

LMZ317102.95V～17V入力、電流共有、 QFNパッケージの10Aパワー・モジュール

1 特長

- 完全に統合された電源ソリューション
 - 小さな占有面積、薄型の設計
 - LMZ31707 および LMZ31704 とピン互換
 - 10mm×10mm×4.3mmのパッケージ
- 最大 95% の効率
- Eco-Mode™ と軽負荷時の効率 (LLE)
- 0.6V～5.5V の範囲で可変の広い出力電圧、基準精度 1%
- 並列動作によって大電流をサポート
- オプションの分割電源レールにより最小 2.95V の入力電圧を使用可能
- 可変スイッチング周波数 (200kHz～1.2MHz)
- 外部クロックに同期
- 位相差 180°のクロック信号を供給
- 可変スロー・スタート
- 出力電圧のシーケンシングとトラッキング
- パワー・グッド出力
- 低電圧誤動作防止 (UVLO) をプログラム可能
- 過電流および過熱保護
- プリバイアスされた出力へのスタートアップ
- 動作温度範囲: -40°C～+85°C
- 強化された熱特性: 13.3°C/W
- EN55022 Class B の放射規格に準拠
 - シールド付きインダクタを内蔵
- WEBENCH® Power Designer により、LMZ31710 を使用するカスタム設計を作成

2 アプリケーション

- ブロードバンドおよび通信インフラストラクチャ
- 自動テスト機器および医療機器
- Compact PCI / PCI Express / PXI Express
- DSP および FPGA ポイント・オブ・ロード (POL) アプリケーション

3 概要

LMZ31710パワー・モジュールは、10AのDC/DCコンバータをパワーMOSFET、シールド付きインダクタ、およびパッシブ部品とともに低プロファイルのQFNパッケージに実装した、使いやすい集積電源ソリューションです。外部部品は3個しか使用せず、ループ補償や磁気部品の選択プロセスも不要になります。

10×10×4.3mmのQFNパッケージは、プリント基板に簡単にハンダ付けでき、コンパクトなポイント・オブ・ロード (POL) 設計が可能です。13.3°C/Wの熱インピーダンスにより、95%を超える効率と優れた消費電力特性を実現します。LMZ31710は、ディスクリートPOL設計と同等の柔軟性および機能セットを備え、幅広い範囲のIC/システムへの電力供給に最適です。先進のパッケージング技術により、標準のQFN実装/試験手法に対応した、堅牢で信頼性の高い電源ソリューションを実現できます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
LMZ31710	RVQ (42)	10.00mm×10.00mm

5 Pin Configuration and Functions

10 mm x 10 mm x 4.3 mm

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
AGND	2	-	Zero volt reference for the analog control circuit. These pins are not connected together internal to the device and must be connected to one another using an AGND plane of the PCB. These pins are associated with the internal analog ground (AGND) of the device. Keep AGND separate from PGND, as a single connection is made internal to the device. See Layout .
	23		
PGND	20	-	This is the return current path for the power stage of the device. Connect these pins to the load and to the bypass capacitors associated with PVIN and VOUT. Keep PGND separate from AGND, as a single connection is made internal to the device.
	21		
	31		
	32		
	33		
VIN	3	I	Input bias voltage pin. Supplies the control circuitry of the power converter. Connect this pin to the input bias supply. Connect bypass capacitors between this pin and PGND.

Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
PVIN	1	I	Input switching voltage. Supplies voltage to the power switches of the converter. Connect these pins to the input supply. Connect bypass capacitors between these pins and PGND.
	11		
	12		
	39		
	40		
VOUT	34	O	Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external bypass capacitors between these pins and PGND.
	35		
	36		
	37		
	38		
	41		
PH	10	O	Phase switch node. These pins must be connected to one another using a small copper island under the device for thermal relief. Do not place any external component on these pins or tie them to a pin of another function.
	13		
	14		
	15		
	16		
	17		
	18		
	19		
	42		
DNC	5	-	Do Not Connect. Do not connect these pins to AGND, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.
	9		
	24		
ISHARE	25	O	Current share pin. Connect this pin to other LMZ31710 device's ISHARE pin when paralleling multiple LMZ31710 devices. When unused, treat this pin as a Do Not Connect (DNC) and leave it isolated from all other signals or ground.
OCP_SEL	4	I	Over current protection select pin. Leave this pin open for hiccup mode operation. Connect this pin to AGND for cycle-by-cycle operation. See Overcurrent Protection for more details.
ILIM	6	I	Current limit pin. Leave this pin open for full current limit threshold. Connect this pin to AGND to reduce the current limit threshold by approximately 3 A.
SYNC_OUT	7	O	Synchronization output pin. Provides a 180° out-of-phase clock signal.
PWRGD	8	O	Power Good flag pin. This open drain output asserts low if the output voltage is more than approximately ±6% out of regulation. A pull-up resistor is required.
RT/CLK	22	I	This pin is connected to an internal frequency setting resistor which sets the default switching frequency. An external resistor can be connected from this pin to AGND to increase the frequency. This pin can also be used to synchronize to an external clock.
VADJ	26	I	Connecting a resistor between this pin and AGND sets the output voltage.
SENSE+	27	O	Remote sense connection. This pin must be connected to VOUT at the load or at the device pins. Connect this pin to VOUT at the load for improved regulation.
SS/TR	28	I	Slow-start and tracking pin. Connecting an external capacitor to this pin adjusts the output voltage rise time. A voltage applied to this pin allows for tracking and sequencing control.
STSEL	29	I	Slow-start or track feature select. Connect this pin to AGND to enable the internal SS capacitor. Leave this pin open to enable the TR feature.
INH/UVLO	30	I	Inhibit and UVLO adjust pin. Use an open drain or open collector logic device to ground this pin to control the INH function. A resistor divider between this pin, AGND, and PVIN/VIN sets the UVLO voltage.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input voltage	VIN, PVIN	−0.3	20	V
	INH/UVLO, PWRGD, RT/CLK, SENSE+	−0.3	6	V
	ILIM, VADJ, SS/TR, STSEL, SYNC_OUT, ISHARE, OCP_SEL	−0.3	3	V
Output voltage	PH	−1.0	20	V
	PH 10ns Transient	−3.0	20	V
	VOUT	−0.3	10	V
Source current	RT/CLK, INH/UVLO		±100	μA
	PH		current limit	A
Sink current	PH		current limit	A
	PVIN		current limit	A
	PWRGD	−0.1	2	mA
Operating junction temperature		−40	125 ⁽²⁾	°C
Storage temperature, T _{stg}		−65	150	°C
Peak Reflow Case Temperature ⁽³⁾			245 ⁽⁴⁾	°C
Maximum Number of Reflows Allowed ⁽³⁾			3 ⁽⁴⁾	
Mechanical shock	Mil-STD-883D, Method 2002.3, 1 msec, 1/2 sine, mounted		1500	G
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000 Hz		20	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) See the temperature derating curves in the Typical Characteristics section for thermal information.
- (3) For soldering specifications, refer to the [Soldering Requirements for BQFN Packages](#) application note.
- (4) Devices with a date code prior to week 14 2018 (1814) have a peak reflow case temperature of 240°C with a maximum of one reflow.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Input switching voltage, PV _{IN}	2.95		17	V
Input bias voltage, V _{IN}	4.5		17	V
Output voltage, V _{OUT}	0.6		5.5	V
Switching frequency, f _{sw}	200		1200	kHz

