

ISOW7841A-Q1 車載用高性能、5000V_{RMS} 強化クワッド・チャネル・デジタル・アイソレータ、高効率低放射の DC/DC コンバータ内蔵

1 特長

- 車載アプリケーション用に認定済み
- 下記内容で AEC-Q100 認定済み:
 - デバイス温度グレード 1: -40°C ~ 125°C の動作時周囲温度範囲
- 100Mbps のデータ・レート
- 機能安全対応
 - 機能安全システムの設計に役立つ資料を利用可能
- 堅牢な絶縁バリア:
 - 1 kV_{RMS} の動作電圧で 100 年を超える予測寿命
 - 最高 5000V_{PMS} の絶縁定格
 - 最高 10 kV_{PK} のサージ耐量
 - 最小 CMTI: ±100kV/μs
- 高効率の DC/DC コンバータとオンチップ変圧器を内蔵
- 3V ~ 5.5V の広い入力電源範囲
- レギュレートされた 5V または 3.3V 出力
- 最大 0.65W の出力電力
- 5V から 5V へ、5V から 3.3V へ: 利用可能負荷電流: 130mA 以上
- 3.3V から 3.3V へ: 利用可能負荷電流: 75mA 以上、3.3V から 5V へ: 利用可能負荷電流: 40mA 以上
- ソフトスタートにより突入電流を制限
- 過負荷および短絡保護
- サーマル・シャットダウン
- デフォルト出力: HIGH と LOW を選択可能
- 小さい伝搬遅延時間: 標準値 13ns (5V 電源)
- 堅牢な電磁気互換性 (EMC)
 - システム・レベルの ESD、EFT、サージ耐性
 - 絶縁バリアの両側で ±8kV の IEC 61000-4-2 接触放電保護
 - 低い放射
- 16 ピンのワイド SOIC パッケージ
- 安全関連認証:
 - DIN V VDE V 0884-11:2017-01 に準拠した強化絶縁耐圧: 7071V_{PK}
 - UL 1577 に準拠した絶縁耐圧: 5000V_{RMS} (1 分間)
 - IEC 60950-1、IEC 62368-1、IEC 60601-1 最終機器規格による CSA 認証
 - GB4943.1-2011 による CQC 認定
 - EN 60950-1 および EN 61010-1 による TUV 認証
 - すべての認定は計画中

2 アプリケーション

- バッテリー管理システム (BMS)
- オンボード充電器 (OBC)
- トラクション・インバータ
- DC/DC コンバータ

3 概要

ISOW7841A-Q1 は、高効率電力コンバータが内蔵された、車載認定の高性能クワッド・チャネル強化デジタル・アイソレータです。低放射の内蔵 DC/DC コンバータは、最大 650mW の絶縁電力を高効率で供給し、各種の入力および出力電圧に構成可能です。このため、このデバイスを使用すると、スペースに制約のある絶縁設計において別個の絶縁電源が不要になります。

製品情報 1

部品番号	パッケージ	本体サイズ (公称)
ISOW7841A-Q1	SOIC (16)	10.30mm × 7.50mm

- 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。

- V_{CC} は GND1 を基準とする一次電源電圧です。V_{ISO} は GND2 を基準とする絶縁電源電圧です。
- V_{SI} および V_{SO} は、チャネルの方向により V_{CC} または V_{ISO} のいずれかです。
- V_{SI} は GND1 を基準とする入力側電源電圧、V_{SO} は GND2 を基準とする出力側電源電圧です。

5 Description Continued

The ISOW7841A-Q1 device provides high electromagnetic immunity and low emissions while isolating CMOS or LVCMOS digital I/Os. The signal-isolation channel has a logic input and output buffer separated by a double capacitive silicon dioxide (SiO₂) insulation barrier, whereas, power isolation uses on-chip transformers separated by thin film polymer as insulating material. If the input signal is lost, the default output is high for the ISOW7841A-Q1 without the F suffix and low for the device with the F suffix.

