

11.3 Gbps Limiting Amplifier

Check for Samples: ONET1151P

FEATURES

- Up to 11.3 Gbps Operation
- Two-Wire Digital Interface
- Adjustable LOS Threshold
- Digitally Selectable Output Voltage
- Digitally Selectable Output De-Emphasis
- Adjustable Input Threshold Voltage
- Output Polarity Select
- Programmable LOS Masking Time
- Input Offset Cancellation
- CML Data Outputs with On-Chip 50- Ω Back-Termination to VCC
- Single +3.3-V Supply
- Low Power Consumption

Output Disable

- Surface Mount Small Footprint 3 mm x 3 mm 16-Pin RoHS Compliant QFN Package
- Pin Compatible to the ONET8501PB

APPLICATIONS

- 10 Gigabit Ethernet Optical Receivers
- 2x/4x/8x and 10x Fibre Channel Optical Receivers
- SONET OC-192/SDH-64 Optical Receivers
- SFP+ and XFP Transceiver Modules
- Cable Driver and Receiver

DESCRIPTION

The ONET1151P is a high-speed, 3.3-V limiting amplifier for multiple fiber optic and copper cable applications with data rates up to 11.3 Gbps.

The device provides a two-wire serial interface which allows digital control of the output amplitude, output preemphasis, input threshold voltage (slice level) and the loss of signal assert level.

The ONET1151P provides a gain of about 33dB which ensures a fully differential output swing for input signals as low as 20 mV $_{p-p}$. The output amplitude can be adjusted between 350 mV $_{p-p}$ and 850 mV $_{p-p}$. To compensate for frequency dependent loss of microstrips or striplines connected to the output of the device, programmable deemphasis is included in the output stage. A settable loss of signal (LOS) detection with programmable output masking time and output disable are also provided.

The part, available in RoHS compliant small footprint 3 mm x 3 mm 16-pin QFN package, typically dissipates 132 mW with 550 mV_{p-p} output and is characterized for operation from -40°C to 100°C.

SLLSEH8 -SEPTEMBER 2013 www.ti.com

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

BLOCK DIAGRAM

A simplified block diagram of the ONET1151P is shown in Figure 1.

This compact, low power 11.3 Gbps limiting amplifier consists of a high-speed data path with offset cancellation block (DC feedback) combined with an analog settable input threshold adjust, a loss of signal detection block using 2 peak detectors, a two-wire interface with a control-logic block and a bandgap voltage reference and bias current generation block.

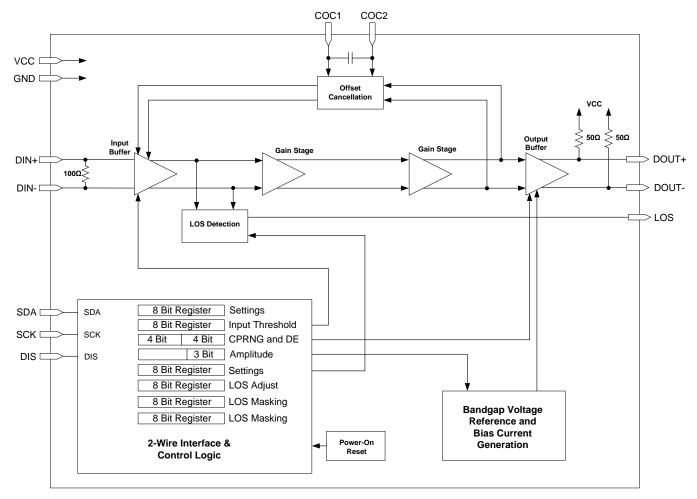

Figure 1. Simplified Block Diagram of the ONET1151P

PACKAGE

The ONET1151P is available in a small footprint 3 mm \times 3 mm 16-pin RoHS compliant QFN package with a lead pitch of 0.5 mm. The pinout is shown in Figure 2.

