

LPV511 Micropower、レール・ツー・レール入出力オペアンプ

1 特長

- 広い電源電圧範囲: 2.7V~12V
- スルーレート: 7.7V/ms
- 消費電流: 880nA
- 出力短絡電流: 1.35mA
- レール・ツー・レール入力
- レール・ツー・レール出力: 電源レールから 100mV
- 帯域幅($C_L = 50\text{pF}$, $R_L = 1\text{M}\Omega$): 27kHz
- ユニティ・ゲインで安定

2 アプリケーション

- バッテリー駆動のシステム
- セキュリティ・システム
- Micropowerサーモスタット
- 太陽電池で動作するシステム
- 携帯機器
- Micropowerフィルタ
- リモート・センサ・アンプ

3 概要

LPV511は、2.7V~12Vの広い電源電圧範囲で動作する Micropower オペアンプであり、3V、5V、12Vでの仕様が保証されています。LPV511は非常に消費電力が低く、卓越した速度/電力比を示し、27kHzの帯域幅でわずか 880nAの電流しか消費しません。これらの仕様から、LPV511は計測機器、センサの条件設定、バッテリー電流監視など、バッテリー駆動で、長時間動作のため低い消費電流が要求されるシステムに理想的です。

LPV511の入力範囲には、グラウンドと、ハイサイドのバッテリー・センシング・アプリケーションの両方の電源レールが含まれています。LPV511の出力は、どちらのレールからも 100mVの範囲内でスイングでき、電源電圧の低いアプリケーションにおいて信号のダイナミック・レンジを最大化できます。さらに、出力は12Vバッテリーによる駆動の場合、650 μ Aの電流を供給できます。

LPV511は、TIの先進のVIP50Cプロセスで製造されます。

LPV511は省スペースのSC70パッケージで供給されるため、PCボードのサイズが制限される携帯用電子機器に理想的です。

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	V_{OUT}	O	Output
2	V^{-}	P	Negative supply voltage
3	V_{IN}^{+}	I	Noninverting input
4	V_{IN}^{-}	I	Inverting input
5	V^{+}	P	Positive supply voltage

6 Specifications

6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
V _{IN} Differential		2.1	V
Supply voltage (V ⁺ - V ⁻)		13.2	V
Voltage at input and output pins	V ⁺ + 0.3	V ⁻ - 0.3	V
Short-circuit duration	See ⁽³⁾		
Junction temperature, T _J ⁽⁴⁾		150	°C
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (3) Output short-circuit duration is infinite for V⁺ < 6 V at room temperature and below. For V⁺ > 6 V, allowable short-circuit duration is 1.5 ms.
- (4) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PC board.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾⁽²⁾	±2000	V
	Machine model (MM) ⁽³⁾	±200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) Human Body Model: 1.5 kΩ in series with 100 pF.
- (3) Machine Model: 0 Ω in series with 200 pF.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Temperature ⁽¹⁾	-40	85	°C
Supply voltage (V ⁺ - V ⁻)	2.7	12	V

- (1) The maximum power dissipation is a function of T_{J(MAX)}, R_{θJA}, and T_A. The maximum allowable power dissipation at any ambient temperature is P_D = (T_{J(MAX)} - T_A) / R_{θJA}. All numbers apply for packages soldered directly onto a PC board.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LPV511	UNIT
		DCK (SC70)	
		5 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	278	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	105.8	°C/W
R _{θJB}	Junction-to-board thermal resistance	56.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	3	°C/W
ψ _{JB}	Junction-to-board characterization parameter	55	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics: 3 V

Unless otherwise specified, all limits are specified for $T_J = 25^\circ\text{C}$, $V^+ = 3\text{ V}$, $V^- = 0\text{ V}$, $V_{\text{CM}} = V_O = V^+/2$, and $R_L = 100\text{ k}\Omega$ to $V^+/2$.⁽¹⁾

PARAMETER		TEST CONDITIONS		MIN ⁽²⁾	TYP ⁽³⁾	MAX ⁽²⁾	UNIT

			$T_J = -40^\circ\text{C}$ to 85°C	3.10			

- (1) Electrical table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device.
- (2) Limits are 100% production tested at 25°C . Limits over the operating temperature range are specified through correlations using the Statistical Quality Control (SQC) method.
- (3) Typical values represent the most likely parametric norm at the time of characterization.
- (4) Offset voltage drift is specified by design and/or characterization and is not tested in production. Offset voltage drift is determined by dividing the change in VOS at temperature extremes into the total temperature change.
- (5) Positive current corresponds to current flowing into the device.
- (6) The Short-Circuit Test is a momentary test. See Note 3 in [Absolute Maximum Ratings](#).
- (7) Slew rate is the average of the rising and falling slew rates.

