JAJSM22F – DECEMBER 2012 – REVISED MAY 2021

LM25019 48V、100mA、コンスタント・オンタイム方式同期整流降圧 / Fly-Buck™ レギュレータ

1 特長

- 7.5V～48V の広い入力電圧範囲
- 100mA のハイサイドおよびローサイド・スイッチを内蔵
- ショットキー不要
- コンスタント・オンタイム制御
- ループ補償が不要
- 超高速の過渡応答
- ほぼ一定の動作周波数
- インテリジェントなピーク電流制限
- 出力電圧を 1.225 V 以上で調整可能
- 2% の高精度帰還基準電圧
- 周波数を最大 1MHz まで調整可能
- 可変の低電圧誤動作防止
- リモート・シャットダウン
- サーマル・シャットダウン
- パッケージ:
  - 8 ピン WSON
  - 8 ピン SO PowerPAD™

2 アプリケーション

- 産業用設備
- スマート電力メータ
- 遠隔通信システム
- 絶縁型バイアス電源 (Fly-Buck™)

3 概要

LM25019 は 48V、100mA の同期整流降圧型レギュレータで、ハイサイドとローサイドの MOSFET が内蔵されています。LM25019 に採用されているコンスタント・オンタイム (COT) 制御方式はループ補償が必要なく、過渡応答が非常に優れており、非常に高い降圧率を実現できます。オンタイムは入力電圧に反比例して変化し、入力電圧範囲の全体にわたって、周波数はほぼ一定に維持されます。高電圧のスタートアップ・レギュレータにより、IC の内部動作用および内蔵ゲート・ドライバ用にバイアス電力が供給されます。

ピーク電流制限回路により、過負荷の状況に対する保護が行われます。低電圧誤動作防止(UVLO)回路は、入力低電圧スレッショルドとヒステリシスを別々にプログラム可能です。その他の保護機能として、サーマル・シャットダウンとバイアス電源低電圧誤動作防止が搭載されています。

LM25019 は、8 ピン WSON および 8 ピン SO PowerPAD プラスチック・パッケージで供給されます。

製品情報

5 Pin Configuration and Functions

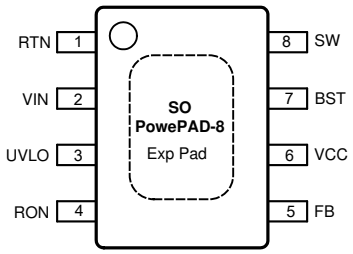

図 5-1. 8-Pin SO PowerPAD DDA Package Top View

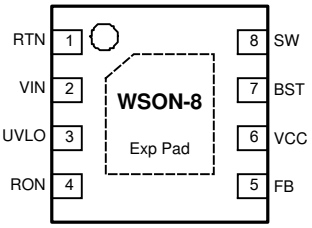

図 5-2. 8-Pin WSON NGU Package Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION	APPLICATION INFORMATION
NO.	NAME			
1	RTN	—	Ground	Ground connection of the integrated circuit
2	VIN	I	Input Voltage	Operating input range is 7.5 V to 48 V.
3	UVLO	I	Input Pin of Undervoltage Comparator	Resistor divider from V_{IN} to UVLO to GND programs the undervoltage detection threshold. An internal current source is enabled when UVLO is above 1.225 V to provide hysteresis. When UVLO pin is pulled below 0.66 V externally, the regulator is in shutdown mode.
4	RON	I	On-Time Control	A resistor between this pin and V_{IN} sets the buck switch on-time as a function of V_{IN}. Minimum recommended on-time is 100 ns at max input voltage.
5	FB	I	Feedback	This pin is connected to the inverting input of the internal regulation comparator. The regulation level is 1.225 V.
6	VCC	O	Output from the Internal High Voltage Series Pass Regulator. Regulated at 7.6 V	The internal V_{CC} regulator provides bias supply for the gate drivers and other internal circuitry. A 1.0-µF decoupling capacitor is recommended.
7	BST	I	Bootstrap Capacitor	An external capacitor is required between the BST and SW pins (0.01-µF ceramic). The BST pin capacitor is charged by the V_{CC} regulator through an internal diode when the SW pin is low.
8	SW	O	Switching Node	Power switching node. Connect to the output inductor and bootstrap capacitor.
—	EP	—	Exposed Pad	Exposed pad must be connected to the RTN pin. Solder to the system ground plane on application board for reduced thermal resistance.

6 Specifications

6.1 Absolute Maximum Ratings

	MIN(1)	MAX	UNIT
V_{IN}, UVLO to RTN	–0.3	53	V
SW to RTN	–1.5	V_{IN} + 0.3	V
SW to RTN (100 ns transient)	–5	V_{IN} + 0.3	V
BST to VCC		53	V
BST to SW		13	V
RON to RTN	–0.3	53	V
VCC to RTN	–0.3	13	V
FB to RTN	–0.3	5	V
Lead Temperature(2)		200	°C
Maximum Junction Temperature(3)		150	°C
Storage temperature, T_{stg}	–55	150	°C

(1) *Absolute Maximum Ratings* are limits beyond which damage to the device may occur. セクション 6.3 are conditions under which operation of the device is intended to be functional. For specifications and test conditions, see セクション 6.5 . The RTN pin is the GND reference electrically connected to the substrate.
(2) For detailed information on soldering plastic SO Power PAD-8 package, refer to the Packaging Data Book available from Texas Instruments. Max solder time not to exceed 4 seconds.
(3) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
V_{IN} Voltage	7.5	48	V
Operating Junction Temperature(2)	−40	125	°C

(1) *Recommended Operating Conditions* are conditions under the device is intended to be functional. For specifications and test conditions, see セクション 6.5.
(2) High junction temperatures degrade operating lifetimes. Operating lifetime is de-rated for junction temperatures greater than 125°C.

