

# PCA9539 割り込み出力 / リセット / コンフィギュレーション・レジスタ付き、 リモート 16 ビット I<sup>2</sup>C/SMBus 低消費電力 I/O エクスパンダ

## 1 特長

- 低いスタンバイ時消費電流: 1 $\mu$ A 以下
- I<sup>2</sup>C からパラレル・ポートへのエクスパンダ
- オープン・ドレインのアクティブ LOW 割り込み出力
- アクティブ LOW のリセット入力
- 5V 許容の I/O ポート
- ほとんどのマイクロコントローラと互換
- 400kHz の高速 I<sup>2</sup>C バス
- 極性反転レジスタ
- 2 本のハードウェア・アドレス・ピンにより、4 つまでのデバイスをアドレス指定可能
- 大電流の駆動能力を持つラッチ付き出力により、LED を直接駆動
- JESD 78、Class II 準拠で 100mA 超のラッチアップ性能
- JESD 22 を超える ESD 保護
  - 2000V、人体モデル (A114-A)
  - 1000V、デバイス帯電モデル (C101)

## 2 概要

この 2 線式双方向バス (I<sup>2</sup>C) 用 16 ビット I/O エクスパンダは、2.3V~5.5V の V<sub>CC</sub> で動作するように設計されています。I<sup>2</sup>C インターフェイス [シリアル・クロック (SCL)、シリアル・データ (SDA)] により、ほとんどのマイクロコントローラ・ファミリの汎用リモート I/O 拡張に使用できます。

PCA9539 は、構成 (入力 / 出力選択)、入力ポート、出力ポート、極性反転 (アクティブ HIGH またはアクティブ LOW 動作) 用の 8 ビット・レジスタをそれぞれ 2 個ずつ搭載しています。電源オン時に、I/O は入力として構成されます。システム・マスタは、I/O 構成ビットに書き込むことで、I/O を入力または出力として有効にできます。それぞれの入力または出力のデータは、対応する入力または出力レジスタに保持されます。入力ポート・レジスタの極性は、極性反転レジスタで反転できます。すべてのレジスタをシステム・マスタで読み出すことができます。

## 4 概要 (続き)

システム・マスタは、タイムアウトまたはその他の不適切な動作の場合、 $\overline{\text{RESET}}$  入力を **LOW** にアサートすることで PCA9539 をリセットできます。パワーオン・リセットにより、レジスタはデフォルト状態に戻り、 $\text{I}^2\text{C}/\text{SMBus}$  ステート・マシンが初期化されます。 $\overline{\text{RESET}}$  をアサートしても同じリセットと初期化が行われ、デバイスの電源はオフになりません。

PCA9539 のオープン・ドレイン割り込み ( $\overline{\text{INT}}$ ) 出力は、いずれかの入力の状態が、対応する入力ポート・レジスタの状態と異なっている場合にアクティブになるため、入力状態が変化したことをシステム・マスタに示すために使用されます。

$\overline{\text{INT}}$  はマイクロコントローラの割り込み入力に接続できます。この配線で割り込み信号を送ることでリモート I/O は、 $\text{I}^2\text{C}$  バス経由で通信しなくてもポート上に受信データが存在するかどうかをマイクロコントローラに通知できます。そのため、PCA9539 はシンプル・スレーブ・デバイスとして機能できます。

本デバイスの出力 (ラッチ付き) は大電流駆動能力を備えているため、LED を直接駆動できます。本デバイスは低消費電流です。

PCA9539 は、内部 I/O プルアップ抵抗が除去されていること、A2 が  $\overline{\text{RESET}}$  に置き換わっていること、アドレス範囲が異なることを除いて PCA9555 と同じです。内部 I/O プルアップ抵抗の除去により、I/O を **LOW** に保持する際の消費電力が大幅に低減されています。

2 本のハードウェア・ピン (A0、A1) を使って固定  $\text{I}^2\text{C}$  アドレスをプログラムおよび変更することで、最大 4 つのデバイスが同じ  $\text{I}^2\text{C}$  バスまたは SMBus を共有できます。

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage range	-0.5	6	V
V <sub>I</sub>	Input voltage range <sup>(2)</sup>	-0.5	6	V
V <sub>O</sub>	Output voltage range <sup>(2)</sup>	-0.5	6	V
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> < 0	-20	mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> < 0	-20	mA
I <sub>IOK</sub>	Input/output clamp current	V <sub>O</sub> < 0 or V <sub>O</sub> > V <sub>CC</sub>	±20	mA
I <sub>OL</sub>	Continuous output low current	V <sub>O</sub> = 0 to V <sub>CC</sub>	50	mA
I <sub>OH</sub>	Continuous output high current	V <sub>O</sub> = 0 to V <sub>CC</sub>	-50	mA
I <sub>CC</sub>	Continuous current through GND		-250	mA