These devices help prevent noise currents on data buses, such as CAN, or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. Through innovative chip design and layout techniques, electromagnetic compatibility of the device has been significantly enhanced to ease system-level ESD, EFT, surge and emissions compliance. The high-efficiency of the power converter allows operation at a higher ambient temperature. The device is available in a 16-pin SOIC wide-body (SOIC-WB) DWE package.

6 Pin Configuration and Functions

ISOW7841A-Q1 DWE Package. 16-Pin SOIC-WB. Top View.

表 6-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
	ISOW7841A-Q1		
GND1	2, 8	—	Ground connection for V _{CC}
GND2	9, 15	—	Ground connection for V _{ISO}
INA	3	I	Input channel A
INB	4	I	Input channel B
INC	5	I	Input channel C
IND	11	I	Input channel D
NC	7	—	Not connected
OUTA	14	O	Output channel A
OUTB	13	O	Output channel B
OUTC	12	O	Output channel C
OUTD	6	O	Output channel D
SEL	10	I	V _{ISO} selection pin. V _{ISO} = 5 V when SEL shorted to V _{ISO} . V _{ISO} = 3.3 V, when SEL shorted to GND2 or when left floating. For more information see セクション 9.4 .
V _{CC}	1	—	Supply voltage
V _{ISO}	16	—	Isolated supply voltage determined by SEL pin

7 Specifications

7.1 Absolute Maximum Ratings

See ⁽¹⁾ ⁽²⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage	−0.5	6	V
V _{ISO}	Isolated supply voltage	−0.5	6	V
V _{IO}	Voltage at INx, OUTx, SEL pins	−0.5	V _{CC} + 0.5, V _{ISO} + 0.5 ⁽³⁾	V
I _O	Maximum output current through data channels	−15	15	mA
T _J	Junction temperature		150	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground pin (GND1 or GND2) and are peak voltage values.
- (3) This value depends on whether the pin is located on the V_{CC} or V_{ISO} side. The maximum voltage at the I/O pins should not exceed 6 V.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾ HBM ESD Classification Level 2	±2000	V
		Charged-device model (CDM), per AEC Q100-011 CDM ESD Classification Level C6	±1000	
		Contact discharge per IEC 61000-4-2 ⁽²⁾ Isolation barrier withstand test	±8000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
- (2) IEC ESD strike is applied across the barrier with all pins on each side tied together creating a two-terminal device.

7.3 Recommended Operating Conditions

See ¹

			MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage		3		5.5	V
I _{OH}	High level output current ²	V _{SO} = 5 V	−4			mA
		V _{SO} = 3.3 V	−2			
I _{OL}	Low level output current ²	V _{SO} = 5 V			4	mA
		V _{SO} = 3.3 V			2	
V _{IH}	High-level input voltage		0.7 × V _{SI}		V _{SI}	V
V _{IL}	Low-level input voltage		0		0.3 × V _{SI}	V
DR	Data rate				100	Mbps
T _A	Ambient temperature		−40		125	°C

1. V_{SI} is the input side supply, V_{SO} is the output side supply
2. This current is for data output channel.

7.4 Thermal Information

THERMAL METRIC ¹		ISOW7841A-Q1	UNIT
		DWE (SOIC)	
		16 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	56.8	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	15.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	28.5	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	2.4	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	28.5	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	—	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

7.5 Power Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P _D	Maximum power dissipation (both sides)	V _{CC} = 5.5 V, I _{ISO} = 110 mA, T _J = 150°C, T _A ≤ 80°C, C _L = 15 pF, input a 50-MHz 50% duty-cycle square wave			1.02	W
P _{D1}	Maximum power dissipation (side-1)				0.51	W
P _{D2}	Maximum power dissipation (side-2)				0.51	W

7.6 Insulation Specifications

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest terminal-to-terminal distance through air	>8	mm
CPG	External creepage ⁽¹⁾	Shortest terminal-to-terminal distance across the package surface	>8	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance – capacitive signal isolation)	> 21	μm
		Minimum internal gap (internal clearance – transformer power isolation)	>120	
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	> 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300 V _{RMS}	I-IV

