

# Low-Noise, High-Speed, 16-Bit Accurate, CMOS OPERATIONAL AMPLIFIER

## FEATURES

- High Bandwidth: 150MHz
- 16-Bit Settling in 150ns
- Low Noise:  $3nV/\sqrt{Hz}$
- Low Distortion: 0.003%
- Low Power: 9.5mA (typ) on 5.5V
- Shutdown to  $5\mu A$
- Unity-Gain Stable
- Excellent Output Swing:  
(V+) – 100mV to (V–) + 100mV
- Single Supply: +2.7V to +5.5V
- Tiny Packages: MSOP and SOT23

## APPLICATIONS

- 16-Bit ADC Input Drivers
- Low-Noise Preamplifiers
- IF/RF Amplifiers
- Active Filtering

## DESCRIPTION

The OPA300 and OPA301 series high-speed, voltage-feedback, CMOS operational amplifiers are designed for 16-bit resolution systems. The OPA300/OPA301 series are unity-gain stable and feature excellent settling and harmonic distortion specifications. Low power applications benefit from low quiescent current. The OPA300 and OPA2300 feature a digital shutdown (Enable) function to provide additional power savings during idle periods. Optimized for single-supply operation, the OPA300/OPA301 series offer superior output swing and excellent common-mode range.

The OPA300 and OPA301 series op amps have 150MHz of unity-gain bandwidth, low  $3nV/\sqrt{Hz}$  voltage noise, and 0.1% settling within 30ns. Single-supply operation from 2.7V ( $\pm 1.35V$ ) to 5.5V ( $\pm 2.75V$ ) and an available shutdown function that reduces supply current to  $5\mu A$  are useful for portable low-power applications. The OPA300 and OPA301 are available in SO-8 and SOT-23 packages. The OPA2300 is available in MSOP-10, and the OPA2301 is available in SO-8 and MSOP-8. All versions are specified over the industrial temperature range of  $-40^{\circ}C$  to  $+125^{\circ}C$ .

Typical Application

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

**PACKAGE/ORDERING INFORMATION(1)**

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	PACKAGE MARKING
OPA300	SO-8	D	300A
OPA300	SOT23-6	DBV	A52
OPA301	SO-8	D	301A
OPA301	SOT23-5	DBV	AUP
OPA2300	MSOP-10	DGS	C01
OPA2301	SO-8	D	OPA2301A
OPA2301	MSOP-8	DGK	OAWM

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at [www.ti.com](http://www.ti.com).

**ABSOLUTE MAXIMUM RATINGS**

over operating free-air temperature range unless otherwise noted(1)

Power Supply V+	7V
Signal Input Terminals(2), Voltage	0.5V to (V+) + 0.5V
Current	±10mA
Open Short-Circuit Current(3)	Continuous
Operating Temperature Range	-55°C to +125°C
Storage Temperature Range	-60°C to +150°C
Junction Temperature	+150°C
ESD Ratings	
Human Body Model (HBM)	4kV
Charged-Device Model (CDM)	500V

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) Input terminals are diode clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current limited to 10mA or less.
- (3) Short-circuit to ground; one amplifier per package.

**ELECTROSTATIC DISCHARGE SENSITIVITY**

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**PIN ASSIGNMENTS**

**ELECTRICAL CHARACTERISTICS:  $V_S = 2.7V$  to  $5.5V$**

**Boldface** limits apply over the temperature range,  $T_A = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ .

All specifications at  $T_A = +25^\circ\text{C}$ ,  $R_L = 2k\Omega$  connected to  $V_S/2$ ,  $V_{OUT} = V_S/2$ , and  $V_{CM} = V_S/2$ , unless otherwise noted.

## TYPICAL CHARACTERISTICS

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{V}$ , and  $R_L = 150\Omega$  connected to  $V_S/2$  unless otherwise noted.

## TYPICAL CHARACTERISTICS (continued)

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{V}$ , and  $R_L = 150\Omega$  connected to  $V_S/2$  unless otherwise noted.

## TYPICAL CHARACTERISTICS (continued)

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{V}$ , and  $R_L = 150\Omega$  connected to  $V_S/2$  unless otherwise noted.

## TYPICAL CHARACTERISTICS (continued)

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{V}$ , and  $R_L = 150\Omega$  connected to  $V_S/2$  unless otherwise noted.

## TYPICAL CHARACTERISTICS (continued)

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{V}$ , and  $R_L = 150\Omega$  connected to  $V_S/2$  unless otherwise noted.

## TYPICAL CHARACTERISTICS (continued)

All specifications at  $T_A = 25^\circ\text{C}$ ,  $V_S = 5\text{V}$ , and  $R_L = 150\Omega$  connected to  $V_S/2$  unless otherwise noted.

## APPLICATIONS INFORMATION

The OPA300 and OPA301 series of single-supply CMOS op amps are designed to interface with high-speed 16-bit analog-to-digital converters (ADCs). Featuring wide 150MHz bandwidth, fast 150ns settling time to 16 bits, and high open loop gain, this series offers excellent performance in a small SO-8 and tiny SOT23 packages.

