrated resistors in fully differential amplifier  $A_3$ . When the output stage is in attenuating gain mode (OUT– shorted to G02– and OUT+ shorted to G02+), both the 1.25-k $\Omega$  and the 5-k $\Omega$  resistors contribute mismatch, as do the traces between the G02x and OUTx pins. Only the 5-k $\Omega$  resistors contribute mismatch when the output stage is in unity gain mode (with G02– and G02+ floating).

At input stage gains greater than 1, gain drift increases as a result of the individual drift of the 3-k $\Omega$  resistors in the feedback of  $A_1$  and  $A_2$ , relative to the drift of external gain resistor  $R_G$ . The low temperature coefficient of the internal feedback resistors improves the overall temperature stability of applications using input-stage gains greater than 1 V/V over alternate solutions. The low resistor values required for high gain make wiring resistance an important consideration. Sockets add to the wiring resistance and contribute additional gain error (such as a possible unstable gain error) at gains of approximately 20 or greater. To maintain stability, avoid parasitic capacitance of more than a few picofarads at the  $R_G$  connections. Careful matching of any parasitics on the  $R_G$  pins maintains optimal CMRR over frequency.

### 8.3.2 Offset Voltage

Low offset voltage is one of the key parameters for an instrumentation amplifier (INA). In a current-feedback INA, this error source is classified in three stages: input, output, and intermediate. The input-stage dc offset ( $V_{OSI}$ ) is mainly caused by the mismatch of the input transistors Q1 and Q2, (see [Figure 8-1](#)). The output-stage dc offset ( $V_{OSO}$ ) is caused partially by the mismatch of the output amplifier A3. In the INA851, A3 is a fully-differential amplifier and gained up by the noise gain of the circuit ( $1 + R_5 / R_3$ ). An additional intermediate stage offset contribution error adds to  $V_{OSO}$  that is caused by the mismatch of the current mirrors in the front end (through R1 and R2).

Unlike typical instrumentation amplifiers that incorporate a difference amplifier (A3) with a fixed output gain, the INA851 has two different output gain stages that subsequently contribute differently to  $V_{OSO}$ ; see Gaussian distributions for  $G = G_{OUT} = 1$  V/V in [Figure 7-3](#) and for  $G = G_{OUT} = 0.2$  V/V in [Figure 7-4](#).

The following equation calculates the total offset voltage error referred to the input:

$$V_{OS} = \sqrt{V_{OSI}^2 + \left( \frac{V_{OSO}(G_{OUT} = 1 \text{ or } G_{OUT} = 0.2)}{G_{IN}} \right)^2} \quad (3)$$

### 8.3.3 Input Common-Mode Range

The linear input voltage range of the INA851 input circuitry extends within 2.5 V (maximum) of both power supplies, and maintains excellent common-mode rejection throughout this range. The valid input common-mode range is a function of the input common-mode voltage, input differential voltage, gain, and output common-mode voltage.

The common-mode range is best calculated using the [INA851 Input-Output Range Design Calculator](#).

The common-mode range for the most common operating conditions are shown in [Figure 8-3](#) to [Figure 8-9](#).

**8-5. Input Common-Mode Voltage vs Output Voltage, Unity-Gain**

**8-6. Input Common-Mode Voltage vs Output Voltage, Unity-Gains**

**8-7. Input Common-Mode Voltage vs Output Voltage, High Gains**

**8-8. Input Common-Mode Voltage vs Output Voltage, High Gains**

**8-9. Input Common-Mode Voltage vs Output Voltage With Output Clamping**

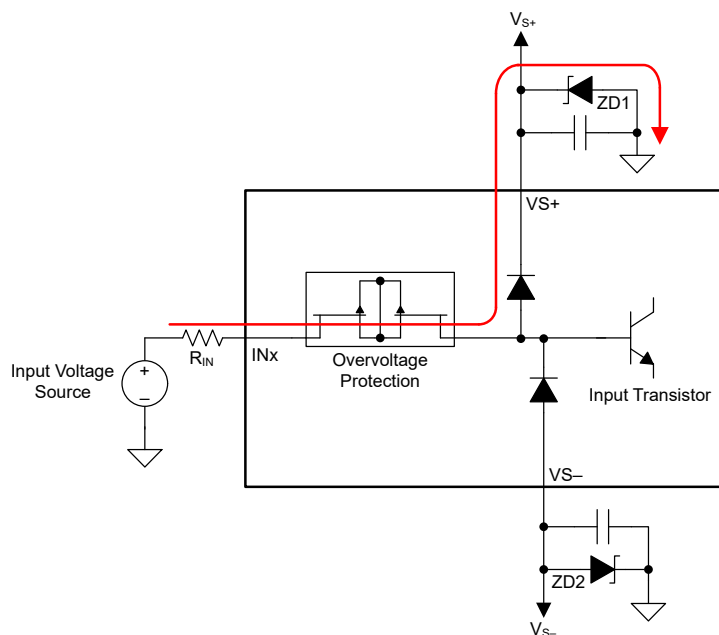

### 8.3.4 Input Protection

The inputs of the INA851 device are individually protected for voltages up to  $\pm 40$  V beyond the power supply rails. For example, a condition of  $V_{S-} = -55$  V on one input and  $V_{S+} = 55$  V on the other input does not cause damage. Internal circuitry on each input provides low series impedance under normal signal conditions. [Figure 8-10](#) shows that if the input is overloaded, the protection circuitry limits the input current to a value of approximately 16 mA.

