SN65HVD485E、半二重、RS-485 トランシーバ

1 特長

- バス・ピンの ESD 保護:最大 15kV
- 1/2 の単位負荷で、バス上に最大 64 のノード
- バス・オープン・フェイルセーフ・レシーバ
- グリッチの発生しないパワーアップ / パワーダウン・バス入出力
- 小型の VSSOP-8 パッケージで利用可能
- TIA/EIA-485A 規格の要件に適合またはそれを上回る性能
- 業界標準の SN75176 フットプリント

2 アプリケーション

- モータ制御
- 電力インバータ
- 産業用オートメーション
- ビル・オートメーション・ネットワーク
- 産業用プロセス制御
- バッテリ駆動のアプリケーション
- 通信機器

3 概要

SN65HVD485E デバイスは、RS-485 データ・バス・ネットワーク用に設計された半二重トランシーバです。5V 電源で動作し、TIA/EIA-485A 規格に完全準拠しています。このデバイスは、長いツイストペア・ケーブルを使用して最大 10Mbps のデータ転送に適しており、負荷を除外して、通常 2mA 未満の非常に低い電源電流で動作するように設計されています。デバイスが非アクティブ・シャットダウン・モードのとき、消費電流は 1mA を下回ります。

このデバイスは同相範囲が広く ESD 保護レベルが高いため、電気インバータ、テレコム・ラックのステータス / コマンド信号、ケーブル接続シャーシ・インターコネクト、ノイズ耐性が重要な産業用オートメーション・ネットワークなど、要求の厳しいアプリケーションに適しています。SN65HVD485E デバイスのフットプリントは、SN75176 デバイスの業界標準のフットプリントと一致しています。パワー・オン・リセット回路は、電源電圧が安定するまで出力を高インピーダンス状態に維持します。サーマル・シャットダウン機能は、システムのフォルト状態による損傷からデバイスを保護します。SN65HVD485E デバイスは、–40℃～85℃で動作が規定されています。

パッケージ情報

部品番号	パッケージ (1)	本体サイズ (公称)
SN65HVD485E	SOIC (8)	4.91mm × 3.90mm
	VSSOP (8)	3.00mm × 3.00mm
	PDIP (8)	9.81mm × 6.35mm

5 Device Comparison Table

Improved Replacement for Devices

PART NUMBER	REPLACE WITH	BENEFITS
ADM485	SN65HVD485E	Better ESD protection (±15 kV versus unspecified) Faster signaling rate (10 Mbps versus 5 Mbps) More nodes on a bus (64 versus 32) Wider power supply tolerance (10% vs 5%)
SP485E	SN65HVD485E	More nodes on a bus (64 versus 32) Wider power supply tolerance (10% versus 5%)
LMS485E	SN65HVD485E	Higher signaling rate (10 Mbps versus 2.5 Mbps) More nodes on a bus (64 versus 32) Wider power supply tolerance (10% versus 5%)
DS485	SN65HVD485E	Higher signaling rate (10 Mbps versus 2.5 Mbps) Better ESD (±15 kV versus ±2 kV) More nodes on a bus (64 versus 32) Wider power supply tolerance (10% versus 5%)
LTC485	SN65HVD485E	Better ESD (±15 kV versus ±2 kV) Wider power supply tolerance (10% versus 5%)
MAX485E	SN65HVD485E	Higher signaling rate (10 Mbps versus 2.5 Mbps) More nodes on a bus (64 versus 32) Wider power supply tolerance (10% versus 5%)
ST485E	SN65HVD485E	Higher signaling rate (10 Mbps versus 5 Mbps) Wider power supply tolerance (10% versus 5%)
ISL8485E	SN65HVD485E	More nodes on a bus (64 versus 32) Faster signaling rate (10 Mbps versus 5 Mbps)

6 Pin Configuration and Functions

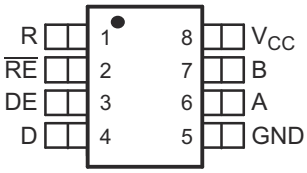

図 6-1. D, DGK, P Packages, 8-Pin SOIC, VSSOP, PDIP (Top View)

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
A	6	Bus input/output	Driver output or receiver input (complementary to B)
B	7	Bus input/output	Driver output or receiver input (complementary to A)
D	4	Digital input	Driver data input
DE	3	Digital input	Driver enable, active high
GND	5	Reference potential	Local device ground
R	1	Digital input	Receive data output
$\overline{RE}$	2	Digital input	Receiver enable, active low
V_{CC}	8	Supply	4.5-V to 5.5-V supply

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1) (2)

		MIN	MAX	UNIT
V_{CC}	Supply voltage	–0.5	7	V
	Voltage range at A or B	–9	14	V
	Voltage range at any logic pin	–0.3	V_{CC} + 0.3	V
	Receiver output current	–24	24	mA
	Voltage input range, transient pulse, A and B, through 100 Ω (see 図 8-13)	–50	50	V
T_J	Junction temperature	170	170	°C
	Continuous total power dissipation	Refer to セクション 7.11		
T_{stg}	Storage temperature	–65	130	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under セクション 7.3 is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.

