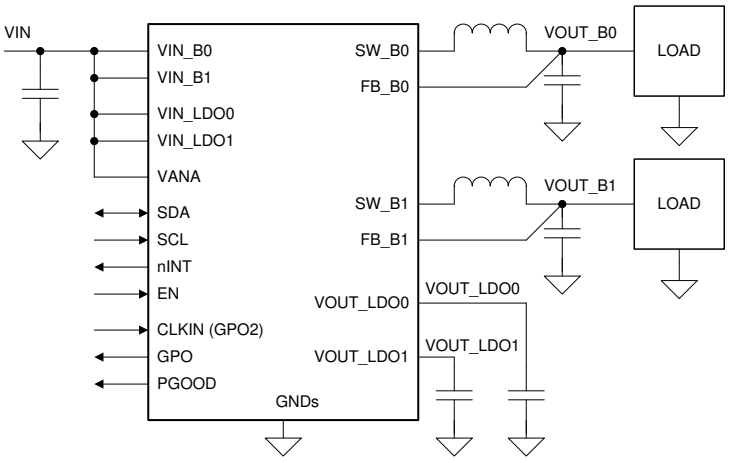
LP87332D-Q1
JAJSDW9A – SEPTEMBER 2017 – REVISED JUNE 2021

LP87332D-Q1 デュアル大電流降圧コンバータおよびデュアル・リニア・レギュレータ

1 特長

- 下記内容で AEC-Q100 認定済み
  - デバイス温度グレード 1：–40℃～+125℃の動作時周囲温度範囲
- 入力電圧：2.8V～5.5V
- 2 つの高効率降圧型 DC/DC コンバータ
  - 出力電圧：0.7V～3.36V
  - 最大出力電流： 3A
  - 出力電圧スルー・レートを 0.5mV/µs～10mV/µs にプログラム可能
  - 2MHz のスイッチング周波数
  - 拡散スペクトラム・モードおよび位相インターリーブによる EMI の低減
- 2 つのリニア・レギュレータ
  - 入力電圧：2.5V～5.5V
  - 出力電圧：0.8V～3.3V
  - 最大出力電流：300mA
- 汎用出力信号 (GPO、GPO2) を構成可能
- マスクをプログラム可能な割り込み機能
- プログラム可能なパワー・グッド信号 (PGOOD)
- 出力短絡および過負荷保護
- 過熱警告および保護
- 過電圧保護 (OVP) および低電圧誤動作防止 (UVLO)
- 28 ピン、5mm × 5mm のウェッタブル・フランク付き VQFN パッケージ



概略回路図

2 アプリケーション

- 車載用ヘッド・ユニットおよびクラスタ
- 車載用カメラ・モジュール
- サラウンド・ビュー・システムの ECU
- レーダー・システムの ECU
- 車載ディスプレイ

3 概要

LP87332D-Q1 は、車載用カメラおよびレーダー・アプリケーションの最新プロセッサおよびプラットフォームの電源管理要件を満たすよう設計されています。このデバイスは 2 つの降圧 DC/DC コンバータ、2 つのリニア・レギュレータ、2 つの汎用デジタル出力信号を備えています。このデバイスは、I^2C 互換のシリアル・インターフェイスとイネーブル信号により制御されます。

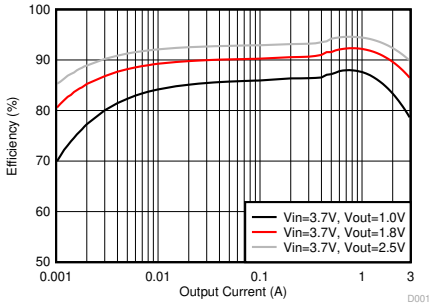
自動 PWM/PFM (AUTO モード) 動作により、広い範囲の出力電流について高い効率が得られます。LP87332D-Q1 はリモート電圧センシングをサポートし、レギュレータ出力と負荷ポイント (POL) との間の IR 降下を補償して、出力電圧の精度を向上します。さらに、スイッチング・クロックを強制的に PWM モードに設定し、外部クロックと同期して、外乱による変動を最小限に抑えることができます。

さらに、 LP87332D-Q1 デバイスはプログラム可能なスタートアップおよびシャットダウン遅延をサポートし、GPO 信号を含むシーケンスをイネーブル信号に同期できます。スタートアップ時および電圧の変化時に、デバイスは出力スルー・レートを制御し、出力電圧のオーバーシュートおよび突入電流を最小化します。

製品情報(1)

部品番号	パッケージ	本体サイズ (公称)
LP87332D-Q1	VQFN (28)	5.00mm × 5.00mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。



DC/DC 効率と出力電流との関係

Changes from Revision * (September 2017) to Revision A (June 2021)	Page
• 文書全体にわたって表、図、相互参照の採番方法を更新	1
• Updated the *LDO Output Capacitor Selection* section	61

5 Pin Configuration and Functions

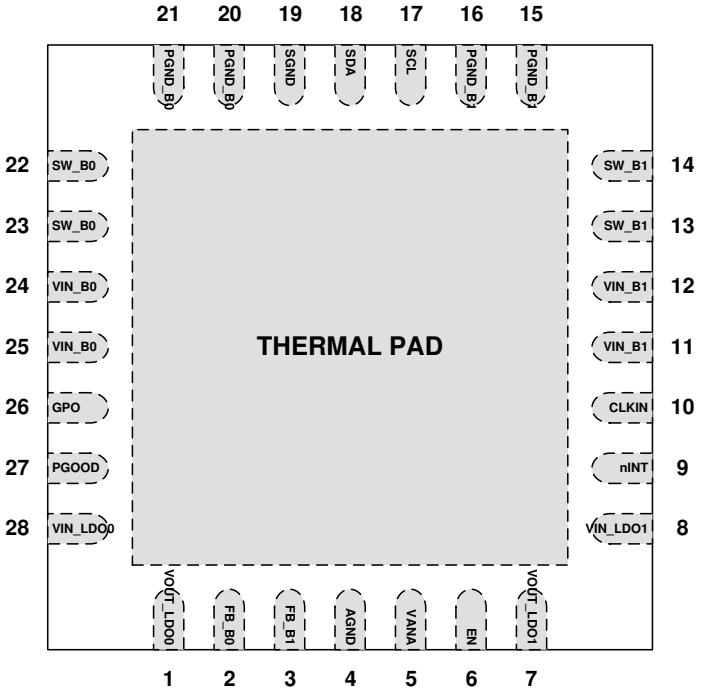

図 5-1. RHD Package 28-Pin VQFN With Thermal Pad Top View

表 5-1. Pin Functions

PIN		TYPE[1]	DESCRIPTION
NUMBER	NAME		
1	VOUT_LDO0	P/O	LDO0 output. If the LDO0 is not used, leave the pin floating.
2	FB_B0	A	Output voltage feedback (positive) for Buck 0.
3	FB_B1	A	Output voltage feedback (positive) for Buck 1
4	AGND	G	Ground.
5	VANA	P/I	Supply voltage for analog and digital blocks. Must be connected to same node with VIN_Bx.
6	EN	D/I	Programmable enable signal for regulators and GPOs. If the pin is not used, leave the pin floating.
7	VOUT_LDO1	P/O	LDO1 output. If LDO1 is not used, leave the pin floating.
8	VIN_LDO1	P/I	Power input for LDO1. If LDO1 is not used, connect the pin to VANA.
9	nINT	D/O	Open-drain interrupt output. Active LOW. If the pin is not used, connect the pin to ground.
10	CLKIN	D/I/O	External clock input. Alternative function is general-purpose digital output (GPO2). If the pin is not used, leave the pin floating.
11, 12	VIN_B1	P/I	Input for Buck 1. The separate power pins VIN_Bx are not connected together internally - VIN_Bx pins must be connected together in the application and be locally bypassed.
13, 14	SW_B1	P/O	Buck 1 switch node. If the Buck 1 is not used, leave the pin floating.
15, 16	PGND_B1	P/G	Power ground for Buck 1.
17	SCL	D/I	Serial interface clock input for I^2C access. Connect a pullup resistor. If the I^2C interface is not used, connect the pin to Ground.
18	SDA	D/I/O	Serial interface data input and output for I^2C access. Connect a pullup resistor. If the I^2C interface is not used, connect the pin to Ground.
19	SGND	G	Ground.
20, 21	PGND_B0	P/G	Power ground for Buck 0.
22, 23	SW_B0	P/O	Buck 0 switch node. If the Buck 0 is not used, leave the pin floating.

表 5-1. Pin Functions (continued)

PIN		TYPE(1)	DESCRIPTION
NUMBER	NAME		
24, 25	VIN_B0	P/I	Input for Buck 0. The separate power pins VIN_Bx are not connected together internally - VIN_Bx pins must be connected together in the application and be locally bypassed.
26	GPO	D/O	General-purpose digital output. If the pin is not used, leave the pin floating.
27	PGOOD	D/O	Power-good indication signal. If the pin is not used, leave the pin floating.
28	VIN_LDO0	P/I	Power input for LDO0. If the LDO0 is not used, connect the pin to VANA.
Thermal Pad	—	—	Connect to PCB ground plane using multiple vias for good thermal performance.

(1) A: Analog Pin, D: Digital Pin, G: Ground Pin, P: Power Pin, I: Input Pin, and O: Output Pin.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)(1) (2)

		MIN	MAX	UNIT
VIN_Bx, VANA	Voltage on power connections (must use the same input supply)	–0.3	6	V
VIN_LDOx	Voltage on power connections	–0.3	6	V
SW_Bx	Voltage on buck switch nodes	–0.3	(VIN_Bx + 0.3 V) with 6-V maximum	V
FB_Bx	Voltage on buck voltage sense nodes	–0.3	(VANA + 0.3 V) with 6-V maximum	V
VOUT_LDOx	Voltage on LDO output	-0.3	(VIN_LDOx + 0.3 V) with 6-V maximum	V
SDA, SCL, nINT, EN	Voltage on logic pins (input or output pins)	–0.3	6	V
PGOOD, GPO, CLKIN (GPO2)	Voltage on logic pins (input or output pins)	–0.3	(VANA + 0.3 V) with 6-V maximum	V
T_{J-MAX}	Junction temperature	−40	150	°C
T_{stg}	Storage temperature	–65	150	
Maximum lead temperature (soldering, 10 seconds)			260	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *セクション 6.3*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground.

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002(1)		±2000	V
		Charged-device model (CDM), per AEC Q100-011	All pins	±500	
			Corner pins (1, 7, 8, 14, 15, 21, 22, 28)	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
INPUT VOLTAGE				
VIN_Bx, VANA	Voltage on power connections (must use the same input supply)	2.8	5.5	V
VIN_LDOx	Voltage on LDO inputs	2.5	5.5	V
EN, nINT	Voltage on logic pins (input or output pins)	0	5.5	V
CLKIN	Voltage on logic pins (input pin)	0	VANA with 5.5-V maximum	V
PGOOD, GPO, GPO2	Voltage on logic pins (output pins)	0	VANA	V
SCL, SDA	Voltage on I2C interface, Standard (100 kHz), Fast (400 kHz), Fast+ (1 MHz), and High-Speed (3.4 MHz) Modes	0	1.95	V
	Voltage on I2C interface, Standard (100 kHz), Fast (400 kHz), and Fast+ (1 MHz) Modes	0	VANA with 3.6-V maximum	V
TEMPERATURE				
T_J	Junction temperature	−40	140	°C
T_A	Ambient temperature	−40	125	°C

6.4 Thermal Information

THERMAL METRIC[1]		LP87332D-Q1 RHD (VQFN) 28 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	36.7	°C/W
$R_{\theta JCtop}$	Junction-to-case (top) thermal resistance	26.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	8.9	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.4	°C/W
ψ_{JB}	Junction-to-board characterization parameter	8.8	°C/W
$R_{\theta JCbot}$	Junction-to-case (bottom) thermal resistance	2.2	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application note.

6.5 Electrical Characteristics

Limits apply over the junction temperature range –40°C ≤ T_J ≤ +140°C, specified V_{VANA}, V_{VIN_Bx}, V_{VIN_LDOx}, V_{VOUT_Bx}, V_{VOUT_LDOx} and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = V_{VIN_LDOx} = 3.7 V, and V_{OUT} = 1 V, unless otherwise noted[1] [2].

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
EXTERNAL COMPONENTS						
C_{IN_BUCK}	Input filtering capacitance for buck regulators	Effective capacitance, connected from VIN_Bx to PGND_Bx	1.9	10		µF
C_{OUT_BUCK}	Output filtering capacitance for buck regulators	Effective capacitance	10	22	500	µF
C_{POL_BUCK}	Point-of-load (POL) capacitance for buck regulators	Optional POL capacitance		22		µF
$C_{OUT-TOTAL\_BUCK}$	Buck output capacitance, total (local and POL)	Total output capacitance			500	µF
C_{IN_LDO}	Input filtering capacitance for LDO regulators	Effective capacitance, connected from VIN_LDOx to AGND. C_{IN_LDO} must be at least two times larger than C_{OUT_LDO}	0.6	2.2		µF
C_{OUT_LDO}	Output filtering capacitance for LDO regulators	Effective capacitance	0.4	1	2.7	µF
ESR_C	Input and output capacitor ESR	[1-10] MHz		2	10	mΩ
L	Inductor	Inductance of the inductor		0.47		µH
			–30%		30%	
DCR_L	Inductor DCR			25		mΩ
BUCK REGULATORS						
$V_{(VIN\_Bx)}$, $V_{(VANA)}$	Input voltage range	VIN_Bx and VANA pins must be connected to the same supply line	2.8	3.7	5.5	V
V_{OUT_Bx}	Output voltage	Programmable voltage range	0.7	1	3.36	V
		Step size, 0.7 V ≤ V_{OUT} < 0.73 V		10		mV
		Step size, 0.73 V ≤ V_{OUT} < 1.4 V		5		
		Step size, 1.4 V ≤ V_{OUT} ≤ 3.36 V		20		
I_{OUT_Bx}	Output current	Output current			3[3]	A
	Input and Output voltage difference	Minimum voltage between $V_{(VIN\_Bx)}$ and V_{OUT} to fulfill the electrical characteristics	0.8			V

6.5 Electrical Characteristics (continued)

Limits apply over the junction temperature range –40°C ≤ T_J ≤ +140°C, specified V_{VANA}, V_{VIN_Bx}, V_{VIN_LDOx}, V_{VOUT_Bx}, V_{VOUT_LDOx} and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = V_{VIN_LDOx} = 3.7 V, and V_{OUT} = 1 V, unless otherwise noted(1) (2).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{OUT\_Bx\_DC}$	DC output voltage accuracy, includes voltage reference, DC load and line regulations, process and temperature	Force PWM mode, V_{OUT} < 1 V	–20		20	mV
		Force PWM mode, V_{OUT} ≥ 1 V	–2%		2%	
		PFM mode, V_{OUT} < 1 V, the average output voltage level is increased by max. 20 mV	–20		40	mV
		PFM mode, V_{OUT} ≥ 1 V, the average output voltage level is increased by max. 20 mV	–2%		2% + 20 mV	
	Ripple voltage	PWM mode		10		mV_{p-p}
		PFM mode, I_{OUT} = 10 mA		25		
DC_{LNR}	DC line regulation	I_{OUT} = 1 A		±0.05		%/V
DC_{LDR}	DC load regulation in PWM mode	V_{OUT_Bx} = 1 V, I_{OUT} from 0 to $I_{OUT(max)}$		0.3%		
T_{LDSR}	Transient load step response	I_{OUT} = 0.1 A to 2 A, T_R = T_F = 400 ns, PWM mode		±55		mV
T_{LNSR}	Transient line response	$V_{(VIN\_Bx)}$ stepping 3 V ↔ 3.5 V, T_R = T_F = 10 µs, I_{OUT} = $I_{OUT(max)}$		±10		mV
$I_{LIM\ FWD}$	Forward current limit per phase (peak for every switching cycle)	Programmable range	1.5		4	A
		Step size		0.5		
		Accuracy, $V_{(VIN\_Bx)}$ ≥ 3 V, I_{LIM} = 4 A	–5%	7.5%	20%	
		Accuracy, 2.8 V ≤ $V_{(VIN\_Bx)}$ < 3 V, I_{LIM} = 4 A	–20%	7.5%	20%	
$I_{LIM\ NEG}$	Negative current limit per phase		1.6	2.0	3.0	A
$R_{DS(ON)\ HS\ FET}$	On-resistance, high-side FET	Each phase, between VIN_Bx and SW_Bx pins (I = 1 A)		50	110	mΩ
$R_{DS(ON)\ LS\ FET}$	On-resistance, low-side FET	Each phase, between SW_Bx and PGND_Bx pins (I = 1 A)		45	90	mΩ
f_{SW}	Switching frequency	PWM mode	1.8	2	2.2	MHz
	Start-up time (soft start)	From ENx to V_{OUT_Bx} = 0.35 V (slew-rate control begins)		120		µs
	Output voltage slew-rate(4)	SLEW_RATEx[2:0] = 010, $C_{OUT\text{-}TOTAL\_BUCK}$ < 80 µF	–15%	10	15%	mV/µs
		SLEW_RATEx[2:0] = 011, $C_{OUT\text{-}TOTAL\_BUCK}$ < 130 µF		7.5		
		SLEW_RATEx[2:0] = 100, $C_{OUT\text{-}TOTAL\_BUCK}$ < 250 µF		3.8		
		SLEW_RATEx[2:0] = 101, $C_{OUT\text{-}TOTAL\_BUCK}$ < 500 µF		1.9		
		SLEW_RATEx[2:0] = 110, $C_{OUT\text{-}TOTAL\_BUCK}$ < 500 µF		0.94		
		SLEW_RATEx[2:0] = 111, $C_{OUT\text{-}TOTAL\_BUCK}$ < 500 µF		0.47		
$I_{PFM\text{-}PWM}$	PFM-to-PWM - current threshold(5)			550		mA
$I_{PWM\text{-}PFM}$	PWM-to-PFM - current threshold(5)			290		mA
R_{DIS_Bx}	Output pulldown resistance	Regulator disabled	150	250	350	Ω