		Rated mains voltage ≤ 1000 V _{RMS}	I-III	
DIN V VDE 0884-11:2017-01 ⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	1414	V _{PK}
V _{IOWM}	Maximum working isolation voltage	AC voltage; Time dependent dielectric breakdown (TDDb) Test ; See 10-5	1000	V _{RMS}
		DC voltage	1414	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} ; t = 60 s (qualification); V _{TEST} = 1.2 × V _{IOTM} ; t = 1 s (100% production)	7071	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽³⁾	Test method per IEC 62368-1, 1.2/50 μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 10000 V _{PK} (qualification)	6250	V _{PK}

PARAMETER		TEST CONDITIONS	VALUE	UNIT
q _{pd}	Apparent charge ⁽⁴⁾	Method a, after input/output safety test subgroup 2/3, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s; $V_{pd(m)} = 1.2 \times V_{IORM}$, $t_m = 10$ s	≤ 5	pC
		Method a, after environmental tests subgroup 1, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s; $V_{pd(m)} = 1.6 \times V_{IORM}$, $t_m = 10$ s	≤ 5	
		Method b1, at routine test (100% production) and preconditioning (type test), $V_{ini} = 1.2 \times V_{IOTM}$, $t_{ini} = 1$ s; $V_{pd(m)} = 1.875 \times V_{IORM}$, $t_m = 1$ s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁵⁾	$V_{IO} = 0.4 \times \sin(2\pi ft)$, $f = 1$ MHz	~ 3.5	pF
R _{IO}	Insulation resistance ⁽⁵⁾	$V_{IO} = 500$ V, $T_A = 25^\circ\text{C}$	$> 10^{12}$	Ω
		$V_{IO} = 500$ V, $100^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$	$> 10^{11}$	
		$V_{IO} = 500$ V, $T_S = 150^\circ\text{C}$	$> 10^9$	
	Pollution degree		2	
	Climatic category		40/125/21	
UL 1577				
V _{ISO(UL)}	Withstand isolation voltage	V _{TEST} = V _{ISO(UL)} = 5000 V _{RMS} , $t = 60$ s (qualification), V _{TEST} = $1.2 \times V_{ISO(UL)} = 6000$ V _{RMS} , $t = 1$ s (100% production)	5000	V _{RMS}

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for safe electrical insulation only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-terminal device.

7.7 Safety-Related Certifications

VDE	CSA	UL	CQC	TUV
Plan to certify according to DIN V VDE V 0884-11:2017-01	Plan to certify according to IEC 60950-1, IEC 62368-1, and IEC 60601-1	Plan to certify under UL 1577 Component Recognition Program	Plan to certify according to GB 4943.1-2011	Plan to certify according to EN 61010-1:2010 and EN 60950-1:2006/A2:2013
Reinforced insulation; Maximum transient isolation voltage, 7071 V _{PK} ; Maximum repetitive peak isolation voltage, 1414 V _{PK} ; Maximum surge isolation voltage, 6250 V _{PK}	Reinforced insulation per CSA 60950-1-07+A1+A2, IEC 60950-1 2nd Ed.+A1+A2, CSA 62368-1-14 and IEC 62368-1 2nd Ed., 800 V _{RMS} maximum working voltage (pollution degree 2, material group I); 2 MOPP (Means of Patient Protection) per CSA 60601-1:14 and IEC 60601-1 Ed. 3+A1, 250 V _{RMS} maximum working voltage; Temperature rating is 90°C for reinforced insulation and 125°C for basic insulation; see certificate for details. 7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S	Safety input, output, or supply current ⁽¹⁾	R _{θJA} = 56.8°C/W, V _I = 5.5 V, T _J = 150°C, T _A = 25°C, see Thermal Derating Curve for Safety Limiting Current per VDE			400	mA
		R _{θJA} = 56.8°C/W, V _I = 3.6 V, T _J = 150°C, T _A = 25°C, see Thermal Derating Curve for Safety Limiting Current per VDE			611	
P _S	Safety input, output, or total power ⁽¹⁾	R _{θJA} = 56.8°C/W, T _J = 150°C, T _A = 25°C, see Thermal Derating Curve for Safety Limiting Power per VDE			2200	mW
T _S	Maximum safety temperature ⁽¹⁾				150	°C

