

LMV331 シングル、LMV393 デュアル、LMV339 クワッド汎用低電圧コンパレータ

1 特長

- 2.7V、5V の性能
- 低い電源電流
 - LMV331 26 μ A (標準値)
 - LMV393 50 μ A (標準値)
 - LMV339 100 μ A (標準値)
- グランドを含む入力同相電圧範囲
- 低い出力飽和電圧: 150mV (標準値)
- 柔軟性が高いオープン コレクタ出力

2 アプリケーション

- ロボット掃除機
- サーバー PSU
- コードレス電動工具
- 電化製品
- ビル オートメーション
- ファクトリ オートメーション / 制御

3 説明

LMV393 および LMV339 デバイスは、デュアルおよびクワッド コンパレータである LM393 および LM339 の低電圧 (2.7V ~ 5.5V) バージョンであり、5V ~ 30V で動作します。LMV331 はシングル コンパレータ バージョンです。

LMV331、LMV339、LMV393 は、低電圧動作、低消費電力、省スペースが回路設計の主要な仕様であるポータブル コンシューマ製品アプリケーションに適した最もコスト効率の優れたデバイスです。これらのデバイスは、使い慣れた LM339 および LM393 デバイスと同等またはそれらを上回る仕様を、何分の 1 かの消費電流で実現しています。

製品情報

部品番号	パッケージ (ピン) ⁽¹⁾	本体サイズ (公称) ⁽²⁾
LMV339 (クワッド)	SOIC (14)	3.91mm × 8.65mm
	TSSOP (14)	4.40mm × 5.00mm
	X2QFN (14)	2.00mm × 2.00 mm
LMV393 (デュアル)	SOIC (8)	3.91mm × 4.90mm
	TSSOP (8)	3.00mm × 4.40mm
LMV331 (シングル)	SC-70 (5)	1.25 mm × 2.00mm
	SOT-23 (5)	1.60 mm × 2.90mm

- (1) 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。
- (2) パッケージ サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます

V _{CC+}	5	8	3	2	I	Supply Pin

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage ⁽²⁾		5.5	V
V _{ID}	Differential input voltage ⁽³⁾		±5.5	V
V _I	Input voltage range (either input)	0	V _{CC+}	V
	Duration of output short circuit (one amplifier) to ground ⁽⁴⁾	At or below T _A = 25°C, V _{CC} ≤ 5.5V		Unlimited
T _J	Operating virtual junction temperature		150	°C
T _{stg}	Storage temperature range	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* can cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [セクション 5.3](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods can affect device reliability.
- (2) All voltage values (except differential voltages and V_{CC} specified for the measurement of I_{OS}) are with respect to the network GND.
- (3) Differential voltages are at IN+ with respect to IN–.
- (4) Short circuits from outputs to V_{CC} can cause excessive heating and eventual destruction.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V _{CC}	Supply voltage (single-supply operation)	2.7	5.5	V
V _{OUT}	Output voltage	V _{CC+} + 0.3		V
T _A	Operating free-air temperature	–40	125	°C

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMV339			LMV393				LMV331		UNIT
		D	PW	RUC	D	DDU	DGK	PW	DBV	DCK

6 Detailed Description

6.1 Overview

The LMV331, LMV393 and LMV339 family of comparators have the ability to operate up to 5V on the supply pin. This standard device has proven ubiquity and versatility across a wide range of applications. This is due to its low I_q and fast response.

The open-drain output allows the user to configure the output's logic low voltage (V_{OL}) and can be utilized to enable the comparator to be used in AND functionality.

6.2 Functional Block Diagram

6.3 Feature Description

The LMV331, LMV393 and LMV339 consists of a PNP input, whose V_{be} creates a limit on the input common mode voltage capability, allowing LMV33x to accurately function from ground to $V_{CC} - V_{be}$ (about 700mV) differential input. This enables much head room for modern day supplies of 3.3V and 5.0V.

The output consists of an open drain NPN (pull-down or low side) transistor. The output NPN sinks current when the negative input voltage is higher than the positive input voltage and the offset voltage. The V_{OL} is resistive and scales with the output current. Please see [Figure 5-3](#) for V_{OL} values with respect to the output current.

6.4 Device Functional Modes

6.4.1 Voltage Comparison

The LMV33x operates solely as a voltage comparator, comparing the differential voltage between the positive and negative pins and outputs a logic low or high impedance (logic high with pull-up) based on the input differential polarity.