6.5 Electrical Characteristics (continued)

Limits apply over the junction temperature range –40°C ≤ T_J ≤ +140°C, specified V_{VANA}, V_{VIN_Bx}, V_{VIN_LDOx}, V_{VOUT_Bx}, V_{VOUT_LDOx} and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = V_{VIN_LDOx} = 3.7 V, and V_{OUT} = 1 V, unless otherwise noted(1) (2).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Output voltage monitoring for PGOOD pin and for power-good Interrupt	$V_{(VIN\_Bx)}$ and $V_{(VANA)}$ fixed 3.7 V				
		Overvoltage threshold (compared to DC output voltage level, $V_{VOUT\_Bx\_DC}$)	39	50	64	mV
		Undervoltage threshold (compared to DC output voltage level, $V_{VOUT\_Bx\_DC}$)	–53	–40	–29	
		Deglitch time during operation and after voltage change	4		15	µs
	Gating time for PGOOD signal after regulator enable or voltage change	PGOOD_MODE = 0		800		µs
LDO REGULATORS						
V_{IN_LDOx}	Input voltage range for LDO power inputs	V_{IN_LDOx} can be higher or lower than $V_{(VANA)}$	2.5	3.7	5.5	V
V_{OUT_LDOx}	Output voltage	Programmable voltage range	0.8		3.3	V
		Step size		0.1		
I_{OUT_LDOx}	Output current				300	mA
	Dropout voltage	$V_{(VIN\_LDOx)}$ – $V_{(VOUT\_LDOx)}$, I_{OUT} = $I_{OUT(max)}$, Programmed output voltage is higher than $V_{(VIN\_LDOx)}$			200	mV
$V_{OUT\_LDO\_DC}$	DC output voltage accuracy, includes voltage reference, DC load and line regulations, process, temperature	V_{OUT} < 1 V	–20		20	mV
		V_{OUT} ≥ 1 V	–2%		2%	
DC_{LNR}	DC line regulation	I_{OUT} = 1 mA		0.1		%/V
DC_{LDR}	DC load regulation	I_{OUT} = 1 mA to $I_{OUT(max)}$		0.8%		
T_{LDSR}	Transient load step response	I_{OUT} = 1 mA to 300 mA, T_R = T_F = 1 µs		–50/+40		mV
T_{LNSR}	Transient line response	$V_{(VIN\_LDOx)}$ stepping 3 V ↔ 3.5 V, T_R = T_F = 10 µs, I_{OUT} = $I_{OUT(max)}$		±7		mV
PSRR	Power supply ripple rejection	f = 10 kHz, I_{OUT} = $I_{OUT(max)}$		53		dB
	Noise	10 Hz < F < 100 kHz, I_{OUT} = $I_{OUT(max)}$		82		$µV_{rms}$
$I_{SHORT(LDOx)}$	LDO current limit	V_{OUT} = 0 V	400	500	600	mA
	Start-up time	From enable to valid output voltage		300		µs
	Slew rate during start-up			15		mV/µs
R_{DIS_LDOx}	Output pulldown resistance	Regulator disabled	150	250	350	Ω
	Output voltage monitoring for PGOOD pin and for power-good interrupt	Overvoltage monitoring, voltage rising (compared to DC output voltage level, $V_{OUT\_LDO\_DC}$)	106%	108%	110%	
		Overvoltage monitoring, hysteresis	3%	3.5%	4%	
		Undervoltage monitoring, voltage falling (compared to DC output voltage level, $V_{OUT\_LDO\_DC}$)	90%	92%	94%	
		Undervoltage monitoring, hysteresis	3%	3.5%	4%	
		Deglitch time during operation and after voltage change	4		15	µs

6.5 Electrical Characteristics (continued)

Limits apply over the junction temperature range –40°C ≤ T_J ≤ +140°C, specified V_{VANA}, V_{VIN_Bx}, V_{VIN_LDOx}, V_{VOUT_Bx}, V_{VOUT_LDOx} and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = V_{VIN_LDOx} = 3.7 V, and V_{OUT} = 1 V, unless otherwise noted(1) (2).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Gating time for PGOOD signal after regulator enable or voltage change	PGOOD_MODE = 0		800		µs
EXTERNAL CLOCK AND PLL						
f_{EXT_CLK}	External input clock(6)	Nominal frequency	1		24	MHz
		Nominal frequency step size		1		
		Required accuracy from nominal frequency	–30%		10%	
	External clock detection	Delay for missing clock detection			1.8	µs
		Delay and debounce for clock detection			20	
	Clock change delay (internal to external)	Delay from valid clock detection to use of external clock		600		µs
	PLL output clock jitter	Cycle to cycle		300		ps, p-p
PROTECTION FUNCTIONS						
	Thermal warning	Temperature rising, TDIE_WARN_LEVEL = 0	115	125	135	°C
		Temperature rising, TDIE_WARN_LEVEL = 1	127	137	147	
		Hysteresis		20		
	Thermal shutdown	Temperature rising	140	150	160	°C
		Hysteresis		20		
$VANA_{OVP}$	VANA overvoltage	Voltage rising	5.6	5.8	6.1	V
		Voltage falling	5.45	5.73	5.96	
		Hysteresis	40			mV
$VANA_{UVLO}$	VANA undervoltage lockout	Voltage rising	2.51	2.63	2.75	V
		Voltage falling	2.5	2.6	2.7	
	Buck short-circuit detection	Threshold	280	360	440	mV
	LDO short-circuit detection	Threshold	190	300	450	mV
LOAD CURRENT MEASUREMENT FOR BUCK REGULATORS						
	Current measurement range	Maximum code			10.22	A
	Resolution	LSB		20		mA
	Measurement accuracy	I_{OUT} > 1 A		<10%		
	Measurement time	PFM mode (automatically changing to PWM mode for the measurement)		45		µs
		PWM mode		4		
CURRENT CONSUMPTION						
	Standby current consumption, regulators disabled			9		µA
	Active current consumption, one buck regulator enabled in auto mode, internal RC oscillator, PGOOD monitoring enabled	I_{OUT_Bx} = 0 mA, not switching		58		µA

6.5 Electrical Characteristics (continued)

Limits apply over the junction temperature range –40°C ≤ T_J ≤ +140°C, specified V_{VANA}, V_{VIN_Bx}, V_{VIN_LDOx}, V_{VOUT_Bx}, V_{VOUT_LDOx} and I_{OUT} range, unless otherwise noted. Typical values are at T_J = 25°C, V_{VANA} = V_{VIN_Bx} = V_{VIN_LDOx} = 3.7 V, and V_{OUT} = 1 V, unless otherwise noted(1) (2).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	Active current consumption, two buck regulators enabled in auto mode, internal RC oscillator, PGOOD monitoring enabled	I_{OUT_Bx} = 0 mA, not switching		100		µA
	Active current consumption during PWM operation, one buck regulator enabled	I_{OUT_Bx} = 0 mA		15		mA
	Active current consumption during PWM operation, two buck regulators enabled	I_{OUT_Bx} = 0 mA		30		mA
	LDO regulator enabled	Additional current consumption per LDO, I_{OUT_LDOx} = 0 mA		86		µA
	PLL and clock detector current consumption	f_{EXT_CLK} = 1 MHz, Additional current consumption when enabled		2		mA
DIGITAL INPUT SIGNALS EN, SCL, SDA, CLKIN						
V_{IL}	Input low level				0.4	V
V_{IH}	Input high level		1.2			
V_{HYS}	Hysteresis of Schmitt Trigger inputs		10	80	200	mV
	EN/CLKIN pulldown resistance	EN_PD/CLKIN_PD = 1		500		kΩ
DIGITAL OUTPUT SIGNALS nINT, SDA						
V_{OL}	Output low level	nINT: I_{SOURCE} = 2 mA			0.4	V
		SDA: I_{SOURCE} = 20 mA			0.4	V
R_P	External pullup resistor for nINT	To VIO Supply		10		kΩ
DIGITAL OUTPUT SIGNALS PGOOD, GPO, GPO2						
V_{OL}	Output low level	I_{SOURCE} = 2 mA			0.4	V
V_{OH}	Output high level, configured to push-pull	I_{SINK} = 2 mA	V_{VANA} – 0.4		V_{VANA}	V
V_{PU}	Supply voltage for external pullup resistor, configured to open-drain				V_{VANA}	V
R_{PU}	External pullup resistor, configured to open-drain			10		kΩ
ALL DIGITAL INPUTS						
I_{LEAK}	Input current	All logic inputs over pin voltage range	−1		1	µA

(1) All voltage values are with respect to network ground.
(2) Minimum (MIN) and Maximum (MAX) limits are specified by design, test, or statistical analysis. Typical (TYP) numbers are not verified, but do represent the most likely norm.
(3) The maximum output current can be limited by the forward current limit $I_{LIM\ FWD}$. The power dissipation inside the die increases the junction temperature and limits the maximum current depending of the length of the current pulse, efficiency, board and ambient temperature.
(4) The slew-rate can be limited by the current limit (forward or negative current limit), output capacitance and load current.
(5) The final PFM-to-PWM and PWM-to-PFM switchover current varies slightly and is dependent on the output voltage, input voltage and the inductor current level.
(6) The external clock frequency must be selected so that buck switching frequency is above 1.7 MHz.

6.6 I²C Serial Bus Timing Parameters

These specifications are ensured by design. Unless otherwise noted, V_{IN_Bx} = 3.7 V (see (1)). See 図 6-1 for details about the I²C-Compatible Timing diagram.

			MIN	MAX	UNIT
f_{SCL}	Serial clock frequency	Standard mode		100	kHz
		Fast mode		400	
		Fast mode+		1	MHz
		High-speed mode, C_b = 100 pF		3.4	
		High-speed mode, C_b = 400 pF		1.7	
t_{LOW}	SCL low time	Standard mode	4.7		µs
		Fast mode	1.3		
		Fast mode+	0.5		
		High-speed mode, C_b = 100 pF	0.16		
		High-speed mode, C_b = 400 pF	0.32		
t_{HIGH}	SCL high time	Standard mode	4		µs
		Fast mode	0.6		
		Fast mode+	0.26		
		High-speed mode, C_b = 100 pF	0.06		
		High-speed mode, C_b = 400 pF	0.12		
$t_{SU;DAT}$	Data setup time	Standard mode	250		ns

7 Detailed Description

7.1 Overview

The LP87332D-Q1 is a high-efficiency, high-performance flexible power supply device with two step-down DC/DC converter cores (Buck0 and Buck1) and two low-dropout (LDO) linear regulators (LDO0 and LDO1) for automotive applications. 表 7-1 lists the output characteristics of the regulators.

表 7-1. Supply Specification

SUPPLY	OUTPUT		
	V_{OUT} RANGE (V)	RESOLUTION (mV)	I_{MAX} MAXIMUM OUTPUT CURRENT (mA)
Buck0	0.7 to 3.36	10 (0.7 V to 0.73 V) 5 (0.73 V to 1.4 V) 20 (1.4 V to 3.36 V)	3000
Buck1	0.7 to 3.36	10 (0.7 V to 0.73 V) 5 (0.73 V to 1.4 V) 20 (1.4 V to 3.36 V)	3000
LDO0	0.8 to 3.3	100	300
LDO1	0.8 to 3.3	100	300

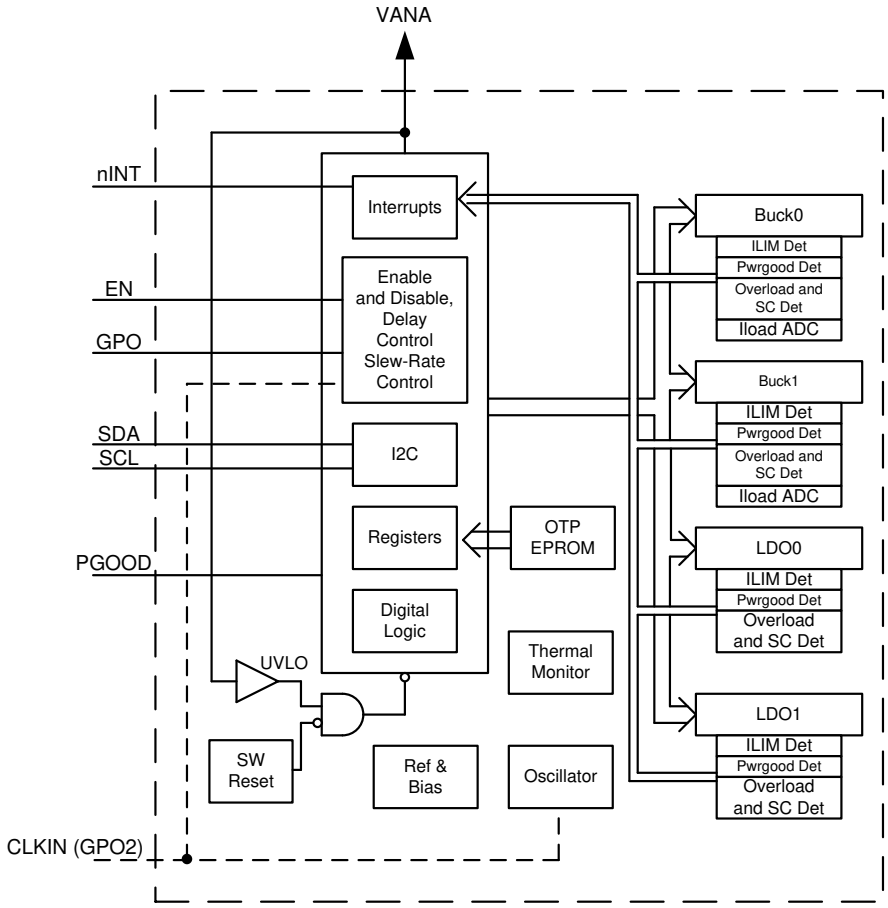
The LP87332D-Q1 also supports switching clock synchronization to an external clock (CLKIN pin). The nominal frequency of the external clock can be from 1 MHz to 24 MHz with 1-MHz steps.

Additional features include:

- Soft-start
- Input voltage protection:
  - Undervoltage lockout
  - Overvoltage protection
- Output voltage monitoring and protection:
  - Overvoltage monitoring
  - Undervoltage monitoring
  - Overload protection
- Thermal warning
- Thermal shutdown

The LP87332D-Q1 has one dedicated general purpose digital output (GPO) signal. The CLKIN pin can be programmed as a second GPO signal (GPO2), if the external clock is not needed. The output type (open-drain or push-pull) is programmable for the GPOs.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 DC/DC Converters

7.3.1.1 Overview

The LP87332D-Q1 includes two step-down DC/DC converter cores. The cores are designed for flexibility; most of the functions are programmable, thus giving a possibility to optimize the regulator operation for each application. The buck regulators deliver 0.7-V to 3.36-V regulated voltage rails from a 2.8-V to 5.5-V supply voltage.

The LP87332D-Q1 has the following features:

- DVS support with programmable slew rate
- Automatic mode control based on the loading (PFM or PWM mode)
- Forced PWM mode option
- Optional external clock input to minimize crosstalk
- Optional spread-spectrum technique to reduce EMI
- Phase control for optimized EMI
- Synchronous rectification
- Current mode loop with PI compensator
- Soft start
- Power Good flag with maskable interrupt
- Power Good signal (PGOOD) with selectable sources
- Average output current sensing (for PFM entry and load current measurement)

The following parameters can be programmed through the registers, the default values are set by OTP bits:

- Output voltage
- Forced PWM operation
- Switch current limit
- Output voltage slew rate
- Enable and disable delays

There are two modes of operation for the buck converter, depending on the output current required: pulse-width modulation (PWM) and pulse-frequency modulation (PFM). The converter operates in PWM mode at high load currents of approximately 600 mA or higher. Lighter output current loads cause the converter to automatically switch into PFM mode for reduced current consumption when forced PWM mode is disabled. The forced PWM mode can be selected to maintain fixed switching frequency at all load current levels.

A block diagram of a single core is shown in 図 7-1.