6.4 Thermal Information

THERMAL METRICS(1)		LM25019		UNIT
		WSON NGU	SO PowerPAD DDA	
		8 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	41.3	41.1	°C/W
$R_{\theta JC}$(bot)	Junction-to-case (bottom) thermal resistance	3.2	2.4	°C/W
Ψ_{JB}	Junction-to-board thermal characteristic parameter	19.2	24.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	19.1	30.6	°C/W
$R_{\theta JC}$(top)	Junction-to-case (top) thermal resistance	34.7	37.3	°C/W

THERMAL METRICS[1]		LM25019		UNIT
		WSON NGU	SO PowerPAD DDA	
		8 PINS		
Ψ_{JT}	Junction-to-top thermal characteristic parameter	0.3	6.7	°C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report (SPRA953).

6.5 Electrical Characteristics

Typical values correspond to T_J = 25°C. Minimum and maximum limits apply over –40°C to 125°C junction temperature range unless otherwise stated. V_{IN} = 48V unless stated otherwise. See(1).

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
V_{CC} SUPPLY						
V_{CC} Reg	V_{CC} Regulator Output	V_{IN} = 48 V, I_{CC} = 20 mA	6.25	7.6	8.55	V
	V_{CC} Current Limit	V_{IN} = 48 V(2)	26			mA
	V_{CC} Undervoltage Lockout Voltage (V_{CC} Increasing)		4.15	4.5	4.9	V
	V_{CC} Undervoltage Hysteresis			300		mV
	V_{CC} Drop Out Voltage	V_{IN} = 9 V, I_{CC} = 20 mA		2.3		V
	I_{IN} Operating Current	Nonswitching, FB = 3 V		1.75		mA
	I_{IN} Shutdown Current	UVLO = 0 V		50	225	µA
SWITCH CHARACTERISTICS						
	Buck Switch $R_{DS(ON)}$	I_{TEST} = 100 mA, BST-SW = 7 V		0.8	1.8	Ω
	Synchronous $R_{DS(ON)}$	I_{TEST} = 200 mA		0.45	1	Ω
	Gate Drive UVLO	V_{BST} – V_{SW} Rising	2.4	3	3.6	V
	Gate Drive UVLO Hysteresis			260		mV
CURRENT LIMIT						
	Current Limit Threshold		150	270	370	mA
	Current Limit Response Time	Time to Switch Off		150		ns
	Off-Time Generator (Test 1)	FB = 0.1 V, V_{IN} = 48 V		12		µs
	Off-Time Generator (Test 2)	FB = 1 V, V_{IN} = 48 V		2.5		µs
REGULATION AND OVERVOLTAGE COMPARATORS						
	FB Regulation Level	Internal Reference Trip Point for Switch ON	1.2	1.225	1.25	V
	FB Overvoltage Threshold	Trip Point for Switch OFF		1.62		V
	FB Bias Current			60		nA
UNDERVOLTAGE SENSING FUNCTION						
	UV Threshold	UV Rising	1.19	1.225	1.26	V
	UV Hysteresis Input Current	UV = 2.5 V	–10	–20	–29	µA
	Remote Shutdown Threshold	Voltage at UVLO Falling	0.32	0.66		V
	Remote Shutdown Hysteresis			110		mV
THERMAL SHUTDOWN						
T_{sd}	Thermal Shutdown Temperature			165		°C
	Thermal Shutdown Hysteresis			20		°C

(1) All hot and cold limits are specified by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
(2) V_{CC} provides self bias for the internal gate drive and control circuits. Device thermal limitations limit external loading.

6.6 Switching Characteristics

Typical values correspond to T_J = 25°C. Minimum and maximum limits apply over –40°C to 125°C junction temperature range unless otherwise stated. V_{IN} = 48 V unless otherwise stated.

		MIN	TYP	MAX	UNIT
ON-TIME GENERATOR					
T_{ON} Test 1	V_{IN} = 32 V, R_{ON} = 100 kΩ	270	350	460	ns
T_{ON} Test 2	V_{IN} = 48 V, R_{ON} = 100 kΩ	188	250	336	ns
T_{ON} Test 4	V_{IN} = 10 V, R_{ON} = 250 kΩ	1880	3200	4425	ns
MINIMUM OFF-TIME					

Typical values correspond to T_J = 25°C. Minimum and maximum limits apply over –40°C to 125°C junction temperature range unless otherwise stated. V_{IN} = 48 V unless otherwise stated.