7.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	Bus pins and GND	±15000	V
			All pins	±4000	
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)		±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)(1)

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage		4.5		5.5	V
V_I	Input voltage at any bus terminal (separately or common mode)		–7		12	V
V_{IH}	High-level input voltage (D, DE, or RE inputs)		2		V_{CC}	V
V_{IL}	Low-level input voltage (D, DE, or RE inputs)		0		0.8	V
V_{ID}	Differential input voltage		–12		12	V
I_O	Output current	Driver	–60		60	mA
		Receiver	–8		8	
R_L	Differential load resistance		54	60		Ω
$1/t_{UI}$	Signaling rate		0		10	Mbps
T_A	Operating free-air temperature		–40		85	°C
T_J	Junction temperature(2)		–40		130	°C

(1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum, is used in this data sheet.
(2) See セクション 7.4 for information on maintenance of this specification for the DGK package.

7.4 Thermal Information

THERMAL METRIC[1]		SN65HVD485E			UNIT
		D (SOIC)	DGK (VSSOP)	P (PDIP)	
		8 PINS	8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance[2]	116.7	137.8	84.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	56.3	31.2	65.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	63.4	71.7	62.1	°C/W
ψ_{JT}	Junction-to-top characterization parameter	8.8	0.6	31.3	°C/W
ψ_{JB}	Junction-to-board characterization parameter	62.6	70.5	60.4	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report (SPRA953).
(2) See the *Package Thermal Characterization Methodologies* application note (SZZA003) for an explanation of this parameter.

7.5 Electrical Characteristics: Driver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP[1]	MAX	UNIT
$\lvert V_{OD}\rvert$	Differential output voltage	I_O = 0, No load	3	4.3		V
		R_L = 54 W (see 図 8-1)	1.5	2.3		
		V_{TEST} = –7 V to 12 V (see 図 8-2)	1.5			
$\Delta\lvert V_{OD}\rvert$	Change in magnitude of differential output voltage	See 図 8-1 and 図 8-2	–0.2	0	0.2	V
$V_{OC(SS)}$	Steady-state common-mode output voltage	See 図 8-3	1	2.6	3	V
$\Delta V_{OC(SS)}$	Change in steady-state common-mode output voltage		–0.1	0	0.1	V
$V_{OC(PP)}$	Common-mode output voltage	See 図 8-3		500		mV
I_{OZ}	High-impedance output current	See receiver input currents				µA
I_I	Input current	D, DE	–100		100	µA
I_{OS}	Short-circuit output current	–7 V ≤ V_O ≤ 12 V (see 図 8-7)	–250		250	mA

(1) All typical values are at 25°C and with a 5-V supply.

7.6 Electrical Characteristics: Receiver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP(1)	MAX	UNIT
V_{IT+}	Positive-going input threshold voltage	I_O = –8 mA		–85	–10	mV
$V_{IT–}$	Negative-going input threshold voltage	I_O = 8 mA	–200	–115		mV
V_{hys}	Hysteresis voltage (V_{IT+} – $V_{IT–}$)			30		mV
V_{OH}	High-level output voltage	V_{ID} = 200 mV, I_{OH} = –8 mA (see 図 8-8)	4	4.6		V
V_{OL}	Low-level output voltage	V_{ID} = –200 mV, I_{OH} = 8 mA (see 図 8-8)		0.15	0.4	V
I_{OZ}	High-impedance-state output current	V_O = 0 to V_{CC}, $\overline{RE}$ = V_{CC}	–1		1	µA
I_I	Bus input current	V_{IH} = 12 V, V_{CC} = 5 V			0.5	mA
		V_{IH} = 12 V, V_{CC} = 0			0.5	
		V_{IH} = –7 V, V_{CC} = 5 V	–0.4			
		V_{IH} = –7 V, V_{CC} = 0	–0.4			
I_{IH}	High-level input current ($\overline{RE}$)	V_{IH} = 2 V	–60	–30		µA
I_{IL}	Low-level input current ($\overline{RE}$)	V_{IL} = 0.8 V	–60	–30		µA
C_{diff}	Differential input capacitance	V_I = 0.4 sin (4E6πt) + 0.5 V, DE at 0 V		7		pF

(1) All typical values are at 25°C and with a 5-V supply.