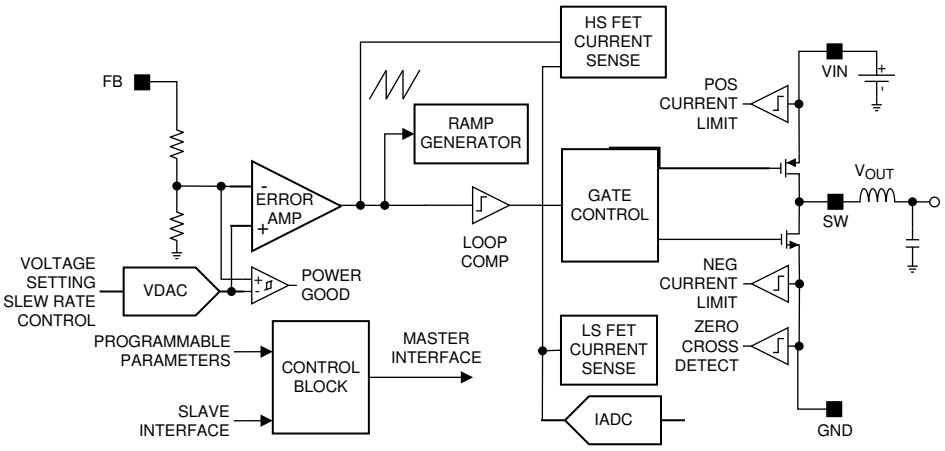


図 7-1. Detailed Block Diagram Showing One Core

7.3.1.2 Transition Between PWM and PFM Modes

The PWM mode operation optimizes efficiency at mid to full load at the expense of light-load efficiency. The LP87332D-Q1 converter operates in the PWM mode at load current of about 600 mA or higher. At lighter load current levels the device automatically switches into the PFM mode for reduced current consumption when forced PWM mode is disabled (AUTO mode operation). By combining the PFM and the PWM modes, a high efficiency is achieved over a wide output-load current range.

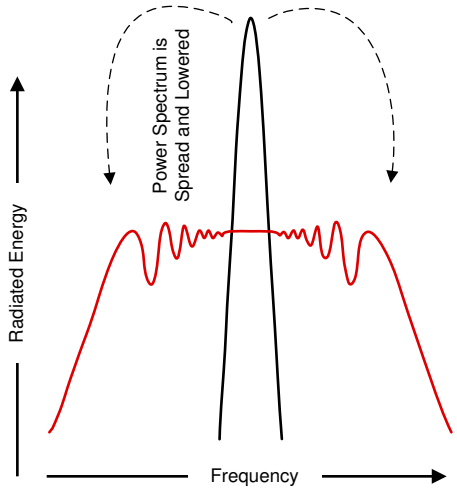
7.3.1.3 Buck Converter Load Current Measurement

The buck load current can be monitored through I^2C registers. The monitored buck converter is selected with the LOAD_CURRENT_BUCK_SELECT bit in the SEL_I_LOAD register. A write to this selection register starts a current measurement sequence. The regulator is automatically forced to the PWM mode for the measurement period. The measurement sequence is 50 µs long, maximum.

The LP87332D-Q1 device can be configured to give out an interrupt (the I_MEAS_INT bit in the INT_TOP_1 register) after the load current measurement sequence is finished. The load current measurement interrupt can be masked with the I_MEAS_MASK bit (TOP_MASK_1 register). The measurement result can be read from the registers I_LOAD_1 and I_LOAD_2. The register I_LOAD_1 bits BUCK_LOAD_CURRENT[7:0] gives out the LSB bits, and the register I_LOAD_2 bit BUCK_LOAD_CURRENT[8] gives out the MSB bit. The measurement result BUCK_LOAD_CURRENT[8:0] LSB is 20 mA, and the maximum code value of the measurement corresponds to 10.22 A.

7.3.1.4 Spread-Spectrum Mode

Systems with periodic switching signals may generate a large amount of switching noise in a set of narrowband frequencies (the switching frequency and its harmonics). The usual solution to reduce noise coupling is to add EMI-filters and shields to the boards. The LP87332D-Q1 has a register-selectable spread-spectrum mode which minimizes the need for output filters, ferrite beads, or chokes. In spread spectrum mode, the switching frequency varies around the center frequency, reducing the EMI emissions radiated by the converter and associated passive components and PCB traces (see Spread-Spectrum Modulation). Spread-spectrum mode is only available when an internal RC oscillator is used (EN_PLL bit is 0 in PLL_CTRL register), it is enabled with the EN_SPREAD_SPEC bit in the CONFIG register, and it affects both buck cores.



Where a fixed frequency converter exhibits large amounts of spectral energy at the switching frequency, the spread spectrum architecture of the LP87332D-Q1 spreads that energy over a large bandwidth.

図 7-2. Spread-Spectrum Modulation

7.3.2 Sync Clock Functionality

The LP87332D-Q1 device contains a CLKIN input to synchronize the switching clock of the buck regulators with the external clock. The block diagram of the clocking and PLL module is shown in 図 7-3. Depending on the EN_PLL bit in the PLL_CTRL register and the external clock availability, the external clock is selected and interrupt is generated as shown in 表 7-2. The interrupt can be masked with the SYNC_CLK_MASK bit in the TOP_MASK_1 register. The nominal frequency of the external input clock is set by the EXT_CLK_FREQ[4:0] bits in the PLL_CTRL register, and it can be from 1 MHz to 24 MHz with 1-MHz steps. The external clock must be inside accuracy limits (–30%/+10%) of the selected frequency for valid clock detection.

The SYNC_CLK_INT interrupt in the INT_TOP_1 register is also generated in cases where the external clock is expected but is not available. These cases occur when EN_PLL is 1 during start-up (read OTP-to-standby transition) and during Buck regulator enable (standby-to-active transition).

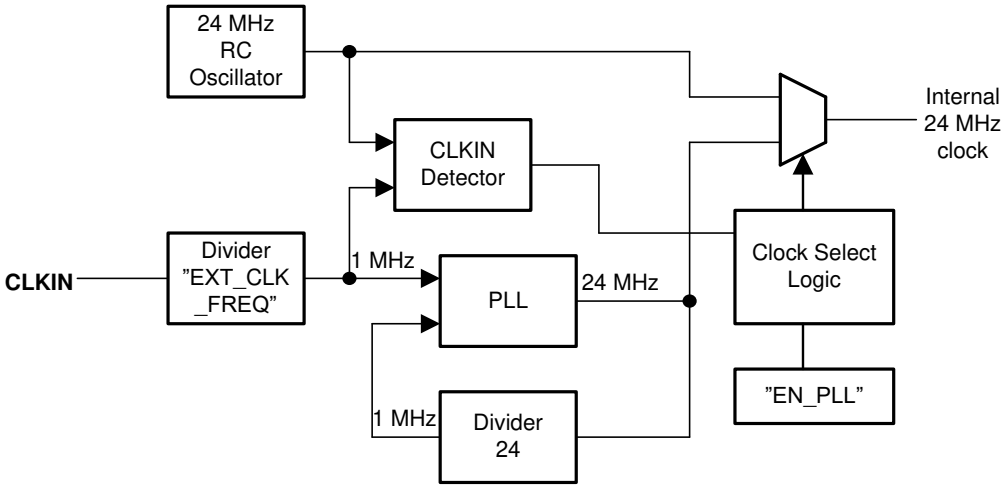


図 7-3. Clock and PLL Module

表 7-2. PLL Operation

DEVICE OPERATION MODE	EN_PLL	PLL AND CLOCK DETECTOR STATE	INTERRUPT FOR EXTERNAL CLOCK	CLOCK
STANDBY	0	Disabled	No	Internal RC
ACTIVE	0	Disabled	No	Internal RC
STANDBY	1	Enabled	When external clock appears or disappears	Automatic change to external clock when available
ACTIVE	1	Enabled	When external clock appears or disappears	Automatic change to external clock when available

7.3.3 Low-Dropout Linear Regulators (LDOs)

The LP87332D-Q1 device includes two identical linear regulators, LDO0 and LDO1, which target analog loads with low noise requirements. The LDO regulators deliver 0.8-V to 3.3-V regulated voltage rails from a 2.5-V to 5.5-V input voltage. Both regulators have dedicated inputs which can be higher or lower than the device system voltage $V_{(VANA)}$ to minimize the power dissipation.

7.3.4 Power-Up

The power-up sequence for the LP87332D-Q1 is as follows:

- The VANA and VIN_Bx reach minimum recommended levels (V_{VANA} > $VANA_{UVLO}$). This initiates power-on-reset (POR), OTP reading, and enables the system I/O interface. The I^2C host should allow at least 1.2 ms before writing or reading data to the LP87332D-Q1.
- The device enters standby mode.
- The host can change the default register setting by I^2C if needed.
- The regulators can be enabled and disabled.
- The GPO signals can be controlled by the EN pin and the I^2C interface.

Transitions between the operating modes are shown in *セクション 7.4.1*.

7.3.5 Regulator Control

7.3.5.1 Enabling and Disabling Regulators

The regulators can be enabled when the device is in STANDBY or ACTIVE state. There are two ways to enable and disable the buck regulators:

- Using the BUCKx_EN bit in the BUCKx_CTRL_1 register (the BUCKx_EN_PIN_CTRL bit is 0 in the BUCKx_CTRL_1 register).
- Using the EN control pin (the BUCKx_EN bit *and* the BUCKx_EN_PIN_CTRL bit is 1).

Similarly, there are two ways to enable and disable the LDO regulators:

- Using the LDOx_EN bit in the LDOx_CTRL register (the LDOx_EN_PIN_CTRL bit is 0 in the LDOx_CTRL register).
- Using the EN control pin (the LDOx_EN bit is 1 *and* the LDOx_EN_PIN_CTRL bit is 1).

If the EN control pin is used for enable and disable, then the following occurs:

- The delay from the control signal rising edge to start-up is set by the BUCKx_STARTUP_DELAY[3:0] bits in the BUCKx_DELAY register and the LDOx_STARTUP_DELAY[3:0] bits in the LDOx_DELAY register.
- The delay from the control signal falling edge to shutdown is set by the BUCKx_SHUTDOWN_DELAY[3:0] bits in the BUCKx_DELAY register and the LDOx_SHUTDOWN_DELAY[3:0] bits in the LDOx_DELAY register.

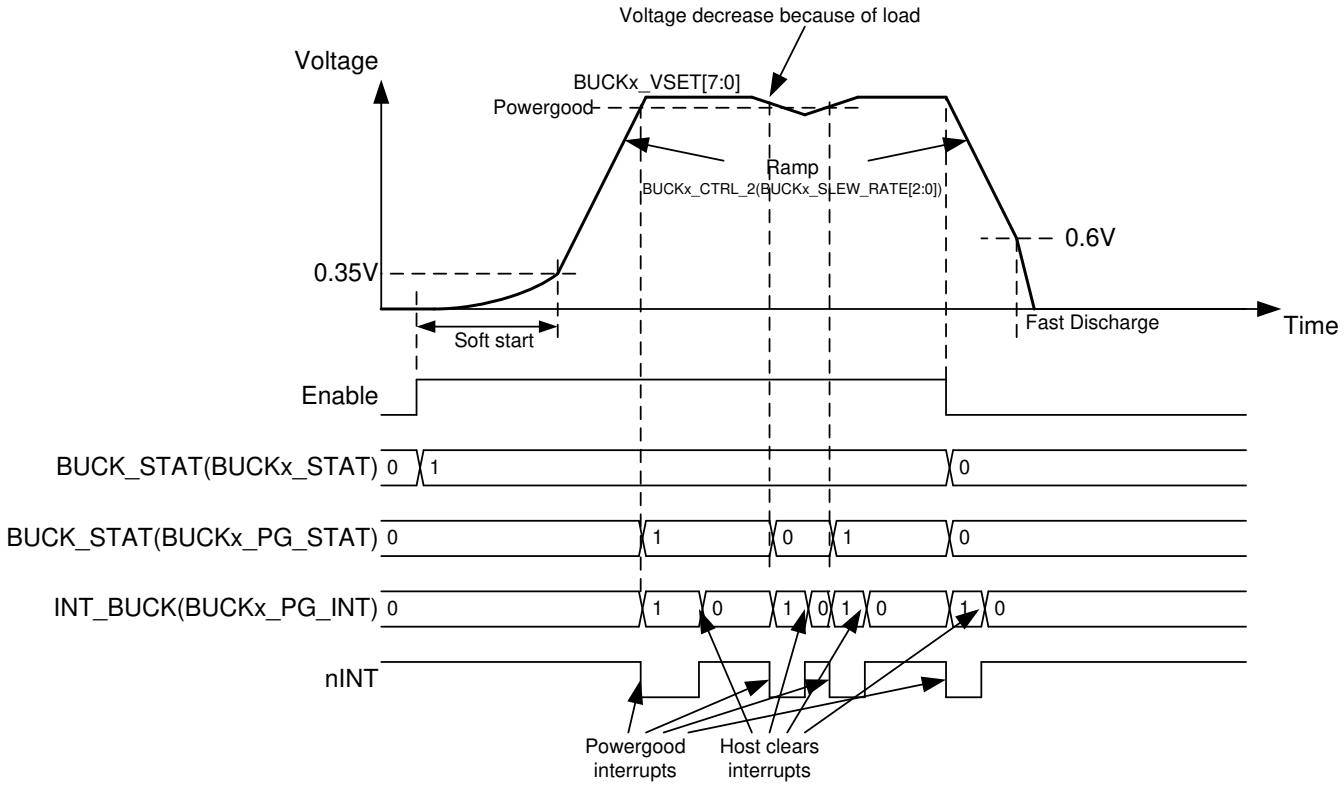
The delays are only valid for the EN signal transitions and not for control with I^2C writings to the BUCKx_EN and the LDOx_EN bits.

The control of the regulator (with 0-ms delays) is shown in 表 7-3.

表 7-3. Regulator Control

	BUCKx_EN AND LDOx_EN	BUCKx_EN_PIN_CTRL AND LDOx_EN_PIN_CTRL	EN PIN	BUCKx OUTPUT VOLTAGE AND LDOx OUTPUT VOLTAGE
Enable and disable control with the BUCKx_EN and the LDOx_EN bit	0	Don't Care	Don't Care	Disabled
	1	0	Don't Care	BUCKx_VSET[7:0] and LDOx_VSET[4:0]
Enable and disable control with the EN pin	1	1	Low	Disabled
	1	1	High	BUCKx_VSET[7:0] and LDOx_VSET[4:0]

The buck regulator is enabled by the EN pin or by I^2C writing as shown in 図 7-4. The soft-start circuit limits the in-rush current during start-up. When the output voltage rises to a 0.35-V level, the output voltage becomes slew-rate controlled. If there is a short circuit at the output, and the output voltage does not increase above the 0.35-V level in 1 ms or the output voltage drops below 0.35-V level during operation (for minimum of 1 ms), then the regulator is disabled, and the BUCKx_SC_INT interrupt in the INT_BUCK register is set. When the output voltage reaches the Power-Good threshold level, the BUCKx_PG_INT interrupt flag in the INT_BUCK register is set. The Power-Good interrupt flag, when reaching valid output voltage, can be masked using the BUCKx_PGR_MASK bit in the BUCK_MASK register. The Power-Good interrupt flag can also be generated when the output voltage becomes invalid. The interrupt mask for invalid output voltage detection is set by the BUCKx_PGF_MASK bit in the BUCK_MASK register. A BUCKx_PG_STAT bit in the BUCK_STAT register always shows the validity of the output voltage; 1 means valid and 0 means invalid output voltage. A PGOOD_WINDOW_BUCK bit in the PGOOD_CTRL_1 register sets the detection method for the valid buck output voltage, either undervoltage detection or undervoltage and overvoltage detection.



BUCK_MASK(BUCKx_PGF_MASK) = 0
BUCK_MASK(BUCKx_PGR_MASK) = 0

図 7-4. Buck Regulator Enable and Disable

The LDO regulator is enabled by the EN pin or by I^2C writing, as shown in 図 7-5. The soft-start circuit limits the in-rush current during start-up. The output voltage increase rate is less than 100 mV/µsec during soft-start. If there is a short circuit at the output, and the output voltage does not increase above the 0.3-V level in 1 ms or the output voltage drops below 0.3-V level during operation (for minimum of 1 ms), then the regulator is disabled, and the LDOx_SC_INT interrupt in the INT_LDO register is set. When the output voltage reaches the Power-Good threshold level, the LDOx_PG_INT interrupt flag in the INT_LDO register is set. The Power-Good interrupt flag, when reaching valid output voltage, can be masked using the LDOx_PGR_MASK bit in the LDO_MASK register. The Power-Good interrupt flag can also be generated when the output voltage becomes invalid. The interrupt mask for invalid output voltage detection is set by the LDOx_PGF_MASK bit in the LDO_MASK register. A LDOx_PG_STAT bit in the LDO_STAT register always shows the validity of the output voltage; 1 means valid, and 0 means invalid output voltage. A PGOOD_WINDOW_LDO bit in the PGOOD_CTRL_1 register sets the detection method for the valid LDO output voltage, either undervoltage detection or undervoltage and overvoltage detection.