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMZ31710	UNIT
		RVQ (B3QFN)	
		42 PINS	
R _{θJA}	Junction-to-ambient thermal resistance ⁽²⁾	13.3	°C/W
R _{θJB}	Junction-to-board thermal resistance ⁽³⁾	1.6	°C/W
ψ _{JT}	Junction-to-top characterization parameter ⁽⁴⁾	5.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) The junction-to-ambient thermal resistance, R_{θJA}, applies to devices soldered directly to a 100 mm × 100 mm double-sided PCB with 2 oz. copper and natural convection cooling. Additional airflow reduces R_{θJA}.
- (3) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). T_J = ψ_{JT} × P_{dis} + T_T; where P_{dis} is the power dissipated in the device and T_T is the temperature of the top of the device.
- (4) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). T_J = ψ_{JB} × P_{dis} + T_B; where P_{dis} is the power dissipated in the device and T_B is the temperature of the board 1 mm from the device.

6.5 Electrical Characteristics

Over –40°C to 85°C free-air temperature, P_{VIN} = V_{IN} = 12 V, V_{OUT} = 1.8 V, I_{OUT} = 10 A, C_{IN} = 0.1 μF + 2 × 22 μF ceramic + 100 μF bulk, C_{OUT} = 4 × 47 μF ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I _{OUT}	Output current	T _A = 85°C, natural convection		0 ⁽¹⁾		10	A
V _{IN}	Input bias voltage range	Over output current range		4.5		17	V
PV _{IN}	Input switching voltage range	Over output current range		2.95 ⁽²⁾		17 ⁽³⁾	V
UVLO	V _{IN} undervoltage lockout	V _{IN} Increasing		4		4.5	V

			V _{OUT} = 3.3 V, f _{SW} = 750 kHz	92%			
			V _{OUT} = 2.5 V, f _{SW} = 750 kHz	90%			
			V _{OUT} = 1.8 V, f _{SW} = 500 kHz	89%			
			V _{OUT} = 1.2 V, f _{SW} = 300 kHz	86%			
			V _{OUT} = 0.9 V, f _{SW} = 250 kHz	84%			
			V _{OUT} = 0.6 V, f _{SW} = 200 kHz	81%			
		P _{VIN} = V _{IN} = 5 V I _O = 5 A	V _{OUT} = 3.3 V, f _{SW} = 750 kHz	94%			
			V _{OUT} = 2.5 V, f _{SW} = 750 kHz	93%			
			V _{OUT} = 1.8 V, f _{SW} = 500 kHz	92%			
			V _{OUT} = 1.2 V, f _{SW} = 300 kHz	89%			
			V _{OUT} = 0.9 V, f _{SW} = 250 kHz	87%			
			V _{OUT} = 0.6 V, f _{SW} = 200 kHz	83%			
Output voltage ripple		20 MHz bandwidth		14		mV _{P-P}	
I _{LIM}	Current limit threshold	ILIM pin open		15		A	
		ILIM pin to AGND		12		A	

- (1) See [Light Load Efficiency \(LLE\)](#) for more information for output voltages < 1.5 V.
- (2) The minimum P_{VIN} is 2.95 V or (V_{OUT} + 0.7 V), whichever is greater. See [Table 7](#) for more details.
- (3) The maximum PV_{IN} voltage is 17 V or (22 × V_{OUT}), whichever is less. See [Table 7](#) for more details.
- (4) The maximum output voltage may be limited by the power dissipation. The maximum power dissipation of this device is 4.5 W.
- (5) The stated limit of the set-point voltage tolerance includes the tolerance of both the internal voltage reference and the internal adjustment resistor. The overall output voltage tolerance will be affected by the tolerance of the external R_{SET} resistor.

