

FULL DIFFERENTIAL ANALOG INPUT 24-BIT, 192-kHz STEREO A/D CONVERTER

FEATURES

- 24-Bit Delta-Sigma Stereo A/D Converter
- High Performance:
 - Dynamic Range: 112 dB (Typical)
 - SNR: 111 dB (Typical)
 - THD+N: –102 dB (Typical)
- High-Performance Linear Phase Antialias Digital Filter:
 - Pass-Band Ripple: ± 0.005 dB
 - Stop-Band Attenuation: –100 dB
- Fully Differential Analog Input: ± 2.5 V
- Audio Interface: Master- or Slave-Mode Selectable
- Data Formats: Left-Justified, I²S, Standard 24-Bit, and DSD
- Function:
 - Peak Detection
 - High-Pass Filter (HPF): –3 dB at 1 Hz, $f_s = 48$ kHz
- Sampling Rate up to 192 kHz
- System Clock: 128 f_s , 256 f_s , 384 f_s , 512 f_s , or 768 f_s
- Dual Power Supplies:
 - 5 V for Analog
 - 3.3 V for Digital
- Power Dissipation: 225 mW
- Small 28-Pin SSOP
- DSD Output: 1 Bit, 64 f_s

APPLICATIONS

- AV Amplifier
- MD Player
- Digital VTR
- Digital Mixer
- Digital Recorder

DESCRIPTION

The PCM1804 is a high-performance, single-chip stereo A/D converter with fully differential analog voltage input. The PCM1804 uses a precision delta-sigma modulator and includes a linear phase antialias digital filter and high-pass filter (HPF) that removes dc offset from the input signal. The PCM1804 is suitable for a wide variety of mid- to high-grade consumer and professional applications, where excellent performance and 5-V analog supply and 3.3-V digital power-supply operation are required. The PCM1804 can achieve both PCM audio and DSD format due to the precision delta-sigma modulator. The PCM1804 is fabricated using an advanced CMOS process and is available in a small 28-pin SSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two, Audio Precision are trademarks of Audio Precision, Inc.
All other trademarks are the property of their respective owners.

This device contains circuits to protect its inputs and outputs against damage due to high static voltages or electrostatic fields. These circuits have been qualified to protect this device against electrostatic discharges (ESD) of up to 2 kV according to MIL-STD-883C, Method 3015; however, it is advised that precautions be taken to avoid application of any voltage higher than maximum-rated voltages to these high-impedance circuits. During storage or handling, the device leads should be shorted together or the device should be placed in conductive foam. In a circuit, unused inputs should always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground. Specific guidelines for handling devices of this type are contained in the publication *Electrostatic Discharge (ESD)* ([SSYA008](#)), available from Texas Instruments.

Terminal Functions

TERMINAL NAME	PIN	I/O	DESCRIPTIONS
AGND	23	–	Analog ground
AGNDL	2	–	Analog ground for V_{REFL}
AGNDR	27	–	Analog ground for V_{REFR}
BCK/DSDL	16	I/O	Bit clock input/output in PCM mode. L-channel audio data output in DSD mode. ⁽¹⁾
BYPAS	12	I	HPF bypass control. High: HPF disabled, Low: HPF enabled ⁽¹⁾
DATA/DSDR	15	O	L-channel and R-channel audio data output in PCM mode. R-channel audio data output in DSD mode. (DSD output, when in DSD mode)
DGND	13	–	Digital ground
FMT0	6	I	Audio data format 0. See Table 5 . ⁽²⁾
FMT1	7	I	Audio data format 1. See Table 5 . ⁽²⁾
LRCK/DSDBCK	17	I/O	Sampling clock input/output in PCM and DSD modes. ⁽¹⁾
OSR0	9	I	Oversampling ratio 0. See Table 1 and Table 2 . ⁽²⁾
OSR1	10	I	Oversampling ratio 1. See Table 1 and Table 2 . ⁽²⁾
OSR2	11	I	Oversampling ratio 2. See Table 1 and Table 2 . ⁽²⁾
OVFL	21	O	Overflow signal of L-channel in PCM mode. This is available in PCM mode only.
OVFR	20	O	Overflow signal of R-channel in PCM mode. This is available in PCM mode only.
\overline{RST}	19	I	Reset, power-down input, active-low ⁽²⁾
SCKI	18	I	System clock input; 128 f _S , 256 f _S , 384 f _S , 512 f _S , or 768 f _S . ⁽³⁾
S/ \overline{M}	8	I	Slave/master mode selection. See Table 4 . ⁽²⁾
V _{CC}	22	–	Analog power supply
V _{COML}	3	–	L-channel analog common-mode voltage (2.5 V)
V _{COMR}	26	–	R-channel analog common-mode voltage (2.5 V)
V _{DD}	14	–	Digital power supply
V _{INL} –	5	I	L-channel analog input, negative pin
V _{INL} +	4	I	L-channel analog input, positive pin
V _{INR} –	24	I	R-channel analog input, negative pin
V _{INR} +	25	I	R-channel analog input, positive pin
V _{REFL}	1	–	L-channel voltage reference output, requires capacitors for decoupling to AGND
V _{REFR}	28	–	R-channel voltage reference output, requires capacitors for decoupling to AGND