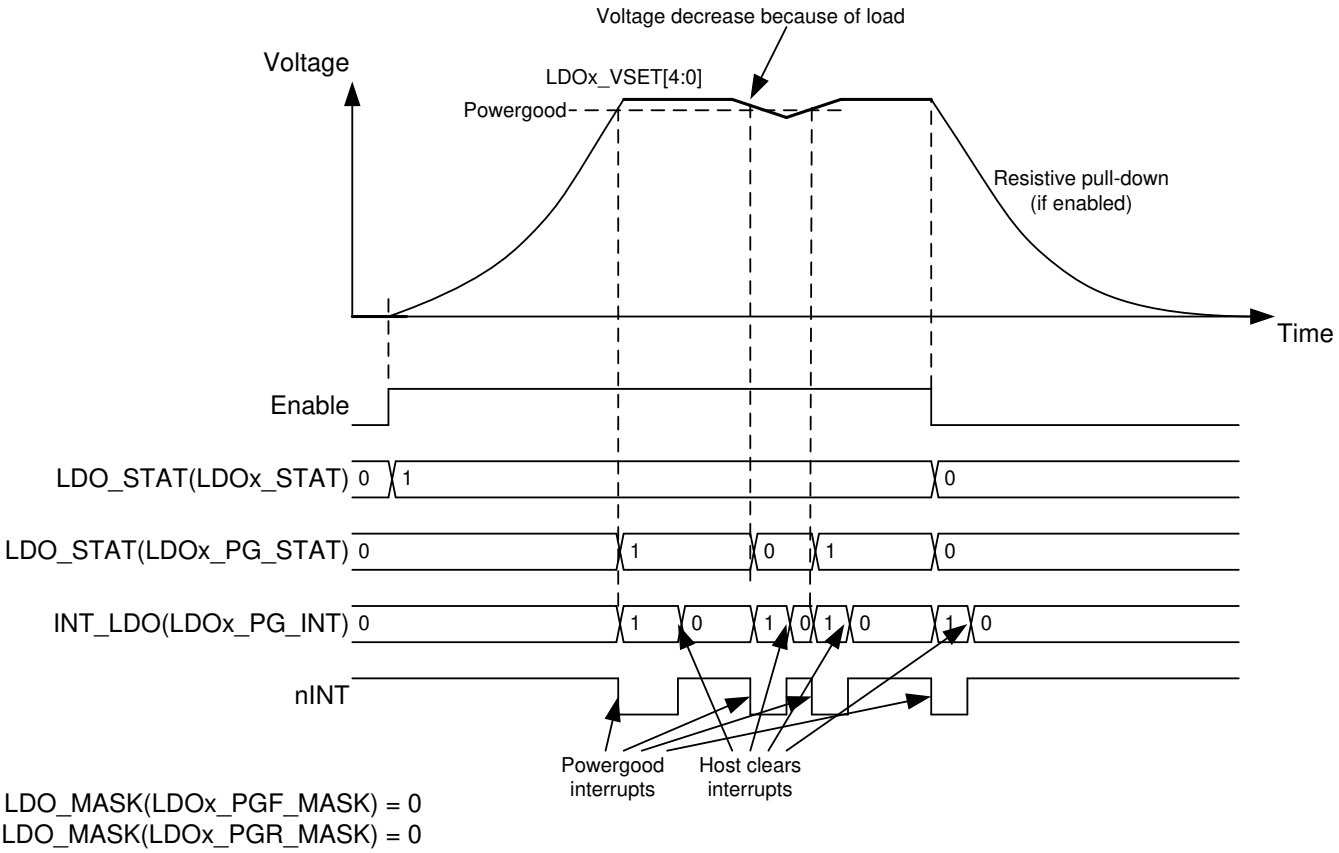


図 7-5. LDO Regulator Enable and Disable

The EN input pin has an integrated pulldown resistor. The pulldown resistor is controlled with the EN_PD bit in the CONFIG register.

7.3.5.2 Changing Output Voltage

The output voltage of the regulator can be changed by writing to the BUCKx_VOUT and LDOx_VOUT register. The voltage change for the buck regulator is always slew-rate controlled, and the slew-rate is defined by the BUCKx_SLEW_RATE[2:0] bits in the BUCKx_CTRL_2 register. During voltage change, the forced PWM mode is used automatically. When the programmed output voltage is achieved, the mode becomes the one defined by the load current, the BUCKx_FPWM bit in the BUCKx_CTRL_1 register.

The voltage change and Power-Good interrupts are shown in 図 7-6.

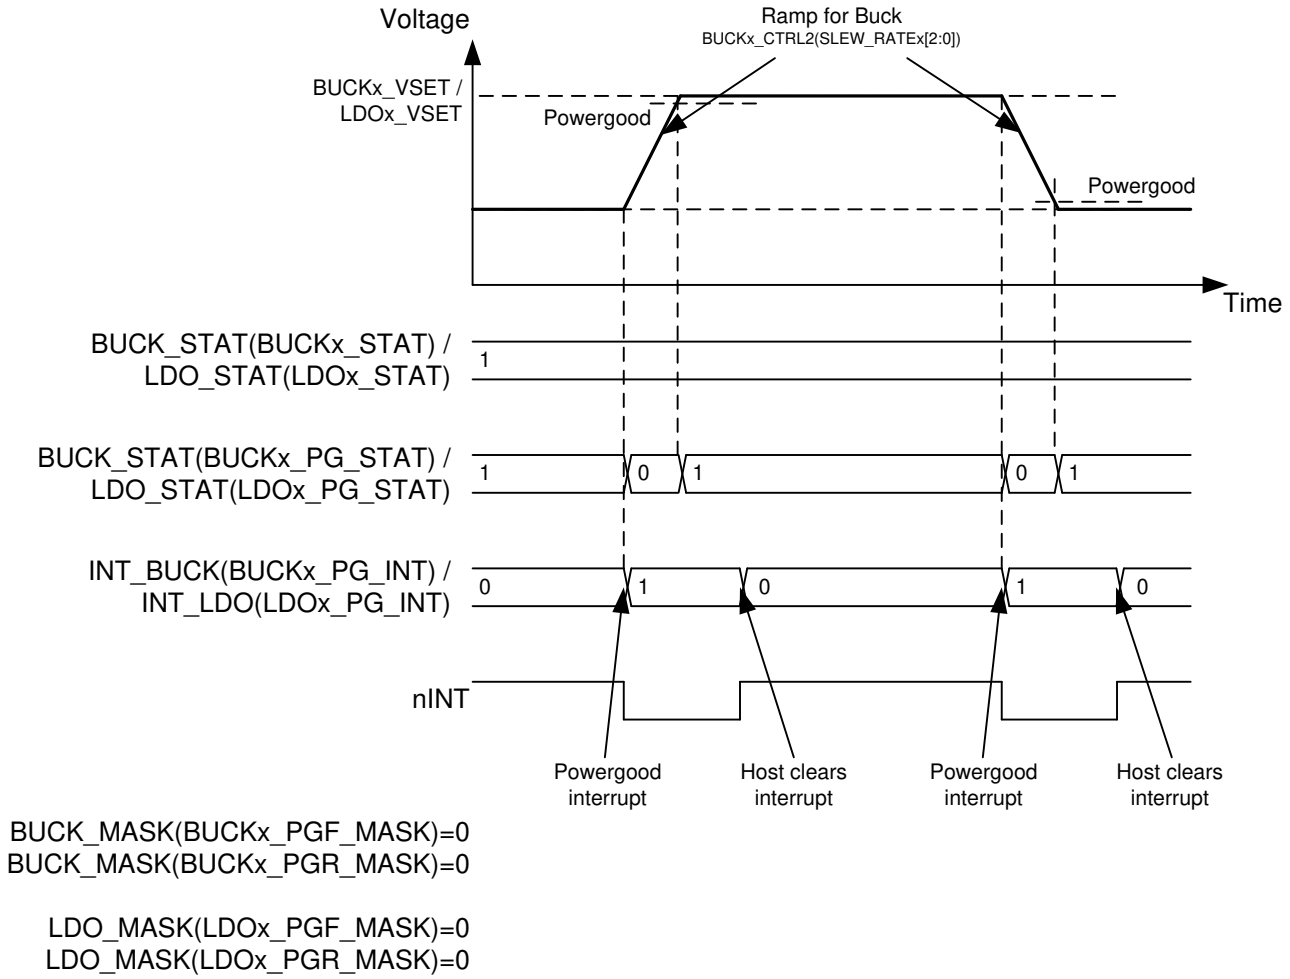

図 7-6. Regulator Output Voltage Change

During an LDO voltage change, the internal reference for the Power-Good detection is also changed. For this reason when the output voltage is changing, toggling of the Power-Good signal may still indicate a valid output. This period takes less than 100 µs and after that time the Power-Good gives correct value.

7.3.6 Enable and Disable Sequences

The LP87332D-Q1 device supports start-up and shutdown sequencing with programmable delays for different regulator outputs using a single EN control signal. The Buck regulator is selected for delayed control with:

- The BUCKx_EN = 1 in the BUCKx_CTRL_1 register
- The BUCKx_EN_PIN_CTRL = 1 in the BUCKx_CTRL_1 register
- The BUCKx_VSET[7:0] bits in the BUCKx_VOUT register defines the voltage when the EN pin is high
- The delay from the rising edge of the EN pin to the regulator enable is set by the BUCKx_STARTUP_DELAY[3:0] bits in the BUCKx_DELAY register.
- The delay from the falling edge of the EN pin to the regulator disable is set by the BUCKx_SHUTDOWN_DELAY[3:0] bits in the BUCKx_DELAY register.

In the same way, the LDO regulator is selected for delayed control with:

- The LDOx_EN = 1 in the LDOx_CTRL register
- The LDOx_EN_PIN_CTRL = 1 in the LDOx_CTRL register
- The LDOx_VSET[4:0] bits in the LDOx_VOUT register defines the voltage when the EN pin is high
- The delay from the rising edge of the EN pin to the regulator enable is set by the LDOx_STARTUP_DELAY[3:0] bits in the LDOx_DELAY register.
- The delay from the falling edge of the EN pin to the regulator disable is set by the LDOx_SHUTDOWN_DELAY[3:0] bits in the LDOx_DELAY register.

The GPO and GPO2 digital output signals can be also controlled as a part of start-up and shutdown sequencing with the following settings:

- GPOx_EN = 1 in GPO_CTRL register
- GPOx_EN_PIN_CTRL = 1 in GPO_CTRL register
- The delay from the rising edge of the EN pin to the rising edge of the GPO or GPO2 signal is set by the GPOx_STARTUP_DELAY[3:0] bits in the GPOx_DELAY register.
- The delay from the falling edge of the EN pin to the falling edge of the GPO or GPO2 signal is set by the GPOx_SHUTDOWN_DELAY[3:0] bits in the GPOx_DELAY register.

An example of the start-up and shutdown sequences for the buck regulators are shown in 図 7-7. The start-up and shutdown delays for the Buck0 regulator are 1 ms and 4 ms, and for the Buck1 regulator the start-up and shutdown delays are 3 ms and 1 ms. The delay settings are only used for enable or disable control with the EN signal.

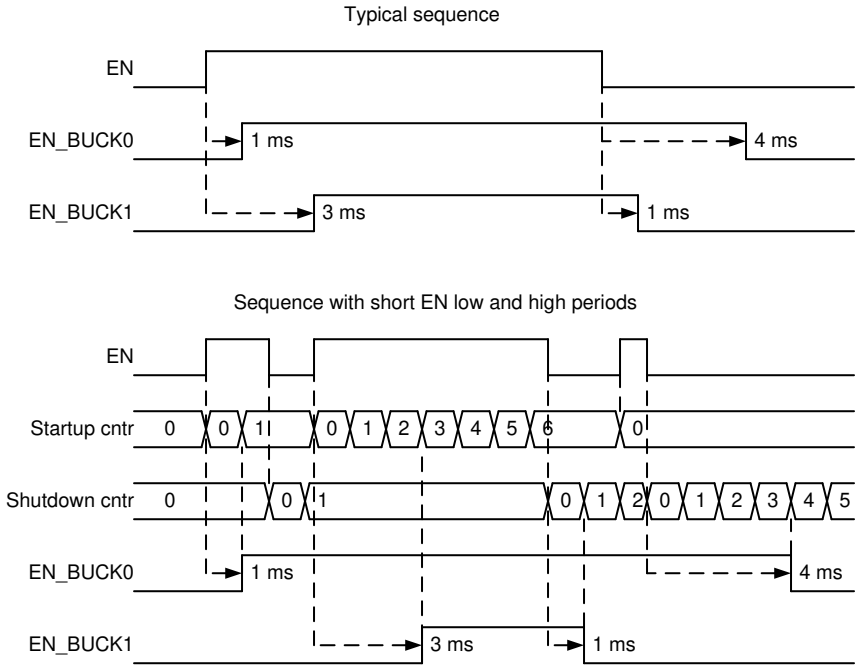

図 7-7. Start-Up and Shutdown Sequencing

7.3.7 Device Reset Scenarios

There are two reset methods implemented on the LP87332D-Q1:

- Software reset with the SW_RESET bit in the RESET register.
- Undervoltage lockout (UVLO) reset from the VANA supply.

An software reset occurs when 1 is written to the SW_RESET bit. The bit is automatically cleared after writing. This event disables all the regulators immediately, drives the GPO or GPO2 signals low, resets all the register bits to the default values, and loads the OTP bits (see 図 7-13). The I^2C interface is not reset during a software reset.

If the VANA supply voltage falls below the UVLO threshold level, then all the regulators are disabled immediately, the GPO or GPO2 signals are driven low, and all the register bits are reset to the default values. When the VANA supply voltage transitions above the UVLO threshold level, an internal POR occurs. The OTP bits are loaded to the registers and a startup is initiated according to the register settings.

7.3.8 Diagnosis and Protection Features

The LP87332D-Q1 is capable of providing four levels of protection features:

- Information of valid regulator output voltage, which sets the interrupt or PGOOD signal.
- Warnings for diagnosis, which sets the interrupt.
- Protection events, which are disabling the regulators.
- Faults, which are causing the device to shutdown.

The LP87332D-Q1 sets the flag bits indicating what protection or warning conditions have occurred, and the nINT pin is pulled low. The nINT is released again after a clear of flags is complete. The nINT signal stays low until all the pending interrupts are cleared.

When a fault is detected or software requested reset, it is indicated by a RESET_REG_INT interrupt flag in the INT_TOP_2 register after next start-up. If the RESET_REG_MASK is set to masked in the OTP, then the interrupt is not generated. The mask bit change with I^2C does not affect, because the RESET_REG_MASK bit is loaded from the OTP during reset sequence.

表 7-4. Summary of Interrupt Signals

EVENT	DEVICE RESPONSE	INTERRUPT BIT	INTERRUPT MASK BIT	STATUS BIT	RECOVERY AND INTERRUPT CLEAR
Buck current limit triggered	No effect	BUCK_INT BUCKx_ILIM_INT	BUCKx_ILIM_MASK	BUCKx_ILIM_STAT	Write 1 to the BUCKx_ILIM_INT bit. Interrupt is not cleared if the current limit is active
LDO current limit triggered	No effect	LDO_INT LDOx_ILIM_INT	LDOx_ILIM_MASK	LDOx_ILIM_STAT	Write 1 to the LDOx_ILIM_INT bit Interrupt is not cleared if the current limit is active
Buck short circuit (V_{VOUT} < 0.35 V at 1 ms after enable) or overload (V_{VOUT} decreasing below 0.35 V during operation, 1-ms debounce)	Regulator disable	BUCK_INT BUCKx_SC_INT	N/A	N/A	Write 1 to the BUCKx_SC_INT bit
LDO short circuit (V_{VOUT} < 0.3 V at 1 ms after enable) or overload (V_{VOUT} decreasing below 0.3 V during operation, 1-ms debounce)	Regulator disable	LDO_INT LDOx_SC_INT	N/A	N/A	Write 1 to the LDOx_SC_INT bit
Thermal warning	No effect	TDIE_WARN_INT	TDIE_WARN_MASK	TDIE_WARN_STAT	Write 1 to tge TDIE_WARN_INT bit Interrupt is not cleared if the temperature is above the thermal warning level
Thermal shutdown	All the regulators are disabled immediately, and the GPO and GPO2 are set to low	TDIE_SD_INT	N/A	TDIE_SD_STAT	Write 1 to the TDIE_SD_INT bit Interrupt is not cleared if the temperature is above the thermal shutdown level
VANA overvoltage ($VANA_{OVP}$)	All the regulators are disabled immediately, and the GPO and GPO2 are set to low	OVP_INT	N/A	OVP_STAT	Write 1 to the OVP_INT bit Interrupt is not cleared if the VANA voltage is above the $VANA_{OVP}$ level
Buck power good, output voltage becomes valid	No effect	BUCK_INT BUCKx_PG_INT	BUCKx_PGR_MASK	BUCKx_PG_STAT	Write 1 to the BUCKx_PG_INT bit
Buck power good, output voltage becomes invalid	No effect	BUCK_INT BUCKx_PG_INT	BUCKx_PGF_MASK	BUCKx_PG_STAT	Write 1 to the BUCKx_PG_INT bit
LDO Power good, output voltage becomes valid	No effect	LDO_INT LDOx_PG_INT	LDOx_PGR_MASK	LDOx_PG_STAT	Write 1 to the LDOx_PG_INT bit
LDO power good, output voltage becomes invalid	No effect	LDO_INT LDOx_PG_INT	LDOx_PGF_MASK	LDOx_PG_STAT	Write 1 to the LDOx_PG_INT bit
PGOOD pin changing from active to inactive state(1)	No effect	PGOOD_INT	PGOOD_MASK	PGOOD_STAT	Write 1 to the PGOOD_INT bit
External clock appears or disappears	No effect to regulators	SYNC_CLK_INT(2)	SYNC_CLK_MASK	SYNC_CLK_STAT	Write 1 to the SYNC_CLK_INT bit
Load current measurement is ready	No effect	I_MEAS_INT	I_MEAS_MASK	N/A	Write 1 to the I_MEAS_INT bit
Supply voltage $VANA_{UVLO}$ triggered (VANA falling)	Immediate shutdown and the registers reset to default values	N/A	N/A	N/A	N/A
Supply voltage $VANA_{UVLO}$ triggered (VANA rising)	Startup and the registers reset to default values and the OTP bits are loaded	RESET_REG_INT	RESET_REG_MASK	N/A	Write 1 to the RESET_REG_INT bit
Software requested reset	Immediate shutdown is followed by power up and the registers are reset to their default values	RESET_REG_INT	RESET_REG_MASK	N/A	Write 1 to the RESET_REG_INT bit

(1) The PGOOD_STAT bit is 1 when the PGOOD pin shows valid voltages. The PGOOD_POL bit in the PGOOD_CTRL_1 register affects only the PGOOD pin polarity, not the Power Good and PGOOD_INT interrupt polarity.
(2) If the clock is not available when the clock detector is enabled, then an interrupt is generated during the clock-dector operation.