**Figure 8-10. Input Current During an Overvoltage Condition**

[Figure 8-11](#) shows that during an input overvoltage condition, current flows through the input protection diodes into the power supplies. If the power supplies are unable to sink current, then place Zener diode clamps (ZD1 and ZD2 in [Figure 8-11](#)) on the power supplies to provide a current pathway to ground.

**Figure 8-11. Input Current Path During an Overvoltage Condition**

If an input stage gain greater than  $G_{IN} = 1$  V/V is implemented, where a gain resistor is present across the RG pins, the inputs are still well protected against overvoltage conditions; however, make sure that the input differential voltage limitations of the INA851 are not exceeded. For example, a condition of  $(V_{S+}) + 40$  V on both inputs does not cause damage. However, a condition of  $(V_{S-}) - 40$  V on one input and  $(V_{S+}) + 40$  V on the other input can cause damage. Precautions can include the use of external resistors in series with each of the inputs.

### 8.3.5 Output Clamping

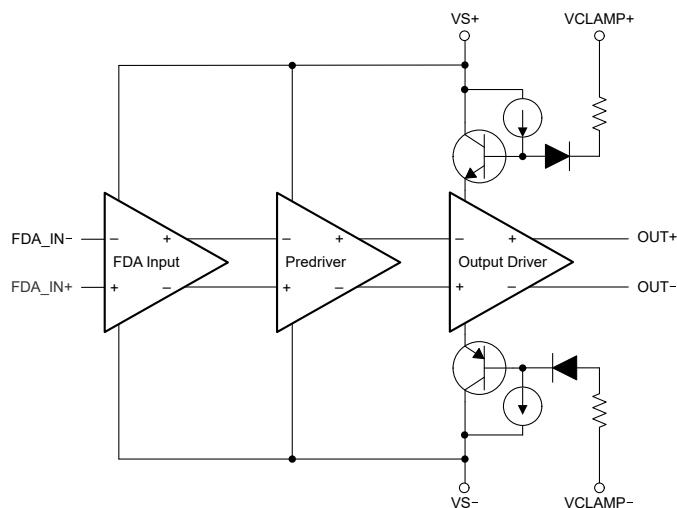

The INA851 features a unique output clamping function that protects the downstream device against damage that results from inadvertent over-driving. Usually the downstream device is an ADC that typically operates at a lower supply voltage than the INA851.

To implement this function, use the VCLAMP+ and VCLAMP– pins to limit the supply voltage range of the differential output drive amplifier. For typical operation, use a low-impedance connection from the pins to the power supplies of the ADC. For proper operation of the clamp circuitry, set the  $V_{S+}$  or  $V_{S-}$  supply voltages at least 1.5 V beyond the respective  $V_{CLAMP+}$  and  $V_{CLAMP-}$  clamping voltages. In addition, for the output driver to function correctly, the  $V_{CLAMP+}$  and  $V_{CLAMP-}$  voltages must be at least 3 V apart. If the output clamping functionality is not desired, short the VCLAMP+ and VCLAMP– pins to the amplifier VS+ and VS– supply pins.

The output driver operates up to the  $V_{CLAMP+}$  or  $V_{CLAMP-}$  limits without experiencing distortion. When the clamping function is in use the output voltage is clamped at approximately 600 mV beyond the clamp voltage.), so that the device output spans the full input range of the ADC. However, if the predriver output swings beyond the  $V_{CLAMP+}$  or  $V_{CLAMP-}$  voltage, the output driver begins to run out of headroom as a result of the clamped supply voltage, shown in [Figure 8-12](#).

The output is unable to swing greater than approximately 500 mV beyond the  $V_{CLAMP+}$  or  $V_{CLAMP-}$  voltage (at zero load), helping prevent or reduce damage to the ADC from overvoltage conditions.

The linear operation becomes distorted when the driver load becomes higher than 20 mA, see [Figure 8-13](#).

**Figure 8-12. Simplified Schematic of Output Driver Clamping Structure**

注

Be aware that instead of providing an immediate *hard-stop* voltage limit, the output driver is not clamped until  $V_{CLAMP+}$  or  $V_{CLAMP-}$  voltage has been exceeded, and the driver starts to run out of headroom. This configuration prevents distortion of the amplifier output when operating near the  $V_{CLAMP+}$  and  $V_{CLAMP-}$  rails. However, the output voltage exceeds  $V_{CLAMP+}$  and  $V_{CLAMP-}$  by several hundreds of millivolts before the clamps turn on strongly. When used in conjunction with several tens of ohms of resistance between the amplifier output and ADC input pins (commonly implemented as part of a low-pass filter for proper ADC acquisition), output clamping helps severely diminish any potential damage to the ADC that can otherwise result.