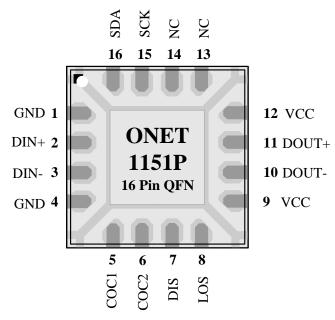

Figure 2. Pinout of ONET1151P in a 3mm x 3mm 16-Pin QFN Package (Top View)

Table 1. PIN DESCRIPTIONS

| | PIN | TVDE | DECORPTION | | | | | |
|-------|----------|-------------------|--|--|--|--|--|--|
| NAME | NO. | TYPE | DESCRIPTION | | | | | |
| GND | 1, 4, EP | Supply | Circuit ground. Exposed die pad (EP) must be grounded. | | | | | |
| DIN+ | 2 | Analog-input | Non-inverted data input. Differentially 100 Ω terminated to DIN–. | | | | | |
| DIN- | 3 | Analog-input | Inverted data input. Differentially 100 Ω terminated to DIN+. | | | | | |
| COC1 | 5 | Analog | Offset cancellation filter capacitor plus terminal. An external capacitor can be connected between this pin and COC2 to reduce the low frequency cutoff. To disable the offset cancellation loop, connect COC1 and COC2 together. | | | | | |
| COC2 | 6 | Analog | Offset cancellation filter capacitor minus terminal. An external capacitor can be connected between this pin and COC1 to reduce the low frequency cutoff. To disable the offset cancellation loop, connect COC1 and COC2 together. | | | | | |
| DIS | 7 | Digital-input | Disables the output stage when set to a high level. | | | | | |
| LOS | 8 | Open drain MOS | High level indicates that the input signal amplitude is below the programmed threshold level. Open drain output. Requires an external $10k\Omega$ pull-up resistor to VCC for proper operation. | | | | | |
| VCC | 9, 12 | Supply | 3.3-V supply voltage. | | | | | |
| DOUT- | 10 | CML-out | Inverted data output. On-chip 50 Ω back-terminated to VCC. | | | | | |
| DOUT+ | 11 | CML-out | Non-inverted data output. On-chip 50 Ω back-terminated to VCC. | | | | | |
| NC | 13, 14 | No Connect | Do not connect | | | | | |
| SCK | 15 | Digital-input | Serial interface clock input. Connect a pull-up resistor (10 kΩ typical) to VCC. | | | | | |
| SDA | 16 | Digital-input | Serial interface data input. Connect a pull-up resistor (10 kΩ typical) to VCC. | | | | | |

SLLSEH8 -SEPTEMBER 2013 www.ti.com

DETAILED DESCRIPTION

HIGH-SPEED DATA PATH

The high-speed data signal is applied to the data path by means of input signal pins DIN+ / DIN–. The data path consists of a $100-\Omega$ differential termination resistor followed by an input buffer. A gain stage and an output buffer stage follow the input buffer, which together provide a gain of 33dB. The device can accept input amplitude levels from $6mV_{p-p}$ up to $2000mV_{p-p}$. The amplified data output signal is available at the output pins DOUT+ / DOUT– which include on-chip $2 \times 50-\Omega$ back-termination to VCC.

Offset cancellation compensates for internal offset voltages and thus ensures proper operation even for very small input data signals. The offset cancellation can be disabled so that the input threshold voltage can be adjusted to optimize the bit error rate or change the eye crossing to compensate for input signal pulse width distortion. The offset cancellation can be disabled by setting OCDIS = 1 (bit 1 of register 0). The input threshold level can be adjusted using register settings THADJ[0..7] (register 1). When register 1 is set to 0x00, the threshold adjustment circuitry is disabled to reduce the supply current. Setting register 1 to any other value will enable the circuitry and the supply current will increase by approximately 2 mA. The amount of adjustment that register 1 can provide is controlled by the CPRNG[1..0] bits (register 2). For details regarding input threshold adjust and range, see Table 12.

The low frequency cutoff is as low as 80 kHz with the built-in filter capacitor. For applications, which require even lower cutoff frequencies, an additional external filter capacitor may be connected to the COC1 and COC2 pins. A value of 330 pF results in a low frequency cutoff of 10 kHz.