7.3.8.1 Power-Good Information (PGOOD pin)

In addition to the interrupt-based indication of the current limit and the Power-Good level, the LP87332D-Q1 device supports monitoring with PGOOD signal:

- Regulator output voltage
- Input supply overvoltage
- Thermal warning
- Thermal shutdown

The regulator output voltage monitoring (not current limit monitoring) can be selected for the PGOOD indication. This selection is individual for both buck regulators and LDO regulators, and is set by the EN_PGOOD_BUCKx bits in the PGOOD_CTRL_1 register and the EN_PGOOD_LDOx bits in the PGOOD_CTRL_1 register. When a regulator is disabled, the monitoring is automatically masked to prevent it forcing the PGOOD inactive. A thermal warning can also be selected for the PGOOD indication with the EN_PGOOD_TWARN bit in the PGOOD_CTRL_2 register. The monitoring from all the output rails, thermal warning (TDIE_WARN_STAT), input overvoltage interrupt (OVP_INT), and thermal shutdown interrupt (TDIE_SD_INT) are combined, and the PGOOD pin is active only if all the selected sources shows a valid status.

The type of output voltage monitoring for the PGOOD signal is selected by the PGOOD_WINDOW_x bits in the PGOOD_CTRL_1 register. If the bit is 0, only undervoltage is monitored; if the bit is 1, both undervoltage and overvoltage are monitored.

The polarity and the output type (push-pull or open-drain) are selected by the PGOOD_POL and PGOOD_OD bits in the PGOOD_CTRL_1 register.

The PGOOD is only *active* and *asserted* when all enabled power resource output voltages are within specified tolerance for each requested and programmed output voltage.

The PGOOD is *inactive* and *de-asserted* if any enabled power resource output voltages is outside specified tolerance for each requested and programmed output voltage.

The device OTP setting selects either gated (or *unusual*) or continuous (or *invalid*) mode of operation.

7.3.8.1.1 PGOOD Pin Gated Mode

The gated (or *unusual*) mode of operation is selected by setting the PGOOD_MODE bit to 0 in the PGOOD_CTRL_2 register.

For the gated mode of operation, the PGOOD behaves as follows:

- PGOOD is set to *active* or *asserted* state upon exiting the OTP configuration as an initial default state.
- PGOOD status is suspended or unchanged during an 800-µs gated time period, thereby *gating-off* the status indication.
- During normal power-up sequencing and requested voltage changes, the PGOOD state is not changed during an 800-µs gated time period. It typically remains *active* or *asserted* for normal conditions.
- During an *abnormal* power-up sequencing and requested voltage changes, the PGOOD status could change to *inactive* or *de-asserted* after an 800-µs gated time period if any output voltage is outside of regulation range.
- Using the *gated mode of operation* could allow the PGOOD signal to initiate an immediate power shutdown sequence if the PGOOD signal is wired-OR with signal connected to the EN input. This type of circuit configuration provides a smart PORz function for processor that eliminates the need for additional components to generate PORz upon start-up and to monitor voltage levels of key voltage domains.

Each detected fault sets the correcting fault bit in the PG_FAULT register to 1. The detected fault must be cleared to continue the PGOOD monitoring. The overvoltage and thermal shutdown are cleared by writing 1 to the OVP_INT and TDIE_SD_INT interrupt bits in the INT_TOP_1 register. The regulator fault is cleared by writing 1 to the corresponding register bit in the PG_FAULT register. The interrupts can also be cleared with the VANA UVLO by toggling the input supply. An example of the PGOOD pin operation in gated mode is shown in 図 7-8.

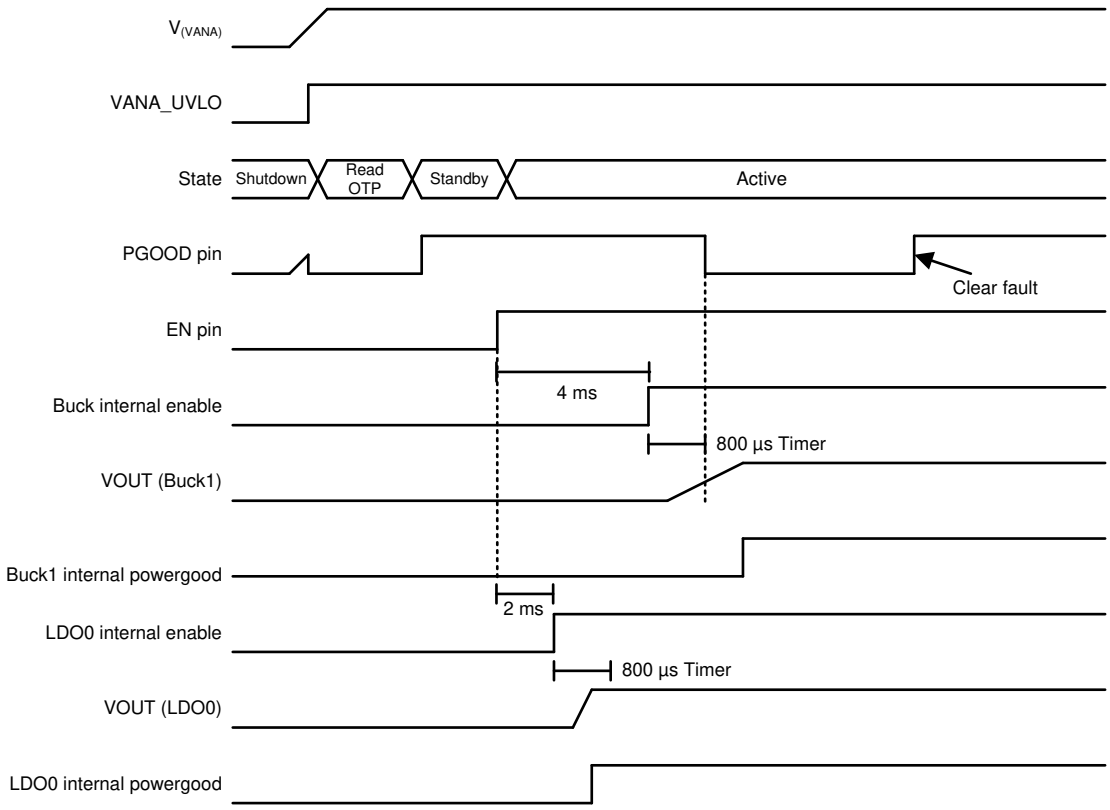

図 7-8. PGOOD Pin Operation in Gated Mode

7.3.8.1.2 PGOOD Pin Continuous Mode

The continuous (or *invalid*) mode of operation is selected by setting the PGOOD_MODE bit to 1 in the PGOOD_CTRL_2 register.

For the continuous mode of operation, PGOOD behaves as follows:

- PGOOD is set to *active* or *asserted* state upon exiting OTP configuration.
- PGOOD is set to *inactive* or *de-asserted* as soon as the regulator is enabled.
- PGOOD status begins indicating output voltage regulation status immediately and continuously.
- During power-up sequencing and requested voltage changes, PGOOD will toggle between *inactive* or *de-asserted* while output voltages are outside of regulation ranges and *active* or *asserted* when inside of regulation ranges.

The PG_FAULT register bits are latched, and maintain the fault information until the host clears the fault bit by writing 1 to the bit. The PGOOD signal also indicates a thermal shutdown and input overvoltage interrupts, which are cleared by clearing the interrupt bits.

When the regulator voltage is transitioning from one target voltage to another, the PGOOD signal becomes inactive.

7.3.8.1.3 PGOOD Pin Inactive Mode

When the PGOOD signal becomes inactive, the source for the fault can be read from the PG_FAULT register. If the invalid output voltage becomes valid again, then the PGOOD signal becomes active. Thus the PGOOD signal always shows if the monitored output voltages are valid. The block diagram for this operation is shown in 図 7-9 and an example of operation is shown in 図 7-10.

The PGOOD signal can also be configured so that it maintains an inactive state even when the monitored outputs are valid, but there are PG_FAULT_x bits in the PG_FAULT register pending clearance. This type of operation is selected by setting the PGFAULT_GATES_PGOOD bit to 1 in the PGOOD_CTRL_2 register.

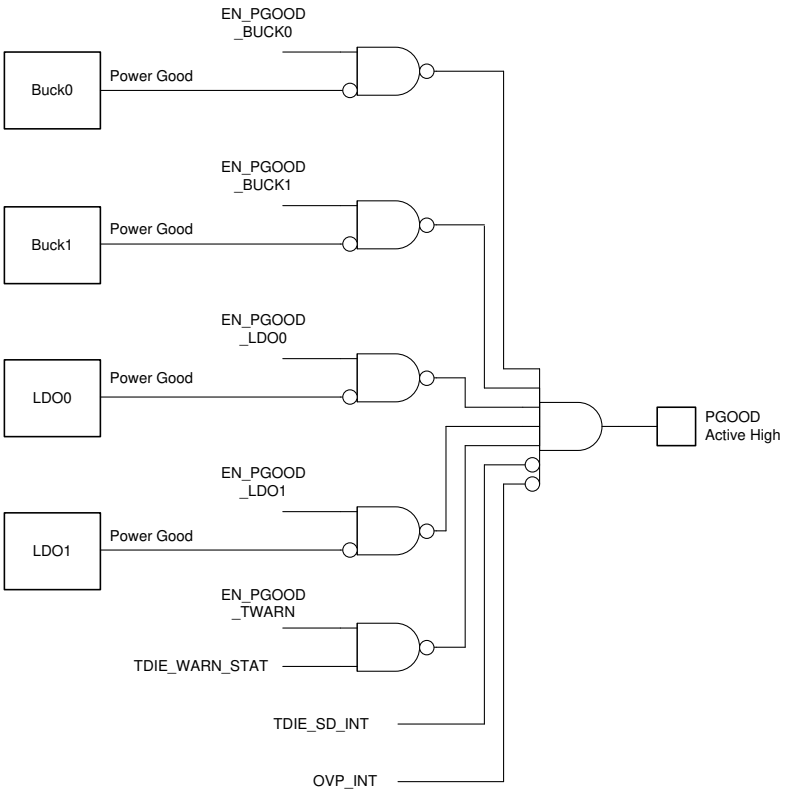

図 7-9. PGOOD Block Diagram (Continuous Mode)

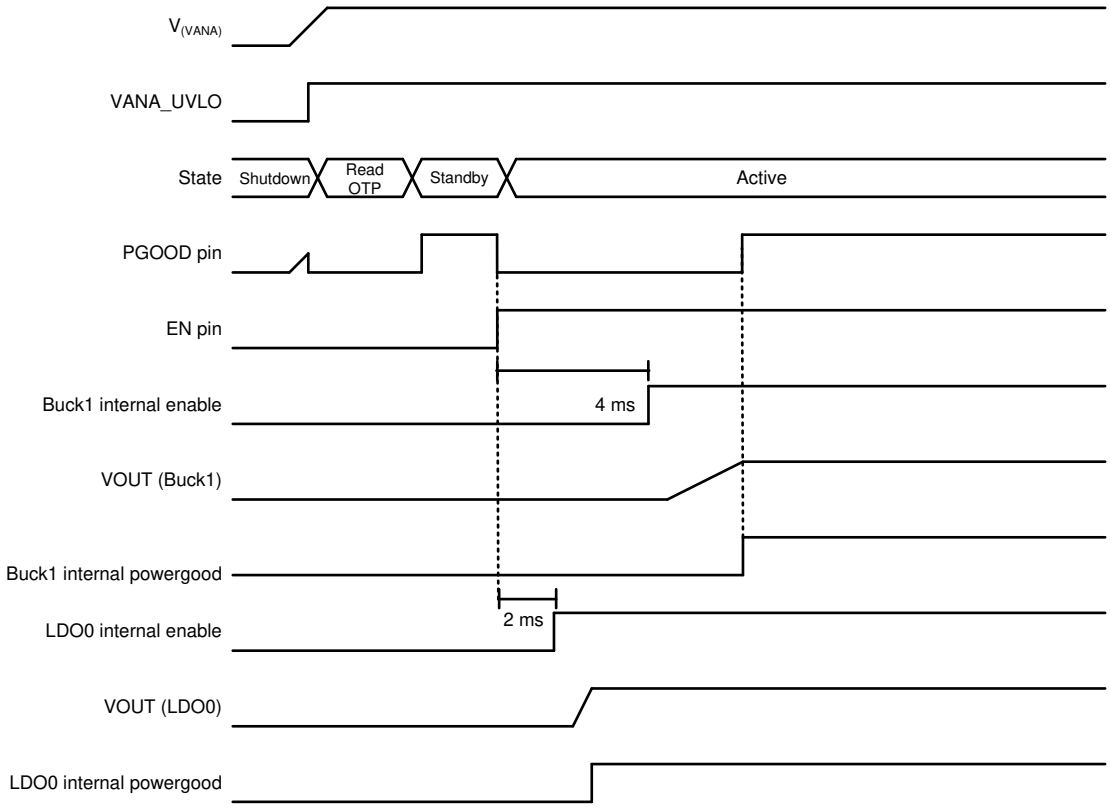

図 7-10. PGOOD Pin Operation in Continuous Mode

7.3.8.2 Warnings for Diagnosis (Interrupt)

7.3.8.2.1 Output Power Limit

The Buck regulators have programmable output peak current limits. The limits are individually programmed for both regulators with the BUCKx_ILIM[2:0] bits in the BUCKx_CTRL_2 register. If the load current is increased so that the current limit is triggered, then the regulator continues to regulate at the limit current level (peak current regulation). The voltage may decrease if the load current is higher than the limit current. If the current regulation continues for 20 µs, than the LP87332D-Q1 device sets the BUCKx_ILIM_INT bit in the INT_BUCK register and pulls the nINT pin low. The host processor can read the BUCKx_ILIM_STAT bits in the BUCK_STAT register to see if the regulator is still in peak current regulation mode, and the interrupt is cleared by writing 1 to the BUCKx_ILIM_INT bit. The current limit interrupt can be masked by setting the BUCKx_ILIM_MASK bit in the BUCK_MASK register to 1. The Buck overload situation is shown in 図 7-11.