7.7 Power Dissipation Characteristics

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$P_{(AVG)}$	Average power dissipation	R_L = 54 Ω, Input to D is a 10 Mbps 50% duty cycle square wave V_{CC} at 5.5 V, T_J = 130°C			219	mW
T_{SD}	Thermal shut-down junction temperature			165		°C

7.8 Supply Current

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP(1)	MAX	UNIT
I_{CC}	Driver and receiver enabled	D at V_{CC} or open or 0 V,	DE at V_{CC}, RE at 0 V, No load			2	mA
	Driver and receiver disabled	D at V_{CC} or open,	DE at 0 V, RE at V_{CC}			1	mA

(1) All typical values are at 25°C and with a 5-V supply.

7.9 Switching Characteristics: Driver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output	R_L = 54 Ω, C_L = 50 pF (see 図 8-4)			30	ns
t_{PHL}	Propagation delay time, high-to-low-level output				30	ns
t_r	Differential output signal rise time				25	ns
t_f	Differential output signal fall time				25	ns
$t_{sk(p)}$	Pulse skew ($\lvert t_{PHL} - t_{PLH} \rvert$)				5	ns
t_{PZH}	Propagation delay time, high-impedance-to-high-level output	R_L = 110 Ω, $\overline{RE}$ at 0 V (see 図 8-5)			150	ns
t_{PHZ}	Propagation delay time, high-level-to-high-impedance output				100	ns
t_{PZL}	Propagation delay time, high-impedance-to-low-level output	R_L = 110 Ω, $\overline{RE}$ at 0 V (see 図 8-6)			150	ns
t_{PLZ}	Propagation delay time, low-level-to-high-impedance output				100	ns
$t_{PZH(SHN)}$	Propagation delay time, shutdown-to-high-level output	R_L = 110 Ω, $\overline{RE}$ at VCC (see 図 8-5)			2600	ns
$t_{PZL(SHDN)}$	Propagation delay time, shutdown-to-low-level output	R_L = 110 Ω, $\overline{RE}$ at VCC (see 図 8-6)			2600	ns

7.10 Switching Characteristics: Receiver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output	V_{ID} = -1.5 V to 1.5 V, C_L = 15 pF (see 図 8-9)			200	ns
t_{PHL}	Propagation delay time, high-to-low-level output				200	ns
$t_{sk(p)}$	Pulse skew ($\lvert t_{PHL} - t_{PLH} \rvert$)			6		ns
t_r	Output signal rise time				3	ns
t_f	Output signal fall time				3	ns
t_{PZH}	Output enable time to high level	C_L = 15 pF, DE at 3 V, (see 図 8-10 and 図 8-11)			50	ns
t_{PZL}	Output enable time to low level				50	ns
t_{PHZ}	Output enable time from high level				50	ns
t_{PLZ}	Output enable time from low level				50	ns
$t_{PZH(SHDN)}$	Propagation delay time, shutdown-to-high-level output	C_L = 15 pF, DE at 0 V, (see 図 8-12)			3500	ns
$t_{PZL(SHDN)}$	Propagation delay time, shutdown-to-low-level output				3500	ns

7.11 Dissipation Ratings

PACKAGE(1)	JEDEC BOARD MODEL	T_A < 25°C POWER RATING	DERATING FACTOR(2) ABOVE T_A = 25°C	T_A = 70°C POWER RATING	T_A = 85°C POWER RATING

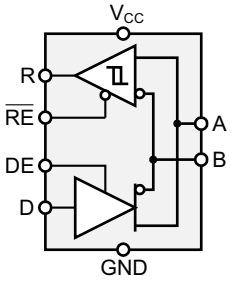
8 Detailed Description

8.1 Overview

The SN65HVD485E device is a half-duplex RS-485 transceiver suitable for data transmission at rates up to 10 Mbps over controlled-impedance transmission media (such as twisted-pair cabling). Up to 64 units of the SN65HVD485E device can share a common RS-485 bus due to the low bus-input currents of the device. The device also features a high degree of ESD protection and low standby current consumption of 1 mA (maximum).

8.2 Functional Block Diagram



8.3 Feature Description

The SN65HVD485E device provides internal biasing of the receiver input thresholds for open-circuit, bus-idle, or short-circuit failsafe conditions. It features a typical hysteresis of 30 mV to improve noise immunity. Internal ESD protection circuits protect the transceiver bus terminals against ±15-kV Human Body Model (HBM) electrostatic discharges.