The receiver can be optimized for various applications using the settings in register 7. To enable the settings, set the SEL bit (bit 7 of register 7) to 1. It is recommended that the BIAS bit (bit 0 of register 7) be set to 1, especially if the input voltage to the ONET1151P will exceed about 500 mV_{p-p} differential. Setting BIAS to 1 adds 2 mA of bias current to the input stage, making it more robust for high input voltages. For input voltages lower than 500 mV_{p-p}, as typically would be supplied from a transimpedance amplifier (TIA), BIAS can be set to 0 to reduce the supply current. In addition, the RXOPT[1..0] bits (register 7) can be used to optimize the jitter based upon the TIA that is used. When RXOPT is set to 00, there is some input equalization set at the input to the limiting amplifier. This is a good general setting to use and for most applications it is recommended to set register 7 to 0x81. If the input voltage to the limiting amplifier does not exceed about 500 mV_{p-p} differential, then the jitter may be reduced by setting register 7 to 0x85.

BANDGAP VOLTAGE AND BIAS GENERATION

The ONET1151P limiting amplifier is supplied by a single +3.3-V supply voltage connected to the VCC pins. This voltage is referred to ground (GND).

On-chip bandgap voltage circuitry generates a reference voltage, independent of supply voltage, from which all other internally required voltages and bias currents are derived.

HIGH-SPEED OUTPUT BUFFER

The output amplitude of the buffer can be varied from 350 mV_{p-p} to 850 mV_{p-p} using the register settings AMP[0..2] (register 3) via the serial interface. The default amplitude setting is AMP[0..2] = 010 which provides 550 mV_{p-p} differential output voltage. To compensate for frequency dependant losses of transmission lines connected to the output, the ONET1151P has adjustable de-emphasis of the output stage. The de-emphasis can be set from 0 to 8dB in 1dB steps using register settings DEADJ[0..3] (register 2).

In addition, the polarity of the output pins can be inverted by setting the output polarity switch bit, POL (bit 4 of register 0) to 1.

Product Folder Links: ONET1151P

LOSS OF SIGNAL DETECTION

The loss of signal detection is done by 2 separate level detectors to cover a wide dynamic range. The peak values of the input signal and the output signal of the gain stage are monitored by the peak detectors. The peak values are compared to a pre-defined loss of signal threshold voltage inside the loss of signal detection block. As a result of the comparison, the LOS signal, which indicates that the input signal amplitude is below the defined threshold level, is generated. The LOS assert level is settable through the serial interface. There are 2 LOS ranges settable with the LOSRNG bit (bit 2 register 0). By setting LOSRNG = 1, the high range of the LOS assert values are used (35 mV_{p-p} to 80 mV_{p-p}) and by setting LOSRNG = 0, the low range of the LOS assert values are used (15 mV_{p-p} to 35 mV_{p-p}).

There are 128 possible internal LOS settings (7bit) for each LOS range to adjust the LOS assert level. If the LOS register selection bit is set low, LOSSEL = 0 (bit 7 of register 11), then the default LOS assert level of approximately 25 mV_{p-p} is used. If the register selection bit is set high, LOSSEL = 1 (bit 7 of register 11), then the content of LOS[0..6] (register 11) is used to set the LOS assert level.

An LOS output masking time can be enabled on the raising and falling edges of the LOS output signal. The LOS rising edge masking time is enabled by setting LOSTMRENA = 1 (bit 7 of register 13) and the time programmed using LOSTMR[0..6] (register 13). The LOS falling edge masking time is enabled by setting LOSTMFENA = 1 (bit 7 of register 12) and the time programmed using LOSTMF[0..6] (register 12). This feature is used to mask a false input to the limiting amplifier after a loss of signal has occurred or when the input signal is re-applied. The masking time can be set from 10 μ s to 2 ms.

