TCA9548A

TCA9548A 低電圧 8 チャネル、リセット機能搭載 I²C スイッチ

1 特長

- 1対8の双方向変換スイッチ
- I²C バスおよび SMBus 互換
- アクティブ LOW のリセット入力
- 3 本のアドレス ピンにより、最大 8 個の TCA9548A を I²C バスに接続可能
- I²C バス経由で、任意の組み合わせのチャネルを選択
- 電源オン時にすべてのスイッチ チャネルの接続解除
- 低い R_{ON} のスイッチ
- 1.8V、2.5V、3.3V、5Vのバス間での電圧レベル変換
- 電源オン時のグリッチなし
- 活線挿抜をサポート
- 低いスタンバイ電流
- 1.65V~5.5V の動作電源電圧範囲
- 5V 許容の入力
- 0~400kHz のクロック周波数
- JESD 78、Class II 準拠で 100mA 超のラッチアップ
- JESD 22 を超える ESD 保護
 - ±2000V、人体モデル (A114-A)
 - 200V、マシン モデル (A115-A)
 - ±1000V、デバイス帯電モデル (C101)

2 アプリケーション

- ・サーバー
- ルーター (テレコム スイッチング機器)
- ファクトリ オートメーション
- I²C ターゲット アドレス競合がある製品 (例: 複数の同 じ温度センサ)

3 概要

TCA9548A デバイスは、I²C バスで制御される 8 つの双 方向変換スイッチを備えています。 SCL/SDA アップストリ ーム ペアが 8 つのダウンストリーム ペア (チャネル) にフ ァンアウトされます。プログラム可能な制御レジスタの設定 により、どのような個別の SCn/SDn チャネルでも、あるい は、チャネルの組み合わせでも選択できます。これらのダ ウンストリーム チャネルを使用して、I²C ターゲット アドレス の競合を解決できます。たとえば、アプリケーションで8つ の同じデジタル温度センサを必要とする場合、0-7。

システムコントローラは、タイムアウトまたはその他の不適 切な動作が発生した場合、RESET 入力を Low にアサー トすることで TCA9548A をリセットできます。 同様に、パワ ーオンリセットではすべてのチャネルが選択解除され、 I²C/SMBus ステート マシンが初期化されます。 RESET をアサートすると、デバイスを電源オフせずに、同じリセット と初期化が行われます。これにより、いずれかのダウンスト リーム I²C バスが Low 状態で停止した場合でも回復でき ます。

スイッチのパス ゲートは、TCA9548A から渡される最高電 圧を、VCCピンを使用して制限できるように構成されてい ます。最大 HIGH 電圧の制限により、ペアごとに異なるバ ス電圧を使用できるため、1.8V、2.5V、3.3V の部品が、 追加保護の必要なしに 5V の部品と通信できます。外付 けのプルアップ抵抗により、各チャネルに求められる電圧 レベルにバスをプルアップします。すべての 1/0 ピンは 5V 許容です。

パッケージ情報

部品番号	パッケージ ⁽¹⁾	本体サイズ (公称)
	PW (TSSOP, 24)	7.80mm × 4.40mm
TCA9548A	RGE (VQFN, 24)	4.00mm × 4.00mm
	DGS (VSSOP, 24)	6.10 mm × 3.00mm