8.4 Device Functional Modes

When the driver enable pin (DE) is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this case, the differential output voltage defined as $V_{OD} = V_A – V_B$ is positive. When D is low, the output states reverse, B turns high, A is low, and V_{OD} is negative.

When DE is low, both outputs turn high impedance. In this condition, the logic state at D is irrelevant. The DE pin has an internal pulldown resistor to ground; thus when left open, the driver is disabled (high impedance) by default. The D pin has an internal pullup resistor to VCC; thus when left open while the driver is enabled, output A turns high and B turns low.

表 8-1. Driver Function Table

INPUT D	ENABLE DE	OUTPUTS		FUNCTION
		A	B	
H	H	H	L	Actively drive bus High
L	H	L	H	Actively drive bus Low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drive bus high by default

When the receiver enable pin ($\overline{RE}$) is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_A – V_B$ is positive and higher than the positive input threshold (V_{IT+}) the receiver output (R) turns high. When V_{ID} is negative and lower than the negative input threshold ($V_{IT–}$), the receiver output (R) turns low. If V_{ID} is between V_{IT+} and $V_{IT–}$, the output is indeterminate.

When $\overline{RE}$ is logic high or left open, the receiver output is high impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

表 8-2. Receiver Function Table

DIFFERENTIAL INPUT $V_{ID} = V_A - V_B$	ENABLE $\overline{RE}$	OUTPUT R	FUNCTION
$V_{IT+} < V_{ID}$	L	H	Receive valid bus High
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	L	Receive valid bus Low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Fail-safe high output
Short-circuit bus	L	H	Fail-safe high output
Idle (terminated) bus	L	H	Fail-safe high output