(2) Schmitt-trigger input with internal pulldown (51 k Ω typically), 5-V tolerant.

(3) Schmitt-trigger input, 5-V tolerant.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

Supply voltage	V _{CC}	–0.3 V to 6.5 V
	V _{DD}	–0.3 V to 4 V
Ground voltage differences	AGND, AGNDL, AGNDR, DGND	±0.1 V
Supply voltage difference	V _{CC} , V _{DD}	V _{CC} – V _{DD} < 3 V
Digital input voltage	FMT0, FMT1, S/M, OSR0, OSR1, OSR2, SCKI, RST	–0.3 V to 6.5 V
	BYPAS, DATA/DSDR, BCK/DSDL, LRCK/DSDBCK, OVFL, OVFR	–0.3 V to (V _{DD} + 0.3 V)
Analog input voltage	V _{REFL} , V _{REFR} , V _{COML} , V _{COMR} , V _{INL+} , V _{INR+} , V _{INL–} , V _{INR–}	–0.3 V to (V _{CC} + 0.3 V)
Input current (any pins except supplies)		±10 mA
T _A	Ambient temperature under bias	–40°C to 125°C
T _{stg}	Storage temperature	–55°C to 150°C
T _J	Junction temperature	150°C
Lead temperature (soldering)		260°C, 5 s
Package temperature (IR reflow, peak)		260°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