**FIG 8-13. Output Voltage With Output Clamping Enabled**

The VCLAMP+ pin features a fail-safe against power-up sequencing issues between the INA851 and a downstream device. For example, a condition of  $V_{(CLAMP+)} + 10\text{ V}$  on this pin does not cause damage. Therefore, the ADC supply can safely turn on while the INA851 supply is still off or just beginning to turn on. In this case, the current draw through the VCLAMP+ pin is limited to a safe value of typically 3 mA.

### 8.3.6 Low Noise

An output noise calculation helps design a low-noise circuit to drive high-precision ADC applications and optimize the signal-to-noise ratio (SNR).

[FIG 8-14](#) shows a simplified noise model for the INA851. The  $e_{NO}$  noise refers to the input resistor network of the FDA. This term incorporates the thermal noise of the internal feedback resistors, and the interaction of the internal current noise density of the output stage with the internal feedback resistors.

**FIG 8-14. Simplified Noise Model for the INA851**

The internal feedback resistor network is considered in the  $e_{NO}$  specification; therefore, the calculation of the total input-referred noise,  $e_{N(RTI)}$ , is simplified to the following equation:

$$e_{N(RTI)} = \sqrt{e_{NI}^2 + \left( \frac{e_{NO}(G_{OUT} = 1 \text{ or } G_{OUT} = 0.2)}{G_{IN}} \right)^2} \quad (4)$$

The total output-referred noise,  $e_{N(RTO)}$ , multiplies directly by the output stage gain,  $G_{OUT}$ , by  $G_{OUT} = 0.2\text{ V/V}$  or  $G_{OUT} = 1\text{ V/V}$  respectively, as shown in the following equation:

$$e_{N(RTO)} = \sqrt{(e_{NI} \times G_{IN} \times 0.2\text{ V/V or } 1\text{ V/V})^2 + (e_{NO}(G_{OUT} = 1 \text{ or } G_{OUT} = 0.2) \times 0.2\text{ V/V or } 1\text{ V/V})^2} \quad (5)$$

## 8.4 Device Functional Modes

The INA851 has a single functional mode and operates when the power-supply voltage is greater than 8 V ( $\pm 4\text{ V}$ ). The maximum power-supply voltage for the INA851 is 36 V ( $\pm 18\text{ V}$ ).

## 9 Application and Implementation

### 注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

### 9.1 Application Information

#### 9.1.1 Output Common-Mode Pin

The output voltage of the INA851 is developed with respect to the voltage on the output common-mode pin, V<sub>OCM</sub>. The starting point for most designs is to assign an output common-mode voltage for the INA851. For ac-coupled signal paths, this voltage is often the default midsupply voltage, so as to retain the most available output swing around the voltage centered at V<sub>OCM</sub>. For dc-coupled signal paths, set this voltage between a minimum of V<sub>S+</sub> – 2.5 V and maximum of V<sub>S–</sub> + 2.5 V. For precision ADC applications, this voltage is typically the input common mode voltage of the ADC.

The voltage at the V<sub>OCM</sub> pin is internally buffered to bias the fully differential output amplifier, eliminating the need for an additional external V<sub>OCM</sub> buffer. While the buffer input is high-ohmic, the V<sub>OCM</sub> pin also connects through internal 500-k $\Omega$  resistors to V<sub>CLAMP+</sub> and V<sub>CLAMP–</sub>, which sets the output common-mode voltage to midsupply in the event that the pin is floating.

While the V<sub>OCM</sub> buffer has high small-signal bandwidth, be aware that large-signal steps with fast edges at the V<sub>OCM</sub> pin cause delays in the output. For best tracking between the buffer input and output signals, use rise times of 200 ns or greater for large steps.

#### 9.1.2 Output-Stage Gain Selection and Noise-Gain Shaping

In the default unity-gain configuration, the INA851 fully differential amplifier output stage uses 5-k $\Omega$  feedback resistors between the OUT+ and OUT– outputs and the inverting and noninverting inputs, respectively. However, the INA851 also features internal 1.25-k $\Omega$  feedback resistors between those inputs and the G02+ and G02– pins. By shorting the G02+ pin to the OUT+ pin, and the G02– pin to the OUT– pin, the amplifier is placed in an attenuating gain of 0.2 V/V.

Additionally, access directly to the inverting and noninverting inputs of the fully differential amplifier is provided through the FDA\_IN– and FDA\_IN+ pins, respectively. This option allows circuit designers to add external feedback capacitors in parallel with the internal feedback resistors to implement noise filtering or noise-gain shaping techniques. These pins can also be used to implement customized attenuating gains for the output stage. Do not treat these pins as outputs, nor use the pins to source or sink current.