Electrical Characteristics (continued)

Over -40°C to 85°C free-air temperature, $\text{PV}_{\text{IN}} = \text{V}_{\text{IN}} = 12\text{ V}$, $\text{V}_{\text{OUT}} = 1.8\text{ V}$, $\text{I}_{\text{OUT}} = 10\text{ A}$,
 $\text{C}_{\text{IN}} = 0.1\text{ }\mu\text{F} + 2 \times 22\text{ }\mu\text{F}$ ceramic + $100\text{ }\mu\text{F}$ bulk, $\text{C}_{\text{OUT}} = 4 \times 47\text{ }\mu\text{F}$ ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
Transient response		1 A/ μs load step from 25 to 75% $\text{I}_{\text{OUT(max)}}$	Recovery time		100		μs
			VOUT over/undershoot		80		mV
V_{INH}	Inhibit threshold voltage	Inhibit High Voltage		1.3		open ⁽⁶⁾	V
		Inhibit Low Voltage		-0.3		1.1	
I_{INH}	INH Input current	$\text{V}_{\text{INH}} < 1.1\text{ V}$			-1.15		μA
	INH Hysteresis current	$\text{V}_{\text{INH}} > 1.3\text{ V}$			-3.3		μA
$\text{I}_{\text{I(stby)}}$	Input standby current	INH pin to AGND			2	10	μA
Power Good	PWRGD Thresholds	V_{OUT} rising	Good		95%		
			Fault		108%		
		V_{OUT} falling	Fault		91%		
			Good		104%		
	PWRGD Low Voltage	$\text{I}(\text{PWRGD}) = 0.5\text{ mA}$				0.3	V
f_{SW}	Switching frequency	$\text{R}_{\text{RT}} = 169\text{ k}\Omega$		400	500	600	kHz
f_{CLK}	Synchronization frequency	CLK Control		200		1200	kHz
$\text{V}_{\text{CLK-H}}$	CLK High-Level			2		5.5	V
$\text{V}_{\text{CLK-L}}$	CLK Low-Level					0.5	V
D_{CLK}	CLK Duty Cycle			20%	50%	80%	
Thermal Shutdown		Thermal shutdown			175		$^{\circ}\text{C}$
		Thermal shutdown hysteresis			10		$^{\circ}\text{C}$
C_{IN}	External input capacitance	Ceramic		44 ⁽⁷⁾			μF
		Non-ceramic			100 ⁽⁷⁾		
C_{OUT}	External output capacitance	$\text{V}_{\text{OUT}} = 0.6\text{ V to } 5.5\text{ V}$	Ceramic	47 ⁽⁸⁾	200	1500	μF
		$\text{V}_{\text{OUT}} = 0.6\text{ V to } 5.5\text{ V}$	Non-ceramic		220 ⁽⁸⁾	5000 ⁽⁹⁾	
		Equivalent series resistance (ESR)				35	m Ω

- (6) Value when no voltage divider is present at the INH/UVLO pin. This pin has an internal pullup. If it is left open, the device operates when input power is applied. A small, low-leakage MOSFET is recommended for control. Do not tie this pin to VIN.
- (7) A minimum of 44 μF of external ceramic capacitance is required across the input (VIN and PVIN connected) for proper operation. An additional 100 μF of bulk capacitance is recommended. It is also recommended to place a 0.1 μF ceramic capacitor directly across the PVIN and PGND pins of the device. Locate the input capacitance close to the device. When operating with split VIN and PVIN rails, place 4.7 μF of ceramic capacitance directly at the VIN pin. See [Table 4](#) for more details.
- (8) The amount of required output capacitance varies depending on the output voltage (see [Table 3](#)). The amount of required capacitance must include at least $1 \times 47\text{ }\mu\text{F}$ ceramic capacitor. Locate the capacitance close to the device. Adding additional capacitance close to the load improves the response of the regulator to load transients. See [Table 3](#) and [Table 4](#) more details.
- (9) The maximum output capacitance of 5000 μF includes the combination of both ceramic and non-ceramic capacitors. It may be necessary to increase the slow-start time when turning on into the maximum capacitance. See the [Slow Start \(SS/TR\)](#) section for information on adjusting the slow-start time.

6.6 Typical Characteristics ($P_{VIN} = V_{IN} = 12\text{ V}$)

The electrical characteristic data has been developed from actual products tested at 25°C. This data is considered typical for the converter. Applies to Figure 1, Figure 2, and Figure 3. The temperature derating curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures. Derating limits apply to devices soldered directly to a 100 mm × 100 mm double-sided PCB with 2 oz. copper. Applies to Figure 5 and Figure 6.

7 Detailed Description

7.1 Overview

The LMZ31710 is a full-featured 2.95 V to 17 V input, 10-A, synchronous step-down converter with PWM, MOSFETs, inductor, and control circuitry integrated into a low-profile, overmolded package. This device enables small designs by integrating all but the input and output capacitors, while still leaving the ability to adjust key parameters to meet specific design requirements. The LMZ31710 provides a wide output voltage range of 0.6 V to 5.5 V. In most applications, a single external resistor is used to adjust the output voltage. The switching frequency is also adjustable by using an external resistor or a synchronization pulse to accommodate various input/output voltage conditions and to optimize efficiency. The device provides accurate voltage regulation for a variety of loads by using an internal voltage reference that is $\pm 1\%$ accurate over temperature. The INH/UVLO pin can be pulled low to put the device in standby mode to reduce input quiescent current. The input under-voltage lockout can be adjusted using a resistor divider on the IN/UVLO pin of the device. The device provides a power good signal to indicate when the output is within $\pm 5\%$ of its nominal voltage. The ability to parallel the LMZ31710 allows it to be used in higher current applications. Thermal shutdown and current limit features protect the device during an overload condition. Automatic pulse skip mode improves light-load efficiency. A 42-pin, QFN, package that includes exposed bottom pads provides a thermally enhanced solution for space-constrained applications.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 VIN and PVIN Input Voltage

The LMZ31710 allows for a variety of applications by using the VIN and PVIN pins together or separately. The VIN voltage supplies the internal control circuits of the device. The PVIN voltage provides the input voltage to the power converter system.