PRINCIPLES OF OPERATION

THEORY OF OPERATION

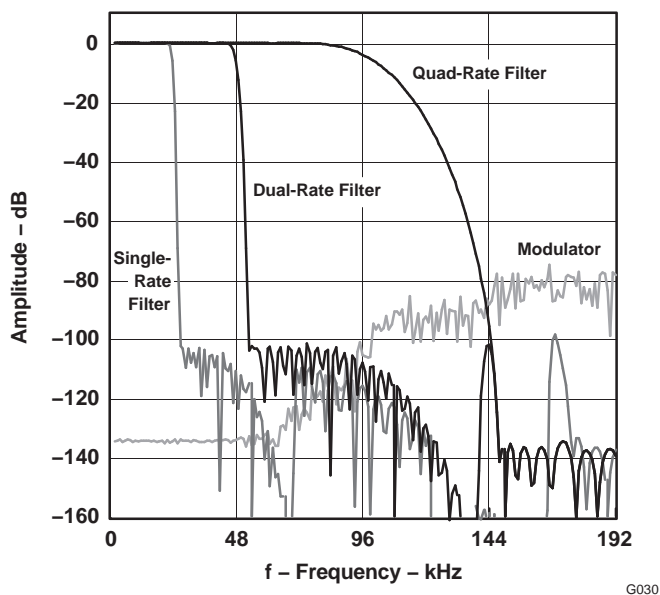

The PCM1804 consists of a band-gap reference, a delta-sigma modulator with full-differential architecture for L-channel and R-channel, a decimation filter with a high-pass filter, and a serial interface circuit. [Figure 30](#) illustrates the total architecture of the PCM1804. An on-chip, high-precision reference with 10- μ F external capacitor(s) provides all the reference voltage needed in the PCM1804, and it defines the full-scale voltage range of both channels. Full-differential architecture provides a wide dynamic range and excellent power-supply rejection performance. The input signal is sampled at $\times 128$, $\times 64$, and $\times 32$ oversampling rates according to the oversampling ratio control, OSR[0:2]. The single rate, dual rate, and quad rate eliminate the external sample-and-hold amplifier. [Figure 31](#) illustrates how for each oversampling ratio the PCM1804 decimates the modulator output down to PCM data when the modulator is running at 6.144 MHz. The delta-sigma modulation randomizes the modulator outputs and reduces the idle tone level. The oversampled data stream from the delta-sigma modulator is converted to a $1/f_s$, 24-bit digital signal, while removing high-frequency noise components using a decimation filter. The dc components of the signal are removed by the HPF, and the HPF output is converted to a time-multiplexed serial signal through the serial interface, which provides flexible serial formats and master/slave modes. The PCM1804 also has a DSD output mode. The PCM1804 can output the signal directly from the modulators to DSDL (pin 16) and DSDR (pin 15).

PRINCIPLES OF OPERATION (continued)

B0029-01

Figure 30. Total Block Diagram of PCM1804

G030

Figure 31. Spectrum of Modulator Output and Decimation Filter

PRINCIPLES OF OPERATION (continued)

SYSTEM CLOCK INPUT

The PCM1804 supports 128 f_s , 192 f_s (only in master mode at quad rate), 256 f_s , 384 f_s , 512 f_s , and 768 f_s as a system clock, where f_s is the audio sampling frequency. The system clock must be supplied on SCKI (pin 18). [Table 3](#) shows the relationship of typical sampling frequency and the system clock frequency, and [Figure 32](#) shows system clock timing. In master mode, the system clock rate is selected by OSR2 (pin 11), OSR1 (pin 10), and OSR0 (pin 9) as shown in [Table 1](#). In slave mode, the system clock rate is automatically detected. In DSD mode, OSR2 (pin 11), OSR1 (pin 10), OSR0 (pin 9), and the system clock frequency are fixed as shown in [Table 1](#) and [Table 3](#).

Figure 32. System Clock Input Timing

POWER-ON AND RESET FUNCTIONS

The PCM1804 has both an internal power-on-reset circuit and $\overline{\text{RST}}$ (pin 19). For internal power-on reset, initialization (reset) is performed automatically at the time when the power supply V_{DD} exceeds 2 V (typical) and V_{CC} exceeds 4 V (typical). $\overline{\text{RST}}$ accepts external forced reset, and a low level on $\overline{\text{RST}}$ initiates the reset sequence. Because an internal pulldown resistor terminates $\overline{\text{RST}}$, no connection of $\overline{\text{RST}}$ is equivalent to a low-level input. Because the system clock is used as a clock signal for the reset circuit, the system clock must be supplied as soon as power is supplied; more specifically, at least three system clocks are required prior to $V_{DD} > 2$ V, $V_{CC} > 4$ V, and $\overline{\text{RST}} = \text{high}$. While $V_{DD} < 2$ V (typical), $V_{CC} < 4$ V (typical), or $\overline{\text{RST}} = \text{low}$, and $1/f_s$ (maximum) count after $V_{DD} > 2$ V (typical), $V_{CC} > 4$ V (typical) and $\overline{\text{RST}} = \text{high}$, the PCM1804 stays in the reset state and the digital output is forced to zero. The digital output is valid after the reset state is released and the time of $1116/f_s$ has passed. [Figure 33](#) and [Figure 34](#) illustrate the internal power-on-reset and external-reset timing, respectively. [Figure 35](#) illustrates the digital output for power-on reset and $\overline{\text{RST}}$ control. The PCM1804 needs $\overline{\text{RST}} = \text{low}$ when control pins are changed or in slave mode when SCKI, LRCK, and BCK are changed.

POWER-DOWN FUNCTION

The PCM1804 has a power-down feature that is controlled by $\overline{\text{RST}}$ (pin 19). Entering the power-down mode is done by keeping the $\overline{\text{RST}}$ input level low for more than $65536/f_s$. In the master mode, the SCKI (pin 18) is used as the clock signal for the power-down counter. While in the slave mode, SCKI (pin 18) and LRCK (pin 17) are used as the clock signal. The clock(s) must be supplied until the power-down sequence completes. As soon as $\overline{\text{RST}}$ goes high, the PCM1804 starts the reset-release sequence described in the *Power-On and Reset Functions* section.

OVERSAMPLING RATIO

The oversampling ratio is selected by OSR2 (pin 11), OSR1 (pin 10), and OSR0 (pin 9) as shown in [Table 1](#) and [Table 2](#). The PCM1804 needs $\overline{\text{RST}} = \text{low}$ when logic levels on the OSR2, OSR1, and OSR0 pins are changed.