Electrical Characteristics: 3 V (continued)

Unless otherwise specified, all limits are specified for $T_J = 25^\circ\text{C}$, $V^+ = 3\text{ V}$, $V^- = 0\text{ V}$, $V_{CM} = V_O = V^+/2$, and $R_L = 100\text{ k}\Omega$ to $V^+/2$.⁽¹⁾

7 Detailed Description

7.1 Overview

The LPV511 is a micropower operational amplifier that operates from a voltage supply range as wide as 2.7 V to 12 V with ensured specifications at 3 V, 5 V, and 12 V. The LPV511 exhibits an excellent speed-to-power ratio, drawing only 880 nA of supply current with a bandwidth of 27 kHz.

7.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

7.3 Feature Description

The LPV511 has a rail-to-rail input which provides more flexibility for the system designer. As can be seen from [Functional Block Diagram](#), rail-to-rail input is achieved by using in parallel, one PNP differential pair and one NPN differential pair. When the common mode input voltage (V_{CM}) is near V^+ , the NPN pair is on and the PNP pair is off. When V_{CM} is near V^- , the NPN pair is off and the PNP pair is on. When V_{CM} is between V^+ and V^- , internal logic decides how much current each differential pair will get. This special logic ensures stable and low distortion amplifier operation within the entire common mode voltage range.

7.4 Device Functional Modes

7.4.1 Input Stage

Because both input stages have their own offset voltage (V_{OS}) characteristic, the offset voltage of the LPV511 becomes a function of V_{CM} . V_{OS} has a crossover point at 1 V below V^+ . See the V_{OS} vs V_{CM} curve in [Typical Characteristics](#). Caution must be taken in situations where the input signal amplitude is comparable to the V_{OS} value and/or the design requires high accuracy. In these situations, it is necessary for the input signal to avoid the crossover point.

The input bias current, I_B will change in value and polarity as the input crosses the transition region. In addition, parameters such as PSRR and CMRR which involve the input offset voltage will also be affected by changes in V_{CM} across the differential pair transition region.

Differential input voltage is the difference in voltage between the noninverting (+) input and the inverting input (-) of the op amp. Due to the three series diodes across the two inputs, the absolute maximum differential input voltage is ± 2.1 V. This may not be a problem to most conventional op amp designs; however, designers **must avoid using the LPV511 as a comparator**.

Device Functional Modes (continued)

7.4.2 Output Stage

The LPV511 output voltage swing 100 mV from rails at 3-V supply, which provides the maximum possible dynamic range at the output. This is particularly important when operating on low supply voltages.

The LPV511 maximum output voltage swing defines the maximum swing possible under a particular output load. The LPV511 output swings 110 mV from the rail at 5-V supply with an output load of 100 k Ω .

7.4.3 Driving Capacitive Load

The LPV511 is internally compensated for stable unity gain operation, with a 27-kHz typical gain bandwidth. However, the unity gain follower is the most sensitive configuration to capacitive load. Direct capacitive loading reduces the phase margin of the op amp. When the output is required to drive a large capacitive load, greater than 100 pF, a small series resistor at the output of the amplifier improves the phase margin (see [Figure 27](#)).

In [Figure 27](#), the isolation resistor R_{ISO} and the load capacitor C_L form a pole to increase stability by adding more phase margin to the overall system. The desired performance depends on the value of R_{ISO} . The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. But the DC accuracy is degraded when the R_{ISO} gets bigger. If there were a load resistor in [Figure 27](#), the output voltage would be divided by R_{ISO} and the load resistor.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LPV511 is fabricated with Texas Instrument's state-of-the-art VIP50C process.

8.2 Typical Applications

8.2.1 Battery Current Sensing

The rail-to-rail common mode input range and the very low quiescent current make the LPV511 ideal to use in high-side and low-side battery current sensing applications. The high-side current sensing circuit in [Figure 28](#) is commonly used in a battery charger to monitor the charging current to prevent over charging. A sense resistor R_{SENSE} is connected to the battery directly.