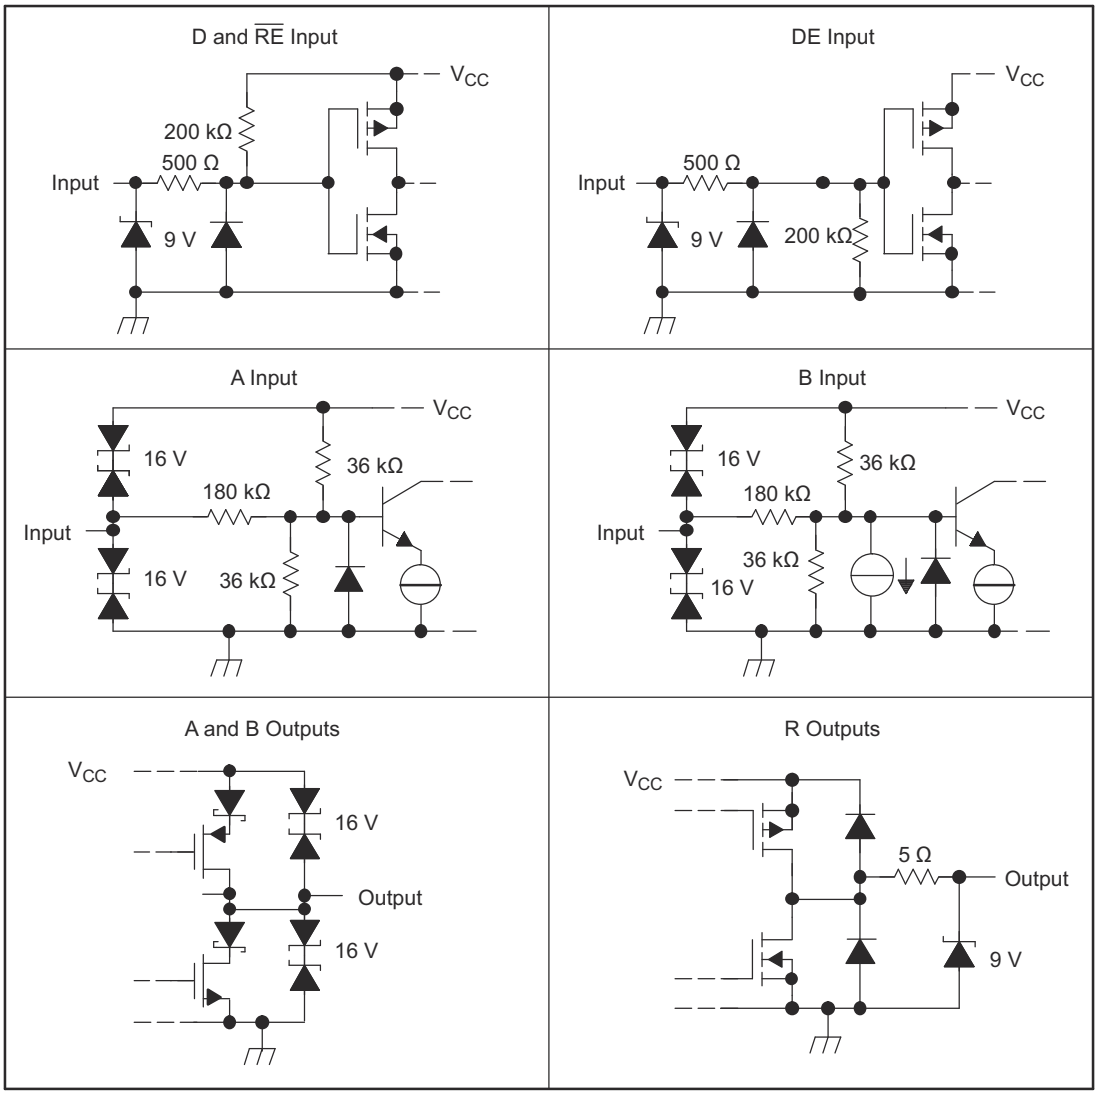


図 8-1. Equivalent Input and Output Schematic Diagrams

9 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

The SN65HVD485E device is a half-duplex RS-485 transceiver commonly used for asynchronous data transmissions. The driver and receiver enable pins allow for configuration of different operating modes.

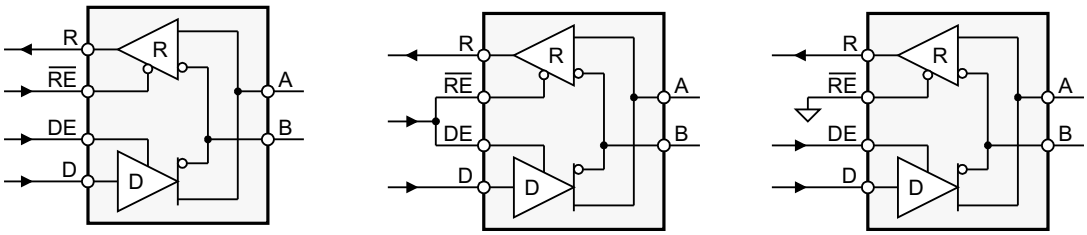

図 9-1. Half-Duplex Transceiver Configurations

Using independent enable lines provides the most flexible control as it allows for the driver and the receiver to be turned on and off individually. While this configuration requires two control lines, it allows for selective listening into the bus traffic whether the driver is transmitting data or not.

Combining the enable signals simplifies the interface to the controller by forming a single direction-control signal. In this configuration, the transceiver operates as a driver when the direction-control line is high and as a receiver when the direction-control line is low.

Additionally, only one line is required when connecting the receiver-enable input to ground and controlling only the driver-enable input. In this configuration, a node receives the data from the bus, receives the data it sends, and can verify that the correct data has been transmitted.

9.2 Typical Application

An RS-485 bus consists of multiple transceivers connecting in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor (R_T) whose value matches the characteristic impedance (Z_0) of the cable. This method, known as parallel termination, allows for higher data rates over longer cable length.

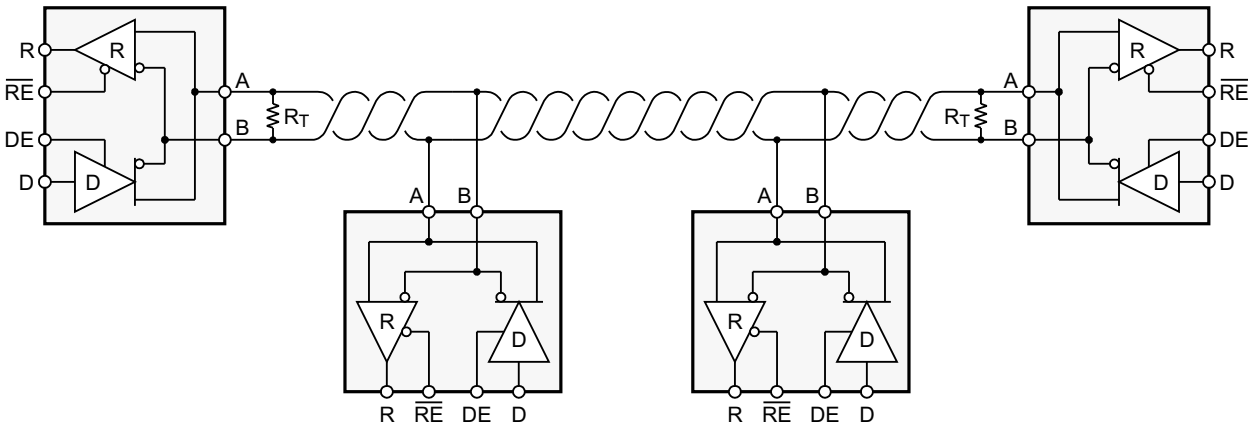

図 9-2. Typical RS-485 Network With Half-Duplex Transceivers

9.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that can be used in a wide range of applications with varying requirements such as distance, data rate, and number of nodes.