Table 1. Oversampling Ratio in Master Mode

OSR2	OSR1	OSR0	OVERSAMPLING RATIO	SYSTEM CLOCK RATE
Low	Low	Low	Single rate ($\times 128 f_s$)	$768 f_s$

Figure 35. ADC Digital Output for Power-On Reset and $\overline{\text{RST}}$ Control

AUDIO DATA INTERFACE

The PCM1804 interfaces the audio system through BCK/DSDL (pin 16), LRCK/DSDBCK (pin 17), and DATA/DSDR (pin 15). The PCM1804 needs $\overline{\text{RST}}$ = low when in the interface mode and/or the data format are changed.

INTERFACE MODE

The PCM1804 supports master mode and slave mode as interface modes, which are selected by $\text{S}/\overline{\text{M}}$ (pin 8) as shown in [Table 4](#). In master mode, the PCM1804 provides the timing of the serial audio data communications between the PCM1804 and the digital audio processor or external circuit. While in slave mode, the PCM1804 receives the timing for data transfer from an external controller. Slave mode is not available for DSD.

Table 4. Interface Mode

$\text{S}/\overline{\text{M}}$	MODE
Low	Master mode
High	Slave mode

DATA FORMAT

The PCM1804 supports four audio data formats in both master and slave modes, and these data formats are selected by FMT0 (pin 6) and FMT1 (pin 7) as shown in [Table 5](#).

Table 5. Data Format

FMT1	FMT0	FORMAT	MASTER	SLAVE
Low	Low	PCM, left-justified, 24-bit	Yes	Yes
Low	High	PCM, I ² S, 24-bit	Yes	Yes
High	Low	PCM, standard, 24-bit	Yes	Yes
High	High	DSD	Yes	–

INTERFACE TIMING FOR PCM

Figure 36 through Figure 38 illustrate the interface timing for PCM.

(1) Left-Justified Data Format; L-Channel = High, R-Channel = Low

(2) I²S Data Format; L-Channel = Low, R-Channel = High

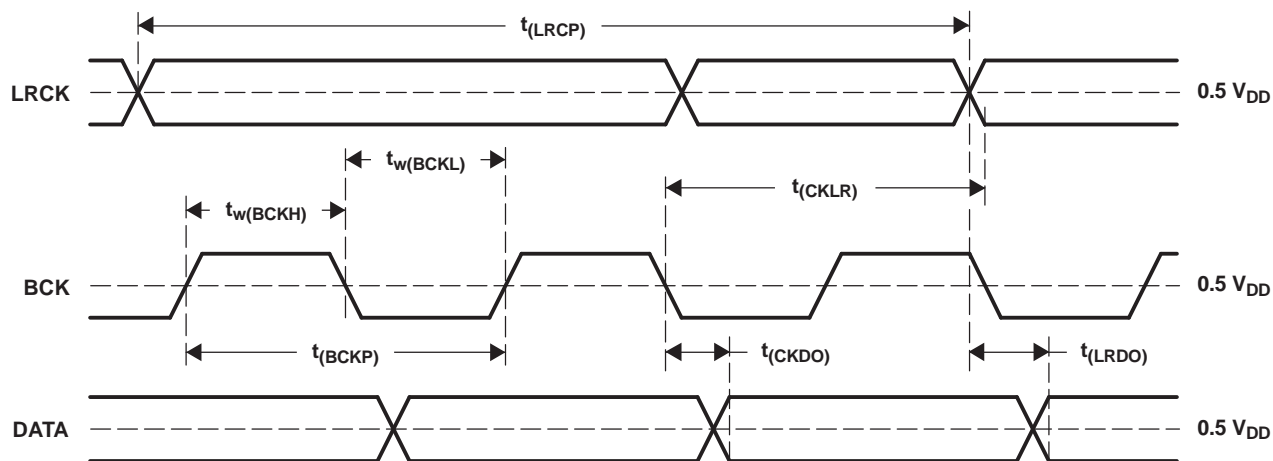

(3) Standard Data Format; L-Channel = High, R-Channel = Low

T0009-03

NOTE: LRCK and BCK work as outputs in master mode and as inputs in slave mode.