Copyright © 2016, Texas Instruments Incorporated

Figure 28. High Side Current Sensing

8.2.1.1 Design Requirements

The high-side current-sensing circuit ([Figure 28](#)) is commonly used in a battery charger to monitor charging current to prevent overcharging. A sense resistor R_{SENSE} is connected to the battery directly. This system requires an op amp with rail-to-rail input. The LPV511 is ideal for this application because its common-mode input range extends up to the positive supply.

8.2.1.2 Detailed Design Procedure

As seen in [Figure 28](#), the I_{CHARGE} current flowing through sense resistor R_{SENSE} develops a voltage drop equal to V_{SENSE} . The voltage at the negative sense point will now be less than the positive sense point by an amount proportional to the V_{SENSE} voltage.

The low-bias currents of the LPV511 cause little voltage drop through R_2 , so the negative input of the LPV511 amplifier is at essentially the same potential as the negative sense input.

The LPV511 will detect this voltage error between its inputs and servo the transistor base to conduct more current through Q1, increasing the voltage drop across R_1 until the LPV511 inverting input matches the noninverting input. At this point, the voltage drop across R_1 now matches V_{SENSE} .

I_G , a current proportional to I_{CHARGE} , will flow according to the following relation to:

$$I_G = V_{R_{SENSE}} / R_1 = (R_{SENSE} \times I_{CHARGE}) / R_1 \quad (1)$$

Typical Applications (continued)

I_G also flows through the gain resistor R_3 developing a voltage drop equal to:

$$V_3 = I_G \times R_3 = (V_{RSENSE} / R_1) \times R_3 = ((R_{SENSE} \times I_{CHARGE}) / R_2) \times R_3 \quad (2)$$

$$V_{OUT} = (R_{SENSE} \times I_{CHARGE}) \times G$$

where

- $G = R_3 / R_1$ (3)

8.2.1.3 Application Curve

Figure 29 shows the results of the example current sense circuit.

The error after 4 V where transistor Q1 runs out of headroom and saturates, limiting the upper output swing.

Figure 29. Current Sense Amplifier Results

8.2.2 Summing Amplifier

The LPV511 operational amplifier is a perfect fit in a summing amplifier circuit because of the rail-to-rail input and output and the sub-micro Amp quiescent current. In this configuration, the amplifier outputs the sum of the three input voltages.

Equation 4 shows the ratio of the sum and the output voltage is defined using feedback and input resistors.

$$V_{OUT} = R_F \left(\frac{V_{REF} - V_1}{R_1} + \frac{V_{REF} - V_2}{R_2} + \frac{V_{REF} - V_3}{R_3} \right) + V_{REF} \quad (4)$$

Copyright © 2016, Texas Instruments Incorporated

Figure 30. Summing Amplifier Circuit

8.3 Dos and Don'ts

Do properly bypass the power supplies.

Do add series resistance to the output when driving capacitive loads, particularly cables, Muxes and ADC inputs.

Do add series current limiting resistors and external Schottky clamp diodes if input voltage is expected to exceed the supplies. Limit the current to 1 mA or less (1 kΩ per volt).

9 Power Supply Recommendations

The LPV80x is specified for operation from 1.6 V to 5.5 V (± 0.8 V to ± 2.75 V) over a -40°C to 125°C temperature range. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the [Electrical Characteristics: 3 V](#).

CAUTION

Supply voltages larger than 13.2 V can permanently damage the device.

For proper operation, the power supplies must be properly decoupled. For decoupling the supply lines it is suggested that 100 nF capacitors be placed as close as possible to the operational amplifier power supply pins. For single supply, place a capacitor between V^+ and V^- supply leads. For dual supplies, place one capacitor between V^+ and ground, and one capacitor between V^- and ground.

Low bandwidth nanopower devices do not have good high frequency (> 1 kHz) AC PSRR rejection against high-frequency switching supplies and other 1 kHz and above noise sources, so extra supply filtering is recommended if kilohertz or above noise is expected on the power supply lines.

10 Layout

10.1 Layout Guidelines

- The V^+ pin should be bypassed to ground with a low-ESR capacitor.
- The optimum placement is closest to the V^+ and ground pins.
- Take care to minimize the loop area formed by the bypass capacitor connection between V^+ and ground.
- The ground pin should be connected to the PCB ground plane at the pin of the device.
- The feedback components should be placed as close to the device as possible minimizing strays.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