2-WIRE INTERFACE AND CONTROL LOGIC

The ONET1151P uses a 2-wire serial interface for digital control. The two circuit inputs, SDA and SCK, are driven, respectively, by the serial data and serial clock from a microcontroller, for example. Both inputs include $100-k\Omega$ pull-up resistors to VCC. For driving these inputs, an open drain output is recommended.

The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out control and status signals. The ONET1151P is a slave device only which means that it can not initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. The protocol for a data transmission is as follows:

- START command
- 2. 7 bit slave address (1000100) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ.
- 3. 8-bit register address
- 4. 8-bit register data word
- 5. STOP command

Regarding timing, the ONET1151P is I²C compatible. The typical timing is shown in Figure 3 and complete data transfer is shown in Figure 4. Parameters for Figure 3 are defined in Table 2.

Bus Idle: Both SDA and SCK lines remain HIGH.

Start Data Transfer: A change in the state of the SDA line, from HIGH to LOW, while the SCK line is HIGH, defines a START condition (S). Each data transfer is initiated with a START condition.

Stop Data Transfer: A change in the state of the SDA line from LOW to HIGH while the SCK line is HIGH defines a STOP condition (P). Each data transfer is terminated with a STOP condition; however, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

Data Transfer: Only one data byte can be transferred between a START and a STOP condition. The receiver acknowledges the transfer of data.

Product Folder Links: ONET1151P

Acknowledge: Each receiving device, when addressed, is obliged to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver doesn't acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition.

| | 1 | AMP1 | 000 = 350 mV _{p-p} , 001 = 450 mV _{p-p} , 010 = 550 mV _{p-p} (default), 011 = 600 mV _{p-p} | | | | | |
| | 0 | AMP0 | $100 = 650 \text{ mV}_{p-p}, 101 = 700 \text{ mV}_{p-p}, 110 = 750 \text{ mV}_{p-p}, 111 = 850 \text{ mV}_{p-p}$ | | | | | |

STRUMENTS

Table 12. Register Functionality (continued)

| Register | Bit | Symbol | Function |
|----------|-----|-----------|---|
| | 7 | SEL | Receiver Optimization: 1 = Content of register used to optimize the receiver 0 = Default receiver settings |
| | 6 | - | |
| | 5 | - | |
| _ | 4 | - | |
| 7 | 3 | RXOPT1 | 00 = Some input equalization (recommended) |
| | 2 | RXOPT0 | 01 = Reduced input equalization |
| | 1 | - | |
| | 0 | BIAS | Bias current for input stage control bit: 1 = Add 2 mA extra bias current to the input stage (recommended). 0 = Default |
| | 7 | LOSSEL | LOS assert level: |
| | 6 | LOSA6 | LOSSEL = 1 |
| | 5 | LOSA5 | Content of register bits 6 to 0 is used to select the LOS assert level |
| 4.4 | 4 | LOSA4 | Minimum LOS assert level for 0000000 |
| 11 | 3 | LOSA3 | Maximum LOS assert level for 1111111 |
| | 2 | LOSA2 | LOSASEL = 0 |
| | 1 | LOSA1 | Default LOS assert level of 25 mV _{p-p} is used |
| | 0 | LOSA0 | |
| | 7 | LOSTMFENA | Falling edge LOS mask enable and duration: |
| | 6 | LOSTMF6 | LOSTMFENA = 1 enables falling edge LOS masking |
| | 5 | LOSTMF5 | LOSTMFENA = 0 disables falling edge LOS masking |
| 12 | 4 | LOSTMF4 | Mask time < 10 μs for 000000 |
| 12 | 3 | LOSTMF3 | Mask time > 2 ms for 111111 |
| | 2 | LOSTMF2 | |
| | 1 | LOSTMF1 | |
| | 0 | LOSTMF0 | |
| | 7 | LOSTMRENA | Rising edge LOS mask enable and duration: |
| | 6 | LOSTMR6 | LOSTMRENA = 1 enables rising edge LOS masking |
| | 5 | LOSTMR5 | LOSTMRENA = 0 disables rising edge LOS masking |
| 13 | 4 | LOSTMR4 | Mask time < 10 μs for 000000 |
| 15 | 3 | LOSTMR3 | Mask time > 2 ms for 111111 |
| | 2 | LOSTMR2 | |
| | 1 | LOSTMR1 | |
| | 0 | LOSTMR0 | |
| | - | - | Selected LOS assert level (read only) |
| | 6 | SELLOS6 | |
| | 5 | SELLOS5 | |
| 15 | 4 | SELLOS4 | |