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

### 6.2 ESD Ratings

			MIN	MAX	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	0	2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	0	1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

C <sub>io</sub>	SDA	V <sub>IO</sub> = V <sub>CC</sub> or GND	2.3 V to 5.5 V		3	9.5	pF
	P port				3.7	9.5	

(1) All typical values are at nominal supply voltage (2.5-V, 3.3-V, or 5-V V<sub>CC</sub>) and T<sub>A</sub> = 25°C.

(2) Each I/O must be externally limited to a maximum of 25 mA, and each octal (P07–P00 and P17–P10) must be limited to a maximum current of 100 mA, for a device total of 200 mA.

(3) The total current sourced by all I/Os must be limited to 160 mA (80 mA for P07–P00 and 80 mA for P17–P10).

(4) RESET = V<sub>CC</sub> (held high) when all other input voltages, V<sub>I</sub> = GND.

**8-1. Logic Diagram (Positive Logic)**

A. At power-on reset, all registers return to default values.

 **8-2. Simplified Schematic Of P-Port I/Os**

## 8.2 Device Functional Modes

### 8.2.1 RESET Input

A reset can be accomplished by holding the  $\overline{\text{RESET}}$  pin low for a minimum of  $t_{W}$ . The PCA9539 registers and I<sup>2</sup>C/SMBus state machine are held in their default states until  $\overline{\text{RESET}}$  is once again high. This input requires a pullup resistor to  $V_{CC}$ , if no active connection is used.

#### 8.2.1.1 $\overline{\text{RESET}}$ Errata

If  $\overline{\text{RESET}}$  voltage set higher than  $V_{CC}$ , current will flow from  $\overline{\text{RESET}}$  pin to  $V_{CC}$  pin.

##### 8.2.1.1.1 System Impact

$V_{CC}$  will be pulled above its regular voltage level

##### 8.2.1.1.2 System Workaround

Design such that  $\overline{\text{RESET}}$  voltage is same or lower than  $V_{CC}$

### 8.2.2 Power-On Reset

When power (from 0 V) is applied to  $V_{CC}$ , an internal power-on reset holds the PCA9539 in a reset condition until  $V_{CC}$  has reached  $V_{POR}$ . At that point, the reset condition is released and the PCA9539 registers and I<sup>2</sup>C/SMBus state machine initialize to their default states. After that,  $V_{CC}$  must be lowered to below 0.2 V and then back up to the operating voltage for a power-reset cycle.

### 8.2.3 I/O Port

When an I/O is configured as an input, FETs Q1 and Q2 (in [Figure 8-2](#)) are off, which creates a high-impedance input. The input voltage may be raised above  $V_{CC}$  to a maximum of 5.5 V.

If the I/O is configured as an output, Q1 or Q2 is enabled, depending on the state of the Output Port register. In this case, there are low-impedance paths between the I/O pin and either  $V_{CC}$  or GND. The external voltage applied to this I/O pin should not exceed the recommended levels for proper operation.

### 8.2.4 Interrupt ( $\overline{\text{INT}}$ ) Output

An interrupt is generated by any rising or falling edge of the port inputs in the input mode. After time,  $t_{iv}$ , the signal  $\overline{\text{INT}}$  is valid. Resetting the interrupt circuit is achieved when data on the port is changed to the original setting, data is read from the port that generated the interrupt. Resetting occurs in the read mode at the acknowledge (ACK) or not acknowledge (NACK) bit after the rising edge of the SCL signal.

Interrupts that occur during the ACK or NACK clock pulse can be lost (or be very short) due to the resetting of the interrupt during this pulse. Each change of the I/Os after resetting is detected and is transmitted as  $\overline{\text{INT}}$ . Writing to another device does not affect the interrupt circuit, and a pin configured as an output cannot cause an interrupt. Changing an I/O from an output to an input may cause a false interrupt to occur, if the state of the pin does not match the contents of the Input Port register. Because each 8-pin port is read independently, the interrupt caused by port 0 is not cleared by a read of port 1 or vice versa.

The  $\overline{\text{INT}}$  output has an open-drain structure and requires pullup resistor to  $V_{CC}$ .