Figure 36. Audio Data Format for PCM

T0018-03

PARAMETERS		MIN	TYP	MAX	UNIT
$t_{(BCKP)}$	BCK period		$1/(64 f_S)^{(3)}$

Figure 40. Audio Data Interface Timing for DSD (Master Mode Only)

SYNCHRONIZATION WITH DIGITAL AUDIO SYSTEM FOR PCM

In slave mode, the PCM1804 operates under LRCK synchronized with the system clock SCKI. The PCM1804 does not need a specific phase relationship between LRCK and SCKI, but does require the synchronization of LRCK and SCKI.

If the relationship between LRCK and SCKI changes more than ± 6 BCK during one sample period due to LRCK or SCKI jitter, internal operation of the ADC halts within $1/f_s$ and digital output is forced into BPZ code until resynchronization between LRCK and SCKI is completed.

In case of changes less than ± 5 BCK, resynchronization does not occur and the previously described digital output control and discontinuity do not occur.

Figure 41 illustrates ADC digital output for loss of synchronization and resynchronization. During undefined data, the PCM1804 may generate some noise in the audio signal. Also, the transitions of normal to undefined data and undefined or zero data to normal cause a discontinuity of data on the digital output. This can generate noise in the audio signal. In master mode, synchronization loss never occurs.

HIGH-PASS FILTER (HPF) BYPASS CONTROL FOR PCM

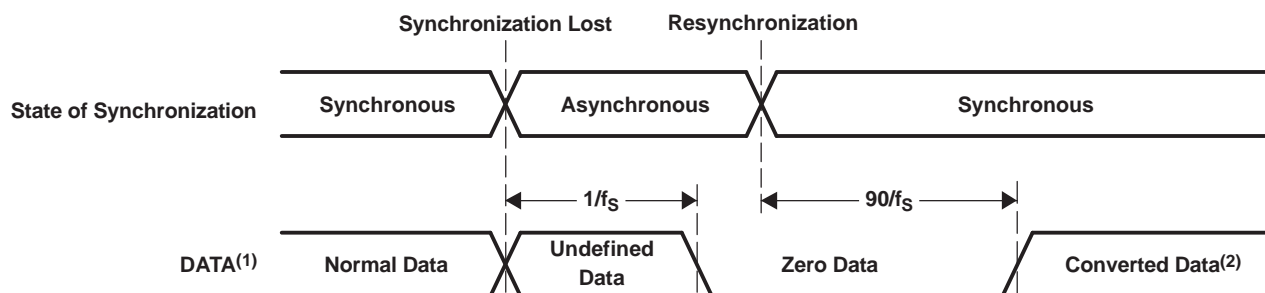

The built-in function for dc component rejection can be bypassed by BYPAS (pin 12) control. In bypass mode, the dc component of the input analog signal and the internal dc offset are also converted and output in the digital output data.

HPF Bypass Control

BYPAS PIN	HPF MODE
Low	Normal (high-pass) mode
High	Bypass (through) mode

OVERFLOW FLAG FOR PCM

The PCM1804 has two overflow flag pins, OVFR (pin 20) and OVFL (pin 21). The pins go to high as soon as the analog input goes across the full-scale range. The high level is held for 1.016 s at maximum, and returns to low if the analog input does not go across the full-scale range for the period.