		MIN	TYP	MAX	UNIT
Minimum Off-Timer	FB = 0 V		144		ns

7 Detailed Description

7.1 Overview

The LM25019 step-down switching regulator features all the functions needed to implement a low-cost, efficient, buck converter that can supply up to 100 mA to the load. This high-voltage regulator contains 48-V, N-channel buck and synchronous switches, is easy to implement, and is provided in thermally-enhanced SO PowerPAD-8 and WSON-8 packages. The regulator operation is based on a constant on-time control scheme using an on-time inversely proportional to V_{IN}. This control scheme does not require loop compensation. The current limit is implemented with a forced off-time inversely proportional to V_{OUT}. This scheme ensures short circuit protection while providing minimum foldback. The simplified block diagram of the LM25019 device is shown in the 図 7-1.

The LM25019 device can be applied in numerous applications to efficiently regulate down higher voltages. This regulator is well suited for 12-V and 24-V rails. Protection features include: thermal shutdown, undervoltage lockout, minimum forced off-time, and an intelligent current limit.

7.2 Functional Block Diagram

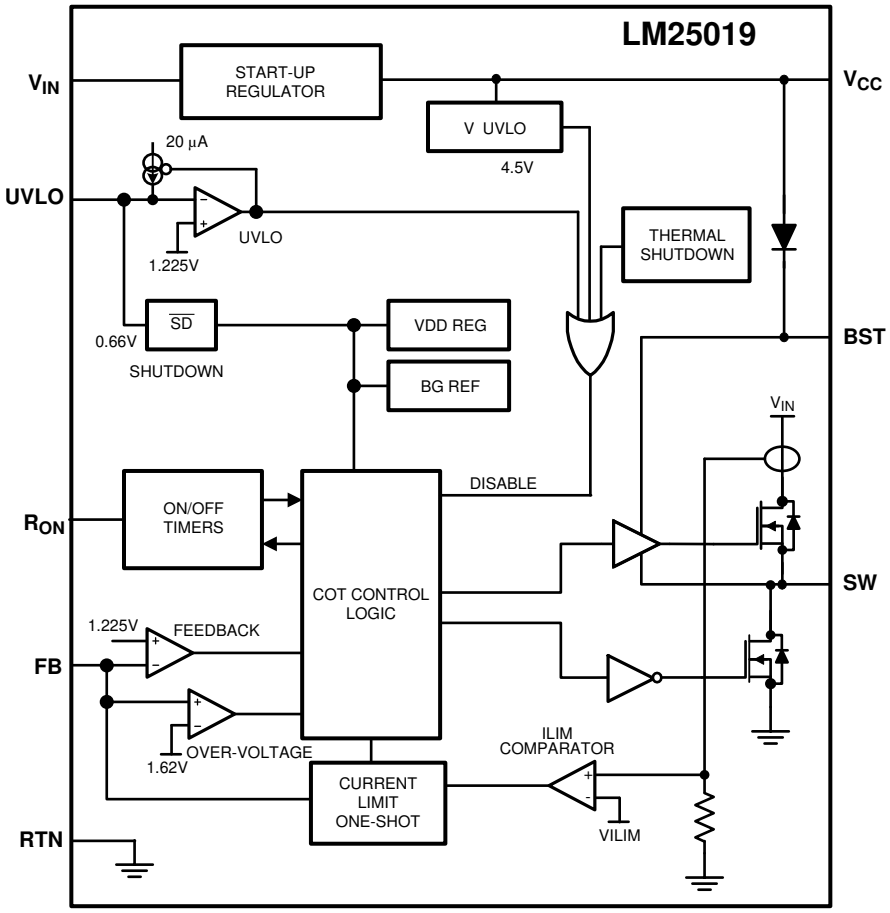

図 7-1. Functional Block Diagram

7.3 Feature Description

7.3.1 Control Overview

The LM25019 buck regulator employs a control principle based on a comparator and a one-shot on-timer, with the output voltage feedback (FB) compared to an internal reference (1.225 V). If the FB voltage is below the reference, the internal buck switch is turned on for the one-shot timer period, which is a function of the input voltage and the programming resistor (R_{ON}). Following the on-time, the switch remains off until the FB voltage falls below the reference, but never before the minimum off-time forced by the minimum off-time one-shot timer.

When the FB pin voltage falls below the reference and the minimum off-time one-shot period expires, the buck switch is turned on for another on-time one-shot period. This continues until regulation is achieved and the FB voltage is approximately equal to 1.225 V (typ).

In a synchronous buck converter, the low-side (sync) FET is on when the high-side (buck) FET is off. The inductor current ramps up when the high-side switch is on and ramps down when the high-side switch is off. There is no diode emulation feature in this IC, and therefore, the inductor current can ramp in the negative direction at light load. This causes the converter to operate in continuous conduction mode (CCM) regardless of the output loading. The operating frequency remains relatively constant with load and line variations. The operating frequency can be calculated as shown in 式 1.

$$f_{SW} = \frac{V_{OUT}}{9 \times 10^{-11} \times R_{ON}} \quad (1)$$

The output voltage (V_{OUT}) is set by two external resistors (R_{FB1}, R_{FB2}). The regulated output voltage is calculated as shown in 式 2.

$$V_{OUT} = 1.225V \times \frac{R_{FB2} + R_{FB1}}{R_{FB1}} \quad (2)$$

This regulator regulates the output voltage based on ripple voltage at the feedback input, requiring a minimum amount of ESR for the output capacitor (C_{OUT}). A minimum of 25 mV of ripple voltage at the feedback pin (FB) is required for the LM25019. In cases where the capacitor ESR is too small, additional series resistance can be required (R_C in 図 7-2).