- (1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power respectively. The maximum limits of I_S and P_S should not be exceeded. These limits vary with the ambient temperature, T_A.
The junction-to-air thermal resistance, R_{θJA}, in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. Use the following equations to calculate the value for each parameter:
 $T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.
 $T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$, where T_{J(max)} is the maximum allowed junction temperature.
 $P_S = I_S \times V_I$, where V_I is the maximum input voltage.

7.9 Electrical Characteristics—5-V Input, 5-V Output

V_{CC} = 5 V ±10%, SEL shorted to V_{ISO} (over recommended operating conditions, unless otherwise specified)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{ISO}	Isolated supply voltage	External I _{ISO} = 0 to 50 mA	4.75	5.07	5.43	V
		External I _{ISO} = 0 to 130 mA	4.5	5.07	5.43	
V _{ISO(LINE)}	DC line regulation	I _{ISO} = 50 mA, V _{CC} = 4.5 V to 5.5 V		2		mV/V
V _{ISO(LOAD)}	DC load regulation	I _{ISO} = 0 to 130 mA		1%		
EFF	Efficiency at maximum load current	I _{ISO} = 130 mA, C _{LOAD} = 0.1 μF 10 μF; V _I = V _{SI} (ISOW7841A-Q1); V _I = 0 V (ISOW7841A-Q1 with F suffix)		53%		
V _{CC+(UVLO)}	Positive-going UVLO threshold on V _{CC} , V _{ISO}				2.7	V
V _{CC-(UVLO)}	Negative-going UVLO threshold on V _{CC} , V _{ISO}		2.1			V
V _{HYS (UVLO)}	UVLO threshold hysteresis on V _{CC} , V _{ISO}			0.2		V
V _{ITH}	Input pin rising threshold				0.7	V _{SI}
V _{ITL}	Input pin falling threshold		0.3			V _{SI}
V _{I(HYS)}	Input pin threshold hysteresis (INx)		0.1			V _{SI}
I _{IL}	Low level input current	V _{IL} = 0 at INx or SEL	–10			μA
I _{IH}	High level input current	V _{IH} = V _{SI} ⁽¹⁾ at INx or SEL			10	μA
V _{OH}	High level output voltage	I _O = –4 mA, see 8-1	V _{SO} ⁽¹⁾ – 0.4	V _{SO} – 0.2		V
V _{OL}	Low level output voltage	I _O = 4 mA, see 8-1		0.2	0.4	V
CMTI	Common mode transient immunity	V _I = V _{SI} or 0 V, V _{CM} = 1000 V; see 8-2	100			kV/us
I _{CC_SC}	DC current from supply under short circuit on V _{ISO}	V _{ISO} shorted to GND2		137		mA
V _{ISO(RIP)}	Output ripple on isolated supply (pk-pk)	20-MHz bandwidth, C _{LOAD} = 0.1 μF 20 μF, I _{ISO} = 130 mA		100		mV