### 注

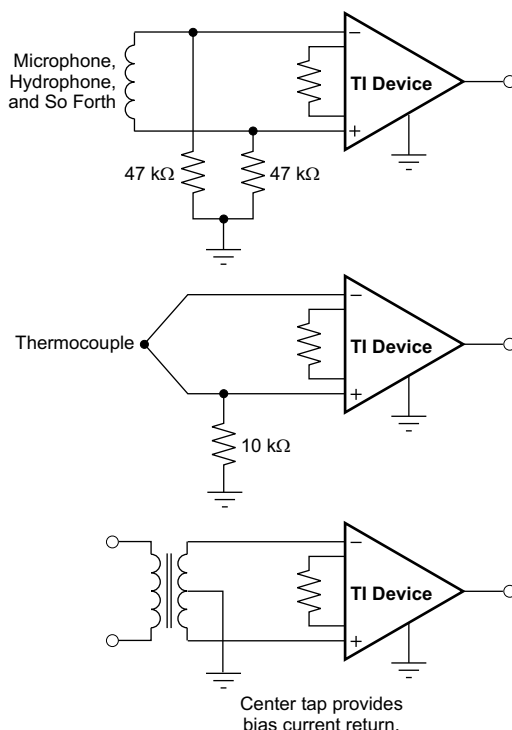

These pins are internally disconnected on preliminary samples of the INA851; these pins will be connected to the aforementioned internal nodes in the final device release.

### 9.1.3 Input Bias Current Return Path

The input impedance of the INA851 is very high at approximately 1 GΩ. However, a path must be provided for the input bias current of both inputs. This input bias current is typically 5 nA. High input impedance means that this input bias current changes very little with varying input voltage.

For proper operation, input circuitry must provide a path for input bias current. [Figure 9-1](#) shows various provisions for an input bias current path. Without a bias current path, the inputs float to a potential that exceeds the common-mode range of the INA851, and the input amplifiers saturate. If the differential source resistance is low, the thermocouple example in [Figure 9-1](#) shows that the bias current return path can connect to one input. With a higher source impedance, using two equal resistors provides a balanced input with the possible advantages of a lower input offset voltage as a result of bias current and better high-frequency common-mode rejection.

For more details about why a valid input bias current return path is necessary, see the [Importance of Input Bias Current Return Paths in Instrumentation Amplifier Applications](#) application report.

**Figure 9-1. Providing an Input Common-Mode Current Path**

#### 9.1.4 Thermal Effects due to Power Dissipation

The INA851 dissipates approximately 180 mW of power under quiescent conditions at a  $\pm 15$ -V supply voltage. The internal resistor network and output load drive causes an additional power dissipation that depends on the input signal. The small silicon area of the INA851 causes the internal circuitry to experience temperature gradients that can adversely affect the electrical performance.

Precision parameters, such as offset voltage, linearity, common-mode rejection ratio, and total harmonic distortion, can be impacted as a result of these thermal effects in the silicon. The thermal gradient particularly affects the performance of low-frequency input signals with higher gains ( $> 10$ ) and large output voltage variation. [Figure 9-2](#) shows that the thermal effect can be minimized by lowering the supply voltage, if the application permits.

To properly dissipate heat from the INA851, connect the thermal pad with sufficient thermal vias to a large copper plane that is connected to the negative supply,  $VS^-$ . A thorough PCB layout is of key importance (see also [Section 9.4](#)).

**Figure 9-2. Linearity vs Supply Voltage for G = 1000**

## 9.2 Typical Applications

### 9.2.1 Three-Pin Programmable Logic Controller (PLC)

Figure 9-3 shows a three-pin programmable-logic controller (PLC) design for the INA851. This PLC reference design accepts inputs of  $\pm 10$  V or  $\pm 20$  mA. The output is a differential voltage of  $\pm 4.95$  V with a  $V_{OCM}$  of 2.5 V (or 25 mV to 4.975 V on OUT+ and OUT-) to be measured by the ADS8920B SAR ADC.