If tied together, the input voltage for the VIN pin and the PVIN pin can range from 4.5 V to 17 V. If using the VIN pin separately from the PVIN pin, the VIN pin must be greater than 4.5 V, and the PVIN pin can range from as low as 2.95 V to 17 V. When operating from a split rail, it is recommended to supply VIN from 5 V to 12 V, for best performance. A voltage divider connected to the INH/UVLO pin can adjust either input voltage UVLO appropriately. See [Programmable Undervoltage Lockout \(UVLO\)](#) for more information.

7.3.2 3.3-V PVIN Operation

Applications operating from a PVIN of 3.3 V must provide at least 4.5 V for VIN. It is recommended to supply V_{IN} from 5 V to 12 V, for best performance. See the [Powering LMZ3 SIMPLE SWITCHER Power Modules From 3.3 V Application Note](#) for help creating 5 V from 3.3 V using a small, simple charge pump device.

7.3.3 Adjusting the Output Voltage (0.6 V to 5.5 V)

The VADJ control sets the output voltage of the LMZ31710. The output voltage adjustment range of the LMZ31710 is from 0.6 V to 5.5 V. The adjustment method requires the addition of R_{SET}, which sets the output voltage, the connection of SENSE+ to VOUT, and in some cases R_{RT} which sets the switching frequency. The R_{SET} resistor must be connected directly between the VADJ (pin 26) and AGND (pin 23). The SENSE+ pin (pin 27) must be connected to VOUT either at the load for improved regulation or at VOUT of the device. The R_{RT} resistor must be connected directly between the RT/CLK (pin 22) and AGND (pin 23). [Table 1](#) gives the standard external R_{SET} resistor for a number of common bus voltages, along with the recommended R_{RT} resistor for that output voltage.

Table 1. Standard R_{SET} Resistor Values for Common Output Voltages

RESISTORS	OUTPUT VOLTAGE V _{OUT} (V)						
	0.9	1.0	1.2	1.8	2.5	3.3	5.0
R _{SET} (kΩ)	2.87	2.15	1.43	0.715	0.453	0.316	0.196
R _{RT} (kΩ)	1000	1000	487	169	90.9	90.9	63.4

For other output voltages, the value of the required resistor can either be calculated using the following formula, or simply selected from the range of values given in [Table 2](#).

$$R_{SET} = \frac{1.43}{\left(\left(\frac{V_{OUT}}{0.6}\right) - 1\right)} \text{ (k}\Omega\text{)} \quad (1)$$

Table 2. Standard R_{SET} Resistor Values

V _{OUT} (V)	R _{SET} (kΩ)	R _{RT} (kΩ)	f _{SW} (kHz)	V _{OUT} (V)	R _{SET} (kΩ)	R _{RT} (kΩ)	f _{SW} (kHz)

7.3.4 Capacitor Recommendations For the LMZ31710 Power Supply

7.3.4.1 Capacitor Technologies

7.3.4.1.1 Electrolytic, Polymer-Electrolytic Capacitors

When using electrolytic capacitors, high-quality, computer-grade electrolytic capacitors are recommended. Polymer-electrolytic type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo OS-CON capacitor series is suggested due to the lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Aluminum electrolytic capacitors provide adequate decoupling over the frequency range of 2 kHz to 150 kHz, and are suitable when ambient temperatures are above 0°C.

7.3.4.1.2 Ceramic Capacitors

The performance of aluminum electrolytic capacitors is less effective than ceramic capacitors above 150 kHz. Multilayer ceramic capacitors have a low ESR and a resonant frequency higher than the bandwidth of the regulator. They can be used to reduce the reflected ripple current at the input as well as improve the transient response of the output.

7.3.4.1.3 Tantalum, Polymer-Tantalum Capacitors

Polymer-tantalum type capacitors are recommended for applications where the ambient operating temperature is less than 0°C. The Sanyo POSCAP series and Kemet T530 capacitor series are recommended rather than many other tantalum types due to their lower ESR, higher rated surge, power dissipation, ripple current capability, and small package size. Tantalum capacitors that have no stated ESR or surge current rating are not recommended for power applications.

7.3.4.2 Input Capacitor

The LMZ31710 requires a minimum input capacitance of 44 μF of ceramic type. An additional 100 μF of non-ceramic capacitance is recommended for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage. At worst case, when operating at 50% duty cycle and maximum load, the combined ripple current rating of the input capacitors must be at least 5 Arms. [Table 4](#) includes a preferred list of capacitors by vendor. It is also recommended to place a 0.1- μF ceramic capacitor directly across the PVIN and PGND pins of the device. When operating with split VIN and PVIN rails, place 4.7 μF of ceramic capacitance directly at the VIN pin.