9.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and bus length: the higher the data rate, the shorter the cable length, and conversely the lower the data rate, the longer the cable can be without introducing data errors. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 250 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

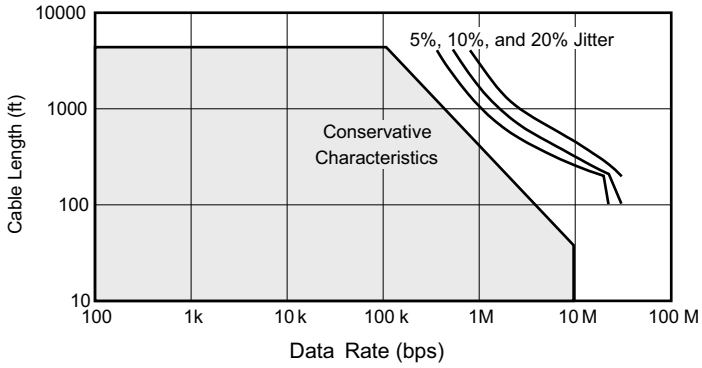

図 9-3. Cable Length vs Data Rate Characteristic

9.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, must be as short as possible. Stubs present a nonterminated piece of bus line that can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub must be less than one-tenth of the rise time of the driver; thus giving a maximum physical stub length as shown in 式 1.

$$L_{stub} \leq 0.1 \times t_r \times v \times c \quad (1)$$

where

- t_r is the 10/90 rise time of the driver
- c is the speed of light (3×10^8 m/s)
- v is the signal velocity of the cable or trace as a factor of c

9.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to drive 32-unit loads (UL), where 1-unit load represents a load impedance of approximately 12 kΩ. Because the SN65HVD485E device is a ½ UL transceiver, it is possible to connect up to 64 receivers to the bus.

9.2.1.4 Receiver Failsafe

The differential receiver of the SN65HVD485E device is failsafe to invalid bus states caused by the following:

- Open bus conditions such as a disconnected connector
- Shorted bus conditions such as cable damage shorting the twisted pair together
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver outputs a failsafe logic-high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the *input indeterminate* range does not include zero volts differential. To comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input V_{ID} is more positive than 200 mV, and it must output a Low when V_{ID} is more negative than –200 mV. The receiver parameters that determine the failsafe performance are V_{IT+}, V_{IT-}, and V_{hys} (the separation between V_{IT+} and V_{IT-}). As shown in the セクション 7.6 table, differential signals more negative than –200 mV cause a low receiver output, and differential signals more positive than 200 mV cause a high receiver output.

When the differential input signal is close to zero, it is still above the V_{IT+} threshold, and the receiver output is High. Only when the differential input is more than V_{hys} below V_{IT+} does the receiver output transition to a Low state. Therefore, the noise immunity of the receiver inputs during bus fault conditions includes the receiver hysteresis value (V_{hys}) as well as the value of V_{IT+}.

9.2.2 Detailed Design Procedure

To protect bus nodes against high-energy transients, the implementation of external transient protection devices is necessary.

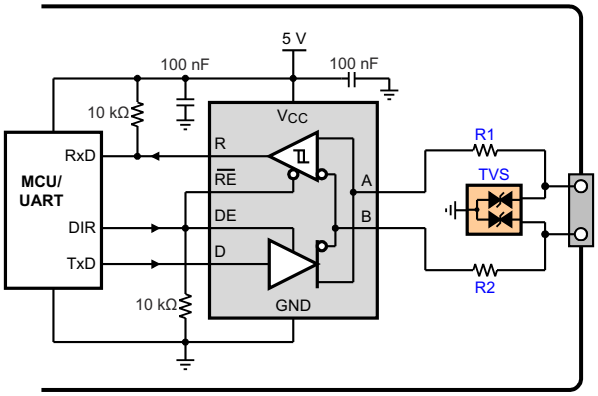

図 9-4. Transient Protection Against ESD, EFT, and Surge Transients

図 9-4 suggests a protection circuit against 10-kV ESD (IEC 61000-4-2), 4-kV EFT (IEC 61000-4-4), and 1-kV surge (IEC 61000-4-5) transients. 表 9-1 shows the associated bill of materials.