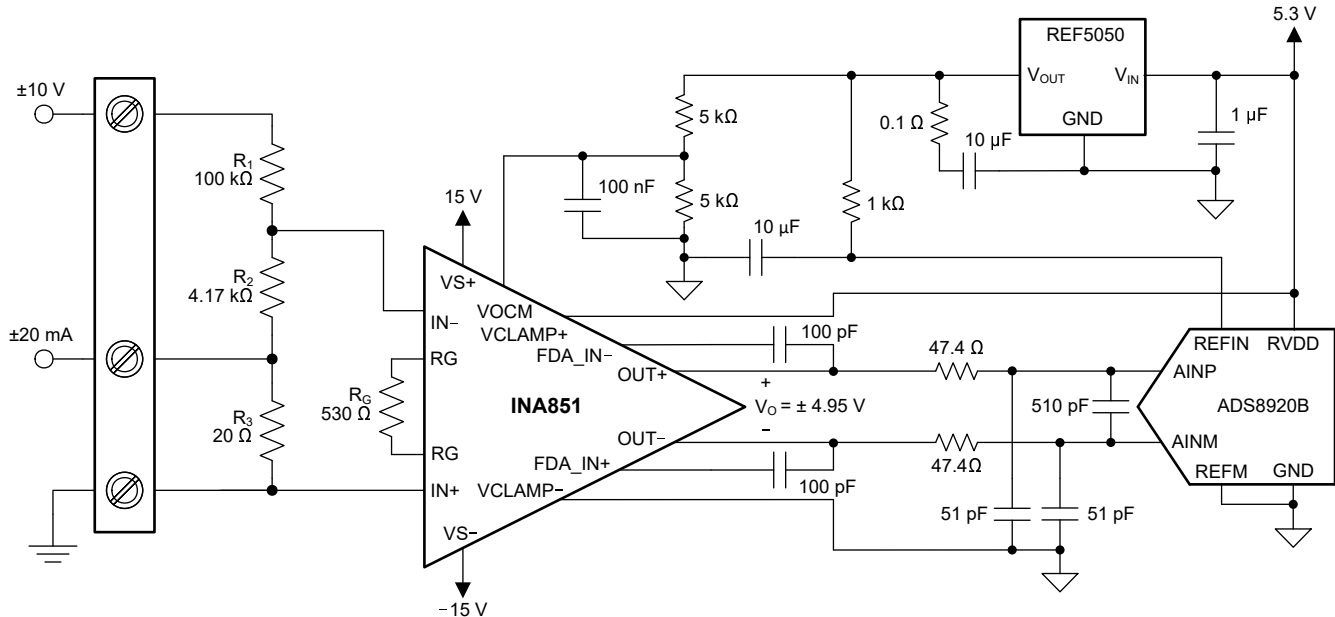

Figure 9-3. PLC Input with INA851 ( $\pm 10$  V, 4 mA to 20 mA)

#### 9.2.1.1 Design Requirements

For this application, the design requirements are as follows:

- 4-mA to 20-mA input with less than 20-Ω burden
- $\pm 20$ -mA input with less than 20-Ω burden
- $\pm 10$ -V input with impedance of approximately 100 kΩ
- Maximum 4-mA to 20-mA or  $\pm 20$ -mA burden voltage equal to  $\pm 0.4$  V
- Output range within 0 V to 5 V

#### 9.2.1.2 Detailed Design Procedure

There are two modes of operation for the circuit shown in Figure 9-3: current input and voltage input. This design requires  $R_1 \gg R_2 \gg R_3$ . Given this relationship, the following equation calculates the current input mode transfer function.

$$V_{OUT} = V_{DIFF} \times G = -(I_{IN} \times R_3) \quad (6)$$

where

- $V_{OUT}$  represents the differential voltage at the INA851 outputs in current input mode.
- $V_{DIFF}$  represents the differential voltage at the INA851 inputs.
- $G$  represents the total gain of the INA851
- $I_{IN}$  is the input current to the PLC.

The following equation shows the transfer function for the voltage input mode:

$$V_{OUT} = V_{DIFF} \times G = - \left( V_{IN} \times \left( \frac{R_2}{R_2 + R_1} \right) \right) \quad (7)$$

where

- $V_{OUT}$  represents the differential voltage at the INA851 outputs in voltage input mode.
- $V_{IN}$  is the input voltage to the PLC.

The voltages on the output pins of the INA851 follow the relationships in 式 8 and 式 9.

$$V_{OUT+} = V_{DIFF} \times \frac{G}{2} + V_{OCM} \quad (8)$$

$$V_{OUT-} = -V_{DIFF} \times \frac{G}{2} + V_{OCM} \quad (9)$$

$R_1$  sets the input impedance of the voltage input mode. The minimum typical input impedance is 100 k $\Omega$ . The  $R_1$  value is 100 k $\Omega$  because increasing the  $R_1$  value also increases noise. The value of  $R_3$  must be extremely small compared to  $R_1$  and  $R_2$ . A 20- $\Omega$  value is selected for  $R_3$  because that resistance value is much smaller than  $R_1$  and yields an input voltage of  $\pm 400$  mV when operated in current mode ( $\pm 20$  mA).

Use 式 10 to calculate  $R_2$  given  $V_{DIFF} = \pm 400$  mV,  $V_{IN} = \pm 10$  V, and  $R_1 = 100$  k $\Omega$ .

$$V_{DIFF} = V_{IN} \times \frac{R_2}{R_1 + R_2} \rightarrow R_2 = \frac{R_1 \times V_{DIFF}}{V_{IN} - V_{DIFF}} = 4.167 \text{ k}\Omega \quad (10)$$

The value obtained from 式 10 is not a standard 0.1% value; therefore, 4.17 k $\Omega$  is selected.  $R_1$  and  $R_2$  also use 0.1% tolerance resistors to minimize error.

Use 式 11 to calculate the gain of the instrumentation amplifier.

$$G = \frac{V_{OUT}}{V_{DIFF}} = \frac{4.95 \text{ V}}{400 \text{ mV}} = 12.375 \text{ V/V} \quad (11)$$

式 12 calculates the gain-setting resistor value using the INA851 gain equation for  $G_{OUT} = 1$  V/V (式 1).

$$R_G = \frac{6 \text{ k}\Omega}{G-1} = \frac{6 \text{ k}\Omega}{12.375-1} = 527.473 \Omega \quad (12)$$

Use a standard 0.1% resistor value of 530  $\Omega$  for this design.