7.3.4.3 Output Capacitor

The required output capacitance is determined by the output voltage of the LMZ31710. See [Table 3](#) for the amount of required capacitance. The effects of temperature and capacitor voltage rating must be considered when selecting capacitors to meet the minimum required capacitance. The required output capacitance can be comprised of all ceramic capacitors, or a combination of ceramic and bulk capacitors. The required capacitance must include at least one 47 μF ceramic. When adding additional non-ceramic bulk capacitors, low-ESR devices like the ones recommended in [Table 4](#) are required. The required capacitance above the minimum is determined by actual transient deviation requirements. See [Table 5](#) for typical transient response values for several output voltage, input voltage and capacitance combinations. [Table 4](#) includes a preferred list of capacitors by vendor.

Table 3. Required Output Capacitance

V _{OUT} RANGE (V)		MINIMUM REQUIRED C _{OUT} (μF)
MIN	MAX	
0.6	< 0.8	500 μF ⁽¹⁾
0.8	< 1.2	300 μF ⁽¹⁾
1.2	< 3.0	200 μF ⁽¹⁾
3.0	< 4.0	100 μF ⁽¹⁾
4.0	5.5	47 μF ceramic

(1) Minimum required must include at least one 47 μF ceramic capacitor.

Table 4. Recommended Input/Output Capacitors⁽¹⁾

(1) **Capacitor Supplier Verification, RoHS, Lead-free, and Material Details**

Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table.

(2) Maximum ESR at 100 kHz, 25°C.

Figure 19. Transient Response (12 V to 1.2 V)

Figure 20. Transient Response (5 V to 1.2 V)

Figure 21. Transient Response (12 V to 1.8 V)

Figure 22. Transient Response (5 V to 1.8 V)

7.3.6 Power Good (PWRGD)

The PWRGD pin is an open drain output. Once the voltage on the SENSE+ pin is between 95% and 104% of the set voltage, the PWRGD pin pulldown is released, and the pin floats. The recommended pullup resistor value is between 10 kΩ and 100 kΩ to a voltage source that is 5.5 V or less. The PWRGD pin is in a defined state once VIN is greater than 1 V, but with reduced current sinking capability. The PWRGD pin achieves full current sinking capability once the VIN pin is above 4.5 V. The PWRGD pin is pulled low when the voltage on SENSE+ is lower than 91% or greater than 108% of the nominal set voltage. Also, the PWRGD pin is pulled low if the input UVLO or thermal shutdown is asserted, the INH pin is pulled low, or the SS/TR pin is below 1.4 V.

7.3.7 Light Load Efficiency (LLE)

The LMZ31710 operates in pulse skip mode at light load currents to improve efficiency and decrease power dissipation by reducing switching and gate drive losses.

These pulses may cause the output voltage to rise when there is no load to discharge the energy. For output voltages < 1.5 V, a minimum load is required. The amount of required load can be determined by Equation 2. In most cases the minimum current drawn by the load circuit will be enough to satisfy this load. Applications requiring a load resistor to meet the minimum load, the added power dissipation will be ≤ 3.6 mW. A single 0402 size resistor across VOUT and PGND can be used.

$$I_{\text{MIN}} = 600 \mu\text{A} - \left(\frac{V_{\text{OUT}}}{1.43\text{k} + R_{\text{SET}}} \right) (\text{A}) \quad (2)$$

When $V_{\text{OUT}} = 0.6 \text{ V}$ and $R_{\text{SET}} = \text{OPEN}$, the minimum load current is 600 μA .

7.3.8 SYNC_OUT

The LMZ31710 provides a 180° out-of-phase clock signal for applications requiring synchronization. The SYNC_OUT pin produces a 50% duty cycle clock signal that is the same frequency as the device's switching frequency, but is 180° out of phase. Operating two devices 180° out of phase reduces input and output voltage ripple. The SYNC_OUT clock signal is compatible with other LMZ3 devices that have a CLK input.

7.3.9 Parallel Operation

Up to six LMZ31710 devices can be paralleled for increased output current. Multiple connections must be made between the paralleled devices and the component selection is slightly different than for a stand-alone LMZ31710 device. A typical LMZ31710 parallel schematic is shown in Figure 23. Refer to application note, SNVA695 for information and design help when paralleling multiple LMZ31710 devices. Additionally, an EVM featuring two LMZ31710 devices operating in parallel can be evaluated using the LMZ31710X2EVM.

Figure 23. Typical LMZ31710 Parallel Schematic

7.3.10 Power-Up Characteristics

When configured as shown in the application circuit on page 1, the LMZ31710 produces a regulated output voltage following the application of a valid input voltage. During the power-up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current that can be drawn from the input source. [Figure 24](#) shows the start-up waveforms for a LMZ31710, operating from a 5-V input ($P_{VIN} = V_{IN}$) and with the output voltage adjusted to 1.8 V. [Figure 25](#) shows the start-up waveforms for a LMZ31710 starting up into a pre-biased output voltage. The waveforms were measured with a 5-A constant current load.

7.3.11 Pre-Biased Start-Up

The LMZ31710 has been designed to prevent the low-side MOSFET from discharging a pre-biased output. During pre-biased startup, the low-side MOSFET does not turn on until the high-side MOSFET has started switching. The high-side MOSFET does not start switching until the slow start voltage exceeds the voltage on the VADJ pin. Refer to [Figure 25](#).

7.3.12 Remote Sense

The SENSE+ pin must be connected to V_{OUT} at the load, or at the device pins.

Connecting the SENSE+ pin to V_{OUT} at the load improves the load regulation performance of the device by allowing it to compensate for any I-R voltage drop between its output pins and the load. An I-R drop is caused by the high output current flowing through the small amount of pin and trace resistance. This must be limited to a maximum of 300 mV.