表 9-1. Bill of Materials

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER
XCVR	5-V, 10-Mbps RS-485 transceiver	SN65HVD485E	TI
R1, R2	10-Ω, pulse-proof thick-film resistor	CRCW0603010RJNEAHP	Vishay
TVS	Bidirectional 400-W transient suppressor	CDSOT23-SM712	Bourns

9.2.2.1 Power Usage in an RS-485 Transceiver

Power consumption is a concern in many applications. Power supply current is delivered to the bus load and to the transceiver circuitry. For a typical RS-485 bus configuration, the load that an active driver must drive consists of all of the receiving nodes plus the termination resistors at each end of the bus.

The load presented by the receiving nodes depends on the input impedance of the receiver. The TIA/EIA-485-A standard defines a unit load as allowing up to 1 mA. With up to 32 unit loads allowed on the bus, the total current supplied to all receivers can be as high as 32 mA. The SN65HVD485E device is rated as a ½ unit load device, so up to 64 can be connected on one bus.

The current in the termination resistors depends on the differential bus voltage. The standard requires active drivers to produce at least 1.5 V of differential signal. For a bus terminated with one standard 120-Ω resistor at

each end, this sums to 25-mA differential output current whenever the bus is active. Typically, the SN65HVD485E device can drive more than 25 mA to a 60-Ω load, which results in a differential output voltage higher than the minimum required by the standard (see 図 7-2).

Supply current increases with signaling rate primarily because of the totem pole outputs of the driver. When these outputs change state, there is a moment when both the high-side and low-side output transistors are conducting, which creates a short spike in the supply current. As the frequency of state changes increases, more power is used.

9.2.3 Application Curve

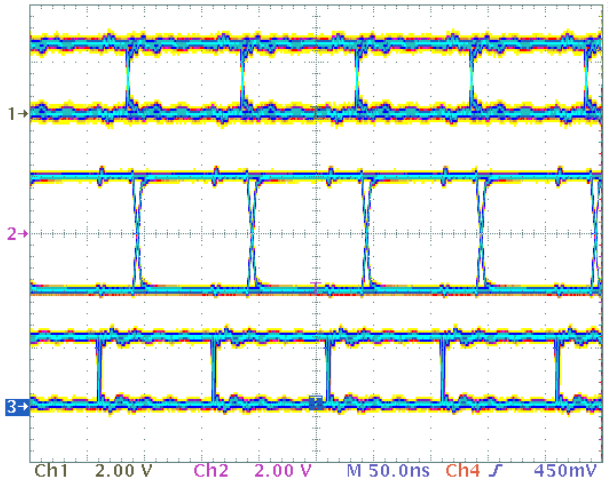

図 9-5. SN65HVD485E Single-Ended Input (Top), Differential Output (Middle), and Single-Ended Output (Bottom) at 10 MHz

9.3 Power Supply Recommendations

To ensure reliable operation at all data rates and supply voltages, each supply must be decoupled with a 100-nF ceramic capacitor located as close as possible to the supply pins. This helps to reduce supply voltage ripple present on the outputs of switched-mode power supplies and also helps to compensate for the resistance and inductance of the PCB power planes.

9.4 Layout

9.4.1 Layout Guidelines

Robust and reliable bus-node design often requires the use of external transient-protection devices to protect against EFT and surge transients that may occur in industrial environments. Because these transients have a wide frequency bandwidth (from approximately 3 MHz to 3 GHz), high-frequency layout techniques must be applied during PCB design.

1. Place the protection circuitry close to the bus connector to prevent noise transients from entering the board.
2. Use V_{CC} and ground planes to provide low-inductance power distribution. High-frequency currents tend to follow the path of least inductance and not the path of least resistance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply 100-nF to 220-nF bypass capacitors as close as possible to the V_{CC} pins of transceiver, UART, or controller ICs on the board.
5. Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize effective via inductance.
6. Use 1-kΩ to 10-kΩ pullup or pulldown resistors for enable lines to limit noise currents in these lines during transient events.
7. Insert series pulse-proof resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus terminals. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs), which reduces the transients to a few hundred volts of clamping voltage and transient blocking units (TBUs) that limit transient current to less than 1 mA.