### 8.2.4.1 Interrupt Errata

The INT will be improperly de-asserted if the following two conditions occur:

1. The last I<sup>2</sup>C command byte (register pointer) written to the device was 00h.

---

#### Note

This generally means the last operation with the device was a Read of the input register. However, the command byte may have been written with 00h without ever going on to read the input register. After reading from the device, if no other command byte written, it will remain 00h.

2. Any other slave device on the I<sup>2</sup>C bus acknowledges an address byte with the R/W bit set high

#### 8.2.4.1.1 System Impact

Can cause improper interrupt handling as the Master will see the interrupt as being cleared.

#### 8.2.4.1.2 System Workaround

Minor software change: User must change command byte to something besides 00h after a Read operation to the PCA9539 device or before reading from another slave device.

---

#### Note

Software change will be compatible with other versions (competition and TI redesigns) of this device.

## 8.3 Programming

### 8.3.1 I<sup>2</sup>C Interface

The bidirectional I<sup>2</sup>C bus consists of the serial clock (SCL) and serial data (SDA) lines. Both lines must be connected to a positive supply via a pullup resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

I<sup>2</sup>C communication with this device is initiated by a master sending a Start condition, a high-to-low transition on the SDA input/output while the SCL input is high (see [Figure 8-3](#)). After the Start condition, the device address byte is sent, MSB first, including the data direction bit (R/  $\bar{W}$ ). This device does not respond to the general call address.

After receiving the valid address byte, this device responds with an ACK, a low on the SDA input/output during the high of the ACK-related clock pulse. The address inputs (A0 and A1) of the slave device must not be changed between the Start and Stop conditions.

On the I<sup>2</sup>C bus, only one data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as control commands (Start or Stop) (see [Figure 8-4](#)).

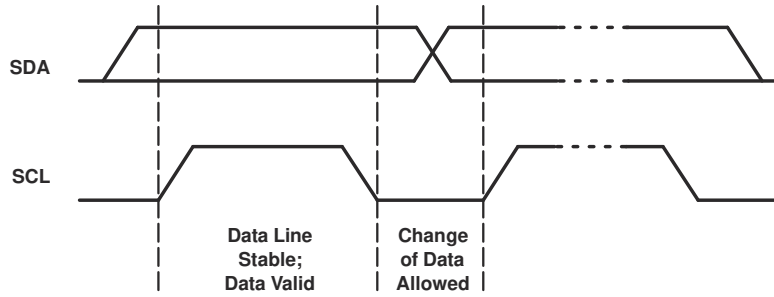

A Stop condition, a low-to-high transition on the SDA input/output while the SCL input is high, is sent by the master (see [Figure 8-3](#)).

Any number of data bytes can be transferred from the transmitter to the receiver between the Start and the Stop conditions. Each byte of eight bits is followed by one ACK bit. The transmitter must release the SDA line before the receiver can send an ACK bit. The device that acknowledges must pull down the SDA line during the ACK clock pulse so that the SDA line is stable low during the high pulse of the ACK-related clock period (see [Figure 8-5](#)). When a slave receiver is addressed, it must generate an ACK after each byte is received. Similarly, the master must generate an ACK after each byte that it receives from the slave transmitter. Setup and hold times must be met to ensure proper operation.

A master receiver signals an end of data to the slave transmitter by not generating an acknowledge (NACK) after the last byte has been clocked out of the slave. This is done by the master receiver by holding the SDA line high. In this event, the transmitter must release the data line to enable the master to generate a Stop condition.

### 8.3.2.1 Device Address

Figure 8-6 shows the address byte of the PCA9539.

H	L	118 (decimal), 76 (hexadecimal)
H	H	119 (decimal), 77 (hexadecimal)

The last bit of the slave address defines the operation (read or write) to be performed. A high (1) selects a read operation, while a low (0) selects a write operation.

### 8.3.2.2 Control Register And Command Byte

Following the successful acknowledgment of the address byte, the bus master sends a command byte that is stored in the control register in the PCA9539. Three bits of this data byte state the operation (read or write) and the internal register (input, output, Polarity Inversion or Configuration) that will be affected. This register can be written or read through the I<sup>2</sup>C bus. The command byte is sent only during a write transmission.

Once a command byte has been sent, the register that was addressed continues to be accessed by reads until a new command byte has been sent.

### 8.3.2.3 Register Descriptions

The Input Port registers (registers 0 and 1) reflect the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by the Configuration register. It only acts on read operation. Writes to these registers have no effect. The default value, X, is determined by the externally applied logic level.