NOTE

The remote sense feature is not designed to compensate for the forward drop of nonlinear or frequency dependent components that may be placed in series with the converter output. Examples include OR-ing diodes, filter inductors, ferrite beads, and fuses. When these components are enclosed by the SENSE+ connection, they are effectively placed inside the regulation control loop, which can adversely affect the stability of the regulator.

7.3.13 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 175°C typically. The device reinitiates the power-up sequence when the junction temperature drops below 165°C typically.

7.3.14 Output On/Off Inhibit (INH)

The INH pin provides electrical on/off control of the device. Once the INH pin voltage exceeds the threshold voltage, the device starts operation. If the INH pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low quiescent current state. The INH pin has an internal pull-up current source, allowing the user to float the INH pin for enabling the device.

If an application requires controlling the INH pin, use an open drain/collector device, or a suitable logic gate to interface with the pin. Using a voltage supervisor to control the INH pin allows control of the turn-on and turn-off of the device as opposed to relying on the ramp up or down of the input voltage source.

Figure 26 shows the typical application of the inhibit function. Turning Q1 on applies a low voltage to the inhibit control (INH) pin and disables the output of the supply, shown in Figure 27. If Q1 is turned off, the supply executes a soft-start power-up sequence, as shown in Figure 28. A regulated output voltage is produced within 2 ms. The waveforms were measured with a 5-A constant current load.

Figure 26. Typical Inhibit Control

Figure 27. Inhibit Turn Off

Figure 28. Inhibit Turn On

7.3.15 Slow Start (SS/TR)

Connecting the STSEL pin to AGND and leaving SS/TR pin open enables the internal SS capacitor with a slow start interval of approximately 1.2 ms. Adding additional capacitance between the SS pin and AGND increases the slow start time. Increasing the slow start time will reduce inrush current seen by the input source and reduce the current seen by the device when charging the output capacitors. To avoid the activation of current limit and ensure proper start-up, the SS capacitor may need to be increased when operating near the maximum output capacitance limit.

Table 6 shows an additional SS capacitor connected to the SS/TR pin and the STSEL pin connected to AGND. See Table 6 for SS capacitor values and timing interval.

Figure 29. Slow-Start Capacitor (C_{SS}) And STSEL Connection

Table 6. Slow-Start Capacitor Values And Slow-Start Time

C_{SS} (nF)	OPEN	3.3	4.7	10	15	22	33
SS Time (msec)	1.2	2.1	2.5	3.8	5.1	7.0	9.8

7.3.16 Overcurrent Protection

For protection against load faults, the LMZ31710 incorporates output overcurrent protection. The overcurrent protection mode can be selected using the OCP_SEL pin. Leaving the OCP_SEL pin open selects hiccup mode and connecting it to AGND selects cycle-by-cycle mode. In hiccup mode, applying a load that exceeds the overcurrent threshold of the regulator causes the regulated output to shut down. Following shutdown, the module periodically attempts to recover by initiating a soft-start power-up as shown in Figure 30. This is described as a hiccup mode of operation, whereby the module continues in a cycle of successive shutdown and power up until the load fault is removed. During this period, the average current flowing into the fault is significantly reduced which reduces power dissipation. Once the fault is removed, the module automatically recovers and returns to normal operation as shown in Figure 31.

In cycle-by-cycle mode, applying a load that exceeds the regulator's overcurrent threshold limits the output current and reduces the output voltage as shown in Figure 32. During this period, the current flowing into the fault remains high causing the power dissipation to stay high as well. Once the overcurrent condition is removed, the output voltage returns to the set-point voltage as shown in Figure 33.

Figure 30. Overcurrent Limiting (Hiccup)

Figure 31. Removal Of Overcurrent (Hiccup)

Figure 32. Overcurrent Limiting (Cycle-By-Cycle)

Figure 33. Removal Of Overcurrent (Cycle-By-Cycle)

7.3.17 Synchronization (CLK)

An internal phase locked loop (PLL) has been implemented to allow synchronization between 200 kHz and 1200 kHz, and to easily switch from RT mode to CLK mode. To implement the synchronization feature, connect a square wave clock signal to the RT/CLK pin with a duty cycle between 20% to 80%. The clock signal amplitude must transition lower than 0.5 V and higher than 2 V. The start of the switching cycle is synchronized to the falling edge of RT/CLK pin. In applications where both RT mode and CLK mode are needed, the device can be configured as shown in [Figure 34](#).

Before the external clock is present, the device works in RT mode and the switching frequency is set by RT resistor. When the external clock is present, the CLK mode overrides the RT mode. The first time the CLK pin is pulled above the RT/CLK high threshold (2 V), the device switches from RT mode to CLK mode and the RT/CLK pin becomes high impedance as the PLL starts to lock onto the frequency of the external clock. It is not recommended to switch from CLK mode back to RT mode because the internal switching frequency drops to 100 kHz first before returning to the switching frequency set by the RT resistor (R_{RT}).

Figure 34. RT/CLK Configuration

The switching frequency must be selected based on the output voltages of the devices being synchronized. [Table 7](#) shows the allowable frequencies for a given range of output voltages. The allowable switching frequency changes based on the maximum output current (I_{OUT}) of an application. The table shows the V_{OUT} range when $I_{OUT} \leq 10$ A, 9 A, and 8 A. For the most efficient solution, always synchronize to the lowest allowable frequency. For example, an application requires synchronizing three LMZ31710 devices with output voltages of 1.0 V, 1.2 V and 1.8 V, all powered from $PV_{IN} = 12$ V. [Table 7](#) shows that all three output voltages must be synchronized to 300 kHz.