The **ADS8920B** is selected because of the differential input, 1-MSPS sampling rate, and integrated reference buffer. Implement the antialiasing R-C-R filter using two 47.4- $\Omega$  resistors, a COG or NPO-type 510-pF differential capacitor, and two ceramic 51-pF common-mode capacitors. The **REF5050** is selected to create a 5-V reference voltage for the ADC. Use well-matched precision resistors to create a voltage divider that generates a stable 2.5-V  $V_{OCM}$  reference. Connect the VCLAMP+ and VCLAMP– pins of the INA851 to the supplies of the ADC to protect against overdrive damage in the event of a fault. Consider implementing a TVS diode from the ADC supply to GND for additional protection, and include 100-nF decoupling capacitors between the amplifier and ADC supplies and GND.

### 9.2.2 20-Bit, 1-MSPS ADS8900B Driver Circuit With FDA Noise Filter

The application circuit in 図 9-6 shows the schematic of a complete input and reference driver circuit for the [ADS8900B](#), a 20-bit, precision, 1-MSPS, successive approximation register (SAR), analog-to-digital converter (ADC). This circuit is used to measure the driving capability of the [INA851](#) with the [ADS8900B](#) ADC.

To test the complete dynamic range of the circuit, the common-mode voltage  $V_{OCM}$  of the input of the ADC is established at a value of  $V_{REF} / 2$ .

To exclude noise caused by supply voltage, the test circuit uses the [TPS7A4700](#), a low-noise 4- $\mu$ V<sub>RMS</sub>, RF LDO voltage regulator, to generate the 5.2-V supply rail.

For  $V_{OCM}$ , the circuit uses the [REF5050](#), a low-noise, low-drift, 5-V reference, a 20k-20k voltage divider to establish  $V_{REF}/2$  and an additional RC filter (10  $\Omega$ , 150 pF) into the  $V_{OCM}$  pin. See also the [ADS8900EVM-PDK user's guide](#).

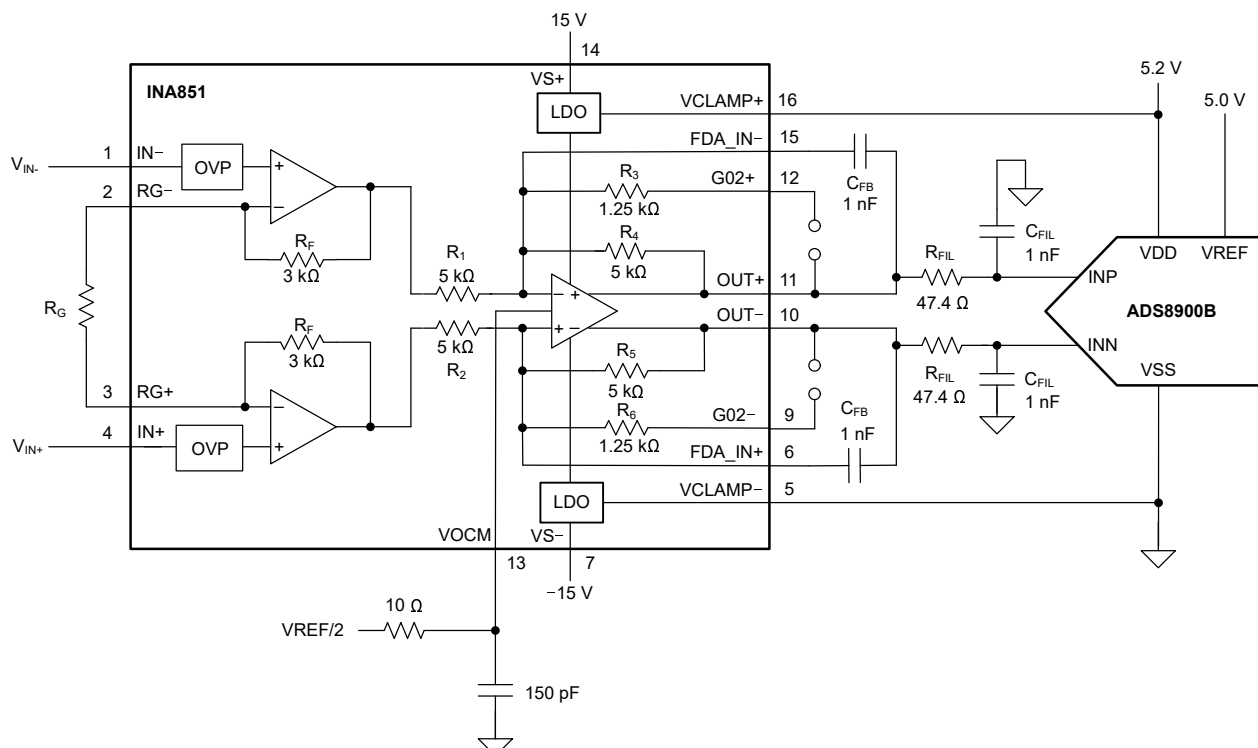

図 9-6. Driving ADS8900B With FDA Noise Filter

### 9.2.2.1 Design Requirements

The requirements for the application driving the ADS8900B ADC are listed in the following table.