For applications where lower output voltage ripple is required the output can be taken directly from a low ESR output capacitor, as shown in 図 7-2. However, R_C slightly degrades the load regulation.

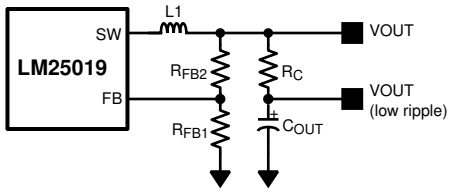

図 7-2. Low Ripple Output Configuration

7.3.2 V_{CC} Regulator

The LM25019 device contains an internal high-voltage linear regulator with a nominal output of 7.6 V. The input pin (V_{IN}) can be connected directly to the line voltages up to 48 V. The V_{CC} regulator is internally current limited to 30 mA. The regulator sources current into the external capacitor at V_{CC}. This regulator supplies current to internal circuit blocks including the synchronous MOSFET driver and the logic circuits. When the voltage on the V_{CC} pin reaches the UVLO threshold of 4.5 V, the IC is enabled.

The V_{CC} regulator contains an internal diode connection to the BST pin to replenish the charge in the gate drive boot capacitor when SW pin is low.

At high input voltages, the power dissipated in the high-voltage regulator is significant and can limit the overall achievable output power. As an example, with the input at 48 V and switching at high frequency, the V_{CC} regulator can supply up to 7 mA of current resulting in 48 V × 7 mA = 336 mW of power dissipation. If the V_{CC} voltage is driven externally by an alternate voltage source, between 8.55 V and 13 V, the internal regulator is disabled. This reduces the power dissipation in the IC.

7.3.3 Regulation Comparator

The feedback voltage at FB is compared to an internal 1.225 V reference. In normal operation, when the output voltage is in regulation, an on-time period is initiated when the voltage at FB falls below 1.225 V. The high-side switch stays on for the on-time, causing the FB voltage to rise above 1.225 V. After the on-time period, the high-side switch stays off until the FB voltage again falls below 1.225 V. During start-up, the FB voltage is below 1.225

V at the end of each on-time, causing the high-side switch to turn on immediately after the minimum forced off-time of 144 ns. The high-side switch can be turned off before the on-time is over if the peak current in the inductor reaches the current limit threshold.

7.3.4 Overvoltage Comparator

The feedback voltage at FB is compared to an internal 1.62-V reference. If the voltage at FB rises above 1.62 V, the on-time pulse is immediately terminated. This condition can occur if the input voltage, the output load, or both, changes suddenly. The high-side switch does not turn on again until the voltage at FB falls below 1.225 V.

7.3.5 On-Time Generator

The on-time for the LM25019 device is determined by the R_{ON} resistor, and is inversely proportional to the input voltage (V_{IN}), resulting in a nearly constant frequency as V_{IN} is varied over its range. The on-time equation for the LM25019 device is shown in 式 3.

$$T_{ON} = \frac{10^{-10} \times R_{ON}}{V_{IN}} \tag{3}$$

See 図 6-5. R_{ON} must be selected for a minimum on-time (at maximum V_{IN}) greater than 100 ns, for proper operation. This requirement limits the maximum switching frequency for high V_{IN}.

7.3.6 Current Limit

The LM25019 device contains an intelligent current limit off-timer. If the current in the buck switch exceeds 240 mA, the present cycle is immediately terminated, and a nonresetable off-timer is initiated. The length of off-time is controlled by the FB voltage and the input voltage V_{IN}. As an example, when FB = 0 V and V_{IN} = 48 V, the maximum off-time is set to 16 µs. This condition occurs when the output is shorted, and during the initial part of start-up. This amount of time ensures safe short circuit operation up to the maximum input voltage of 48 V.

In cases of overload where the FB voltage is above zero volts (not a short circuit), the current limit off-time is reduced. Reducing the off-time during less severe overloads reduces the amount of foldback, recovery time, and start-up time. The off-time is calculated from 式 4.

$$T_{OFF(ILIM)} = \frac{0.07 \times V_{IN}}{V_{FB} + 0.2V} \ \mu s \tag{4}$$

The current limit protection feature is peak limited. The maximum average output is less than the peak.

7.3.7 N-Channel Buck Switch and Driver

The LM25019 device integrates an N-Channel Buck switch and associated floating high-voltage gate driver. The gate driver circuit works in conjunction with an external bootstrap capacitor and an internal high-voltage diode. A 0.01-uF ceramic capacitor connected between the BST pin and the SW pin provides the voltage to the driver during the on-time. During each off-time, the SW pin is at approximately 0 V, and the bootstrap capacitor charges from V_{CC} through the internal diode. The minimum off-timer, set to 144 ns, ensures a minimum time each cycle to recharge the bootstrap capacitor.

7.3.8 Synchronous Rectifier

The LM25019 device provides an internal synchronous N-channel MOSFET rectifier. This MOSFET provides a path for the inductor current to flow when the high-side MOSFET is turned off.

The synchronous rectifier has no diode emulation mode, and is designed to keep the regulator in continuous conduction mode even during light loads which would otherwise result in discontinuous operation.