- (1) V_{SI} = input side supply; V_{SO} = output side supply

7.10 Supply Current Characteristics—5-V Input, 5-V Output

$V_{CC} = 5\text{ V} \pm 10\%$, SEL shorted to V_{ISO} (over recommended operating conditions, unless otherwise specified)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{CC}	Current drawn from supply	No external I_{LOAD} ; $V_I = 0\text{ V}$ (ISOW7841A-Q1); $V_I = V_{SI}$ ⁽¹⁾ (ISOW7841A-Q1 with F suffix)		23		mA
		No external I_{LOAD} ; $V_I = V_{SI}$ (ISOW7841A-Q1); $V_I = 0\text{ V}$ (ISOW7841A-Q1 with F suffix)		17		
		All channels switching with square wave clock input of 1 Mbps; $C_L = 15\text{ pF}$, No external I_{LOAD}		20		
		All channels switching with square wave clock input of 10 Mbps; $C_L = 15\text{ pF}$, No external I_{LOAD}		24		
		All channels switching with square wave clock input of 100 Mbps; $C_L = 15\text{ pF}$, No external I_{LOAD}		54		
$I_{ISO(OUT)}$ ⁽²⁾	Current available to isolated supply	$V_I = 0\text{ V}$ (ISOW7841A-Q1); $V_I = V_{SI}$ (ISOW7841A-Q1 with F suffix)	128			mA
		$V_I = V_{SI}$ (ISOW7841A-Q1); $V_I = 0\text{ V}$ (ISOW7841A-Q1 with F suffix)	130			
		All channels switching with square wave clock input of 1 Mbps; $C_L = 15\text{ pF}$	128			
		All channels switching with square wave clock input of 10 Mbps; $C_L = 15\text{ pF}$	127			
		All channels switching with square wave clock input of 100 Mbps; $C_L = 15\text{ pF}$	112			

- (1) V_{SI} = input side supply; V_{SO} = output side supply
(2) Current available to load should be derated by $2\text{ mA}/^\circ\text{C}$ for $T_A > 80^\circ\text{C}$.

7.11 Electrical Characteristics—3.3-V Input, 5-V Output

$V_{CC} = 3.3\text{ V} \pm 10\%$, SEL shorted to V_{ISO} (over recommended operating conditions, unless otherwise specified)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{ISO}	Isolated supply voltage	External $I_{ISO} = 0$ to 40 mA	4.5	5.07	5.43	V
$V_{ISO(LINE)}$	DC line regulation	$I_{ISO} = 20\text{ mA}$, $V_{CC} = 4.5\text{ V}$ to 5.5 V		2		mV/V
$V_{ISO(LOAD)}$	DC load regulation	$I_{ISO} = 0$ to 40 mA		1%		
EFF	Efficiency at maximum load current	$I_{ISO} = 40\text{ mA}$, $C_{LOAD} = 0.1\text{ }\mu\text{F} \parallel 10\text{ }\mu\text{F}$; $V_I = V_{SI}$ (ISOW7841A-Q1); $V_I = 0\text{ V}$ (ISOW7841A-Q1 with F suffix)		42%		
$V_{CC+(UVLO)}$	Positive-going UVLO threshold on V_{CC} , V_{ISO}				2.7	V
$V_{CC-(UVLO)}$	Negative-going UVLO threshold on V_{CC} , V_{ISO}		2.1			V
$V_{HYS(UVLO)}$	UVLO threshold hysteresis on V_{CC} , V_{ISO}			0.2		V
V_{ITH}	Input pin rising threshold				0.7	V_{SI}
V_{ITL}	Input pin falling threshold		0.3			V_{SI}
$V_{I(HYS)}$	Input pin threshold hysteresis (INx)		0.1			V_{SI}
I_{IL}	Low level input current	$V_{IL} = 0$ at INx or SEL	-10			μA
I_{IH}	High level input current	$V_{IH} = V_{SI}$ ⁽¹⁾ at INx or SEL			10	μA
V_{OH}	High level output voltage	$I_O = -4\text{ mA}$, see 8-1	V_{SO} ⁽¹⁾ - 0.4	$V_{SO} - 0.2$		V
V_{OL}	Low level output voltage	$I_O = 4\text{ mA}$, see 8-1		0.2	0.4	V

8 Parameter Measurement Information

1. The input pulse is supplied by a generator having the following characteristics: PRR $\leq$ 50 kHz, 50% duty cycle, $t_r \leq 3$ ns, $t_f \leq 3$ ns, $Z_O = 50 \Omega$. At the input, 50- Ω resistor is required to terminate the input generator signal. The resistor is not required in the actual application.
2. $C_L = 15$ pF and includes instrumentation and fixture capacitance within $\pm 20\%$.