利用可能なすべてのパッケージについては、データシートの末尾 にある注文情報を参照してください。

表 4-1. Pin Functions

	PIN					
NAME	TSSOP, VSSOP (PW, DGS)	VQFN (RGE)	TYPE	DESCRIPTION		
A0	1	22	Ι	Address input 0. Connect directly to V _{CC} or ground		
A1	2	23	Ι	Address input 1. Connect directly to V _{CC} or ground		
A2	21	18	Ι	Address input 2. Connect directly to V _{CC} or ground		
GND	12	9		Ground		
RESET	3	24	Ι	Active-low reset input. Connect to V _{CC} or V _{DPUM} ⁽¹⁾ through a pull-up resistor, if not used		
SD0	4	1	I/O	Serial data 0. Connect to V _{DPU0} ⁽¹⁾ through a pull-up resistor		
SC0	5	2	I/O	Serial clock 0. Connect to V _{DPU0} ⁽¹⁾ through a pull-up resistor		
SD1	6	3	I/O	Serial data 1. Connect to V _{DPU1} ⁽¹⁾ through a pull-up resistor		
SC1	7	4	I/O	Serial clock 1. Connect to V _{DPU1} ⁽¹⁾ through a pull-up resistor		
SD2	8	5	I/O	Serial data 2. Connect to V _{DPU2} ⁽¹⁾ through a pull-up resistor		
SC2	9	6	I/O	Serial clock 2. Connect to V _{DPU2} ⁽¹⁾ through a pull-up resistor		
SD3	10	7	I/O	Serial data 3. Connect to V _{DPU3} ⁽¹⁾ through a pull-up resistor		
SC3	11	8	I/O	Serial clock 3. Connect to V _{DPU3} ⁽¹⁾ through a pull-up resistor		
SD4	13	10	I/O	Serial data 4. Connect to V _{DPU4} ⁽¹⁾ through a pull-up resistor		
SC4	14	11	I/O	Serial clock 4. Connect to V _{DPU4} ⁽¹⁾ through a pull-up resistor		
SD5	15	12	I/O	Serial data 5. Connect to V _{DPU5} ⁽¹⁾ through a pull-up resistor		
SC5	16	13	I/O	Serial clock 5. Connect to V _{DPU5} ⁽¹⁾ through a pull-up resistor		
SD6	17	14	I/O	Serial data 6. Connect to V _{DPU6} ⁽¹⁾ through a pull-up resistor		
SC6	18	15	I/O	Serial clock 6. Connect to V _{DPU6} ⁽¹⁾ through a pull-up resistor		
SD7	19	16	I/O	Serial data 7. Connect to V _{DPU7} ⁽¹⁾ through a pull-up resistor		
SC7	20	17	I/O	Serial clock 7. Connect to V _{DPU7} ⁽¹⁾ through a pull-up resistor		
SCL	22	19	I/O	Serial clock bus. Connect to V _{DPUM} ⁽¹⁾ through a pull-up resistor		
SDA	23	20	I/O	Serial data bus. Connect to V _{DPUM} ⁽¹⁾ through a pull-up resistor		
VCC	24	21	Power	Supply voltage		

⁽¹⁾ V_{DPUX} is the pull-up reference voltage for the associated data line. V_{DPUM} is the controller I²C reference voltage and V_{DPU0}-V_{DPU7} are the target channel reference voltages.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

	3 1 3 (·	M	IN MAX	UNIT
V _{CC}	Supply voltage		-().5 7	V
VI	Input voltage ⁽²⁾		-().5 7	V
I _I	Input current		_	20 20	mA
Io	Output current		_	25	mA
I _{CC}	Supply current	Supply current		00 100	mA
T _{stg}	Storage temperature	Storage temperature		65 150	°C
TJ	Max Junction Temperature	V _{CC} ≤ 3.6 V		130	°C
T _J	max surrough remperature	V _{CC} ≤ 5.5 V		90	

⁽¹⁾ Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability

5.2 ESD Ratings

			VALUE	UNIT
V	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
V _(ESD)	Liectiostatic discharge	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	v

⁽¹⁾ JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

			MIN	MAX	UNIT
V	CC Supply voltage	-40 °C ≤ T _A ≤ 85 °C	1.65	5.5	V
V CC		85 °C < T _A ≤ 125 °C	1.65	3.6	v
V _{IH}	High-level input voltage	SCL, SDA	0.7 × V _{CC}	6	V
VIH	High-level input voltage	A2-A0, RESET	0.7 × V _{CC}	V _{CC} + 0.5	v
V _{IL}	Low-level input voltage	SCL, SDA	-0.5	0.3 × V _{CC}	V
\v L	Low-level input voltage	A2-A0, RESET	-0.5	0.3 × V _{CC}	v
т.	T _A Operating free-air temperature	3.6 V < V _{CC} ≤ 5.5 V	-40	85	°C
'A		$1.65 \text{ V} \le \text{V}_{CC} \le 3.6 \text{ V}$	-40	125

7 Detailed Description

7.1 Overview

The TCA9548A is an 8-channel, bidirectional translating I²C switch. The controller SCL/SDA signal pair is directed to eight channels of target devices, SC0/SD0-SC7/SD7. Any individual downstream channel can be selected as well as any combination of the eight channels.

The device offers an active-low \overline{RESET} input which resets the state machine and allows the TCA9548A to recover must one of the downstream I²C buses get stuck in a low state. The state machine of the device can also be reset by cycling the power supply, V_{CC}, also known as a power-on reset (POR). Both the \overline{RESET} function and a POR cause all channels to be deselected.

The connections of the I^2C data path are controlled by the same I^2C controller device that is switched to communicate with multiple I^2C targets. After the successful acknowledgment of the target address (hardware selectable by A0, A1, and A2 pins), a single 8-bit control register is written to or read from to determine the selected channels.

The TCA9548A may also be used for voltage translation, allowing the use of different bus voltages on each SCn/SDn pair such that 1.8-V, 2.5-V, or 3.3-V parts can communicate with 5-V parts. This is achieved by using external pull-up resistors to pull the bus up to the desired voltage for the controller and each target channel.

7.2 Functional Block Diagram

7.3 Feature Description

The TCA9548A is an 8-channel, bidirectional translating switch for I²C buses that supports Standard-Mode (100 kHz) and Fast-Mode (400 kHz) operation. The TCA9548A features I²C control using a single 8-bit control register in which each bit controls the enabling and disabling of one of the corresponding 8 switch channels for I²C data flow. Depending on the application, voltage translation of the I²C bus can also be achieved using the TCA9548A to allow 1.8-V, 2.5-V, or 3.3-V parts to communicate with 5-V parts. Additionally, in the event that

communication on the I^2C bus enters a fault state, the TCA9548A can be reset to resume normal operation using the \overline{RESET} pin feature or by a power-on reset which results from cycling power to the device.

7.4 Device Functional Modes

7.4.1 RESET Input

The $\overline{\text{RESET}}$ input is an active-low signal that may be used to recover from a bus-fault condition. When this signal is asserted low for a minimum of t_{WL} , the TCA9548A resets its registers and I^2C state machine and deselects all channels. The $\overline{\text{RESET}}$ input must be connected to V_{CC} through a pull-up resistor.

7.4.2 Power-On Reset

When power is applied to the VCC pin, an internal power-on reset holds the TCA9548A in a reset condition until V_{CC} has reached V_{PORR} . At this point, the reset condition is released, and the TCA9548A registers and I^2C state machine are initialized to their default states, all zeroes, causing all the channels to be deselected. Thereafter, V_{CC} must be lowered below V_{PORF} to reset the device.

7.5 Programming

7.5.1 I²C Interface

The TCA9548A has a standard bidirectional I²C interface that is controlled by a controller device in order to be configured or read the status of this device. Each target on the I²C bus has a specific device address to differentiate between other target devices that are on the same I²C bus. Many target devices require configuration upon startup to set the behavior of the device. This is typically done when the controller accesses internal register maps of the target, which have unique register addresses. A device can have one or multiple registers where data is stored, written, or read.

The physical I²C interface consists of the serial clock (SCL) and serial data (SDA) lines. Both SDA and SCL lines must be connected to V_{CC} through a pull-up resistor. The size of the pull-up resistor is determined by the amount of capacitance on the I²C lines. (For further details, see the I²C Pull-up Resistor Calculation application report. Data transfer may be initiated only when the bus is idle. A bus is considered idle if both SDA and SCL lines are high after a STOP condition (See \boxtimes 7-1 and \boxtimes 7-2).

The following is the general procedure for a controller to access a target device:

- 1. If a controller wants to send data to a target:
 - Controller-transmitter sends a START condition and addresses the target-receiver.
 - · Controller-transmitter sends data to target-receiver.
 - Controller-transmitter terminates the transfer with a STOP condition.
- 2. If a controller wants to receive or read data from a target:
 - Controller-receiver sends a START condition and addresses the target-transmitter.
 - · Controller-receiver sends the requested register to read to target-transmitter.
 - Controller-receiver receives data from the target-transmitter.

7.5.3 Bus Transactions

Data must be sent to and received from the target devices, and this is accomplished by reading from or writing to registers in the target device.

Registers are locations in the memory of the target which contain information, whether it be the configuration information or some sampled data to send back to the controller. The controller must write information to these registers in order to instruct the target device to perform a task.

While it is common to have registers in I²C targets, note that not all target devices have registers. Some devices are simple and contain only 1 register, which may be written to directly by sending the register data immediately after the target address, instead of addressing a register. The TCA9548A is example of a single-register device, which is controlled via I²C commands. Since it has 1 bit to enable or disable a channel, there is only 1 register needed, and the controller merely writes the register data after the target address, skipping the register number.

7.5.3.1 Writes

To write on the I^2C bus, the controller sends a START condition on the bus with the address of the target, as well as the last bit (the R/ \overline{W} bit) set to 0, which signifies a write. The target acknowledges, letting the controller know it is ready. After this, the controller starts sending the control register data to the target until the controller has sent all the data necessary (which is sometimes only a single byte), and the controller terminates the transmission with a STOP condition.

There is no limit to the number of bytes sent, but the last byte sent is what is in the register.

Write to one register in a device

図 7-4. Write to Register

7.5.3.2 Reads

Reading from a target is very similar to writing, but the controller sends a START condition, followed by the target address with the R/ \overline{W} bit set to 1 (signifying a read). The target acknowledges the read request, and the controller releases the SDA bus but continues supplying the clock to the target. During this part of the transaction, the controller becomes the controller-receiver, and the target becomes the target-transmitter.

The controller continues to send out the clock pulses, but releases the SDA line so that the target can transmit data. At the end of every byte of data, the controller sends an ACK to the target, letting the target know that it is ready for more data. Once the controller has received the number of bytes it is expecting, it sends a NACK, signaling to the target to halt communications and release the bus. The controller follows this up with a STOP condition.

17

図 7-5. Read from Control Register

7.5.4 Control Register

Following the successful acknowledgment of the address byte, the bus controller sends a command byte that is stored in the control register in the TCA9548A (see \boxtimes 7-6). This register can be written and read via the I²C bus. Each bit in the command byte corresponds to a SCn/SDn channel and a high (or 1) selects this channel. Multiple SCn/SDn channels may be selected at the same time. When a channel is selected, the channel becomes active after a stop condition has been placed on the I²C bus. This makes sure that all SCn/SDn lines are in a high state when the channel is made active, so that no false conditions are generated at the time of connection. A stop condition always must occur immediately after the acknowledge cycle. If multiple bytes are received by the TCA9548A, it saves the last byte received.

Channel Selection Bits (Read/Write)

図 7-6. Control Register

0	0	0	0	0	0	0	0	No channel selected, power-up/reset default state

7.5.5 RESET Input

The $\overline{\text{RESET}}$ input is an active-low signal that may be used to recover from a bus-fault condition. When this signal is asserted low for a minimum of t_{WL} , the TCA9548A resets its registers and I^2C state machine and deselects all channels. The $\overline{\text{RESET}}$ input must be connected to V_{CC} through a pull-up resistor.

7.5.6 Power-On Reset

When power (from 0 V) is applied to V_{CC} , an internal power-on reset holds the TCA9548A in a reset condition until V_{CC} has reached V_{POR} . At that point, the reset condition is released and the TCA9548A registers and I^2C state machine initialize to their default states. After that, V_{CC} must be lowered to below V_{POR} and then back up to the operating voltage for a power-reset cycle.

8 Application and Implementation

注

以下のアプリケーション情報は、TIの製品仕様に含まれるものではなく、TIではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

Applications of the TCA9548A contain an I²C (or SMBus) controller device and up to eight I²C target devices. The downstream channels are used to resolve I²C target address conflicts. For example, if eight identical digital temperature sensors are needed in the application, one sensor can be connected at each channel: 0-7. When the temperature at a specific location is read, the appropriate channel can be enabled and all other channels switched off, the data can be retrieved, and the I²C controller can move on and read the next channel.

In an application where the I^2C bus contains many additional target devices that do not result in I^2C target address conflicts, these target devices can be connected to any desired channel to distribute the total bus capacitance across multiple channels. If multiple switches are enabled simultaneously, additional design requirements must be considered (see the *Design Requirements* section and *Detailed Design Procedure* section).

8.2 Typical Application

せ) を送信 Copyright © 2024 Texas Instruments Incorporated Product Folder Links: *TCA9548A*

Pin numbers shown are for the PW package.

図 8-1. Typical Application Schematic

21

Product Folder Links: TCA9548A

8.2.1 Design Requirements

A typical application of the TCA9548A contains one or more data pull-up voltages, V_{DPUX} , one for the controller device (V_{DPUM}) and one for each of the selectable target channels ($V_{DPU0} - V_{DPU7}$). In the event where the controller device and all target devices operate at the same voltage, then $V_{DPUM} = V_{DPUX} = VCC$. In an application where voltage translation is necessary, additional design requirements must be considered to determine an appropriate V_{CC} voltage.

The A0, A1, and A2 pins are hardware selectable to control the target address of the TCA9548A. These pins may be tied directly to GND or V_{CC} in the application.

If multiple target channels are activated simultaneously in the application, then the total I_{OL} from SCL/SDA to GND on the controller side is the sum of the currents through all pull-up resistors, R_p .

The pass-gate transistors of the TCA9548A are constructed such that the V_{CC} voltage can be used to limit the maximum voltage that is passed from one I^2C bus to another.

8.2.2 Detailed Design Procedure

Once all the targets are assigned to the appropriate target channels and bus voltages are identified, the pull-up resistors, R_p , for each of the buses need to be selected appropriately. The minimum pull-up resistance is a function of V_{DPUX} , $V_{OL,(max)}$, and I_{OL} as shown in $\not \equiv 1$:

$$R_{p(min)} = \frac{V_{DPUX} - V_{OL(max)}}{I_{OL}}$$
(1)

The maximum pull-up resistance is a function of the maximum rise time, t_r (300 ns for fast-mode operation, f_{SCL} = 400 kHz) and bus capacitance, C_b as shown in $\gtrsim 2$:

$$R_{p(max)} = \frac{t_r}{0.8473 \times C_b} \tag{2}$$

The maximum bus capacitance for an I^2C bus must not exceed 400 pF for fast-mode operation. The bus capacitance can be approximated by adding the capacitance of the TCA9548A, $C_{io(OFF)}$, the capacitance of wires, connections and traces, and the capacitance of each individual target on a given channel. If multiple channels are activated simultaneously, each of the targets on all channels contribute to total bus capacitance.

8.2.3 Application Curves

8.3 Power Supply Recommendations

The operating power-supply voltage range of the TCA9548A is 1.65 V to 5.5 V applied at the VCC pin. When the TCA9548A is powered on for the first time or anytime, the device must be reset by cycling the power supply. The power-on reset requirements must be followed to make sure the I²C bus logic is initialized properly.

8.3.1 Power-On Reset Requirements

In the event of a glitch or data corruption, PCA9548A can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application.

A power-on reset is shown in \boxtimes 8-5.

23

Product Folder Links: TCA9548A

 V_{CC} is Lowered Below the POR Threshold, Then Ramped Back Up to V_{CC}

図 8-5. Power-On Reset Waveform

表 8-1 specifies the performance of the power-on reset feature for PCA9548A for both types of power-on reset.

表 8-1. Recommended Supply Sequencing and Ramp Rates (1)

	PARAMETER								
V _{CC_FT}	Fall time	See 図 8-5	1	100	ms				
V _{CC_RT}	Rise time	See 図 8-5	0.1	100	ms				
V _{CC_TRR}	Time to re-ramp (when V_{CC} drops below $V_{PORF(min)} - 50~\text{mV}$ or when V_{CC} drops to GND)	See 図 8-5	40		μs				
V _{CC_GH}	Level that V_{CC} can glitch down to, but not cause a functional disruption when V_{CC_GW} = 1 μs	See 図 8-6		1.2	V				
V _{CC_GW}	Glitch width that does not cause a functional disruption when V_{CC_GH} = 0.5 × V_{CC}	See 図 8-6		10	μs				

(1) All supply sequencing and ramp rate values are measured at T_A = 25°C

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width (V_{CC_GW}) and height (V_{CC_GH}) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. \boxtimes 8-6 and \bigstar 8-1 provide more information on how to measure these specifications.

図 8-6. Glitch Width and Glitch Height

 V_{POR} is critical to the power-on reset. V_{POR} is the voltage level at which the reset condition is released and all the registers and the I²C/SMBus state machine are initialized to their default states. The value of V_{POR} differs based on the V_{CC} being lowered to or from 0. \boxtimes 8-7 and \bigotimes 8-1 provide more details on this specification.

8.4 Layout

8.4.1 Layout Guidelines

For PCB layout of the TCA9548A, common PCB layout practices must be followed but additional concerns related to high-speed data transfer such as matched impedances and differential pairs are not a concern for I²C signal speeds. It is common to have a dedicated ground plane on an inner layer of the board and pins that are connected to ground must have a low-impedance path to the ground plane in the form of wide polygon pours and multiple vias. By-pass and de-coupling capacitors are commonly used to control the voltage on the VCC pin, using a larger capacitor to provide additional power in the event of a short power supply glitch and a smaller capacitor to filter out high-frequency ripple.

In an application where voltage translation is not required, all V_{DPUX} voltages and V_{CC} could be at the same potential and a single copper plane could connect all of pull-up resistors to the appropriate reference voltage. In an application where voltage translation is required, V_{DPUM} and $V_{DPU0} - V_{DPU7}$, may all be on the same layer of the board with split planes to isolate different voltage potentials.

To reduce the total I²C bus capacitance added by PCB parasitics, data lines (SCn and SDn) must be a short as possible and the widths of the traces must also be minimized (for example, 5-10 mils depending on copper weight).

⁽¹⁾ Status: For more details on status, see our product life cycle.

⁽²⁾ Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

⁽⁴⁾ Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

PACKAGE OPTION ADDENDUM

www.ti.com 7-Oct-2025

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

SMALL OUTLINE PACKAGE

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

 2. This drawing is subject to change without notice.

 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-153.

SMALL OUTLINE PACKAGE

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE PACKAGE

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

PLASTIC QUAD FLATPACK - NO LEAD

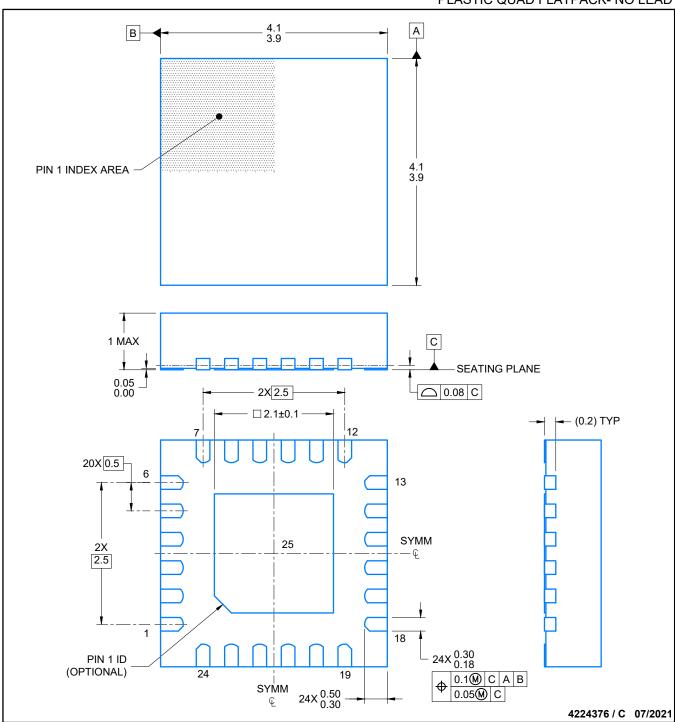

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

PLASTIC QUAD FLATPACK- NO LEAD

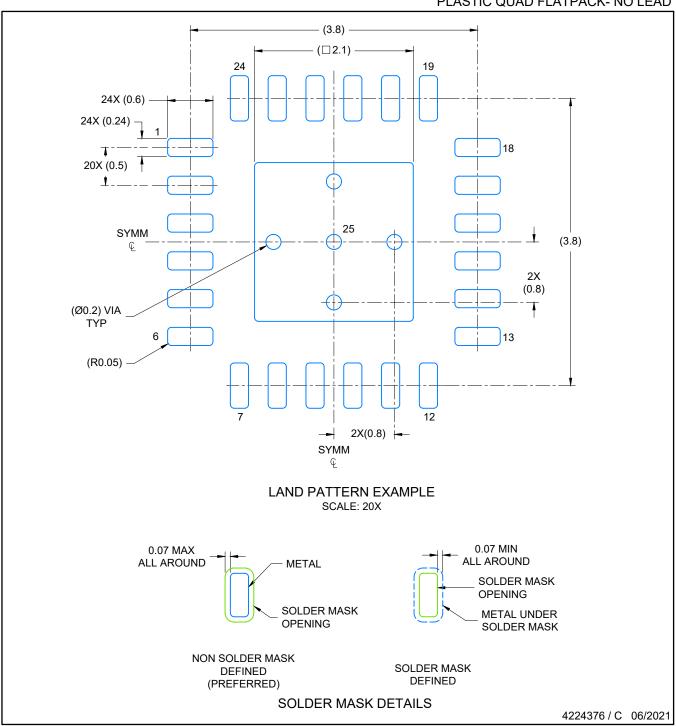

NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC QUAD FLATPACK- NO LEAD

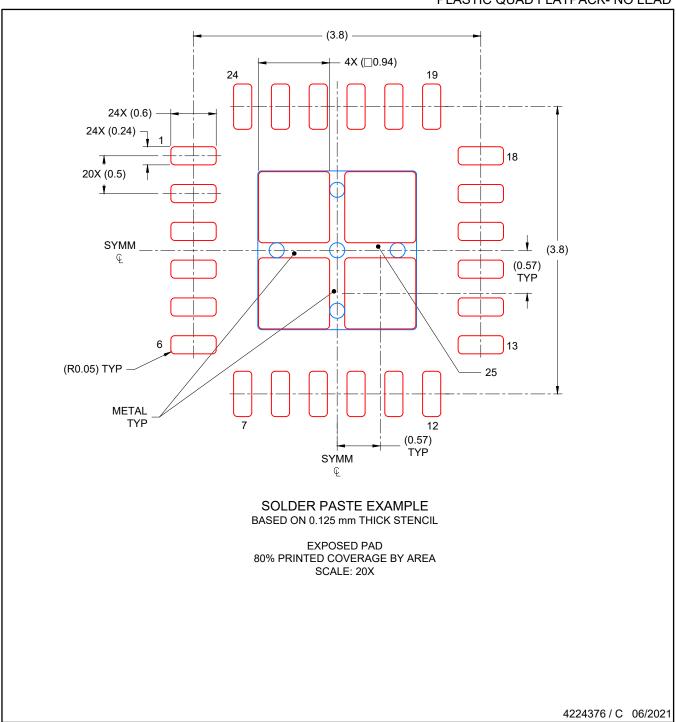

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Solder mask tolerances between and around signal pads can vary based on board fabrication site.

PLASTIC QUAD FLATPACK- NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations..