7.3.9 Undervoltage Detector

The LM25019 device contains a dual-level UVLO circuit. A summary of threshold voltages and operational states is provided in the *セクション 7.4*. When the UVLO pin voltage is below 0.66 V, the controller is in a low-current shutdown mode. When the UVLO pin voltage is greater than 0.66 V but less than 1.225 V, the controller is in standby mode. In standby mode, the V_{CC} bias regulator is active while the regulator output is disabled. When the V_{CC} pin exceeds the V_{CC} undervoltage threshold and the UVLO pin voltage is greater than 1.225 V, normal operation begins. An external set-point voltage divider from V_{IN} to GND can be used to set the minimum operating voltage of the regulator.

UVLO hysteresis is accomplished with an internal 20-µA current source that is switched on or off into the impedance of the set-point divider. When the UVLO threshold is exceeded, the current source is activated to quickly raise the voltage at the UVLO pin. The hysteresis is equal to the value of this current times the resistance R_{UV2}.

If the UVLO pin is wired directly to the V_{IN} pin, the regulator begins operation once the V_{CC} undervoltage is satisfied.

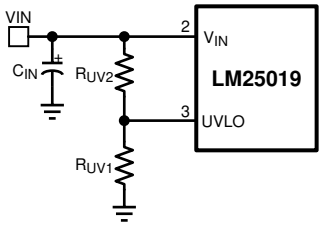

図 7-3. UVLO Resistor Setting

7.3.10 Thermal Protection

The LM25019 device must be operated so the junction temperature does not exceed 150°C during normal operation. An internal Thermal Shutdown circuit is provided to protect the LM25019 in the event of a higher than normal junction temperature. When activated, typically at 165°C, the controller is forced into a low-power reset state, disabling the buck switch and the V_{CC} regulator. This feature prevents catastrophic failures from accidental device overheating. When the junction temperature reduces below 145°C (typical hysteresis = 20°C), the V_{CC} regulator is enabled, and normal operation is resumed.

7.3.11 Ripple Configuration

The LM25019 uses Constant-On-Time (COT) control scheme where the on-time is terminated by an on-timer, and the off-time is terminated by the feedback voltage (V_{FB}) falling below the reference voltage (V_{REF}). Therefore, for stable operation, the feedback voltage must decrease monotonically, in phase with the inductor current during the off-time. Furthermore, this change in feedback voltage (V_{FB}) during off-time must be large enough to suppress any noise component present at the feedback node.

表 7-1 shows three different methods for generating appropriate voltage ripple at the feedback node. Type 1 and Type 2 ripple circuits couple the ripple at the output of the converter to the feedback node (FB). The output voltage ripple has two components:

1. Capacitive ripple caused by the inductor current ripple charging/discharging the output capacitor.
2. Resistive ripple caused by the inductor current ripple flowing through the ESR of the output capacitor.

The capacitive ripple is not in phase with the inductor current. As a result, the capacitive ripple does not decrease monotonically during the off-time. The resistive ripple is in phase with the inductor current and decreases monotonically during the off-time. The resistive ripple must exceed the capacitive ripple at the output node (V_{OUT}) for stable operation. If this condition is not satisfied, unstable switching behavior is observed in COT converters, with multiple on-time bursts in close succession followed by a long off-time.

Type 3 ripple method uses R_r and C_r and the switch node (SW) voltage to generate a triangular ramp. This triangular ramp is ac coupled using C_{ac} to the feedback node (FB). Because this circuit does not use the output voltage ripple, it is ideally suited for applications where low output voltage ripple is required. See the *AN-1481 Controlling Output Ripple and Achieving ESR Independence in Constant On-Time (COT) Regulator Designs Application Report* for more details for each ripple generation method.

表 7-1. Ripple Configurations

TYPE 1 LOWEST COST CONFIGURATION	TYPE 2 REDUCED RIPPLE CONFIGURATION	TYPE 3 MINIMUM RIPPLE CONFIGURATION
		$R_C \geq \frac{25\ mV}{\Delta I_{L(MIN)}} \times \frac{V_{OUT}}{V_{REF}}$ (5)	$C \geq \frac{5}{f_{sw}(R_{FB2} \| R_{FB1})}$ $R_C \geq \frac{25\ mV}{\Delta I_{L(MIN)}}$ (6)	$C_r = 3300\ pF$ $C_{ac} = 100\ nF$ $R_r C_r \leq \frac{(V_{IN(MIN)} - V_{OUT}) \times T_{ON}}{25\ mV}$ (7)

7.3.12 Soft Start

A soft-start feature can be implemented with the LM25019 device using an external circuit. As shown in 図 7-4, the soft-start circuit consists of one capacitor C_1, two resistors, R_1 and R_2, and a diode, D. During the initial start-up, the VCC voltage is established before the V_{OUT} voltage. Capacitor C_1 is discharged and D is thereby forward biased. The FB voltage is pulled up above the reference voltage (1.225 V) and switching is thereby disabled. As capacitor C_1 charges, the voltage at node B gradually decreases and switching commences. V_{OUT} gradually rises to maintain the FB voltage at the reference voltage. Once the voltage at node B is less than a diode drop above the FB voltage, the soft-start sequence is finished and D is reverse-biased.