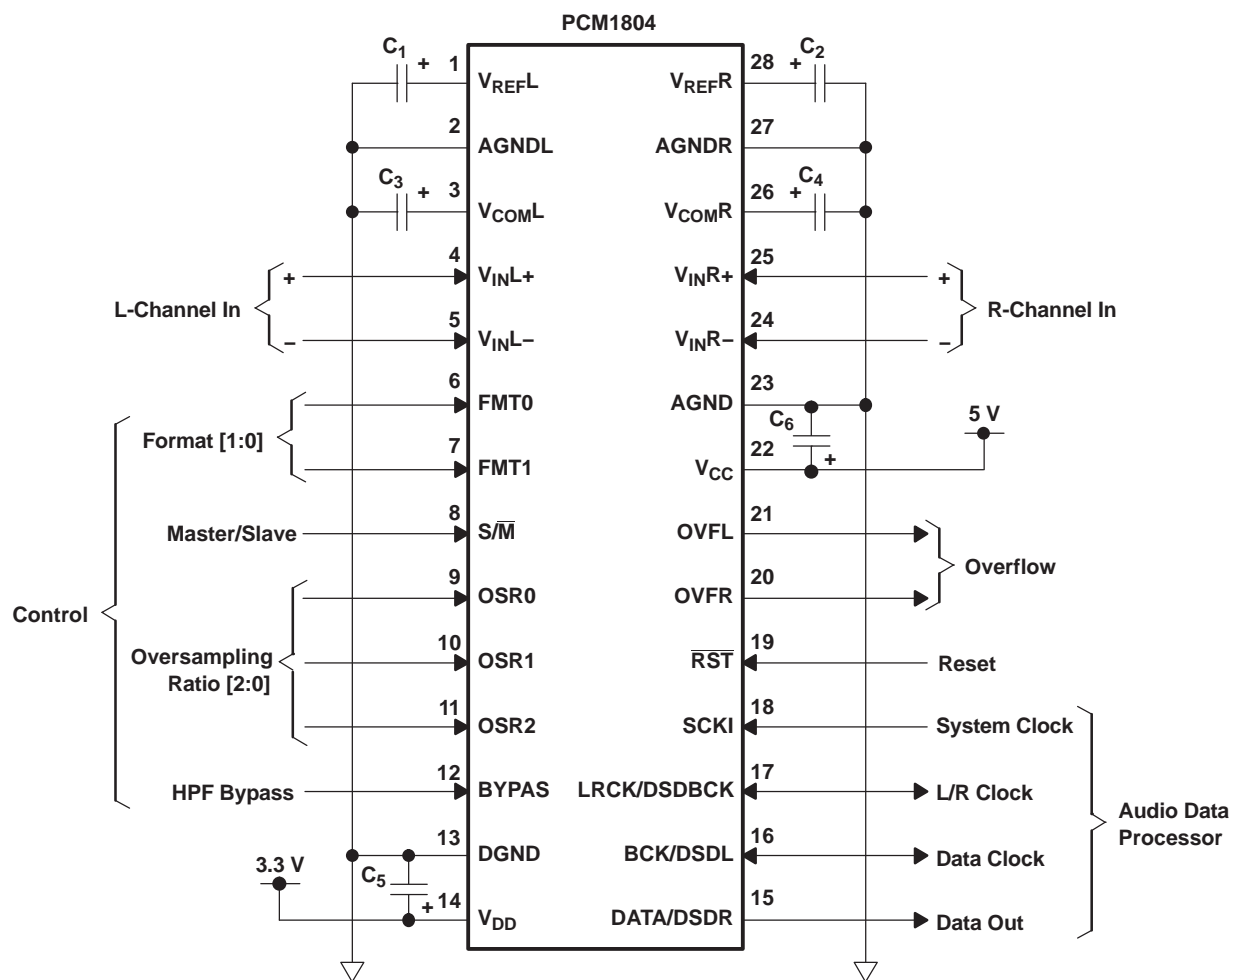

T0020-06

- (1) Applies only for slave mode; the loss of synchronization never occurs in master mode.
 (2) The HPF transient response appears initially.

Figure 41. ADC Digital Output for Loss of Synchronization and Resynchronization

TYPICAL CIRCUIT CONNECTION DIAGRAM

APPLICATION INFORMATION

BOARD DESIGN AND LAYOUT CONSIDERATIONS

V_{CC} , V_{DD} Pins

The digital and analog power supply lines to the PCM1804 should be bypassed to the corresponding ground pins with 0.1- μ F ceramic and 10- μ F tantalum capacitors placed as close to the pins as possible to maximize the dynamic performance of the ADC. Although the PCM1804 has two power lines to maximize the potential of dynamic performance, using one common power supply is recommended to avoid unexpected power-supply trouble like latch-up or power-supply sequence.

V_{IN} Pins

Use of 0.01- μ F film capacitors between V_{INL+} and V_{INL-} and between V_{INR+} and V_{INR-} is strongly recommended to remove higher-frequency noise from the delta-sigma input section.

V_{REFX} , V_{COMX} Inputs

Use 0.1- μ F ceramic and 10- μ F tantalum capacitors between V_{REFL} , V_{REFR} , and corresponding AGNDx, to ensure low-source impedance at ADC references. Use 0.1- μ F tantalum capacitors between V_{COML} , V_{COMR} and corresponding AGNDx to ensure low source impedance of common voltage. These capacitors should be located as close as possible to the V_{REFL} , V_{REFR} , V_{COML} , and V_{COMR} pins to reduce dynamic errors on references and common voltage. The dc voltage level of these pins is 2.5 V.