7 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

LMV331, LMV393, and LMV339 typically is used to compare a single signal to a reference or two signals against each other. Many users take advantage of the open drain output to drive the comparison logic output to a logic voltage level to an MCU or logic device. The wide supply range and high voltage capability makes LMV331, LMV393, and LMV339 an excellent choice for level shifting to a higher or lower voltage.

7.2 Typical Application

図 7-1. Typical Application Schematic

7.2.1 Design Requirements

For this design example, use the parameters listed in 表 7-1 as the input parameters.

表 7-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage Range	0V to 4.2V
Supply Voltage	2.7V to 5V
Logic Supply Voltage (R_{PULLUP} Voltage)	1V to 5V
Output Current (V_{LOGIC}/R_{PULLUP})	1 μ A to 20mA
Input Overdrive Voltage	100mV
Reference Voltage	2.5V
Load Capacitance (C_L)	15pF

7.2.2 Detailed Design Procedure

When using LMV331, LMV393, and LMV339 in a general comparator application, determine the following:

- Input Voltage Range
- Minimum Overdrive Voltage
- Output and Drive Current
- Response Time

7.2.2.1 Input Voltage Range

When choosing the input voltage range, the input common mode voltage range (V_{ICR}) must be taken in to account. If operating temperature is above or below 25°C the V_{ICR} can range from 0V to $V_{CC} - 0.7V$. This limits the input voltage range to as high as $V_{CC} - 0.7V$ and as low as 0V. Operation outside of this range can yield incorrect comparisons.

Below is a possible list of input voltage situation and the outcomes:

1. When both IN- and IN+ are both within the common mode range:
 - a. If IN- is higher than IN+ and the offset voltage, the output is low and the output transistor is sinking current
 - b. If IN- is lower than IN+ and the offset voltage, the output is high impedance and the output transistor is not conducting
2. When IN- is higher than common mode and IN+ is within common mode, the output is low and the output transistor is sinking current
3. When IN+ is higher than common mode and IN- is within common mode, the output is high impedance and the output transistor is not conducting
4. When IN- and IN+ are both higher than common mode, the output is low and the output transistor is sinking current

7.2.2.2 Minimum Overdrive Voltage

Overdrive Voltage is the differential voltage produced between the positive and negative inputs of the comparator over the offset voltage (V_{IO}). To make an accurate comparison; the Overdrive Voltage (V_{OD}) must be higher than the input offset voltage (V_{IO}). Overdrive voltage can also determine the response time of the comparator, with the response time decreasing with increasing overdrive. [Figure 7-2](#) show positive and negative response times with respect to overdrive voltage.

7.2.2.3 Output and Drive Current

Output current is determined by the pull-up resistance (R_{pullup}) and Vlogic voltage, refer to [Figure 7-1](#). The output current produces a output low voltage (V_{OL}) from the comparator. In which V_{OL} is proportional to the output current. Use [Figure 5-3](#) to determine V_{OL} based on the output current.

The output current can also effect the transient response. This is explained in the next section.

7.2.2.4 Response Time

The transient response can be determined by the load capacitance (C_L), load/pull-up resistance (R_{PULLUP}) and equivalent collector-emitter resistance (R_{CE}).

- The positive response time (T_P) is approximately $T_P = R_{PULLUP} \times C_L$
- The negative response time (T_N) is approximately $T_N = R_{CE} \times C_L$
 - R_{CE} can be determine by taking the slope of [Figure 5-3](#) in it's linear region at the desired temperature, or by dividing the V_{OL} by I_{out}

7.2.3 Application Curves

The following curves were generated with 5V on V_{CC} and V_{Logic} , $R_{PULLUP} = 5.1k\Omega$, and 50pF scope probe.

図 7-2. Response Time for Various Overdrives (Negative Transition)

8 Power Supply Recommendations

For fast response and comparison applications with noisy or AC inputs, a bypass capacitor is recommended on the supply pin to reject any variation on the supply voltage. This variation cause temporary fluctuations in the comparator's input common mode range and create an inaccurate comparison.

9 Layout

9.1 Layout Guidelines

For accurate comparator applications without hysteresis, a stable power supply is necessary with minimized noise and glitches, which can affect the high level input common mode voltage range. To achieve this, add a bypass capacitor between the supply voltage and ground. This can be implemented on the positive power supply and negative supply (if available). If a negative supply is not being used, do not put a capacitor between the IC's GND pin and system ground.

9.2 Layout Example

図 9-1. LMV331 Layout Example

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