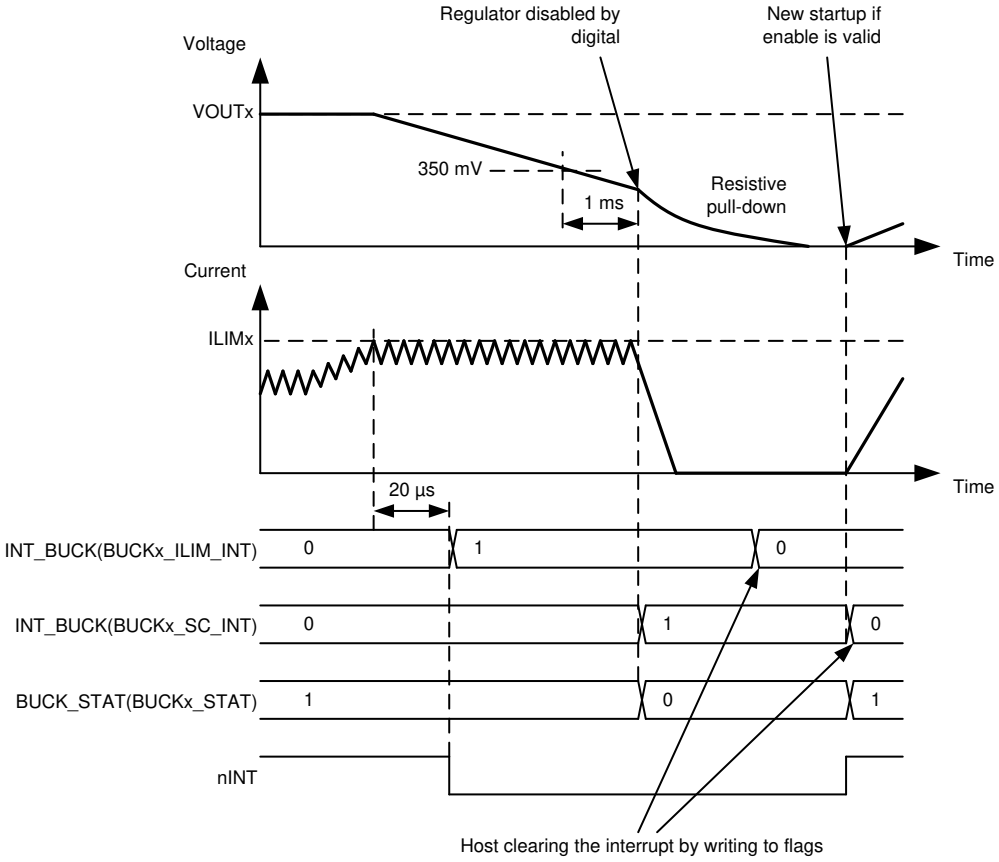

図 7-11. Buck Regulator Overload Situation

The LDO regulators also include current limit circuitry. If the load current is increased so that the current limit is triggered, the regulator limits the output current to the threshold level. The voltage may decrease if the load current is higher than the current limit. If the current regulation continues for 20 µs, the LP87332D-Q1 device sets the LDOx_ILIM_INT bit in the INT_LDO register and pulls the nINT pin low. The host processor can read the LDOx_ILIM_STAT bits in the LDO_STAT register to see if the regulator is still in current regulation mode and the interrupt is cleared by writing 1 to the LDOx_ILIM_INT bit. The current limit interrupt can be masked by setting the LDOx_ILIM_MASK bit in the LDO_MASK register to 1. The LDO overload situation is shown in 図 7-12.

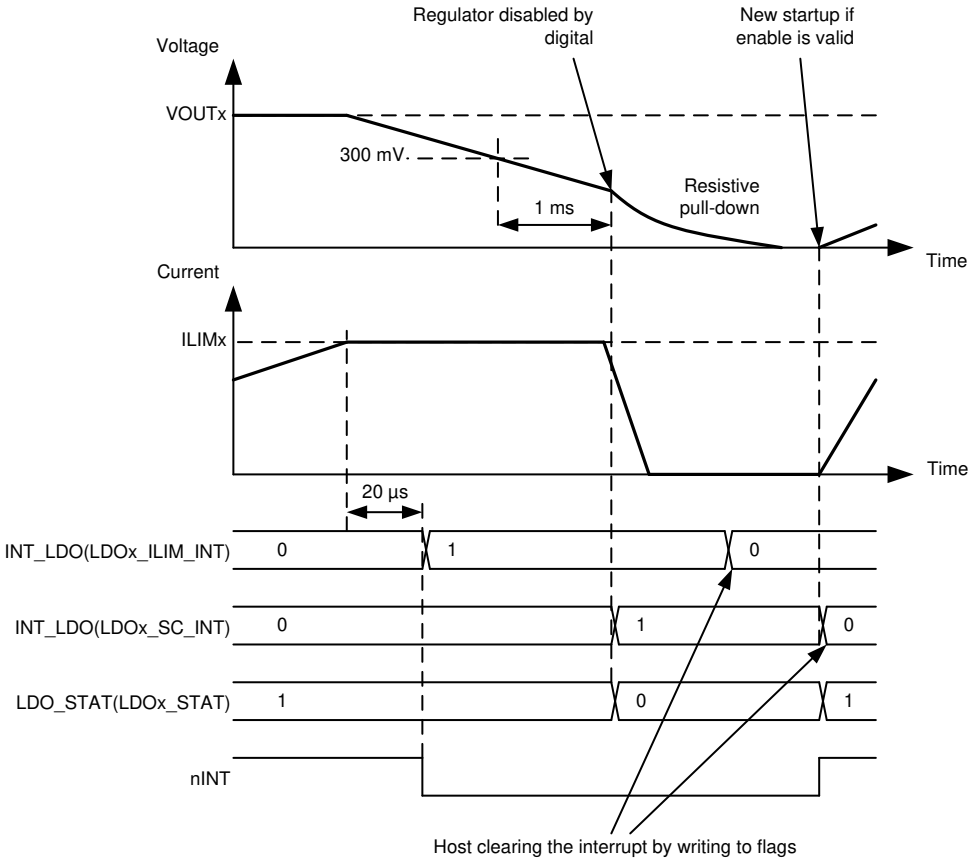

図 7-12. LDO Regulator Overload Situation

7.3.8.2.2 Thermal Warning

The LP87332D-Q1 device includes a protection feature against overtemperature by setting an interrupt for the host processor. The threshold level of the thermal warning is selected with the TDIE_WARN_LEVEL bit in the CONFIG register.

If the LP87332D-Q1 device temperature increases above the thermal warning level, then the device sets the TDIE_WARN_INT bit in the INT_TOP_1 register and pulls the nINT pin low. The status of the thermal warning can be read from the TDIE_WARN_STAT bit in the TOP_STAT register, and the interrupt is cleared by writing 1 to the TDIE_WARN_INT bit. The thermal warning interrupt can be masked by setting the TDIE_WARN_MASK bit in the TOP_MASK_1 register to 1.

7.3.8.3 Protection (Regulator Disable)

If the regulator is disabled, because of protection or fault (short-circuit protection, overload protection, thermal shutdown, input overvoltage protection, or UVLO), then the output power FETs are set to high-impedance mode and the output pulldown resistor is enabled (if enabled with the BUCKx_RDIS_EN bit in the BUCKx_CTRL_1 register and the LDOx_RDIS_EN bit in the LDOx_CTRL register). The turnoff time of the output voltage is defined by the output capacitance, load current, and resistance of the integrated pull-down resistor. The pull-down resistors are active as long as the VANA voltage is above approximately a 1.2-V level.

7.3.8.3.1 Short-Circuit and Overload Protection

A short-circuit protection feature allows the LP87332D-Q1 to protect itself and the external components against a short circuit at the output or against overload during start-up. For the buck and LDO regulators, the fault thresholds are about 350 mV (buck) and 300 mV (LDO). The protection is triggered and the regulator is disabled if the output voltage is below the threshold level (1 ms) after the regulator is enabled.

In a similar way, the overload situation is protected during normal operation. If the output voltage falls below 0.35 V and 0.3 V and remains below the threshold level for 1 ms, then the regulator is disabled.

In Buck regulator short-circuit and overload situations, the BUCKx_SC_INT bit in the INT_BUCK register and the INT_BUCKx bit in the INT_TOP_1 register are set to 1, the BUCKx_STAT bit in BUCK_STAT register is set to 0, and the nINT signal is pulled low. In LDO regulator short-circuit and overload situations, the LDOx_SC_INT bit in the INT_LDO register and the INT_LDOx bit in the INT_TOP_1 register are set to 1, the LDOx_STAT bit in the LDO_STAT register is set to 0, and the nINT signal is pulled low. The host processor clears the interrupt by writing 1 to the BUCKx_SC_INT or to the LDOx_SC_INT bit. Upon clearing the interrupt, the regulator makes a new start-up attempt if the regulator is in an enabled state.

7.3.8.3.2 Overvoltage Protection

The LP87332D-Q1 device monitors the input voltage from the VANA pin in standby and active operation modes. If the input voltage rises above the $VANA_{OVP}$ voltage level, the following occurs:

- All regulators are disabled immediately (without switching ramp or shutdown delays).
- The pull-down resistors discharge the output voltages, if the pull-down resistors are enabled (the BUCKx_RDIS_EN = 1 in the BUCKx_CTRL_1 register and the LDOx_RDIS_EN = 1 in the LDOx_CTRL register).
- The GPOs are set to logic low level.
- The nINT signal is pulled low.
- The OVP_INT bit in the INT_TOP_1 register is set to 1.
- The BUCKx_STAT bit in the BUCK_STAT register and the LDOx_STAT bit in the LDO_STAT register are set to 0.

The host processor clears the interrupt by writing 1 to the OVP_INT bit. If the input voltage is above the overvoltage detection level, then the interrupt is not cleared. The host can read the status of the overvoltage from the OVP_STAT bit in the TOP_STAT register. The regulators cannot be enabled as long as the input voltage is above the overvoltage detection level or while the overvoltage interrupt is pending.

7.3.8.3.3 Thermal Shutdown

The LP87332D-Q1 has an overtemperature protection function that operates to protect itself from short-term misuse and overload conditions. When the junction temperature exceeds around 150°C, the regulators are disabled immediately (without switching ramp and shutdown delays), the TDIE_SD_INT bit in the INT_TOP_1 register is set to 1, the nINT signal is pulled low, and the device enters STANDBY. The nINT is cleared by writing 1 to the TDIE_SD_INT bit. If the temperature is above thermal shutdown level, then the interrupt is not cleared. The host can read the status of the thermal shutdown from the TDIE_SD_STAT bit in the TOP_STAT register. The regulators cannot be enabled as long as the junction temperature is above the thermal shutdown level or while the thermal shutdown interrupt is pending.

7.3.8.4 Fault (Power Down)

7.3.8.4.1 Undervoltage Lockout

When the input voltage falls below the $VANA_{UVLO}$ at the VANA pin, the buck and LDO regulators are disabled immediately (without switching ramp and shutdown delays), the output capacitor is discharged using the pulldown resistor, and the LP87332D-Q1 device enters SHUTDOWN. When the $V_{(VANA)}$ voltage is above the $VANA_{UVLO}$ threshold level, the device powers up to STANDBY state.

If the reset interrupt is unmasked by default (OTP bit for RESET_REG_MASK is 0 in TOP_MASK_2 register), then the RESET_REG_INT interrupt bit in the INT_TOP_2 register indicates that the device has been in SHUTDOWN. The host processor must clear the interrupt by writing 1 to the RESET_REG_INT bit. If the host processor reads the RESET_REG_INT interrupt bit after detecting an nINT low signal, then it detects that the input supply voltage has been below the $VANA_{UVLO}$ level (or the host has requested reset with the SW_RESET bit in the RESET register), and the registers are reset to default values.

7.3.9 Operation of the GPO Signals

The LP87332D-Q1 device supports up to two general purpose output signals, GPO and GPO2. The GPO2 signal is multiplexed with the CLKIN signal. The selection between the CLKIN and GPO2 pin function is set with the CLKIN_PIN_SEL bit in the CONFIG register.

The GPO pins are configured with the following bits:

- The GPOx_OD bit in The GPO_CTRL register defines the type of the output, either push-pull with $V_{(VANA)}$ level or open drain.

The logic level of the GPOx pin is set by the EN_GPOx bit in the GPO_CTRL register.

The control of the GPOs can be included to start-up and shutdown sequences. The GPO control for a sequence with an EN pin is selected by the GPOx_EN_PIN_CTRL bit in the GPO_CTRL register. For start-up and shutdown sequence control, see *セクション 7.3.6*.

7.3.10 Digital Signal Filtering

The digital signals have a debounce filtering. The signal or supply is sampled with a clock signal and a counter. This results as an accuracy of one clock period for the debounce window.

表 7-5. Digital Signal Filtering

EVENT	SIGNAL/SUPPLY	RISING EDGE	FALLING EDGE
		LENGTH	LENGTH
Enable/disable for BUCKx, LDOx or GPOx	EN	3 µs(1)	3 µs(1)
VANA UVLO	VANA	3 µs(1) (VANA voltage rising)	Immediate (VANA voltage falling)
VANA overvoltage	VANA	1 µs (VANA voltage rising)	20 µs (VANA voltage falling)
Thermal warning	TDIE_WARN_INT	20 µs	20 µs
Thermal shutdown	TDIE_SD_INT	20 µs	20 µs
Current limit	VOUTx_ILIM	20 µs	20 µs
Overload	FB_B0, FB_B1, VOUT_LDO0, VOUT_LDO1	1 ms	N/V
PGOOD pin and power-good interrupt	PGOOD / FB_B0, FB_B1, VOUT_LDO0, VOUT_LDO1	6 µs	6 µs

(1) No glitch filtering, only synchronization.

7.4 Device Functional Modes

7.4.1 Modes of Operation

SHUTDOWN: The $V_{(VANA)}$ voltage is below $VANA_{UVLO}$ threshold level. All switch, reference, control, and bias circuitry of the LP87332D-Q1 device are turned off.

READ OTP: The main supply voltage $V_{(VANA)}$ is above $VANA_{UVLO}$ level. The regulators are disabled, and the reference and bias circuitry of the LP87332D-Q1 are enabled. The OTP bits are loaded to registers.

STANDBY: The main supply voltage $V_{(VANA)}$ is above $VANA_{UVLO}$ level. The regulators are disabled, and the reference, control, and bias circuitry of the LP87332D-Q1 are enabled. All registers can be read or written by the host processor through the system serial interface. The regulators can be enabled if needed.

ACTIVE: The main supply voltage $V_{(VANA)}$ is above $VANA_{UVLO}$ level. At least one regulator is enabled. All registers can be read or written by the host processor through the system serial interface.

The operating modes and transitions between the modes are shown in 図 7-13.

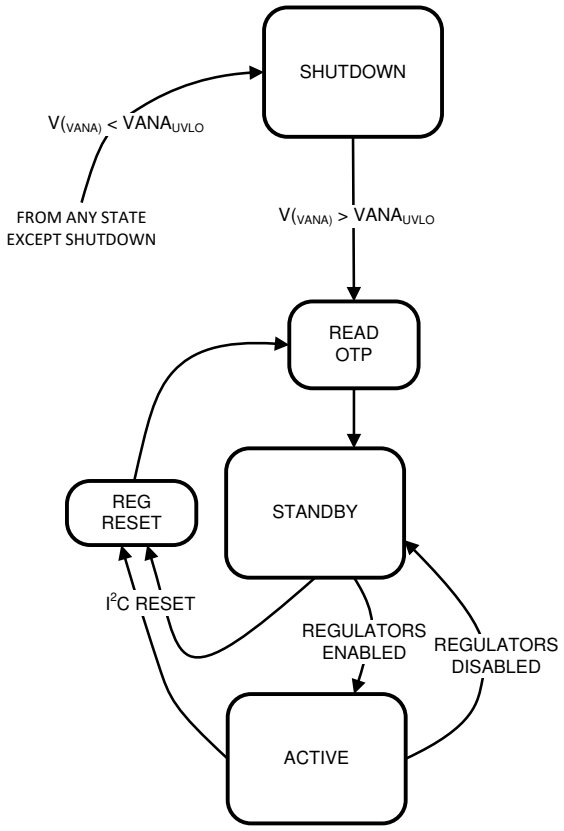

図 7-13. Device Operation Modes

7.5 Programming

7.5.1 I²C-Compatible Interface

The I²C-compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the ICs connected to the bus. The two interface lines are the serial data line (SDA), and the serial clock line (SCL). Every device on the bus is assigned a unique address, and acts as either a master or a slave depending on whether it generates or receives the serial clock SCL. The SCL and SDA lines must each have a pullup resistor placed on the line and remain HIGH even when the bus is idle. The LP87332D-Q1 supports standard mode (100 kHz), fast mode (400 kHz), fast mode plus (1 MHz), and high-speed mode (3.4 MHz).

7.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, the state of the data line can only be changed when clock signal is LOW.

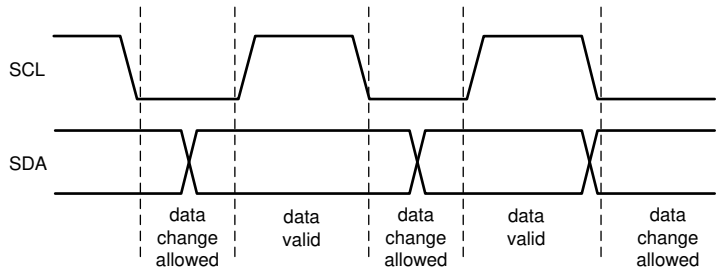

図 7-14. Data Validity Diagram

7.5.1.2 Start and Stop Conditions

The LP87332D-Q1 is controlled through an I²C-compatible interface. START and STOP conditions classify the beginning and end of the I²C session. A START condition is defined as SDA transitions from HIGH to LOW while SCL is HIGH. A STOP condition is defined as an SDA transition from LOW to HIGH while SCL is HIGH. The I²C master always generates the START and STOP conditions.