During the initial part of the start-up, the FB voltage can be approximated as shown in 式 8.

$$V_{FB} = (VCC - V_D) \times \frac{R_{FB1} \times R_{FB2}}{R_2 \times (R_{FB1} + R_{FB2}) + R_{FB1} \times R_{FB2}} \quad (8)$$

C1 is charged after the first start-up. Diode D1 is optional and can be added to discharge C1 and initialize the soft-start sequence when the input voltage experiences a momentary drop.

To achieve the desired soft start, the following design guidance is recommended:

1. R_2 is selected so that V_{FB} is higher than 1.225 V for a V_{CC} of 4.5 V, but is lower than 5 V when V_{CC} is 8.55 V. If an external V_{CC} is used, V_{FB} must not exceed 5 V at maximum V_{CC}.
2. C_1 is selected to achieve the desired start-up time that can be determined from 式 9.

$$t_S = C_1 \times (R_2 + \frac{R_{FB1} \times R_{FB2}}{R_{FB1} + R_{FB2}}) \quad (9)$$

3. R_1 is used to maintain the node B voltage at zero after the soft start is finished. A value larger than the feedback resistor divider is preferred. The effect of resistor R1 is ignored in 式 9.

With component values from the applications schematic shown in 図 8-1, selecting C_1 = 1 µF, R_2 = 1 kΩ, and R_1 = 30 kΩ results in a soft-start time of about 2 ms.

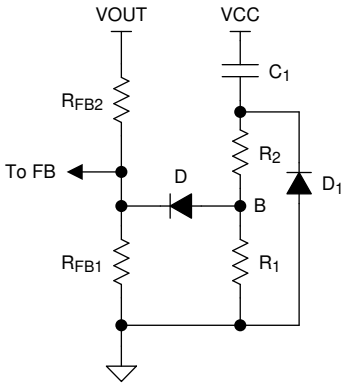

図 7-4. Soft-Start Circuit

7.4 Device Functional Modes

The UVLO pin controls the operating mode of the LM25019 device (see 表 7-2 for the detailed functional states).

表 7-2. UVLO Mode

UVLO	V_{CC}	MODE	DESCRIPTION
< 0.66 V	Disabled	Shutdown	V_{CC} regulator disabled. Switching disabled
0.66 V – 1.225 V	Enabled	Standby	V_{CC} regulator enabled Switching disabled

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The LM25019 device is step-down DC-DC converter. The device is typically used to convert a higher DC voltage to a lower DC voltage with a maximum available output current of 650 mA. Use the following design procedure to select component values for the LM25019 device. Alternately, use the WEBENCH® software to generate a complete design. The WEBENCH software uses an iterative design procedure and accesses a comprehensive database of components when generating a design. This section presents a simplified discussion of the design process.

8.2 Typical Application

The application schematic of a buck supply is shown in 図 8-1. For output voltage (V_{OUT}) more than one diode drop higher than the maximum regulation voltage of V_{CC} (8.55 V, see the *セクション 6.5*), the V_{CC} pin can be connected to V_{OUT} through a diode (D2), as shown in 図 8-1, to improve efficiency and reduce power dissipation in the IC.

The design example shown in 図 8-1 uses equations from the *セクション 7.3* with component names provided in the *図 3-1* schematic. Corresponding component designators from 図 8-1 are also provided for each selected value.

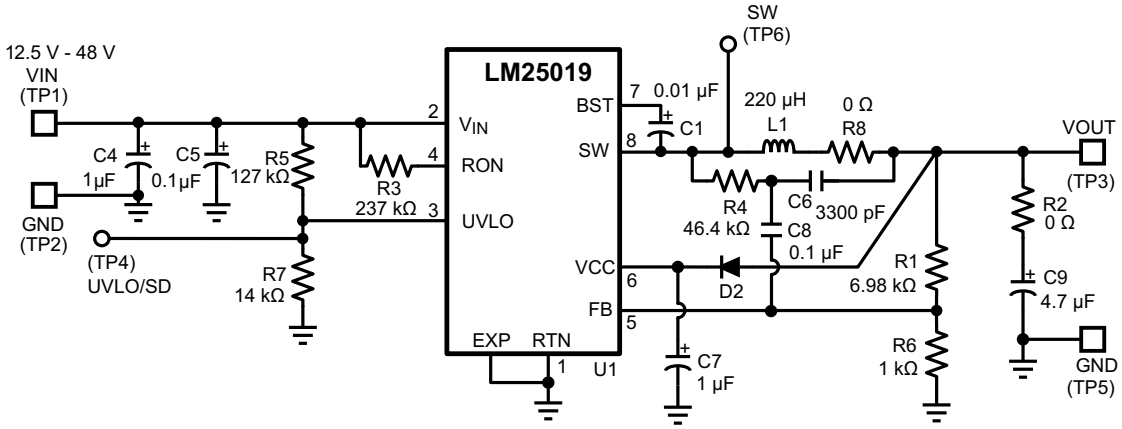

図 8-1. Final Schematic for 12.5-V to 48-V Input, and 10-V, 100-mA Output Buck Converter

8.2.1 Design Requirements

DESIGN PARAMETERS	VALUE
Input Range	12.5 V to 48 V
Output Voltage	10 V
Maximum Output Current	100 mA
Nominal Switching Frequency	≈ 440 kHz

8.2.2 Detailed Design Procedure

8.2.2.1 RFB1, RFB2

$V_{OUT} = V_{FB} \times (R_{FB2} / R_{FB1} + 1)$, and because V_{FB} = 1.225 V, the ratio of R_{FB2} to R_{FB1} calculates as 7:1. Standard values are chosen with R_{FB2} = R1 = 6.98 kΩ and R_{FB1} = R6 = 1.00 kΩ. Other values can be used as long as the 7:1 ratio is maintained.