FIG 8-1. Switching Characteristics Test Circuit and Voltage Waveforms

1. $C_L = 15$ pF and includes instrumentation and fixture capacitance within $\pm 20\%$.

9 Detailed Description

9.1 Overview

The ISOW7841A-Q1 has a high-efficiency, low-emissions isolated DC-DC converter, and four high-speed isolated data channels. [Block Diagram](#) shows the functional block diagram of the ISOW7841A-Q1.

The integrated DC-DC converter uses switched mode operation and proprietary circuit techniques to reduce power losses and boost efficiency. Specialized control mechanisms, clocking schemes, and the use of a high-Q on-chip transformer provide high efficiency and low radiated emissions. The integrated transformer uses thin film polymer as the insulation barrier.

The V_{CC} supply is provided to the primary power controller that switches the power stage connected to the integrated transformer. Power is transferred to the secondary side, rectified and regulated to either 3.3 V or 5 V, depending on the SEL pin. The output voltage, V_{ISO} , is monitored and feedback information is conveyed to the primary side through a dedicated isolation channel. The duty cycle of the primary switching stage is adjusted accordingly. The fast feedback control loop of the power converter ensures low overshoots and undershoots during load transients. Undervoltage lockout (UVLO) with hysteresis is integrated on the V_{CC} and V_{ISO} supplies which ensures robust system performance under noisy conditions. An integrated soft-start mechanism ensures controlled inrush current and avoids any overshoot on the output during power up.

The integrated signal-isolation channels employ an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon-dioxide based isolation barrier. The transmitter sends a high-frequency carrier across the barrier to represent one state and sends no signal to represent the other state. The receiver demodulates the signal after signal conditioning and produces the output through a buffer stage. The signal-isolation channels incorporate advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions from the high frequency carrier and IO buffer switching. [Figure 9-2](#) shows a functional block diagram of a typical signal isolation channel.

The ISOW7841A-Q1 is suitable for applications that have limited board space and require more integration. This device is also suitable for very-high voltage applications, where power transformers meeting the required isolation specifications are bulky and expensive.

9.2 Functional Block Diagram

Figure 9-1. Block Diagram

9.3 Feature Description

表 9-1 shows an overview of the device features.

表 9-1. Device Features

PART NUMBER ⁽¹⁾	CHANNEL DIRECTION	MAXIMUM DATA RATE	DEFAULT OUTPUT STATE	RATED ISOLATION ⁽²⁾
ISOW7841A-Q1	3 forward, 1 reverse	100 Mbps	High	5 kV _{RMS} / 7071 V _{PK}
ISOW7841FA-Q1			Low	

(1) The F suffix is part of the orderable part number. See the section for the full orderable part number.

(2) For detailed isolation ratings, see the table.

9.3.1 Electromagnetic Compatibility (EMC) Considerations

The ISOW7841A-Q1 uses emissions reduction schemes for the internal oscillator and advanced internal layout scheme to minimize radiated emissions at the system level.

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level

performance and reliability depends, to a large extent, on the application board design and layout, the ISOW7841A-Q1 incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

9.3.2 Power-Up and Power-Down Behavior

The ISOW7841A-Q1 has built-in UVLO on the V_{CC} and V_{ISO} supplies with positive-going and negative-going thresholds and hysteresis. When the V_{CC} voltage crosses the positive-going UVLO threshold during power-up, the DC-DC converter initializes and the power converter duty cycle is increased in a controlled manner. This soft-start scheme limits primary peak currents drawn from the V_{CC} supply and charges the V_{ISO} output in a controlled manner, avoiding overshoots. Outputs of the isolated data channels are in an indeterminate state until the V_{CC} or V_{ISO} voltage crosses the positive-going UVLO threshold. When the UVLO positive-going threshold is crossed on the secondary side V_{ISO} pin, the feedback data channel starts providing feedback to the primary controller. The regulation loop takes over and the isolated data channels go to the normal state defined by the respective input channels or their default states. Design should consider a sufficient time margin (typically 10 ms with 10- μ F load capacitance) to allow this power up sequence before valid data channels are accounted for system functionality.