## THEORY OF OPERATION

The OPA300 and OPA301 series op amps use a classic two-stage topology, shown in Figure 1. The differential input pair is biased to maximize slew rate without compromising stability or bandwidth. The folded cascode adds the signal from the input pair and presents a differential signal to the class AB output stage. The class AB output stage allows rail-to-rail output swing, with high-impedance loads ( $> 2k\Omega$ ), typically 100mV from the supply rails. With  $10\Omega$  loads, a useful output swing can be achieved and still maintain high open-loop gain. See the typical characteristic *Output Voltage Swing vs Output Current*.

Figure 1. OPA30x Classic Two-Stage Topology

## OPERATING VOLTAGE

OPA300/OPA301 series op amp parameters are fully specified from +2.7V to +5.5V. Supply voltages higher than 5.5V (absolute maximum) can cause permanent damage to the amplifier. Many specifications apply from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . Parameters that vary significantly with operating voltages or temperature are shown in the Typical Characteristics.

## PCB LAYOUT

As with most high-speed operational amplifiers, board layout requires special attention to maximize AC and DC performance. Extensive use of ground planes, short lead lengths, and high-quality bypass capacitors will minimize leakage that can compromise signal quality. Guard rings applied with potential as near to the input pins as possible help minimize board leakage.

## INPUT AND ESD PROTECTION

All OPA300/OPA301 series op amps' pins are static-protected with internal ESD protection diodes tied to the supplies, as shown in Figure 2. These diodes will provide overdrive protection if the current is externally limited to 10mA, as stated in the Absolute Maximum Ratings. Any input current beyond the Absolute Maximum Ratings, or long-term operation at maximum ratings, will shorten the lifespan of the amplifier.

Figure 2. ESD Protection Diodes

## ENABLE FUNCTION

The shutdown function of the OPA300 and OPA2300 is referenced to the negative supply voltage of the operational amplifier. A logic level HIGH enables the op amp. A valid logic HIGH is defined as 2.5V above the negative supply applied to the enable pin. A valid logic LOW is defined as  $< 0.8\text{V}$  above the negative supply pin. If dual or split power supplies are used, care should be taken to ensure logic input signals are properly referred to the negative supply voltage. If this pin is not connected to a valid high or low voltage, the internal circuitry will pull the node high and enable the part to function.

The logic input is a high-impedance CMOS input. For battery-operated applications, this feature may be used to greatly reduce the average current and extend battery life. The enable time is  $10\mu\text{s}$ ; disable time is  $1\mu\text{s}$ . When disabled, the output assumes a high-impedance state. This allows the OPA300 to be operated as a gated amplifier, or to have its output multiplexed onto a common analog output bus.

## DRIVING CAPACITIVE LOADS

When using high-speed operational amplifiers, it is extremely important to consider the effects of capacitive loading on amplifier stability. Capacitive loading will interact with the output impedance of the operational amplifier, and depending on the capacitor value, may significantly decrease the gain bandwidth, as well as introduce peaking. To reduce the effects of capacitive loading and allow for additional capacitive load drive, place a series resistor between the output and the load. This will reduce available bandwidth, but permit stable operation with capacitive loading. Figure 3 illustrates the recommended relationship between the resistor and capacitor values.

Figure 3. Recommended  $R_S$  and  $C_L$  Combinations

Amplifiers configured in unity gain are most susceptible to stability issues. The typical characteristic, *Frequency Response vs Capacitive Load*, describes the relationship between capacitive load and stability for the OPA300/OPA301 series. In unity gain, the OPA300/OPA301 series is capable of driving a few picofarads of capacitive load without compromising stability. Board level parasitic capacitance can often fall into the range of a picofarad or more, and should be minimized through good circuit-board layout practices to avoid compromising the stability of the OPA300/OPA301. For more information on detecting parasitics during testing, see the Application Note *Measuring Board Parasitics in High-Speed Analog Design* (SBOA094), available at the TI web site [www.ti.com](http://www.ti.com).

## DRIVING A 16-BIT ADC

The OPA300/OPA301 series feature excellent THD+noise, even at frequencies greater than 1MHz, with a 16-bit settling time of 150ns. Figure 4 shows a total single supply solution for high-speed data acquisition. The OPA300/OPA301 directly drives the ADS8401, a 1.25 mega sample per second (MSPS) 16-bit data converter. The OPA300/OPA301 is configured in an inverting gain of 1, with a 5V single supply. Results of the OPA300/OPA301 performance are summarized in Table 1.

Figure 4. The OPA30x Drives the 16-Bit ADS8401

PARAMETER	RESULTS (f = 10kHz)
THD	-99.3dB
SFDR	101.2dB
THD+N	84.2dB
SNR	84.3dB

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

# PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

4214862/A 04/2023

**NOTES:**

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.