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

PLASTIC QUAD FLATPACK - NO LEAD

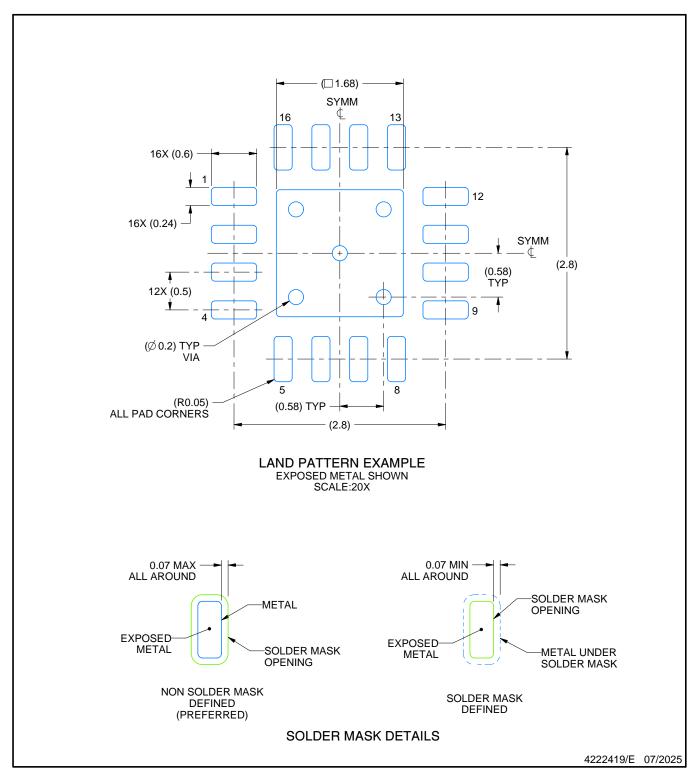

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC QUAD FLATPACK - NO LEAD

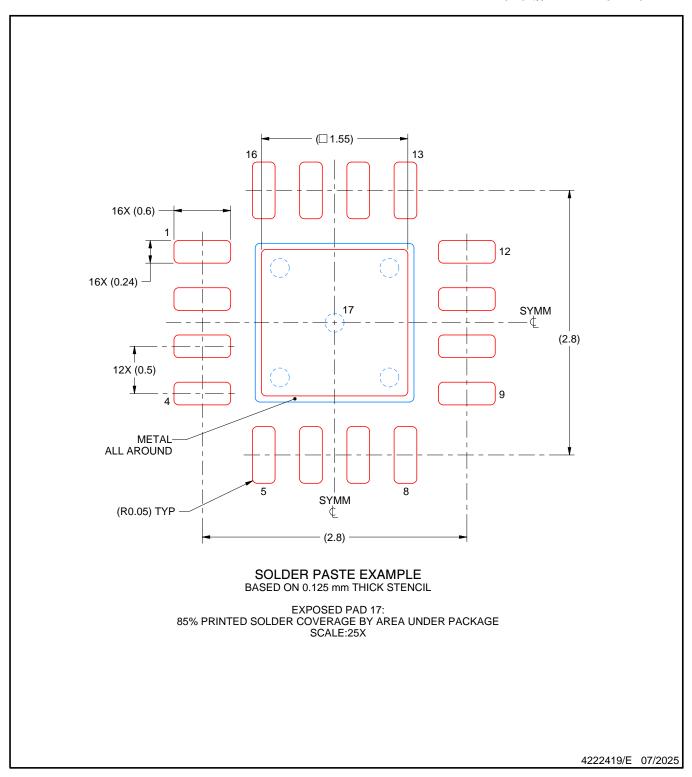

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource.