8.2.2.2 Frequency Selection

At the minimum input voltage, the maximum switching frequency of the LM25019 is restricted by the forced minimum off-time ($T_{OFF(MIN)}$) as shown in 式 10.

$$f_{SW(MAX)} = \frac{1 - D_{MAX}}{T_{OFF(MIN)}} = \frac{1 - 10/12.5}{200\ ns} = 1\ MHz \tag{10}$$

Similarly, at maximum input voltage, the maximum switching frequency of the LM25019 is restricted by the minimum T_{ON} as shown in 式 11.

$$f_{SW(MAX)} = \frac{D_{MIN}}{T_{ON(MIN)}} = \frac{10/48}{100\ ns} = 2.1\ MHz \tag{11}$$

Resistor R_{ON} sets the nominal switching frequency based on 式 12.

$$f_{SW} = \frac{V_{OUT}}{K \times R_{ON}} \tag{12}$$

where

- $K = 9 \times 10^{-11}$

Operation at high switching frequency results in lower efficiency while providing the smallest solution. Using 440 kHz as the target swtiching frequency, the calculated valued of R_{ON} is 253 kΩ. The standard value for R_{ON} = R3 = 237 kΩ is selected.

8.2.2.3 Inductor Selection

The inductance selection is a compromise between solution size, output ripple, and efficiency. The peak inductor current at maximum load current must be smaller than the minimum current limit of 150 mA. The maximum permissible peak to peak inductor ripple is determined by 式 13.

$$\Delta IL = 2 \times (I_{LIM(min)} - I_{OUT(max)}) = 2 \times 50 = 100\ mA \tag{13}$$

The minimum inductance is determined by 式 14.

$$\Delta I_L = \frac{V_{IN} - V_{OUT}}{L1 \times f_{SW}} \times \frac{V_{OUT}}{V_{IN}} \tag{14}$$

Using the maximum V_{IN} of 48 V, the calculation from 式 14 results in L = 179 µH. A standard value of 220 µH is selected. For proper operation, the inductor saturation current must be higher than the peak current encountered in the application. For robust short circuit protection, the inductor saturation current must be higher than the maximum current limit of 300 mA.

8.2.2.4 Output Capacitor

The output capacitor is selected to minimize the capacitive ripple across it. The maximum ripple is observed at maximum input voltage and is shown in 式 15.

$$C_{OUT} = \frac{\Delta I_L}{8 \times f_{sw} \times \Delta V_{ripple}} \tag{15}$$

where

- ΔV_{ripple} is the voltage ripple across the capacitor
- ΔI_L is calculated using 式 14

Substituting ΔV_{ripple} = 5 mV gives C_{OUT} = 4.65 µF. A 4.7-µF standard value is selected for C_{OUT} =C9. An X5R or X7R type capacitor with a voltage rating 16 V or higher must be selected.

8.2.2.5 Type III Ripple Circuit

Type III ripple circuit as described in the *セクション 7.3.11* section is chosen for this example. For a constant on-time converter to be stable, the injected in-phase ripple must be larger than the capacitive ripple on C_{OUT}.

Using type III ripple circuit equations, the target ripple must be greater than the capacitive ripple generated at the primary output.

C_r = C6 = 3300 pF

C_{ac} = C8 = 100 nF

$$R_r \leq \frac{(V_{IN(MIN)} - V_{OUT}) \times T_{ON(VINMIN)}}{(25\,mV \times C_r)} \tag{16}$$

For T_{ON}, refer to 式 3.

Ripple resistor R_r is calculated to be 57.6 kΩ. This value provides the minimum ripple for stable operation. A smaller resistance should be selected to allow for variations in T_{ON}, C_{OUT}, and other components. R_r = R4 = 46.4 kΩ is selected for this example application.

8.2.2.6 V_{CC} and Bootstrap Capacitor

The V_{CC} capacitor provides charge to bootstrap capacitor as well as internal circuitry and low-side gate driver. The bootstrap capacitor provides charge to high-side gate driver. The recommended value for C_{VCC} = C7 is 1-µF. A good value for C_{BST} = C1 is 0.01 µF.

8.2.2.7 Input Capacitor

The input capacitor should be large enough to limit the input voltage ripple and can be calculated using 式 17.

$$C_{IN} \geq \frac{I_{OUT(MAX)}}{4 \times f_{SW} \times \Delta V_{IN}} \tag{17}$$

Choosing a ΔV_{IN} = 0.5 V gives a minimum C_{IN} = 0.12 µF. A standard value of 1 µF is selected for C_{IN} = C4. The input capacitor should be rated for the maximum input voltage under all conditions. A 50-V, X7R dielectric should be selected for this design.

The input capacitor should be placed directly across V_{IN} and RTN (pin 2 and 1) of the IC. If it is not possible to place all of the input capacitor close to the IC, a 0.1-µF capacitor should be placed near the IC to provide a bypass path for the high-frequency component of the switching current. This helps limit the switching noise.