DATA/DSDR, BCK/DSDL, and LRCK/DSDBCK Pins

The DATA/DSDR, BCK/DSDL, and LRCK/DSDBCK pins in master mode have large load drive capability. Locating the buffer near the PCM1804 and minimizing the load capacitance, minimizes the digital-analog crosstalk and maximizes the dynamic performance of the ADC.

System Clock

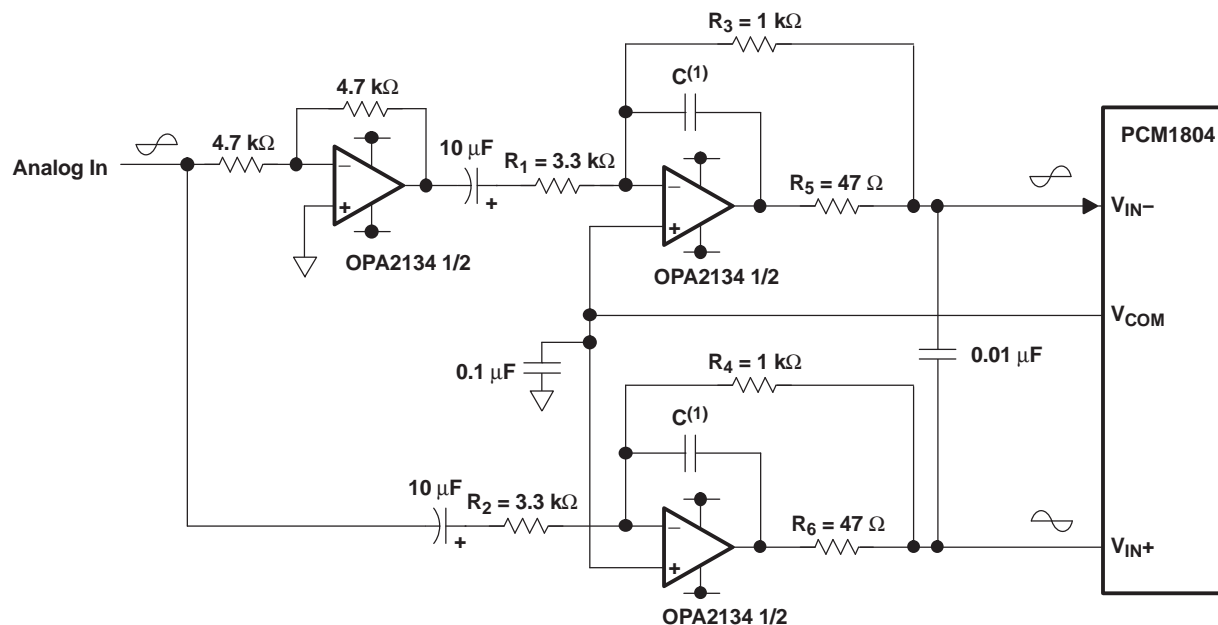

The quality of the system clock can influence dynamic performance, as the PCM1804 operates based on a system clock. Therefore, it might be necessary to consider the system clock duty, jitter, and the time difference between system clock transition and BCK/DSDL or LRCK/DSDBCK transition in slave mode.

Reset Control

If capacitors larger than 10 μ F are used on V_{REFL} and V_{REFR} , an external reset control with a delay time corresponding to the V_{REFL} and V_{REFR} response is required. Also, it works as a power-down control.

APPLICATION CIRCUIT FOR SINGLE-ENDED INPUT

An application diagram for a single-ended input circuit is shown in [Figure 44](#). The maximum signal input voltage and differential gain of this circuit is designed as $V_{inmax} = 8.28$ Vpp, $A_d = 0.3$. Differential gain (A_d) is given by $R3/R1(R4/R2)$ in a circuit configured as a normal inverted-gain amplifier. Resistor $R5(R6)$ in the feedback loop gives low-impedance drive operation and noise filtering for the analog input of the PCM1804. The circuit technique using $R5(R6)$ is recommended.

S0059-01

- (1) A capacitor value of 1800 pF is recommended, unless an input signal greater than -6 dBFS at 100 kHz or higher is applied in the DSD mode. In that case, 3300 pF is recommended.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