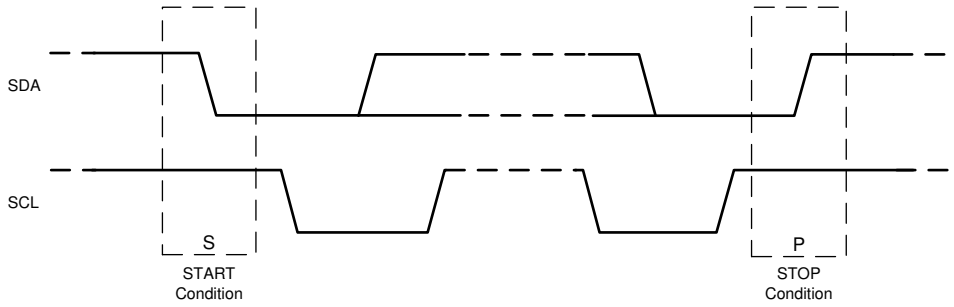

図 7-15. Start and Stop Sequences

The I²C bus is considered busy after a START condition and free after a STOP condition. During data transmission, the I²C master can generate repeated START conditions. A START and a repeated START condition are equivalent function-wise. The data on SDA must be stable during the HIGH period of the clock signal (SCL). In other words, the state of SDA can only be changed when SCL is LOW. 図 7-16 shows the SDA and SCL signal timing for the I²C-compatible bus. See セクション 6.6 for the timing values.

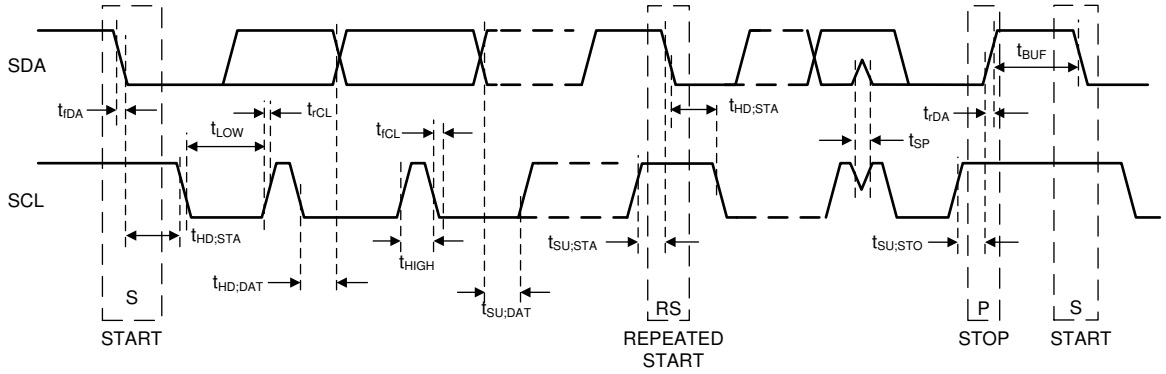

図 7-16. I²C-Compatible Timing

7.5.1.3 Transferring Data

Every byte put on the SDA line must be eight bits long, with the most significant bit (MSB) transferred first. Each byte of data has to be followed by an acknowledge bit. The acknowledge-related clock pulse is generated by the master. The master releases the SDA line (HIGH) during the acknowledge clock pulse. The LP87332D-Q1 pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The LP87332D-Q1 generates an acknowledge after each byte has been received.

There is one exception to the *acknowledge after every byte* rule. When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (*negative acknowledge*) the last byte clocked out of the slave. This *negative acknowledge* still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

Note

If the $V_{(VANA)}$ voltage is below the $VANA_{UVLO}$ threshold level during I²C communication, the LP87332D-Q1 device does not drive SDA line. The ACK signal and data transfer to the master is disabled at that time.

After the START condition, the bus master sends a chip address. This address is seven bits long, followed by an eighth bit, which is a data direction bit (READ or WRITE). For the eighth bit, a 0 indicates a WRITE, and a 1 indicates a READ. The second byte selects the register to which the data will be written. The third byte contains data to write to the selected register.

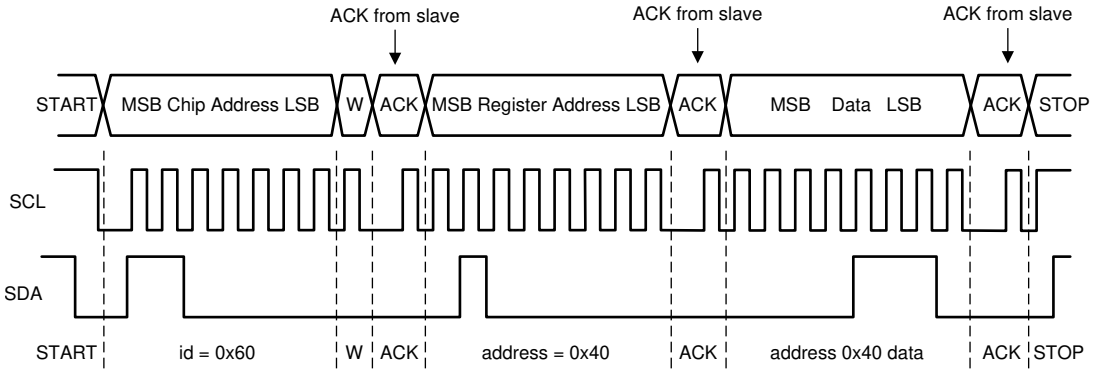

図 7-17. Write Cycle (w = write; SDA = 0). Example Device Address = 0x60

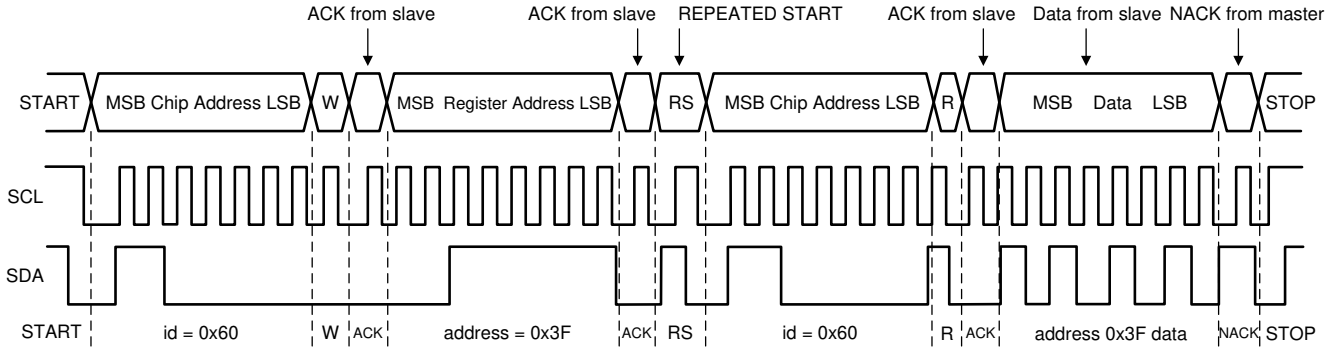


When READ function is to be accomplished, a WRITE function must precede the READ function as shown above.

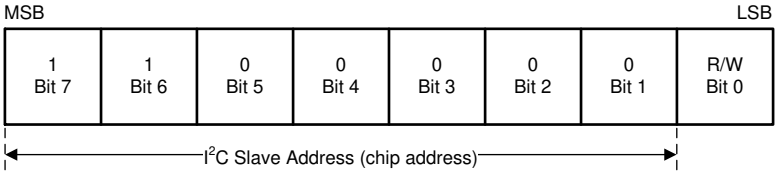
図 7-18. Read Cycle (r = read; SDA = 1). Example Device Address = 0x60

7.5.1.4 I²C-Compatible Chip Address

Note

The device address for the LP87332D-Q1 is 0x60.

After the START condition, the I²C master sends the 7-bit address followed by an eighth bit, read or write (R/W). R/W = 0 indicates a WRITE and R/W = 1 indicates a READ. The second byte following the device address selects the register address to which the data is written. The third byte contains the data for the selected register.



Here in an example with device address of 1100000Bin = 60Hex.

図 7-19. Device Address Example

7.5.1.5 Auto-Increment Feature

The auto-increment feature allows writing several consecutive registers within one transmission. Every time an 8-bit word is sent to the LP87332D-Q1, the internal address index counter is incremented by one and the next register is written. 表 7-6 shows writing sequence to two consecutive registers. The auto-increment feature does not work for read.

表 7-6. Auto-Increment Example

MASTER ACTION	START	DEVICE ADDRESS = 0x60	WRITE		REGISTER ADDRESS		DATA		DATA		STOP
LP87332D-Q1				ACK		ACK		ACK		ACK	

7.6 Register Maps

7.6.1 Register Descriptions

The LP87332D-Q1 is controlled by a set of registers through the I^{2}C-compatible interface. The device registers addresses and abbreviations are listed in 表 7-7. A more detailed description is given in the *セクション 7.6.1.1* to セクション 7.6.1.39 sections.

The asterisk (*) marking indicates register bits which are updated from OTP memory during READ OTP state.

Note

This register map describes the default values for a device with orderable code of LP87332DRHDRQ1. For other device versions the default values read from OTP memory can be different.

表 7-51. PGOOD_CTRL_1 Register Field Descriptions

Bits	Field	Type	Default	Description
7	PGOOD_POL	R/W	0	PGOOD signal polarity: 0 - PGOOD signal high when the monitored outputs are valid. 1 - PGOOD signal low when the monitored outputs are valid.
6	PGOOD_OD	R/W	1	PGOOD signal type: 0 - Push-pull output (VANA level) 1 - Open-drain output
5	PGOOD_ WINDOW_LDO	R/W	1	LDO Output voltage monitoring method for the PGOOD signal: 0 - Only undervoltage monitoring 1 - Overvoltage and undervoltage monitoring
4	PGOOD_ WINDOW_BUCK	R/W	1	Buck Output voltage monitoring method for the PGOOD signal: 0 - Only undervoltage monitoring 1 - Overvoltage and undervoltage monitoring
3	EN_PGOOD_LDO1	R/W	0	PGOOD signal source control from LDO1: 0 - LDO1 is not monitored. 1 - LDO1 Power-Good threshold voltage is monitored.
2	EN_PGOOD_LDO0	R/W	0	PGOOD signal source control from theLDO0: 0 - LDO0 is not monitored. 1 - LDO0 Power-Good threshold voltage is monitored.
1	EN_PGOOD_BUCK1	R/W	1	PGOOD signal source control from the Buck1: 0 - Buck1 is not monitored. 1 - Buck1 Power-Good threshold voltage is monitored.
0	EN_PGOOD_BUCK0	R/W	1	PGOOD signal source control from the Buck0: 0 - Buck0 is not monitored. 1 - Buck0 Power-Good threshold voltage is monitored.

7.6.1.23 PGOOD_CTRL_2

PGOOD_CTRL_2 is shown in 表 7-53, Address: 0x16

表 7-52. PGOOD_CTRL_2 Register

D7	D6	D5	D4	D3	D2	D1	D0
Reserved - do not use					EN_PGOOD_TWARN	PG_FAULT_GATES_PGOOD	PGOOD_MODE

表 7-53. PGOOD_CTRL_2 Register Field Descriptions

Bits	Field	Type	Default	Description
7:3	Reserved - do not use	R/W	0 0000	
2	EN_PGOOD_TWARN	R/W	1	Thermal warning control for the PGOOD signal: 0 - Thermal warning is not monitored. 1 - PGOOD inactive if the thermal warning flag is active.
1	PG_FAULT_GATES_PGOOD	R/W	0	Type of operation for the PGOOD signal: 0 - Indicates live status of monitored voltage outputs. 1 - Indicates status of the PG_FAULT register, inactive when at least one PG_FAULT_x bit is inactive.
0	PGOOD_MODE	R/W	0	Operating mode for the PGOOD signal: 0 - Gated mode 1 - Continuous mode

7.6.1.24 PG_FAULT

PG_FAULT is shown in 表 7-55, Address: 0x17

表 7-54. PG_FAULT Register

D7	D6	D5	D4	D3	D2	D1	D0
Reserved - do not use				PG_FAULT_LDO1	PG_FAULT_LDO0	PG_FAULT_BUCK1	PG_FAULT_BUCK0

表 7-55. PG_FAULT Register Field Descriptions

Bits	Field	Type	Default	Description
7:4	Reserved - do not use	R/W	0000	
3	PG_FAULT_LDO1	R/W	0	Source for the PGOOD inactive signal: 0 - LDO1 has not set the PGOOD signal inactive. 1 - LDO1 is selected for the PGOOD signal and it has set the PGOOD signal inactive. This bit can be cleared by writing '1' to this bit when the LDO1 output is valid.
2	PG_FAULT_LDO0	R/W	0	Source for PGOOD inactive signal: 0 - LDO0 has not set the PGOOD signal inactive. 1 - LDO0 is selected for the PGOOD signal and it has set the PGOOD signal inactive. This bit can be cleared by writing '1' to this bit when the LDO0 output is valid.
1	PG_FAULT_BUCK1	R/W	0	Source for PGOOD inactive signal: 0 - Buck1 has not set PGOOD signal inactive. 1 - Buck1 is selected for the PGOOD signal and it has set the PGOOD signal inactive. This bit can be cleared by writing '1' to this bit when the Buck1 output is valid.
0	PG_FAULT_BUCK0	R/W	0	Source for PGOOD inactive signal: 0 - Buck0 has not set PGOOD signal inactive. 1 - Buck0 is selected for the PGOOD signal and it has set the PGOOD signal inactive. This bit can be cleared by writing '1' to this bit when the Buck0 output is valid.

7.6.1.25 RESET

RESET is shown in 表 7-57, Address: 0x18

表 7-56. RESET Register

D7	D6	D5	D4	D3	D2	D1	D0
Reserved - do not use							SW_RESET

表 7-57. RESET Register Field Descriptions

Bits	Field	Type	Default	Description
7:1	Reserved - do not use	R/W	000 0000	
0	SW_RESET	R/W	0	Software commanded reset. When written to 1, the registers will be reset to the default values, the OTP memory is read, and the I^2C interface is reset. The bit is automatically cleared.

7.6.1.26 INT_TOP_1

INT_TOP_1 is shown in 表 7-59, Address: 0x19

表 7-58. INT_TOP_1 Register

7	PGOOD_INT	R/W	0	Latched status bit indicating that the PGOOD pin has changed from active to inactive. Write 1 to clear interrupt.

表 7-59. INT_TOP_1 Register Field Descriptions (continued)

Bits	Field	Type	Default	Description
6	LDO_INT	R	0	Interrupt indicating that the LDO1 and LDO0 have a pending interrupt. The reason for the interrupt is indicated in the INT_LDO register. This bit is cleared automatically when the INT_LDO register is cleared to 0x00.
5	BUCK_INT	R	0	Interrupt indicating that the Buck1 and Buck0 have a pending interrupt. The reason for the interrupt is indicated in the INT_BUCK register. This bit is cleared automatically when INT_BUCK register is cleared to 0x00.
4	SYNC_CLK_INT	R/W	0	Latched status bit indicating that the external clock has appeared or disappeared. Write 1 to clear interrupt.
3	TDIE_SD_INT	R/W	0	Latched status bit indicating that the die junction temperature has exceeded the thermal shutdown level. The regulators have been disabled if they were enabled and the GPO and GPO2 signals are driven low. The regulators cannot be enabled if this bit is active. The actual status of the thermal shutdown is indicated by the TDIE_SD_STAT bit in the TOP_STAT register. Write 1 to clear interrupt.
2	TDIE_WARN_INT	R/W	0	Latched status bit indicating that the die junction temperature has exceeded the thermal warning level. The actual status of the thermal warning is indicated by the TDIE_WARN_STAT bit in the TOP_STAT register. Write 1 to clear interrupt.
1	OVP_INT	R/W	0	Latched status bit indicating that the input voltage has exceeded the over-voltage detection level. The regulators have been disabled if they were enabled and the GPO and GPO2 signals are driven low. The actual status of the over-voltage is indicated by the OVP_STAT bit in the TOP_STAT register. Write 1 to clear interrupt.
0	I_MEAS_INT	R/W	0	Latched status bit indicating that the load current measurement result is available in the I_LOAD_1 and I_LOAD_2 registers. Write 1 to clear interrupt.

7.6.1.27 INT_TOP_2

INT_TOP_2 is shown in 表 7-61, Address: 0x1A

表 7-60. INT_TOP_2 Register

D7	D6	D5	D4	D3	D2	D1	D0
Reserved - do not use							RESET_REG_INT

表 7-61. INT_TOP_2 Register Field Descriptions

Bits	Field	Type	Default	Description
7:1	Reserved - do not use	R/W	000 0000	
0	RESET_REG_INT	R/W	0	Latched status bit indicating that either VANA supply voltage has been below the undervoltage threshold level or the host has requested a reset using the SW_RESET bit in RESET register. The regulators have been disabled, the registers are reset to the default values, and the normal startup procedure is done. Write 1 to clear interrupt.