**表 9-1. Design Parameters**

PARAMETER	VALUE
Differential to differential conversion	$V_{INDIFF}$ to $V_{OUTDIFF}$
Supply voltages	$V_{S\pm} = \pm 15\text{ V}$ , $V_{DD} = 5.2\text{ V}$ , $V_{REF} = 5\text{ V}$
Full-scale range of ADC for FSR	$FSR = \pm 5\text{ V}$
Driver configuration	See 表 9-2
Circuit bandwidth	$f_{(-3dB)} = 31.7\text{ kHz}$
Output RC elements	See ADS8900B input requirements

To eliminate ground loops, unwanted parasitic effects, and distortion, use appropriate PCB layout and grounding techniques (see also セクション 9.4).

### 9.2.2.2 Application Curves

表 9-2 show the typical signal-to-noise (SNR) and total harmonic distortion (THD) of the INA851 driving the ADS8900B SAR ADC at full-scale range and at different gain configurations. The RC filter combination ( $R_{FIL}$ ,  $C_{FIL}$ ) shown in 図 9-6 helps attenuate the nonlinear charge kickback of the ADC and optimize for best THD performance. The combination of the RC filter and the feedback capacitor  $C_{FB}$  allow for the best trade-off between harmonic distortion and maintaining stability of the FDA. Low voltage-coefficient C0G capacitors are used everywhere in the signal path ( $C_{FB}$ ,  $C_{FIL}$ ) for the low-distortion properties.

For other bandwidth requirements, adjust the feedback capacitor accordingly, and verify the circuit performance using a SPICE simulation using the [INA851 TINA-TI™ SPICE Model](#). The amplifier output voltage must settle within the ADC bit accuracy during the ADC acquisition time window. Verify the desired circuit is stable; that is, the FDA has more than a 45° phase margin.

**表 9-2. INA851 + ADS8900B FFT Data Summary**

INPUT AMPLITUDE (Vpk)	RG RESISTOR ( $\Omega$ )	$G_{IN}$ (V/V)	$G_{OUT}$ (V/V)	SNR (dB)	THD (dB)	ENOB (Bits)
23.7378	None	1	0.2	100.7	-117.3	16.42
4.7476	None	1	1	100.6	-122.7	16.41
0.2374	316	20	1	99.1	-112.0	16.10
0.0475	60.4	100	1	91.1	-99.0	14.64

$G = 0.2 \text{ V/V}$ ,  $f_{\text{IN}} = 1 \text{ kHz}$ ,  $\text{SNR} = 100.73 \text{ dB}$ ,  $\text{THD} = -117.28 \text{ dB}$

### 9.2.3 24-Bit, 200 kSPS, Delta-Sigma ADS127L11 ADC Driver Circuit With FDA Noise Filter

The application circuit in [Figure 9-9](#) shows a schematic for a 24-bit-precision, 200-kSPS, delta-sigma, ADC. The circuit is used to measure the driving capacity of the INA851 with the [ADS127L11](#) ADC.

The ADS127L11 ADC offers two digital filters to optimize for ac applications (wideband filter) or dc applications (Sinc4 filter). [Application Curves](#) shows measurement results in both filter settings. For detailed design procedure to operate the ADS127L11 ADC, see the [ADS127L11EVM-PDK evaluation module](#).

**Figure 9-9. Driving the Delta-Sigma ADC ADS127L11**

#### 9.2.3.1 Design Requirements

The design requirements for the application driving the ADS127L11 ADC are listed in the following table.

**Table 9-3. Design Parameters**

PARAMETER	VALUE
Differential-to-differential conversion	$V_{INDIFF}$ to $V_{OUTDIFF}$
Supply voltages	$VS_{\pm} = \pm 15$ V, $AVDD = 5.2$ V, $VREF = 2.5$ V
Full-scale range of ADC for FSR	$FSR = \pm 5$ V
Data rate of ADC	$f_{DATA} = 187.5$ kSPS
ADC filter configuration	(1) High-speed mode, Sinc4 filter, $OSR = 64$ (2) High-speed mode, wideband filter, $OSR = 64$
INA gain and filter configuration	See <a href="#">Table 9-4</a> and <a href="#">Table 9-5</a>
Signal frequency	$f_{IN} = 1$ kHz
RC kickback filter <sup>(1)</sup>	$R_{FIL} = 47.4 \Omega + C_{DIFF} = 510$ pF + $R_{FIL} = 47.4 \Omega$ , $C_{FIL} = 51$ pF

- (1) A trade-off must be considered between THD, frequency response and drift. The differential current drift into the ADC can interact with this filter resistors and result in higher drift errors. However, low resistance degrades the phase margin of the INA851. For low drift applications, keep  $R_{FIL} < 50 \Omega$ .

For optimized linearity and THD performance, use good printed circuit board (PCB) layout practice. For proper heat dissipation of the INA851, connect the thermal pad to a plane or a large copper pour at the bottom connected to VS– (see also [セクション 9.4.2](#)).

### 9.2.3.2 Application Curves

[表 9-4](#) and [表 9-5](#) show the typical signal-to-noise (SNR) and total harmonic distortion (THD) of the INA851 driving the ADS127L11 delta-sigma ADC at full-scale range and at different gain configurations.