Table 7. Allowable Switching Frequency versus Output Voltage

SWITCHING FREQUENCY (kHz)	PVIN = 12 V			PVIN = 5 V		
	V _{OUT} RANGE (V)			V _{OUT} RANGE (V)		
	I _{OUT} ≤ 10 A	I _{OUT} ≤ 9 A	I _{OUT} ≤ 8 A	I _{OUT} ≤ 10 A	I _{OUT} ≤ 9 A	I _{OUT} ≤ 8 A
200	0.6 - 1.2	0.6 - 1.6	0.6 - 2.0	0.6 - 1.5	0.6 - 2.5	0.6 - 4.3

1000	2.5 - 5.5	2.5 - 5.5	2.5 - 5.5	1.1 - 4.3	1.1 - 4.3	1.1 - 4.3
1100	2.7 - 5.5	2.7 - 5.5	2.7 - 5.5	1.3 - 4.3	1.2 - 4.3	1.2 - 4.3
1200	3.0 - 5.5	3.0 - 5.5	3.0 - 5.5	1.4 - 4.3	1.3 - 4.3	1.3 - 4.3

7.3.18 Sequencing (SS/TR)

Many of the common power supply sequencing methods can be implemented using the SS/TR, INH and PWRGD pins. The sequential method is illustrated in [Figure 35](#) using two LMZ31710 devices. The PWRGD pin of the first device is coupled to the INH pin of the second device which enables the second power supply once the primary supply reaches regulation. [Figure 36](#) shows sequential turn-on waveforms of two LMZ31710 devices.

Figure 35. Sequencing Schematic

Figure 36. Sequencing Waveforms

Simultaneous power supply sequencing can be implemented by connecting the resistor network of R1 and R2 shown in [Figure 37](#) to the output of the power supply that needs to be tracked or to another voltage reference source. The tracking voltage must exceed 750mV before V_{OUT2} reaches its set-point voltage. The PWRGD output of the V_{OUT2} device may remain low if the tracking voltage does not exceed 1.4 V. [Figure 38](#) shows simultaneous turn-on waveforms of two LMZ31710 devices. [Equation 3](#) and [Equation 4](#) calculate the values of R1 and R2.

$$R1 = \frac{(V_{OUT2} \times 12.6)}{0.6} \text{ (k}\Omega\text{)} \quad (3)$$

$$R2 = \frac{0.6 \times R1}{(V_{OUT2} - 0.6)} \text{ (k}\Omega\text{)} \quad (4)$$

Figure 37. Simultaneous Tracking Schematic

Figure 38. Simultaneous Tracking Waveforms

7.4 Device Functional Modes

7.4.1 Programmable Undervoltage Lockout (UVLO)

The LMZ31710 implements internal UVLO circuitry on the VIN pin. The device is disabled when the VIN pin voltage falls below the internal VIN UVLO threshold. The internal VIN UVLO rising threshold is 4.5 V(max) with a typical hysteresis of 150 mV.

If an application requires either a higher UVLO threshold on the VIN pin or a higher UVLO threshold for a combined VIN and PVIN, then the UVLO pin can be configured as shown in [Figure 39](#) or [Figure 40](#). [Table 8](#) lists standard values for R_{UVLO1} and R_{UVLO2} to adjust the VIN UVLO voltage up.

Table 8. Standard Resistor Values For Adjusting VIN UVLO

VIN UVLO (V)	5	5.5	6	6.5	7	7.5	8	8.5	9	9.5	10
R_{UVLO1} (k Ω)	68.1	68.1	68.1	68.1	68.1	68.1	68.1	68.1	68.1	68.1	68.1
R_{UVLO2} (k Ω)	21.5	18.7	16.9	15.4	14.0	13.0	12.1	11.3	10.5	9.76	9.31
Hysteresis (mV)	400	415	430	450	465	480	500	515	530	550	565

For a split rail application, if a secondary UVLO on PVIN is required, VIN must be ≥ 4.5 V. [Figure 41](#) shows the PVIN UVLO configuration. Use [Table 9](#) to select R_{UVLO1} and R_{UVLO2} for PVIN. If PVIN UVLO is set for less than 3.5 V, a 5.1-V zener diode must be added to clamp the voltage on the UVLO pin below 6 V.

Table 9. Standard Resistor Values For Adjusting Pvin UVLO, (VIN ≥ 4.5 V)

PVIN UVLO (V)	2.9	3.0	3.5	4.0	4.5	For higher PVIN UVLO voltages, see Table 8 for resistor values
R_{UVLO1} (k Ω)	68.1	68.1	68.1	68.1	68.1	
R_{UVLO2} (k Ω)	47.5	44.2	34.8	28.7	24.3	
Hysteresis (mV)	330	335	350	365	385	

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMZ31710 power module is an easy-to-use integrated power solution that combines a 10-A DC/DC converter with power MOSFETs, a shielded inductor, and passives into a low profile, QFN package. This total power solution allows as few as three external components and eliminates the loop compensation and magnetics part selection process.

8.2 Typical Application

A typical LMZ31710 application requires input and output capacitors, a voltage setting resistor, and a switching frequency setting resistor. [Figure 42](#) shows a typical LMZ31710 schematic with only the minimum required components.