Before a read operation, a write transmission is sent with the command byte to indicate to the I<sup>2</sup>C device that the Input Port register will be accessed next.

**表 8-4. Registers 0 And 1 (Input Port Registers)**

The Output Port registers (registers 2 and 3) show the outgoing logic levels of the pins defined as outputs by the Configuration register. Bit values in this register have no effect on pins defined as inputs. In turn, reads from this register reflect the value that is in the flip-flop controlling the output selection, not the actual pin value.

**表 8-5. Registers 2 And 3 (Output Port Registers)**

The Polarity Inversion registers (registers 4 and 5) allow Polarity Inversion of pins defined as inputs by the Configuration register. If a bit in this register is set (written with 1), the corresponding port pin's polarity is inverted. If a bit in this register is cleared (written with a 0), the corresponding port pin's original polarity is retained.

The Configuration registers (registers 6 and 7) configure the directions of the I/O pins. If a bit in this register is set to 1, the corresponding port pin is enabled as an input with a high-impedance output driver. If a bit in this register is cleared to 0, the corresponding port pin is enabled as an output.

### 8.3.2.4 Bus Transactions

Data is exchanged between the master and PCA9539 through write and read commands.

#### 8.3.2.4.1 Writes

Data is transmitted to the PCA9539 by sending the device address and setting the least-significant bit to a logic 0 (see [Figure 8-6](#) for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte.

The eight registers within the PCA9539 are configured to operate as four register pairs. The four pairs are Input Ports, Output Ports, Polarity Inversion ports, and Configuration ports. After sending data to one register, the next data byte is sent to the other register in the pair (see [Figure 8-8](#) and [Figure 8-9](#)). For example, if the first byte is sent to Output Port 1 (register 3), the next byte is stored in Output Port 0 (register 2).

There is no limitation on the number of data bytes sent in one write transmission. In this way, each 8-bit register may be updated independently of the other registers.

**Figure 8-8. Write To Output Port Registers**

**Figure 8-9. Write To Configuration Registers**

#### 8.3.2.4.2 Reads

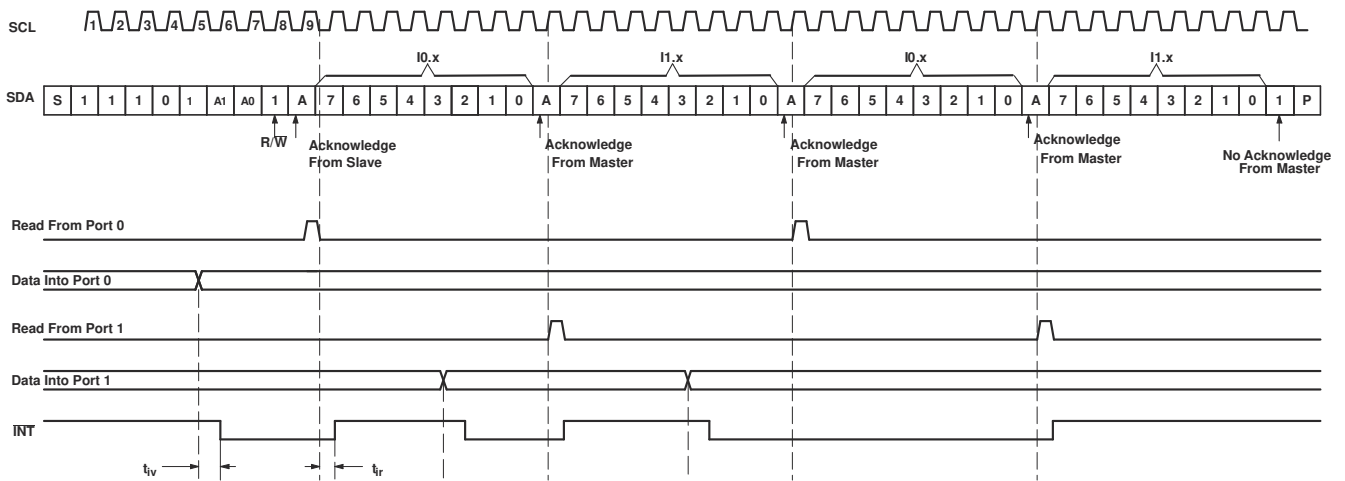

The bus master first must send the PCA9539 address with the least-significant bit set to a logic 0 (see [Figure 8-6](#) for device address). The command byte is sent after the address and determines which register is accessed. After a restart, the device address is sent again, but this time, the least-significant bit is set to a logic 1. Data from the register defined by the command byte then is sent by the PCA9539 (see [Figure 8-10](#) through [Figure 8-12](#)).