When V_{CC} power is lost, the primary side DC-DC controller turns off when the UVLO lower threshold is reached. The V_{ISO} capacitor then discharges depending on the external load. The isolated data outputs on the V_{ISO} side are returned to the default state for the brief time that the V_{ISO} voltage takes to discharge to zero.

9.3.3 Current Limit, Thermal Overload Protection

The ISOW7841A-Q1 is protected against output overload and short circuit. Output voltage starts dropping when the power converter is not able to deliver the current demanded during overload conditions. For a V_{ISO} short-circuit to ground, the duty cycle of the converter is limited to help protect against any damage.

Thermal protection is also integrated to help prevent the device from getting damaged during overload and short-circuit conditions on the isolated output. Under these conditions, the device temperature starts to increase. When the temperature goes above 180°C, thermal shutdown activates and the primary controller turns off which removes the energy supplied to the V_{ISO} load, which causes the device to cool off. When the junction temperature goes below 150°C, the device starts to function normally. If an overload or output short-circuit condition prevails, this protection cycle is repeated. Care should be taken in the design to prevent the device junction temperatures from reaching such high values.

9.4 Device Functional Modes

表 9-2 lists the supply configurations for these devices.

表 9-2. Supply Configurations

SEL INPUT	V_{CC}	V_{ISO}
Shorted to V_{ISO}	5 V	5 V
Shorted to V_{ISO}	3.3 V	5 V
Shorted to GND2 or floating	5 V	3.3 V
Shorted to GND2 or floating	3.3 V	3.3 V ⁽¹⁾

- (1) The SEL pin has a weak pulldown internally. Therefore for $V_{ISO} = 3.3$ V, the SEL pin should be strongly connected to the GND2 pin in noisy system scenarios.

表 9-3 lists the functional modes for ISOW7841A-Q1.

表 9-3. Function Table

INPUT SUPPLY (V _{CC})	INPUT (IN _x)	OUTPUT (OUT _x)	COMMENTS
PU	H	H	Output channel assumes the logic state of its input
	L	L	
	Open	Default	Default mode ⁽¹⁾ : When IN _x is open, the corresponding output channel assumes logic based on default output mode of selected version
PD	X	Undetermined ⁽²⁾	

(1) In the default condition, the output is high for ISOW7841A-Q1 and low for ISOW7841A-Q1 with the F suffix.

(2) The outputs are in an undetermined state when V_{CC} < 2.1 V.

9.4.1 Device I/O Schematics

図 9-4. Device I/O Schematics

10 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The device is a high-performance, quad channel digital isolator with integrated DC-DC converter. Typically digital isolators require two power supplies isolated from each other to power up both sides of device. Due to the integrated DC-DC converter in the device, the isolated supply is generated inside the device that can be used to power isolated side of the device and peripherals on isolated side, thus saving board space. The device uses single-ended CMOS-logic switching technology. When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is Microcontroller or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

The device is suitable for applications that have limited board space and desire more integration. The device is also suitable for very high voltage applications, where power transformers meeting the required isolation specifications are bulky and expensive.

10.2 Typical Application

Figure 10-1 shows the typical schematic for SPI isolation. Typically, an ADC is used to monitor HV battery to chassis insulation resistance.

Figure 10-1. Isolated Power and SPI for Automotive BMS Insulation monitoring Application with ISOW7841A-Q1

10.2.1 Design Requirements

To design with this device, use the parameters listed in Table 10-1.