The RC filter combination is dimensioned such to help attenuate the nonlinear charge kickback and optimize for best THD performance. The ADC requires a low impedance input for lowest distortion performance; however, driving heavier loads degrades the phase margin of the INA851. Use a feedback capacitor ( $C_{FB}$ ) in the range of 47 pF to 100 pF to optimize for stability versus THD performance. Low voltage-coefficient C0G capacitors are used everywhere in the signal path ( $C_{FB}$ ,  $C_{DIFF}$ ,  $C_{CM}$ ) for their low distortion properties.

For other bandwidth requirements, adjust the feedback capacitor accordingly and verify the circuit performance using a SPICE simulation using [INA851 TINA-TI™ SPICE Model](#). Confirm that the desired circuit is stable; that is, the FDA has more than a 45° phase margin.

**表 9-4. INA851 + ADS127L11 (Sinc4 Filter) FFT Data Summary**

INPUT AMPLITUDE (Vpk)	RG RESISTOR (Ω)	$G_{IN}$ (V/V)	$G_{OUT}$ (V/V)	SNR (dB)	THD (dB)	ENOB (Bits)
23.7378	None	1	0.2	106.8	–116.0	17.36
4.7476	None	1	1	105.9	–122.0	17.28

## 9.3 Power Supply Recommendations

The nominal performance of the INA851 is specified with a supply voltage of  $\pm 15$  V, and  $V_{ICM}$  and  $V_{OCM}$  at midsupply. The device also operates using power supplies from  $\pm 4$  V (8 V) to  $\pm 18$  V (36 V) and non-midsupply input and output common-mode voltages with excellent performance.

## 9.4 Layout

### 9.4.1 Layout Guidelines

Attention to good layout practices is always recommended. For best operational performance of the device, use good printed circuit board (PCB) layout practices:

- To avoid converting common-mode signals into differential signals and thermal electromotive forces (EMFs), make sure that both input paths are symmetrical and well-matched for source impedance and capacitance.
- As shown in [Figure 9-14](#), keep the external gain resistor close to the  $R_G$  pins to keep the loop inductance as low as possible and to avoid a potential parasitic coupling path. Even slight mismatch in parasitic capacitance at the gain setting pins can degrade CMRR over frequency. In applications that implement gain switching using switches or PhotoMOS® relays to change the value of  $R_G$ , select the component so that the switch capacitance is as small as possible, and most importantly, so that capacitance mismatch between the  $R_G$  pins is minimized.
- Noise can propagate into analog circuitry through the power pins of the device and of the circuit as a whole. Bypass capacitors reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground, placed as close as possible to the device. A single bypass capacitor from  $V+$  to ground is applicable for single-supply applications.
- To reduce parasitic coupling, run the input traces as far away as possible from the supply or output traces. If these traces cannot be kept separate, crossing the sensitive trace perpendicular to the noisy trace is much better than in parallel.
- Leakage on the  $FDA\_IN+$  and  $FDA\_IN-$  pins can cause in a dc offset error in the output voltages. Additionally, excessive parasitic capacitance at these pins can result in decreased phase margin and affect the stability of the output stage. If these pins are not used to implement deliberate capacitive feedback, follow best practices to minimize leakage and parasitic capacitance. Consider implementing *keep-out* areas in any ground planes that lie immediately below the pins.
- Minimize the number of thermal junctions. Ideally, the signal path is routed within a single layer without vias.
- Keep sufficient distance from major thermal energy sources (circuits with high power dissipation). If not possible, place the device so that the effects of the thermal energy source on the high and low sides of the differential signal path are evenly matched.
- Solder the thermal pad to the PCB. For the INA851 to properly dissipate heat, connect the thermal pad to a plane or large copper pour that is electrically connected to  $VS-$ , even for low-power applications.
- Keep the traces as short as possible.

### 10.4 サポート・リソース

TI E2E™ サポート・フォーラムは、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

### 10.5 Trademarks

TINA-TI™ and TI E2E™ are trademarks of Texas Instruments.

TINA™ is a trademark of DesignSoft, Inc.

PhotoMOS® is a registered trademark of Panasonic Electric Works Europe AG.

PSpice® is a registered trademark of Cadence Design Systems, Inc.

すべての商標は、それぞれの所有者に帰属します。

## 10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## 10.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">INA851RGTR</a>	Active	Production	VQFN (RGT)   16	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	INA851
INA851RGTR.B	Active	Production	VQFN (RGT)   16	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	INA851
<a href="#">INA851RGTT</a>	Active	Production	VQFN (RGT)   16	250   SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	INA851
INA851RGTT.B	Active	Production	VQFN (RGT)   16	250   SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	INA851

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
INA851RGTR	VQFN	RGT	16	3000	330.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2
INA851RGTT	VQFN	RGT	16	250	180.0	12.4	3.3	3.3	1.1	8.0	12.0	Q2

## TAPE AND REEL BOX DIMENSIONS

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
INA851RGTR	VQFN	RGT	16	3000	367.0	367.0	35.0
INA851RGTT	VQFN	RGT	16	250	210.0	185.0	35.0

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slue271](http://www.ti.com/lit/slue271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