After a restart, the value of the register defined by the command byte matches the register being accessed when the restart occurred. For example, if the command byte references Input Port 1 before the restart, and the restart occurs when Input Port 0 is being read, the stored command byte changes to reference Input Port 0. The original command byte is forgotten. If a subsequent restart occurs, Input Port 0 is read first. Data is clocked into the register on the rising edge of the ACK clock pulse. After the first byte is read, additional bytes may be read, but the data now reflect the information in the other register in the pair. For example, if Input Port 1 is read, the next byte read is Input Port 0.

Data is clocked into the register on the rising edge of the ACK clock pulse. There is no limitation on the number of data bytes received in one read transmission, but when the final byte is received, the bus master must not acknowledge the data.

8-10. Read From Register

- A. Transfer of data can be stopped at any time by a Stop condition. When this occurs, data present at the latest acknowledge phase is valid (output mode). It is assumed that the command byte previously has been set to 00 (Read Input Port register).
- B. This figure eliminates the command byte transfer, a restart, and slave address call between the initial slave address call and actual data transfer from the P port (see 8-10 for these details).

8-11. Read Input Port Register, Scenario 1

- A. Transfer of data can be stopped at any time by a Stop condition. When this occurs, data present at the latest acknowledge phase is valid (output mode). It is assumed that the command byte previously has been set to 00 (Read Input Port register).
- B. This figure eliminates the command byte transfer, a restart, and slave address call between the initial slave address call and actual data transfer from the P port (see [8-10](#) for these details).

## 9.2.1 Detailed Design Procedure

### 9.2.1.1 Minimizing $I_{CC}$ When I/O Is Used To Control Led

When an I/O is used to control an LED, normally it is connected to  $V_{CC}$  through a resistor (see [Figure 9-1](#)). Because the LED acts as a diode, when the LED is off, the I/O  $V_{IN}$  is about 1.2 V less than  $V_{CC}$ . The  $\Delta I_{CC}$  parameter in Electrical Characteristics shows how  $I_{CC}$  increases as  $V_{IN}$  becomes lower than  $V_{CC}$ . For battery-powered applications, it is essential that the voltage of I/O pins is greater than or equal to  $V_{CC}$ , when the LED is off, to minimize current consumption.

[Figure 9-2](#) shows a high-value resistor in parallel with the LED. [Figure 9-3](#) shows  $V_{CC}$  less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the I/O  $V_{CC}$  at or above  $V_{CC}$  and prevent additional supply-current consumption when the LED is off.

## 10 Power Supply Recommendations

### 10.1 Power-On Reset Requirements

In the event of a glitch or data corruption, PCA9539 can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

The two types of power-on reset are shown in [Figure 10-1](#) and [Figure 10-2](#).

**Figure 10-1. V<sub>CC</sub> Is Lowered Below 0.2 V Or 0 V And Then Ramped Up To V<sub>CC</sub>**

**Figure 10-2. V<sub>CC</sub> Is Lowered Below The Por Threshold, Then Ramped Back Up To V<sub>CC</sub>**

[Table 10-1](#) specifies the performance of the power-on reset feature for PCA9539 for both types of power-on reset.

**Table 10-1. Recommended Supply Sequencing And Ramp Rates<sup>(1)</sup>**

V <sub>PORR</sub>	Voltage trip point of POR on rising V <sub>CC</sub>		1.033		1.428	V

(1) T<sub>A</sub> = –40°C to 85°C (unless otherwise noted)

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (V<sub>CC\_GW</sub>) and height (V<sub>CC\_GH</sub>) are dependent on each other. The bypass capacitance, source impedance, and the device impedance are factors that affect power-on reset performance. [Figure 10-3](#) and [Table 10-1](#) provide more information on how to measure these specifications.

FIG 10-3. Glitch Width And Glitch Height

$V_{POR}$  is critical to the power-on reset.  $V_{POR}$  is the voltage level at which the reset condition is released and all the registers and the I<sup>2</sup>C/SMBus state machine are initialized to their default states. The value of  $V_{POR}$  differs based on the  $V_{CC}$  being lowered to or from 0. FIG 10-4 and 表 10-1 provide more details on this specification.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
  - D. Falls within JEDEC MS-013 variation AD.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.