9.4.2 Layout Example

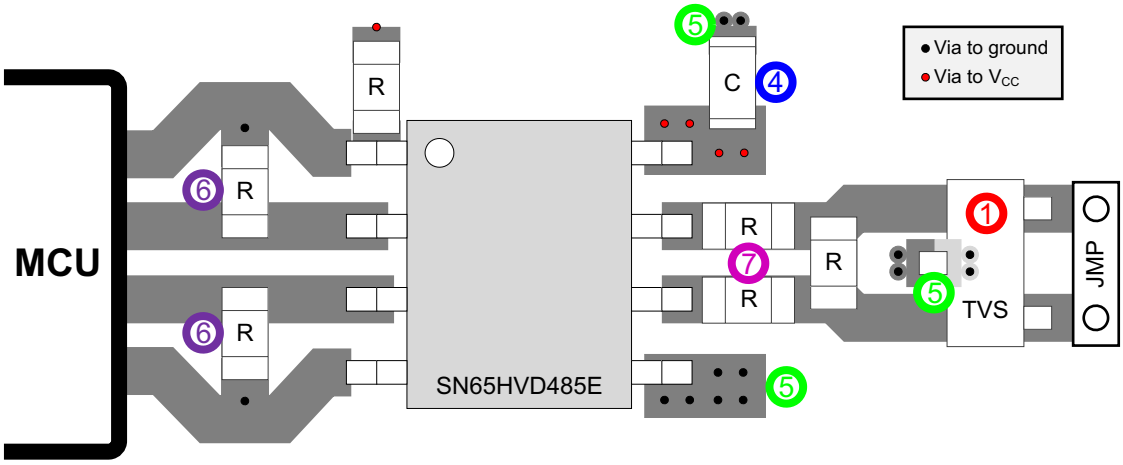

図 9-6. Layout Example

10 Device and Documentation Support

10.1 Device Support

10.1.1 Device Nomenclature

10.1.1.1 Thermal Characteristics of IC Packages

θ_{JA} (Junction-to-Ambient Thermal Resistance) is defined as the difference in junction temperature to ambient temperature divided by the operating power

θ_{JA} is NOT a constant and is a strong function of

- the PCB design (50% variation)
- altitude (20% variation)
- device power (5% variation)

θ_{JA} can be used to compare the thermal performance of packages if the specific test conditions are defined and used. Standardized testing includes specification of PCB construction, test chamber volume, sensor locations, and the thermal characteristics of holding fixtures. θ_{JA} is often misused when it is used to calculate junction temperatures for other installations.

TI uses two test PCBs as defined by JEDEC specifications. The low-k board gives average in-use condition thermal performance and consists of a single trace layer 25 mm long and 2-oz thick copper. The high-k board gives best case in-use condition and consists of two 1-oz buried power planes with a single trace layer 25 mm long with 2-oz thick copper. A 4% to 50% difference in θ_{JA} can be measured between these two test cards

θ_{JC} (Junction-to-Case Thermal Resistance) is defined as difference in junction temperature to case divided by the operating power. It is measured by putting the mounted package up against a copper block cold plate to force heat to flow from die, through the mold compound into the copper block.

θ_{JC} is a useful thermal characteristic when a heatsink is applied to package. It is NOT a useful characteristic to predict junction temperature as it provides pessimistic numbers if the case temperature is measured in a non-standard system and junction temperatures are backed out. It can be used with θ_{JB} in 1-dimensional thermal simulation of a package system.

θ_{JB} (Junction-to-Board Thermal Resistance) is defined to be the difference in the junction temperature and the PCB temperature at the center of the package (closest to the die) when the PCB is clamped in a cold-plate structure. θ_{JB} is only defined for the high-k test card.

θ_{JB} provides an overall thermal resistance between the die and the PCB. It includes a bit of the PCB thermal resistance (especially for BGA's with thermal balls) and can be used for simple 1-dimensional network analysis of package system (see 図 10-1).

10.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

10.6 用語集

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

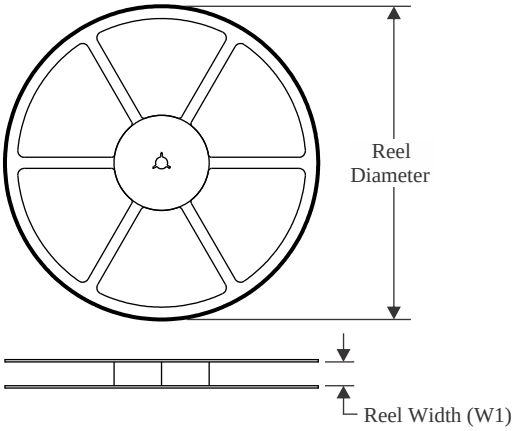
(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

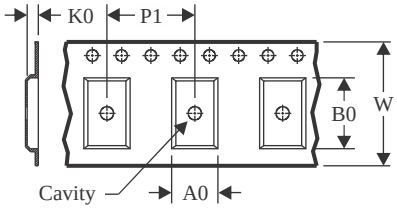
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers
