SCBS192E - JANUARY 1991 - REVISED JUNE 1997

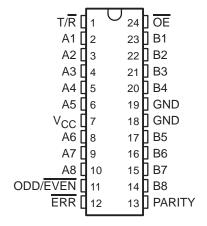

- State-of-the-Art EPIC-IIB™ BiCMOS Design Significantly Reduces Power Dissipation
- ESD Protection Exceeds 2000 V Per MIL-STD-883, Method 3015; Exceeds 200 V Using Machine Model (C = 200 pF, R = 0)
- Latch-Up Performance Exceeds 500 mA Per JEDEC Standard JESD-17
- Typical V_{OLP} (Output Ground Bounce) < 1 V at V_{CC} = 5 V, T_A = 25°C
- High-Impedance State During Power Up and Power Down
- Flow-Through Architecture Optimizes PCB Layout
- High-Drive Outputs (-32-mA I_{OH}, 64-mA I_{OI})
- Package Options Include Plastic Small-Outline (DW) Packages, Ceramic Chip Carriers (FK), and Plastic (NT) and Ceramic (JT) DIPs

description

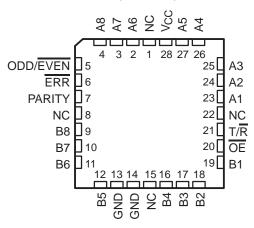

'ABT657A The transceivers have eight noninverting buffers with parity-generator/ checker circuits and control signals. transmit/receive (T/\overline{R}) input determines the direction of data flow. When T/\overline{R} is high, data flows from the A port to the B port (transmit mode); when T/\overline{R} is low, data flows from the B port to the A port (receive mode). When the output-enable (OE) input is high, both the A and B ports are in the high-impedance state.

Odd or even parity is selected by a logic high or low level on the ODD/EVEN input. PARITY carries the parity-bit value; it is an output from the parity generator/checker in the transmit mode and an input to the parity generator/checker in the receive mode.

SN54ABT657A . . . JT PACKAGE SN74ABT657A . . . DW OR NT PACKAGE (TOP VIEW)

SN54ABT657A . . . FK PACKAGE (TOP VIEW)

NC - No internal connection

In the transmit mode, after the A bus is polled to determine the number of high bits, PARITY is set to the logic level that maintains the parity sense selected by the level at ODD/EVEN. For example, if ODD/EVEN is low (even parity selected) and there are five high bits on the A bus, PARITY is set to the logic high level so that an even number of the nine total bits (eight A-bus bits plus parity bit) are high.

In the receive mode, after the B bus is polled to determine the number of high bits, the error $\overline{(ERR)}$ output logic level indicates whether or not the data to be received exhibits the correct parity sense. For example, if ODD/ \overline{EVEN} is high (odd parity selected), PARITY is high, and there are three high bits on the B bus, \overline{ERR} is low, indicating a parity error.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

EPIC-IIB is a trademark of Texas Instruments Incorporated.

SCBS192E - JANUARY 1991 - REVISED JUNE 1997

description (continued)

When V_{CC} is between 0 and 2.1 V, the device is in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 2.1 V, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

The SN54ABT657A is characterized for operation over the full military temperature range of –55°C to 125°C. The SN74ABT657A is characterized for operation from –40°C to 85°C.

logic symbol†

 $[\]dagger$ This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12. Pin numbers shown are for the DW, JT, and NT packages.

logic diagram (positive logic)

Pin numbers shown are for the DW, JT, and NT packages.

SCBS192E - JANUARY 1991 - REVISED JUNE 1997

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

| Supply voltage range, V _{CC} | 0.5 V to 7 V |
|------------------------------------------------------------------------|-----------------|
| Input voltage range, V _I (except I/O ports) (see Note 1) | –0.5 V to 7 V |
| Voltage range applied to any output in the high or power-off state, VO | –0.5 V to 5.5 V |
| Current into any output in the low state, IO: SN54ABT657A | 96 mA |
| SN74ABT657A | |
| Input clamp current, $I_{ K }(V_{ I } < 0)$ | –18 mA |
| Output clamp current, I _{OK} (V _O < 0) | –50 mA |
| Package thermal impedance, θ _{JA} (see Note 2): DW package | 81°C/W |
| NT package | 67°C/W |
| Storage temperature range, T _{stg} | –65°C to 150°C |

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

recommended operating conditions (see Note 3)

| | | | SN54AB | T657A | SN74AB | T657A | UNIT |
|---------------------|------------------------------------|-----------------|--------|-------|--------|-------|------|
| | | | MIN | MAX | MIN | MAX | UNIT |
| Vcc | Supply voltage | | 4.5 | 5.5 | 4.5 | 5.5 | V |
| VIH | High-level input voltage | | 2 | 3 | 2 | | V |
| V _{IL} | Low-level input voltage | | | 0.8 | | 0.8 | V |
| VI | Input voltage | | 0 | Vcc | 0 | VCC | V |
| IOH | High-level output current | | 7 | -24 | | -32 | mA |
| loL | Low-level output current | | 2 | 48 | | 64 | mA |
| Δt/Δν | Input transition rise or fall rate | Outputs enabled | 20% | 5 | | 5 | ns/V |
| Δt/ΔV _{CC} | Power-up ramp rate | | 200 | | 200 | | μs/V |
| TA | Operating free-air temperature | | -55 | 125 | -40 | 85 | °C |

NOTE 3: Unused pins (input or I/O) must be held high or low to prevent them from floating.

^{2.} The package thermal impedance is calculated in accordance with EIA/JEDEC Std JESD51, except for through-hole packages, which use a trace length of zero.

^{*} On products compliant to MIL-PRF-38535, this parameter does not apply.

[†] All typical values are at $V_{CC} = 5 \text{ V}$.

[‡] This parameter is characterized, but not production tested.

[§] The parameters IOZH and IOZL include the input leakage current.

[¶] Not more than one output should be tested at a time, and the duration of the test should not exceed one second.

[#]This is the increase in supply current for each input that is at the specified TTL voltage level rather than VCC or GND.

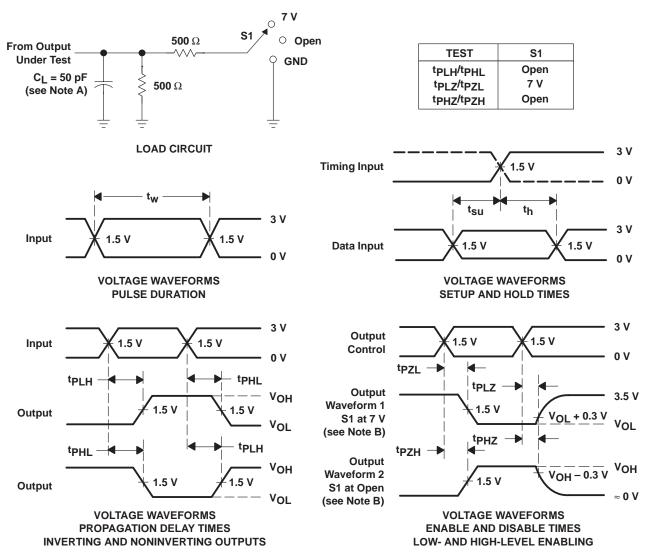

SCBS192E - JANUARY 1991 - REVISED JUNE 1997

switching characteristics over recommended ranges of supply voltage and operating free-air temperature, C_L = 50 pF (unless otherwise noted) (see Figure 1)

SCBS192E - JANUARY 1991 - REVISED JUNE 1997

PARAMETER MEASUREMENT INFORMATION

NOTES: A. C_L includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR \leq 10 MHz, $Z_Q = 50 \Omega$, $t_f \leq$ 2.5 ns. $t_f \leq$ 2.5 ns.
- D. The outputs are measured one at a time with one transition per measurement.

⁽¹⁾ Status: For more details on status, see our product life cycle.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

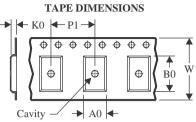

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.