7.6.1.28 INT_BUCK

INT_BUCK is shown in 表 7-63, Address: 0x1B

表 7-62. INT_BUCK Register

D7	D6	D5	D4	D3	D2	D1	D0
Reserved - do not use	BUCK1_PG_INT	BUCK1_SC_INT	BUCK1_ILIM_INT	Reserved - do not use	BUCK0_PG_INT	BUCK0_SC_INT	BUCK0_ILIM_INT

表 7-63. INT_BUCK Register Field Descriptions

Bits	Field	Type	Default	Description
7	Reserved - do not use	R/W	0	
6	BUCK1_PG_INT	R/W	0	Latched status bit indicating that Buck1 Power-Good event has been detected. Write 1 to clear.
5	BUCK1_SC_INT	R/W	0	Latched status bit indicating that the Buck1 output voltage has been over 1 ms below the short-circuit threshold level. Write 1 to clear.
4	BUCK1_ILIM_INT	R/W	0	Latched status bit indicating that the Buck1 output current limit has been active. Write 1 to clear.
3	Reserved - do not use	R/W	0	
2	BUCK0_PG_INT	R/W	0	Latched status bit indicating that the Buck0 Power-Good event has been detected. Write 1 to clear.
1	BUCK0_SC_INT	R/W	0	Latched status bit indicating that the Buck0 output voltage has been over 1 ms below the short-circuit threshold level. Write 1 to clear.
0	BUCK0_ILIM_INT	R/W	0	Latched status bit indicating that the Buck0 output current limit has been active. Write 1 to clear.

7.6.1.29 INT_LDO

INT_LDO is shown in 表 7-65, Address: 0x1C

表 7-64. INT_LDO Register

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LP87332D-Q1 is a power management unit including two step-down regulators, two linear regulators, and two general-purpose digital output signals.

8.2 Typical Application

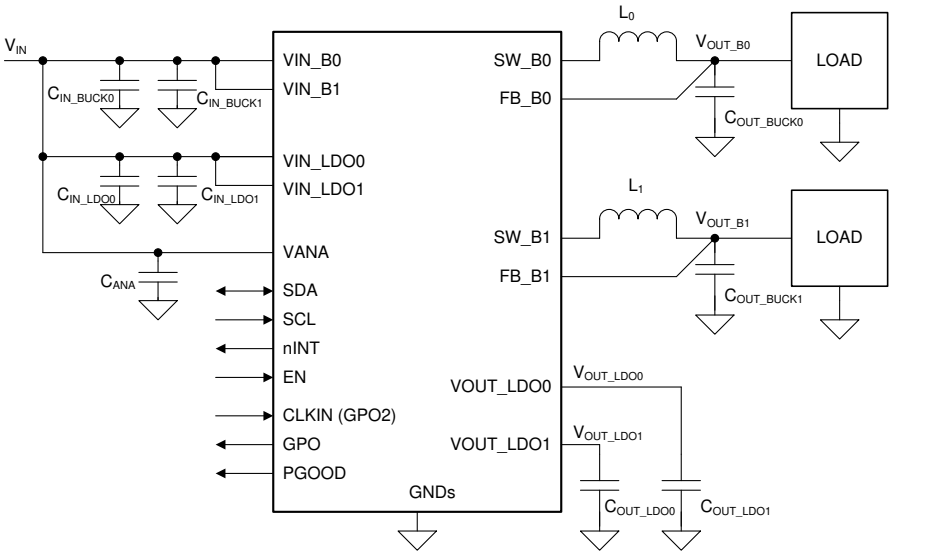

図 8-1. LP87332D-Q1 Typical Application

8.2.1 Design Requirements

8.2.1.1 Inductor Selection

The inductors L_0 and L_1 are shown in the *セクション 8.2*. The inductance and DCR of the inductor affects the control loop of the buck regulator. TI recommends using inductors similar to those listed in 表 8-1. Pay attention to the saturation current and temperature rise current of the inductor. Check that the saturation current is higher than the peak current limit and the temperature rise current is higher than the maximum expected rms output current. The minimum effective inductance to ensure good performance is 0.22 µH at maximum peak output current over the operating temperature range. DC resistance of the inductor must be less than 0.05 Ω for good efficiency at high-current conditions. The inductor AC loss also affects conversion efficiency. Higher Q factor at switching frequency usually gives better efficiency at light load to middle load. Shielded inductors are preferred, as they radiate less noise.

表 8-1. Recommended Inductors

MANUFACTURER	PART NUMBER	VALUE	DIMENSIONS L × W × H (mm)	RATED DC CURRENT I_{SAT} maximum (typical) / I_{TEMP} maximum (typical) (A)	DCR typical / maximum (mΩ)
TOKO	DFE252012PD-R47M	0.47 µH (20%)	2.5 × 2 × 1.2	5.2 (–) / 4 (–)(1)	— / 27

表 8-1. Recommended Inductors (continued)

MANUFACTURER	PART NUMBER	VALUE	DIMENSIONS L × W × H (mm)	RATED DC CURRENT I_{SAT} maximum (typical) / I_{TEMP} maximum (typical) (A)	DCR typical / maximum (mΩ)
Tayo Yuden	MDMK2020TR47MMV	0.47 µH (20%)	2 × 2 ×1.2	4.2 (4.8) / 2.3 (2.45)	40 / 46

(1) Operating temperature range is up to 125°C including self temperature rise.

8.2.1.2 Buck Input Capacitor Selection

The input capacitors C_{IN_BUCK0} and C_{IN_BUCK1} are shown in the *セクション 8.2*. A ceramic input bypass capacitor of 10 µF is required for each phase of the regulator. Place the input capacitor as close as possible to the VIN_Bx pin and PGND_Bx pin of the device. A larger value or higher voltage rating improves the input voltage filtering. Use X7R type of capacitors, not Y5V or F. Also, the DC bias characteristics capacitors must be considered. The minimum effective input capacitance to ensure good performance is 1.9 µF per buck input at maximum input voltage including tolerances, ambient temperature range, and aging (assuming at least 22 µF of additional capacitance is common for all the power input pins on the system power rail). See 表 8-2.

The input filter capacitor supplies current to the high-side FET switch in the first half of each cycle and reduces voltage ripple imposed on the input power source. The low ESR of the ceramic capacitor provides the best noise filtering of the input voltage spikes due to this rapidly changing current. Select an input filter capacitor with sufficient ripple current rating. In addition, ferrite can be used in front of the input capacitor to reduce the EMI.

表 8-2. Recommended Buck Input Capacitor (X7R Dielectric)

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L × W × H (mm)	VOLTAGE RATING
Murata	GCM21BR71A106KE22	10 µF (10%)	0805	2 × 1.25 × 1.25	10 V

8.2.1.3 Buck Output Capacitor Selection

The output capacitor C_{OUT_BUCK0} and C_{OUT_BUCK1} are shown in *セクション 8.2*. A ceramic local output capacitor of 22 µF is required per phase. Use ceramic capacitors, X7R type; do not use Y5V or F. DC bias voltage characteristics of ceramic capacitors must be considered. The output filter capacitor smooths out current flow from the inductor to the load, which helps maintain a steady output voltage during transient load changes and reduces output voltage ripple. These capacitors must be selected with sufficient capacitance and sufficiently low ESR and ESL to perform these functions. The minimum effective output capacitance to ensure good performance is 10 µF per phase, including the DC voltage rolloff, tolerances, aging, and temperature effects.

The output voltage ripple is caused by the charging and discharging of the output capacitor and due to its R_{ESR}. The R_{ESR} is frequency dependent (and temperature dependent); ensure the value used for selection process is at the switching frequency of the part. See 表 8-3.

POL capacitors can be used to improve load transient performance and to decrease the ripple voltage. A higher output capacitance improves the load step behavior, reduces the output voltage ripple, and decreases the PFM switching frequency. However, output capacitance higher than 150 µF per phase is not necessarily of any benefit. The output capacitor may be the limiting factor in the output voltage ramp, see セクション 6 for maximum output capacitance for different slew-rate settings. For large output capacitors, the output voltage might be slower than the programmed ramp rate at voltage transitions, because of the higher energy stored on the output capacitance. Also at start-up, the time required to charge the output capacitor to target value might be longer. At shutdown, the output voltage is discharged to a 0.6 V level using forced-PWM operation. This can increase the input voltage if the load current is small and the output capacitor is large compared to input capacitor. Below the 0.6 V level, the output capacitor is discharged by the internal discharge resistor, and with large capacitor more time is required to settle V_{OUT} down as a consequence of the increased time constant.

表 8-3. Recommended Buck Output Capacitors (X7R Dielectric)

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L × W × H (mm)	VOLTAGE RATING
Murata	GCM31CR71A226KE02	22 µF (10%)	1206	3.2 × 1.6 × 1.6	10 V

8.2.1.4 LDO Input Capacitor Selection

The input capacitors C_{IN_LDO0} and C_{IN_LDO1} are shown in the 表 8-4. A ceramic input capacitor of 2.2 µF, 6.3 V is sufficient for most applications. Place the input capacitor as close as possible to the VIN_LDOx pin and AGND pin of the device. A larger value or higher voltage rating improves the input voltage filtering. Use X7R type of capacitors, not Y5V or F. DC bias characteristics of capacitors must be considered, the minimum effective input capacitance to ensure good performance is 0.6 µF per LDO input at maximum input voltage including tolerances, ambient temperature range, and aging. See 表 8-4.

表 8-4. Recommended LDO Input Capacitors (X7R Dielectric)

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L × W × H (mm)	VOLTAGE RATING
Murata	GCM188R70J225KE22	2.2 µF (10%)	0603	1.6 × 0.8 × 0.8	6.3 V
Murata	GCM21BR71C475KA73	4.7 µF (10%)	0805	2 × 1.25 × 1.25	16 V

8.2.1.5 LDO Output Capacitor Selection

The output capacitors C_{OUT_LDO0} and C_{OUT_LDO1} are shown in the セクション 8.2. A ceramic output capacitor of minimum 1.0 µF is required. Place the output capacitor as close to the VOUT_LDOx pin and AGND pin of the device as possible. Use X7R type of capacitors, not Y5V or F. DC bias characteristics of capacitors must be considered, the minimum effective output capacitance to ensure good performance is 0.4 µF per LDO input at maximum input voltage including tolerances, ambient temperature range, and aging. See 表 8-5.

Note: the output capcitor requirements excludes any capacitance seen at the point of load and only refers to the capacitance seen close to the device. Additional capacitance placed near the load can be supported, but the end applcation system should be evaluated for stability and to ensure the sequencing requirements are met. The shutdown decay will be longer with higher output capcitance, which can also impact the startup time. Total output capacitance should be kept below 100 µF.

The output capacitance must be smaller than the input capacitance to ensure the stability of the LDO. With a 1-µF output capacitor, TI recommends using at least a 2.2-µF input capacitor; with a 2.2-µF output capacitor at least 4.7-µF input capacitance.

The VANA input is used to supply analog and digital circuits in the device. See 表 8-6 for recommended components from for VANA input supply filtering.

表 8-5. Recommended LDO Output Capacitors (X7R Dielectric)

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L × W × H (mm)	VOLTAGE RATING
Murata	GCM188R71C105KA64	1 µF (10%)	0603	1.6 × 0.8 × 0.8	16 V
Murata	GCM188R70J225KE22	2.2 µF (10%)	0603	1.6 × 0.8 × 0.8	6.3 V

表 8-6. Recommended Supply Filtering Components

MANUFACTURER	PART NUMBER	VALUE	CASE SIZE	DIMENSIONS L × W × H (mm)	VOLTAGE RATING
Murata	GCM155R71C104KA55	100 nF (10%)	0402	1 × 0.5 × 0.5	16 V
Murata	GCM188R71C104KA37	100 nF (10%)	0603	1.6 × 0.8 × 0.8	16 V

8.2.2 Detailed Design Procedure

The performance of the LP87332D-Q1 device depends greatly on the care taken in designing the printed circuit board (PCB). The use of low-inductance and low serial-resistance ceramic capacitors is strongly recommended, while proper grounding is crucial. Attention must be given to decoupling the power supplies. Decoupling capacitors must be connected close to the device and between the power and ground pins to support high peak currents being drawn from system power rail during turnon of the switching MOSFETs. Keep input and output traces as short as possible, because trace inductance, resistance, and capacitance can become performance limiting items. The separate buck regulator power pins VIN_Bx are not connected together internally. Connect the VIN_Bx power connections together outside the package using power plane construction.

8.2.3 Application Curves

Measurements are done using typical application set up with connections shown in 図 8-1. Graphs may not reflect the OTP default settings. Unless otherwise specified: $V_{(VIN\_Bx)} = V_{(VIN\_LDOx)} = V_{(VANA)} = 3.7$ V, $V_{OUT\_Bx} = 1$ V, $V_{OUT\_LDOx} = 1$ V, $T_A = 25°C$, L = 0.47 µH (TOKO DFE252012PD-R47M), $C_{OUT\_BUCK} = 22$ µF , and $C_{POL\_BUCK} = 22$ µF, $C_{OUT\_LDO} = 1$ µF.

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 2.8 V and 5.5 V. The VANA input and VIN_Bx buck inputs must be connected together, and they must use the same input supply. This input supply must be well regulated and able to withstand maximum input current and maintain stable voltage without voltage drop even at load transition condition. The resistance of the input supply rail must be low enough that the input current transient does not cause too high a drop in the LP87332D-Q1 supply voltage that can cause false UVLO fault triggering. If the input supply is located more than a few inches from the LP87332D-Q1, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. The VIN_LDOx LDO input supply voltage range is 2.5 V to 5.5 V and can be higher or lower than VANA supply voltage.

10 Layout

10.1 Layout Guidelines

The high frequency and large switching currents of the LP87332D-Q1 make the choice of layout important. Good power supply results only occur when care is given to proper design and layout. Layout affects noise pickup and generation and can cause a good design to perform with less-than-expected results. With a range of output currents from milliamps to several amps, good power supply layout is much more difficult than most general PCB design. Use the following steps as a reference to ensure the device is stable and maintains proper voltage and current regulation across its intended operating voltage and current range.

1. Place C_{IN} as close as possible to the VIN_Bx pin and the PGND_Bx pin. Route the V_{IN} trace wide and thick to avoid IR drops. The trace between the positive node of the input capacitor and the VIN_Bx pins of LP87332D-Q1, as well as the trace between the negative node of the input capacitor and the power PGND_Bx pins, must be kept as short as possible. The input capacitance provides a low-impedance voltage source for the switching converter. The inductance of the connection is the most important parameter of a local decoupling capacitor — parasitic inductance on these traces must be kept as small as possible for proper device operation. The parasitic inductance can be reduced by using a ground plane as close as possible to the top layer by using thin dielectric layer between the top layer and the ground plane.
2. The output filter, consisting of L and COUT, converts the switching signal at SW_Bx to the noiseless output voltage. The output filter must be placed as close as possible to the device, keeping the switch node small for best EMI behavior. Route the traces between the output capacitors of the LP87332D-Q1 and the input capacitors of the load direct and wide to avoid losses due to the IR drop.
3. Input for analog blocks (VANA and AGND) must be isolated from noisy signals. Connect VANA directly to a quiet system voltage node and AGND to a quiet ground point where no IR drop occurs. Place the decoupling capacitor as close as possible to the VANA pin.
4. If remote voltage sensing can be used for the load, connect the LP87332D-Q1 feedback pins FB_Bx to the respective sense pins on the load capacitor. The sense lines are susceptible to noise. They must be kept away from noisy signals such as PGND_Bx, VIN_Bx, and SW_Bx, as well as high bandwidth signals such as the I^2C. Avoid both capacitive and inductive coupling by keeping the sense lines short and direct, and close to each other. Run the lines in a quiet layer. Isolate them from noisy signals by a voltage or ground plane if possible. If series resistors are used for load current measurement, place them after connection of the voltage feedback.
5. PGND_Bx, VIN_Bx and SW_Bx must be routed on thick layers. They must not surround inner signal layers which are not able to withstand interference from noisy PGND_Bx, VIN_Bx and SW_Bx.
6. LDO performance (PSRR, noise, and transient response) depend on the layout of the PCB. Best performance is achieved by placing CIN and COUT as close to the LP87332D-Q1 device as practical. The ground connections for CIN and COUT must be back to the LP87332D-Q1 AGND with as wide and as short of a copper trace as is practical and with multiple vias if routing is done on other layer. Avoid connections using long trace lengths, narrow trace widths, or connection through small via. These add parasitic inductances and resistance that results in inferior performance, especially during transient conditions.

Due to the small package of this converter and the overall small solution size, the thermal performance of the PCB layout is important. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component. Proper PCB layout, focusing on thermal performance, results in lower die temperatures. Wide power traces can sink dissipated heat. This can be improved further on multi-layer PCB designs with vias to different planes. This results in reduced junction-to-ambient ($R_{\theta JA}$) and junction-to-board ($R_{\theta JB}$) thermal resistances, thereby reducing the device junction temperature, T_J. TI strongly recommends performance of a careful system-level 2D or full 3D dynamic thermal analysis at the beginning product design process by using a thermal modeling analysis software.

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.6 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
LP87332DRHDRQ1	Active	Production	VQFN (RHD) | 28	3000 | LARGE T&R	Yes	NIPDAU | SN	Level-2-260C-1 YEAR	-40 to 125	LP8733 2D-Q1
LP87332DRHDRQ1.A	Active	Production	VQFN (RHD) | 28	3000 | LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	LP8733 2D-Q1
LP87332DRHDTQ1	Active	Production	VQFN (RHD) | 28	250 | SMALL T&R	Yes	NIPDAU | SN	Level-2-260C-1 YEAR	-40 to 125	LP8733 2D-Q1
LP87332DRHDTQ1.A	Active	Production	VQFN (RHD) | 28	250 | SMALL T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	LP8733 2D-Q1

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