8.2.2.8 UVLO Resistors

The UVLO resistors R_{UV1} and R_{UV2} set the UVLO threshold and hysteresis according to 式 18 and 式 19.

$$V_{IN}(HYS) = I_{HYS} \times R_{UV2} \tag{18}$$

$$V_{IN}(UVLO,rising) = 1.225V \times \left(\frac{R_{UV2}}{R_{UV1}} + 1\right) \tag{19}$$

where

- I_{HYS} = 20 µA

Selecting UVLO hysteresis of 2.5 V and UVLO rising threshold of 12 V results in R_{UV1} = 14.53 kΩ and

R_{UV2} = 125 kΩ. Selecting a standard value of R_{UV1} = R7 = 14 kΩ and R_{UV2} = R5 = 127 kΩ results in UVLO thresholds and hysteresis of 12.5 V to 2.5 V, respectively.

8.2.3 Application Curves

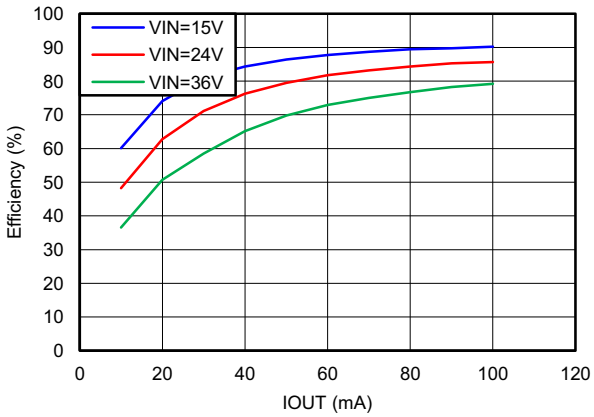

図 8-2. Efficiency versus Load Current

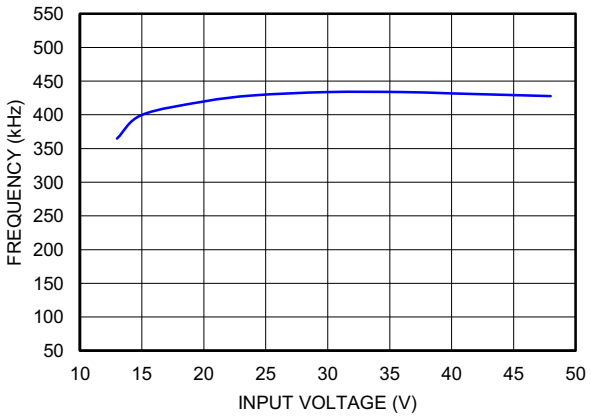

図 8-3. Frequency versus Input Voltage (I_{OUT} = 100 mA)

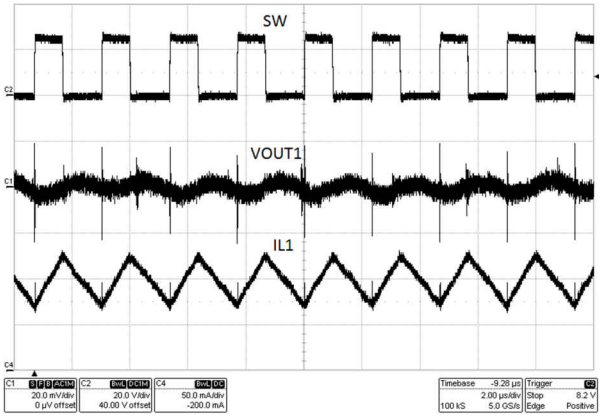

図 8-4. Typical Switching Waveform (V_{IN} = 24 V, I_{OUT} = 100 mA)

9 Power Supply Recommendations

The LM25019 is a power-management device. The power supply for the device is any DC voltage source within the specified input range.

10 Layout

10.1 Layout Guidelines

A proper layout is essential for optimum performance of the circuit. In particular, the following guidelines should be observed:

1. C_{IN}: The loop consisting of input capacitor (C_{IN}), V_{IN} pin, and RTN pin carries switching currents. Therefore, the input capacitor must be placed close to the IC, directly across V_{IN} and RTN pins and the connections to these two pins should be direct to minimize the loop area. In general it is not possible to accommodate all of input capacitance near the IC. A good practice is to use a 0.1-µF or 0.47-µF capacitor directly across the V_{IN} and RTN pins close to the IC, and the remaining bulk capacitor as close as possible (see 図 10-1).
2. C_{VCC} and C_{BST}: The V_{CC} and bootstrap (BST) bypass capacitors supply switching currents to the high-side and low-side gate drivers. These two capacitors must also be placed as close to the IC as possible, and the connecting trace length and loop area should be minimized (see 図 10-1).
3. The feedback trace carries the output voltage information and a small ripple component that is necessary for proper operation of the LM25019. Therefore, take care while routing the feedback trace to avoid coupling any noise to this pin. In particular, feedback trace must not run close to magnetic components, or parallel to any other switching trace.
4. SW trace: The SW node switches rapidly between V_{IN} and GND every cycle is therefore a possible source of noise. The SW node area should be minimized. In particular, the SW node must not be inadvertently connected to a copper plane or pour.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