Figure 42. Typical Schematic
 $P_{VIN} = V_{IN} = 4.5 \text{ V To } 17 \text{ V}, V_{OUT} = 1.2 \text{ V}$

8.2.1 Design Requirements

For this design example, use the parameters listed in [Table 10](#) and follow these design procedures:

Table 10. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage	11.4 V to 12.6 V
Output voltage	1.2 V
Output current	10 A

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the LMZ31710 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Setting The Output Voltage

The output voltage of the LMZ31710 is externally adjustable using a single resistor (R_{SET}). Select the value of R_{SET} from [Table 2](#) or calculate using [Equation 5](#).

$$R_{SET} = \frac{1.43}{\left(\left(\frac{V_{OUT}}{0.6}\right) - 1\right)} \text{ (k}\Omega\text{)} \quad (5)$$

To set the output voltage to 1.2 V, the calculated value for R_{SET} is 1.43 k Ω .

8.2.2.3 Setting the Switching Frequency

The recommended switching frequency for 1.2 V output voltage is 300 kHz. To set the switching frequency to 300 kHz, a 487 k Ω R_{RT} resistor is required. Refer to [Table 2](#) for recommended switching frequencies for other output voltages.

8.2.2.4 Input Capacitance

The minimum required input capacitance for the LMZ31710 is 44 μ F of ceramic capacitance. However, adding a 0.1 μ F ceramic capacitor placed directly at the input pins of the device will help with high frequency bypassing. Additionally, adding a bulk input capacitor is helpful in applications with fast changing load current.

In this application, a combination of a 100 μ F bulk capacitor, a 47 μ F ceramic capacitor, and a 0.1 μ F ceramic capacitor was used.

8.2.2.5 Output Capacitance

The amount of required output capacitance depends on the output voltage setting, as shown in [Table 3](#). For an output voltage of 1.2 V, the required minimum output capacitance is 200 μ F, with a requirement that at least 47 μ F must be ceramic type.

In this application, a combination of a 200 μ F of ceramic capacitance and a 220 μ F bulk capacitor was used. The additional 220 μ F bulk capacitor will help in applications with fast changing load current.

8.3 Additional Application Schematics

[Figure 43](#) and [Figure 44](#) show additional typical schematics. [Figure 43](#) shows a typical schematic for a 3.3 V output while $PVIN$ and VIN are tied to the same input voltage rail. [Figure 44](#) shows a typical schematic for a 1.0 V output, however $PVIN$ and VIN are powered from separate input voltage rails.

Additional Application Schematics (continued)

Figure 43. Typical Schematic
PVIN = VIN = 4.5 V To 17 V, Vout = 3.3 V

Figure 44. Typical Schematic
PVIN = 3.3 V, VIN = 4.5 V To 17 V, Vout = 1.0 V

9 Power Supply Recommendations

The LMZ31710 is designed to operate from an input voltage supply range between 2.95 V and 17 V. This input supply should be well regulated and able to withstand maximum input current and maintain a stable voltage. The resistance of the input supply rail should be low enough that an input current transient does not cause a high enough drop at the supply voltage that can cause a false UVLO fault triggering and system reset.

If the input supply is located more than a few inches from the LMZ31710, additional bulk capacitance may be required at the input pins. A typical recommended amount of bulk input capacitance is 47 µF - 100 µF.

10 Layout

10.1 Layout Considerations

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 45 through Figure 48, shows a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (PVIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the device pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Keep AGND and PGND separate from one another.
- Place R_{SET} , R_{RT} , and C_{SS} as close as possible to their respective pins.
- Use multiple vias to connect the power planes to internal layers.

10.2 Layout Examples

Figure 45. Typical Top-Layer Layout

Figure 46. Typical Layer-2 Layout

Layout Examples (continued)

Figure 47. Typical Layer 3 Layout

Figure 48. Typical Bottom-Layer Layout

10.2.1 EMI

The LMZ31710 is compliant with EN55022 Class B radiated emissions. Figure 49 and Figure 50 show typical examples of radiated emissions plots for the LMZ31710 operating from 5 V and 12 V, respectively. Both graphs include the plots of the antenna in the horizontal and vertical positions.

Figure 49. Radiated Emissions 5-V Input, 1.8-V Output, 10-A Load (EN55022 Class B)

Figure 50. Radiated Emissions 12-V Input, 1.8-V Output, 10-A Load (EN55022 Class B)

11 デバイスおよびドキュメントのサポート

11.1 デバイス・サポート

11.1.1 開発サポート

11.1.1.1 WEBENCH®ツールによるカスタム設計

[ここをクリック](#)すると、WEBENCH® Power Designerにより、LMZ31710デバイスを使用するカスタム設計を作成できます。

1. 最初に、入力電圧(V_{IN})、出力電圧(V_{OUT})、出力電流(I_{OUT})の要件を入力します。
2. オプティマイザのダイヤルを使用して、効率、占有面積、コストなどの主要なパラメータについて設計を最適化します。
3. 生成された設計を、テキサス・インスツルメンツが提供する他の方式と比較します。

WEBENCH Power Designerでは、カスタマイズされた回路図と部品リストを、リアルタイムの価格と部品の在庫情報と併せて参照できます。

通常、次の操作を実行可能です。

- 電氣的なシミュレーションを実行し、重要な波形と回路の性能を確認する。
- 熱シミュレーションを実行し、基板の熱特性を把握する。
- カスタマイズされた回路図やレイアウトを、一般的なCADフォーマットで出力する。
- 設計のレポートをPDFで印刷し、設計を共有する。

WEBENCHツールの詳細は、www.ti.com/WEBENCHでご覧になれます。

11.1.2 デベロッパー・ネットワークの製品に関する免責事項

デベロッパー・ネットワークの製品またはサービスに関するTIの出版物は、単独またはTIの製品、サービスと一緒に提供される場合に関係なく、デベロッパー・ネットワークの製品またはサービスの適合性に関する是認、デベロッパー・ネットワークの製品またはサービスの是認の表明を意味するものではありません。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