Table 10-1. Design Parameters

PARAMETER	VALUE
Input voltage	3 V to 5.5 V
Decoupling capacitor between V_{CC} and GND1	0.1 μ F to 10 μ F
Decoupling capacitor between V_{ISO} and GND2	0.1 μ F to 10 μ F

Because of very-high current flowing through the ISOW7841A-Q1 device V_{CC} and V_{ISO} supplies, higher decoupling capacitors typically provide better noise and ripple performance. Although a 10- μ F capacitor is adequate, higher decoupling capacitors (such as 22 μ F or 47 μ F) on both the V_{CC} and V_{ISO} pins to the respective grounds are strongly recommended to achieve the best performance.

10.2.2 Detailed Design Procedure

The devices requires only external bypass capacitors to operate. These low-ESR ceramic bypass capacitors must be placed as close to the chip pads as possible.

図 10-2. Typical ISOW7841A-Q1 Circuit Hook-Up

The V_{CC} power-supply input provides power to isolated data channels and to the isolated DC-DC converter. Use 式 1 to calculate the total power budget on the primary side.

$$I_{CC} = (V_{ISO} \times I_{ISO}) / (\eta \times V_{CC}) + I_{inpx} \quad (1)$$

where

- I_{CC} is the total current required by the primary supply.
- V_{ISO} is the isolated supply voltage.
- I_{ISO} is the external load on the isolated supply voltage.
- η is the efficiency.
- V_{CC} is the supply voltage.
- I_{inpx} is the total current drawn for the isolated data channels and power converter when data channels are toggling at a specific data rate. This data is shown in the セクション 7.9 table.

10.2.3 Application Curve

 $V_{CC} = 3.3 \text{ V}$
 $I_{ISO} = 70 \text{ mA}$

Input current spike is because of charging the input supply decoupling capacitor

10.3. Soft-Start Waveform

10.2.3.1 Insulation Lifetime

Insulation lifetime projection data is collected by using industry-standard Time Dependent Dielectric Breakdown (TDDB) test method. In this test, all pins on each side of the barrier are tied together creating a two-terminal device and high voltage applied between the two sides; See 10-4 for TDDB test setup. The insulation breakdown data is collected at various high voltages switching at 60 Hz over temperature. For reinforced insulation, VDE standard requires the use of TDDB projection line with failure rate of less than 1 part per million (ppm). Even though the expected minimum insulation lifetime is 20 years at the specified working isolation voltage, VDE reinforced certification requires additional safety margin of 20% for working voltage and 87.5% for lifetime which translates into minimum required insulation lifetime of 37.5 years at a working voltage that's 20% higher than the specified value.

10-5 shows the intrinsic capability of the isolation barrier to withstand high voltage stress over its lifetime. Based on the TDDB data, the intrinsic capability of the insulation is 1000 V_{RMS} with a lifetime of 1184 years.

10-4. Test Setup for Insulation Lifetime Measurement

10-5. Insulation Lifetime Projection Data

Power Supply Recommendations

To help make sure that operation is reliable at data rates and supply voltages, adequate decoupling capacitors must be located as close to supply pins as possible. The input supply (V_{CC}) must have an appropriate current rating to support output load and switching at the maximum data rate required by the end application. For more information, refer to the [Detailed Design Procedure](#) section.

11 Layout

11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low-EMI PCB design (see [Figure 11-1](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane, and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.
- Keep decoupling capacitors as close as possible to the V_{CC} and V_{ISO} pins.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

Because the device has no thermal pad to dissipate heat, the device dissipates heat through the respective GND pins. Ensure that enough copper is present on both GND pins to prevent the internal junction temperature of the device from rising to unacceptable levels.

The integrated signal and power isolation device simplifies system design and reduces board area. The use of low-inductance micro-transformers in the device necessitates the use of high frequency switching, resulting in higher radiated emissions compared to discrete solutions. The device uses on-chip circuit techniques to reduce emissions compared to competing solutions. For further reduction in radiated emissions at system level, refer to the [Low-Emission Designs With ISOW7841 Integrated Signal and Power Isolator application report](#).

11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

11.2 Layout Example

Solid supply islands reduce inductance because large peak currents flow into the V_{CC} pin

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
